1 Foreword

1.1 Notes on the documentation

This description is only intended for the use of trained specialists in control and automation engineering who are familiar with applicable national standards.

It is essential that the documentation and the following notes and explanations are followed when installing and commissioning the components.

It is the duty of the technical personnel to use the documentation published at the respective time of each installation and commissioning.

The responsible staff must ensure that the application or use of the products described satisfy all the requirements for safety, including all the relevant laws, regulations, guidelines and standards.

Disclaimer

The documentation has been prepared with care. The products described are, however, constantly under development.

We reserve the right to revise and change the documentation at any time and without prior announcement. No claims for the modification of products that have already been supplied may be made on the basis of the data, diagrams and descriptions in this documentation.

Trademarks

Beckhoff®, TwinCAT®, TwinCAT/BSD®, TC/BSD®, EtherCAT®, EtherCAT G®, EtherCAT G10®, EtherCAT P®, Safety over EtherCAT®, TwinSAFE®, XFC®, XTS® and XPlanar® are registered trademarks of and licensed by Beckhoff Automation GmbH.

Other designations used in this publication may be trademarks whose use by third parties for their own purposes could violate the rights of the owners.

Patent Pending

The EtherCAT Technology is covered, including but not limited to the following patent applications and patents:

EP1590927, EP1789857, EP1456722, EP2137893, DE102015105702
with corresponding applications or registrations in various other countries.

EtherCAT® is a registered trademark and patented technology, licensed by Beckhoff Automation GmbH, Germany

Copyright

The reproduction, distribution and utilization of this document as well as the communication of its contents to others without express authorization are prohibited.

Offenders will be held liable for the payment of damages. All rights reserved in the event of the grant of a patent, utility model or design.

1.2 For your safety

Safety regulations

Read the following explanations for your safety.

Always observe and follow product-specific safety instructions, which you may find at the appropriate places in this document.

Exclusion of liability

All the components are supplied in particular hardware and software configurations which are appropriate for the application. Modifications to hardware or software configurations other than those described in the documentation are not permitted, and nullify the liability of Beckhoff Automation GmbH & Co. KG.

Personnel qualification

This description is only intended for trained specialists in control, automation, and drive technology who are familiar with the applicable national standards.

Signal words

The signal words used in the documentation are classified below. In order to prevent injury and damage to persons and property, read and follow the safety and warning notices.

Personal injury warnings

DANGER

Hazard with high risk of death or serious injury.

WARNING

Hazard with medium risk of death or serious injury.

CAUTION

There is a low-risk hazard that could result in medium or minor injury.

Warning of damage to property or environment

NOTICE

The environment, equipment, or data may be damaged.

Information on handling the product

This information includes, for example:
recommendations for action, assistance or further information on the product.

1.3 Notes on information security

The products of Beckhoff Automation GmbH & Co. KG (Beckhoff), insofar as they can be accessed online, are equipped with security functions that support the secure operation of plants, systems, machines and networks. Despite the security functions, the creation, implementation and constant updating of a holistic security concept for the operation are necessary to protect the respective plant, system, machine and networks against cyber threats. The products sold by Beckhoff are only part of the overall security concept. The customer is responsible for preventing unauthorized access by third parties to its equipment, systems, machines and networks. The latter should be connected to the corporate network or the Internet only if appropriate protective measures have been set up.

In addition, the recommendations from Beckhoff regarding appropriate protective measures should be observed. Further information regarding information security and industrial security can be found in our <https://www.beckhoff.com/secguide>.

Beckhoff products and solutions undergo continuous further development. This also applies to security functions. In light of this continuous further development, Beckhoff expressly recommends that the products are kept up to date at all times and that updates are installed for the products once they have been made available. Using outdated or unsupported product versions can increase the risk of cyber threats.

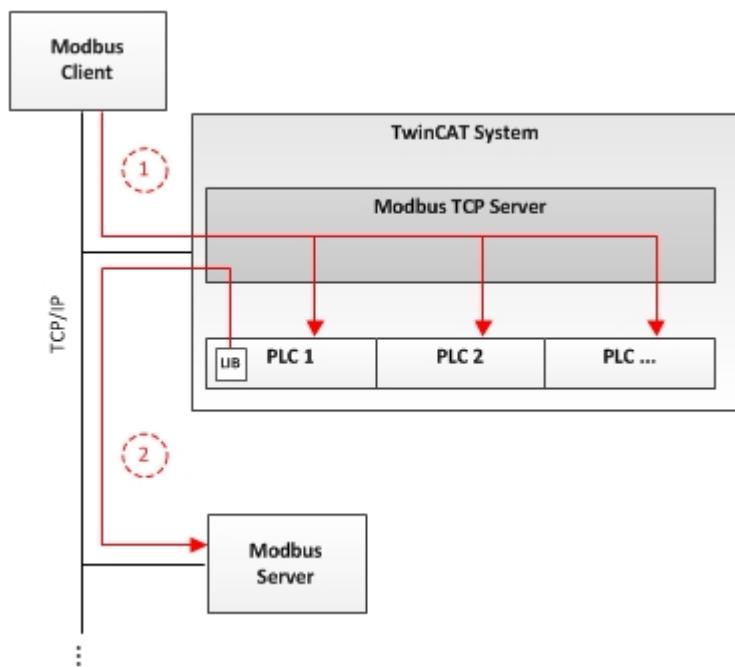

To stay informed about information security for Beckhoff products, subscribe to the RSS feed at <https://www.beckhoff.com/secinfo>.

2 Overview

The TwinCAT Modbus TCP server enables to communicate over a network connection (TCP/IP) with the Modbus protocol.

Modbus is an open standard in industrial communication which will be maintained by the independent Modbus Organization.

The protocol is based on a client/server-architecture. Therefore the product can be used as client or as server:

Server functionality: [▶ 12]

(1) The TwinCAT Modbus TCP server enables to access the TwinCAT PLC. The Modbus register and I/O's are then mapped to TwinCAT PLC areas.

Client functionality: [▶ 18]

(2) The supplied PLC-library allows to communicate with other Modbus devices to request data (e.g. measured values, states) and control them.

3 Requirements

Technical data	TwinCAT Modbus TCP Server
Target system	Windows NT/2000/XP/Vista/7 PC (x86-compatibel)
Min. TwinCAT-Version	2.8.0
Min. TwinCAT-Level	TwinCAT PLC

4 Installation

This part of the documentation gives a step-by-step explanation of the TwinCAT OPC-UA setup process for Windows XP based operating systems. The following topics are part of this document:

- Downloading the setup file
- Starting the installation
- After the installation

Downloading the setup file

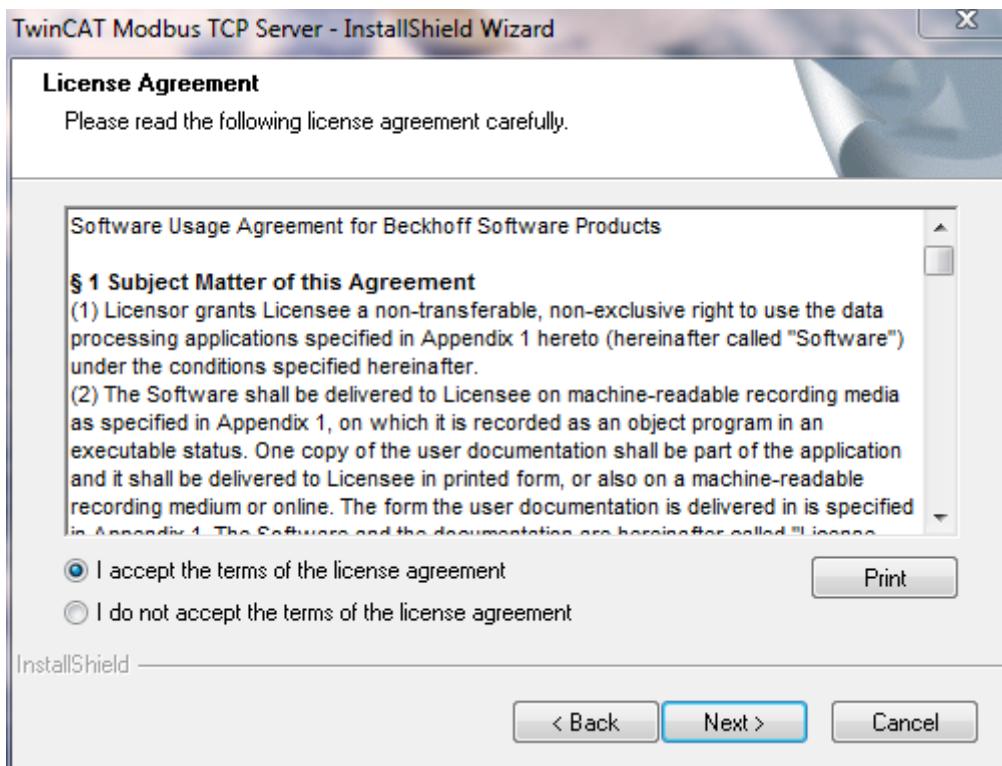

Like many other TwinCAT Supplement products, Modbus TCP is available for download via the Beckhoff FTP-Server. The download represents the most current version, which can be licensed either as a 30-Day Demo or as a full version. To download the setup file, please perform the following steps:

- Open a connection to [TwinCAT Supplement Communication](#).
- Select TS6250 TwinCAT Modbus Server and start the download via the download-cart.
- (Optional) Transfer the file to the TwinCAT runtime system on which you want to install the supplement.

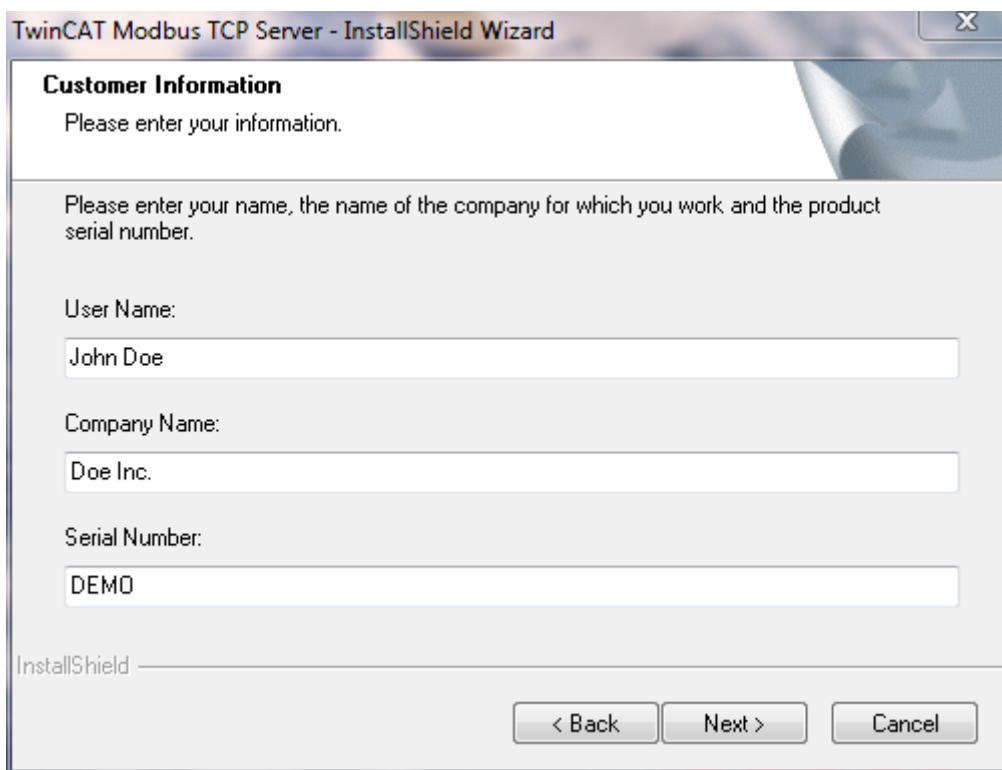

Starting the installation

To install the Supplement, please perform the following steps:

- Double-click the downloaded setup file.
Under Windows 7 32-bit/64-bit, start the installation with "Run as Administrator" by right-clicking the setup file and selecting the corresponding option in the context menu.
- Select an installation language.
- Click on "Next" and accept the license agreement.

- Enter your user information. All fields are mandatory. If you would like to install a 30-Day demo, enter "DEMO" as a license key.

- Click on "**Install**" to start installation.
- At the end of the setup process, please restart your computer.

After the installation

The Supplement "TwinCAT Modbus TCP" is automatically configured by setup and no additional settings are needed to use the product. At this point, additional steps could include:

- The Modbus TCP Server starts up with TwinCAT and provide the default mapping to the TwinCAT PLC
- Use the [Modbus configurator \[▶ 12\]](#) if you want to change the mapping

Also see about this

[Configuration \[▶ 12\]](#)

5 Configuration

The server can receive Modbus functions via TCP/IP.

Modbus areas

The Modbus specification defines these four modbus-areas:

Modbus-areas	Data type	Access	Example
digital inputs (Discrete Inputs)	1 Bit	Read only	
digitale outputs (Coils)	1 Bit	Read / write	
Input registers	16 Bit	Read only	
Output registers	16 Bit	Read / write	

After the installation the modbus areas are mapped to the PLC areas. Check the article about the [default-mapping \[▶ 14\]](#).

The [TwinCAT Modbus TCP/IP server configurator \[▶ 12\]](#) is used for configuring this mapping.

ADS-Access

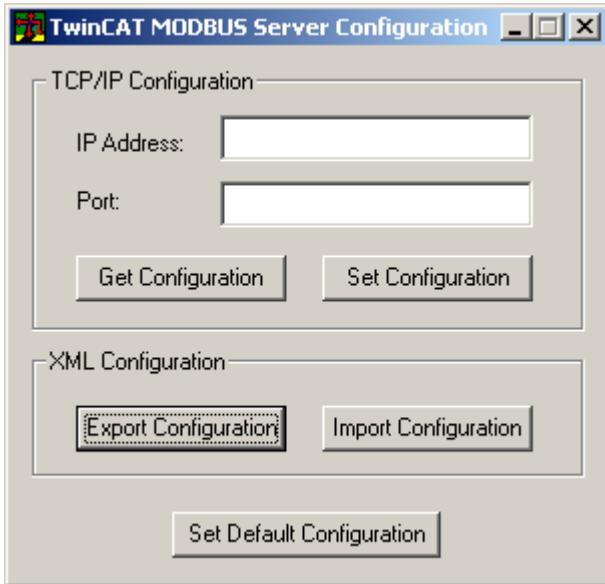

If you want to access the specific modbus areas, you have to add these global variables to your PLC project.

```
VAR_GLOBAL
    mb_Input_Coils      : ARRAY [0..255] OF BOOL;
    mb_Output_Coils     : ARRAY [0..255] OF BOOL;
    mb_Input_Registers  : ARRAY [0..255] OF WORD;
    mb_Output_Registers : ARRAY [0..255] OF WORD;
END_VAR
```

5.1 TwinCAT Modbus TCP Configurator

The configurator is installed per default to the directory **\TwinCAT\TcModbusSrv**. The tools allow to read and change the actual configuration of TwinCAT Modbus TCP server.

IP Address: IP of the server. If no address is set, the local one is used (default) .

Port: Configured port of the server (default port = 502).

Get Configuration: Read configured IP address and port.

Set Configuration: Set IP address and port.

Export Configuration: Read and save configuration.

Import Configuration: Import new configuration.

Set Default Configuration: Reset to default-settings (use local ip, Port = 502, and default mapping [▶ 14]).

Note: TwinCAT must be stopped if you want to use the configurator, which will be done by the tool.

Export configuration

The configuration is XML-based and can be changed by a text editor.

Hint: It is easier to edit and activate an exported configuration.

Importing Mapping information

Use the "Import Configuration" function to import and set active an existing (altered) configuration file.

Example for simple mapping:

```
<Configuration>
  <Port>502</Port>
  <IpAddr\>
    <Mapping>
      <InputRegisters>
        <MappingInfo>
          <!--Port 801 = PLC1 TC2 -->
          <AdsPort>801</AdsPort>
          <StartAddress>0</StartAddress>
          <EndAddress>32767</EndAddress>
          <!-- IndexGroup 61472 = 0xF020 physical plc input register %I -->
          <IndexGroup>61472</IndexGroup>
          <IndexOffset>0</IndexOffset>
        </MappingInfo>
        <MappingInfo>
          <AdsPort>801</AdsPort>
          <!-- Modbus input registers -->
          <StartAddress>32768</StartAddress>
          <EndAddress>33023</EndAddress>
          <VarName>.mb_Input_Registers</VarName>
        </MappingInfo>
      </InputRegisters>;
      <OutputRegisters/>
```

```

<InputCoils/>
<OutputCoils/>
</Mapping>
</Configuration>

```

This samples maps the input register (IndexGroup 0xF020) of the first TwinCAT2 runtime (port = 801) to the Modbus input registers.

Hint: It is possible to map by variablename or IndexGroup/Offset(better performance).

The default configuration can be found [here \[► 14\]](#).

5.2 Mapping between Modbus and ADS

The default mapping is shown in the following table:

Modbus areas	Modbus address	ADS area	
Digital inputs	0x0000 - 0x7FFF	Index group	Index offset
		0xF021 - process image of the physical inputs (bit access)	0x0
	0x8000 - 0x80FF	Name of the variables in the PLC program	Data type
		.mb_Input_Coils	ARRAY [0..255] OF BOOL
Digital outputs (coils)	0x0000 - 0x7FFF	Index group	Index offset
		0xF031 - process image of the physical outputs (bit access)	0x0
	0x8000 - 0x80FF	Name of the variables in the PLC program	Data type
		.mb_Output_Coils	ARRAY [0..255] OF BOOL
Input registers	0x0000 - 0x7FFF	Index group	Index offset
		0xF020 - process image of the physical inputs	0x0
	0x8000 - 0x80FF	Name of the variables in the PLC program	Data type
		.mb_Input_Registers	ARRAY [0..255] OF WORD
Output registers	0x0000 - 0x2FFF	Index group	Index offset
		0xF030 - process image of the physical outputs	0x0
	0x3000 - 0x5FFF	0x4020 - PLC memory area	0x0
	0x6000 - 0x7FFF	0x4040 - PLC data area	0x0
	0x8000 - 0x80FF	Name of the variables in the PLC program	Data type
		.mb_Output_Registers	ARRAY [0..255] OF WORD

The server maps the individuals ADS areas and enables the access to the physical process image and maps the PLC data area.

The mapping can be adjusted by the [configurator \[► 12\]](#).

Default XML

The default configuration with optional comments for a better explanation:

```

<Configuration>
  <!-- Modbus TCP port, default = 502-->
  <Port>502</Port>
  <!-- optional IP configuration for Modbus TCP server-->
  <IpAddr/>
  <Mapping>
    <InputCoils>

```

```
<MappingInfo>
<!-- AdsPort: TwinCAT2 PLC1 = 801, PLC2 = 811...-->
<AdsPort>801</AdsPort>
<StartAddress>0</StartAddress>
<EndAddress>32767</EndAddress>
<!-- IndexGroup 61473 = 0xF021 -> physical plc inputs %IX -->
<IndexGroup>61473</IndexGroup>
<!-- Bit offset-->
<IndexOffset>0</IndexOffset>
</MappingInfo>
<MappingInfo>
<AdsPort>801</AdsPort>
<!-- Modbus input coils -->
<StartAddress>32768</StartAddress>
<EndAddress>33023</EndAddress>

<MappingInfo>
<AdsPort>801</AdsPort>
<StartAddress>12288</StartAddress>
<EndAddress>24575</EndAddress>
<!-- IndexGroup 16416 = 0x4020 -> plc memory area %M -->
<IndexGroup>16416</IndexGroup>
<!-- Byte offset-->
<IndexOffset>0</IndexOffset>
</MappingInfo>
<MappingInfo>
<AdsPort>801</AdsPort>
<StartAddress>24576</StartAddress>
<EndAddress>32767</EndAddress>
<!-- IndexGroup 16448 = 0x4040 -> plc data area -->
<IndexGroup>16448</IndexGroup>
<!-- Byte offset-->
<IndexOffset>0</IndexOffset>
```

```
</MappingInfo>
<MappingInfo>
<AdsPort>801</AdsPort>
<!-- Modbus output registers -->
<StartAddress>32768</StartAddress>
<EndAddress>33023</EndAddress>
<VarName>.mb_Output_Registers</VarName>
</MappingInfo>
</OutputRegisters>
</Mapping>
</Configuration>
```

6 Modbus ADS Diagnose Interface

The following information can be requested via ADS:

Index Group	Index Offset	Access	Datatype	Description	Minimale Modbus Server Version
0x2000	0	ADS Read	UINT32	GetConnectedClientCount Return amount of connected Modbus clients	1.0.50
0x2000	1	ADS Read	UINT32	GetModbusRequestCount Return amount of received Modbus requests	1.0.50
0x2000	2	ADS Read	UINT32	GetModbusResponseCount Return amount of sent Modbus responses	1.0.50

7 PLC libraries

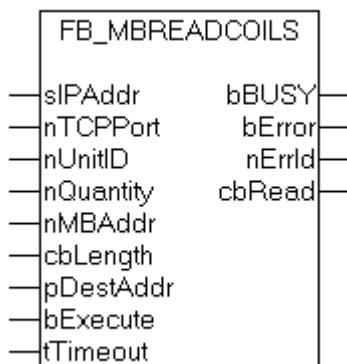

7.1 TcModbusSrv

The defined modbus functions are implemented in the PLC library TcModbusSrv.lib.

Modbus TCP function	Function code	PLC block
Read Coils	1	FB_MBReadCoils [▶ 18]
Read Discrete Inputs	2	FB_MBReadInputs [▶ 20]
Read Registers	3	FB_MBReadRegs [▶ 22]
Read Input Registers	4	FB_MBReadInputRegs [▶ 24]
Write Single Coil	5	FB_MBWriteSingleCoil [▶ 26]
Write Single Register	6	FB_MBWriteSingleReg [▶ 28]
Write Multiple Coils	15	FB_MBWriteCoils [▶ 29]
Write Multiple Registers	16	FB_MBWriteRegs [▶ 31]
Read/Write Multiple Registers	23	FB_MBReadWriteRegs [▶ 33]
Diagnostic	8	FB_MBDiagnose [▶ 35]

Modbus UDP function	Function code	PLC block
Read Coils	1	FB_MBUpdReadCoils [▶ 37]
Read Discrete Inputs	2	FB_MBUpdReadInputs [▶ 38]
Read Registers	3	FB_MBUpdReadRegs [▶ 40]
Read Input Registers	4	FB_MBUpdReadInputRegs [▶ 41]
Write Single Coil	5	FB_MBUpdWriteSingleCoil [▶ 42]
Write Single Register	6	FB_MBUpdWriteSingleReg [▶ 43]
Write Multiple Coils	15	FB_MBUpdWriteCoils [▶ 44]
Write Multiple Registers	16	FB_MBUpdWriteRegs [▶ 46]
Read/Write Multiple Registers	23	FB_MBUpdReadWriteRegs [▶ 47]
Diagnostic	8	FB_MBUpdDiagnose [▶ 49]

7.1.1 FB_MBReadCoils (Modbus function 1)

This function is used for reading 1 to 2048 digital outputs (coils). One digital output corresponds to one bit of the read data bytes.

VAR_INPUT

```
VAR_INPUT
    sIPAddr      : STRING(15);
    nTCPPort     : UINT:= MODBUS_TCP_PORT;
    nUnitID      : BYTE:=16#FF;
    nQuantity    : WORD;
    nMBAddr      : WORD;
    cbLength     : UDINT;
    pDestAddr   : UDINT;
    bExecute     : BOOL;
    tTimeout     : TIME;
END_VAR
```

sIPAddr : Is a string containing the IP address of the target device.

nTCPPort : Port number of the target device.

nUnitID: Identification number of a serial sub-network device. If a device is addressed directly via TCP/IP, this value must be 16#FF.

nQuantity : Number of digital inputs (data bits) to be read. The value of *nQuantity* must be > 0.

nMBAddr : Start address of the digital inputs to be read (bit offset).

cbLength : Contains the max. byte size of the destination buffer into which the data are to be read. The minimum buffer byte size must be: $(nQuantity + 7) / 8$.

pDestAddr : Contains the address of the destination buffer into which the data are to be read. The buffer can be a single variable, an array or a structure, whose address can be found with the ADR operator.

bExecute: The function block is activated by a rising edge at this input.

tTimeout: States the length of the timeout that may not be exceeded by execution of the ADS command.

VAR_OUTPUT

```
VAR_OUTPUT
    bBUSY      : BOOL;
    bError     : BOOL;
    nErrId     : UDINT;
    cbRead     : UDINT;
END_VAR
```

bBusy : When the function block is activated this output is set. It remains set until an acknowledgement is received.

bError : If an ADS error should occur during the transfer of the command, then this output is set once the bBusy output is reset.

nErrId : Supplies the ADS error number when the bError output is set.

cbRead: Contains the number of bytes currently read.

Function specific ADS error code	Possible reason
0x8001	Modbus function not implemented
0x8002	Invalid address or length
0x8003	Invalid parameters: - wrong number of registers
0x8004	Modbus server error

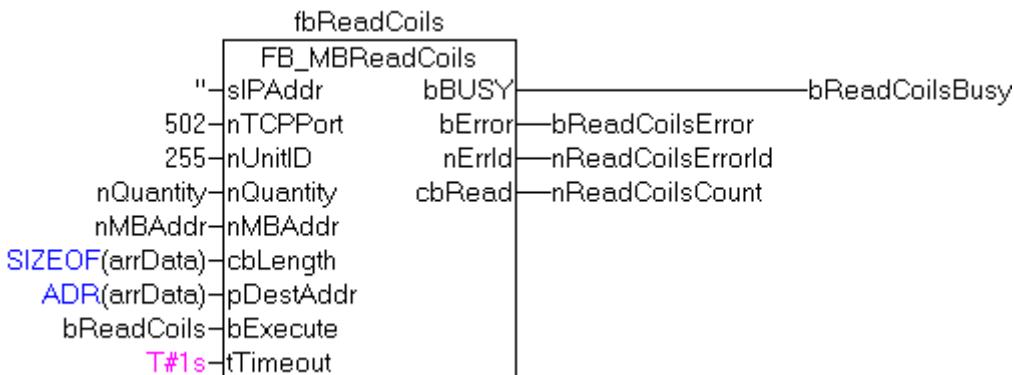

Example of calling the block in FBD:

```
PROGRAM Test
VAR
    fbReadCoils      : FB_MBReadCoils;
    bReadCoils       : BOOL;
    bReadCoilsBusy   : BOOL;
    bReadCoilsError  : BOOL;
    nReadCoilsErrorId : UDINT;
    nReadCoilsCount  : UDINT;
```

```

nQuantity      : WORD := 10;
nMBAddr        : WORD := 5;
arrData         : ARRAY [1..2] OF BYTE;
END_VAR

```

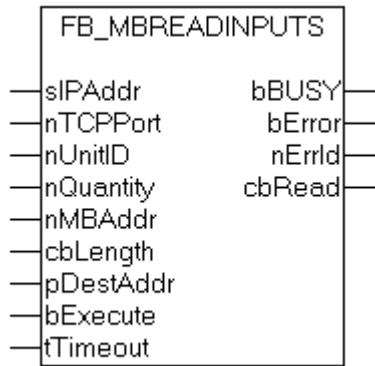

After a rising edge of "bExecute" and successful execution of the ReadCoils command, the content of digital outputs 6 - 15 is written into the arrData array:

Digital outputs	Array offset	Status
6-13	1	0x54 The status of output 13 is the MSB of this byte (left) The status of output 6 is the LSB of this byte (right)
14-15	2	0x02 Since only 10 outputs are to be read, the remaining bits (3-8) are set to 0.

Requirements

Development environment	Target system type	PLC libraries to be linked
TwinCAT v2.8.0	PC (i386)	TcModbusSrv.Lib

7.1.2 FB_MBReadInputs (Modbus function 2)

This function is used for reading 1 to 2048 digital inputs. One digital input corresponds to one bit of the read data bytes.

VAR_INPUT

```

VAR_INPUT
  sIPAddr      : STRING(15);
  nTCPPort     : UINT:= MODBUS_TCP_PORT;

```

```

nUnitID      : BYTE:=16#FF;
nQuantity    : WORD;
nMBAddr      : WORD;
cbLength     : UDINT;
pDestAddr    : UDINT;
bExecute     : BOOL;
tTimeout     : TIME;
END_VAR

```

sIPAddr: Is a string containing the IP address of the target device.

nTCPPort: Port number of the target device.

nUnitID: Identification number of a serial sub-network device. If a device is addressed directly via TCP/IP, this value must be 16#FF.

nQuantity: Number of digital inputs (data bits) to be read. The *value of nQuantity* must be > 0.

nMBAddr: Start address of the digital inputs to be read (bit offset).

cbLength: Contains the max. byte size of the destination buffer. The minimum buffer byte size must be: $(nQuantity + 7) / 8$.

pDestAddr: Contains the address of the destination buffer into which the data are to be read. The buffer can be a single variable, an array or a structure, whose address can be found with the ADR operator.

bExecute: The function block is activated by a rising edge at this input.

tTimeout: States the length of the timeout that may not be exceeded by execution of the ADS command.

VAR_OUTPUT

```

VAR_OUTPUT
  bBUSY      : BOOL;
  bError     : BOOL;
  nErrId     : UDINT;
  cbRead     : UDINT;
END_VAR

```

bBusy : When the function block is activated this output is set. It remains set until an acknowledgement is received.

bError : If an ADS error should occur during the transfer of the command, then this output is set once the bBusy output is reset.

nErrId : Supplies the ADS error number when the bError output is set.

cbRead: Contains the number of bytes currently read.

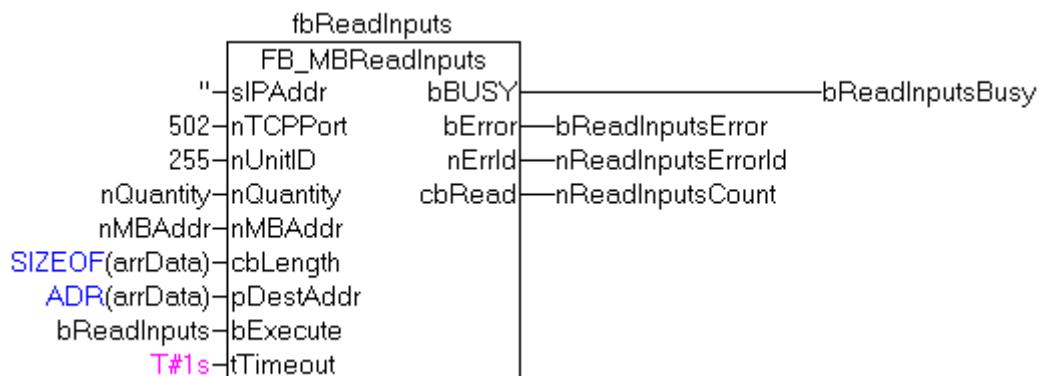

Function specific ADS error code	Possible reason
0x8001	Modbus function not implemented
0x8002	Invalid address or length
0x8003	Invalid parameters: - wrong number of registers
0x8004	Modbus server error

Example of calling the block in FBD:

```

PROGRAM Test
VAR
  fbReadInputs      : FB_MBReadInputs;
  bReadInputs       : BOOL;
  bReadInputsBusy   : BOOL;
  bReadInputsError  : BOOL;
  nReadInputsErrorId : UDINT;
  nReadInputsCount  : UDINT;
  nQuantity         : WORD := 20;
  nMBAddr          : WORD := 29;
  arrData          : ARRAY [1..3] OF BYTE;
END_VAR

```

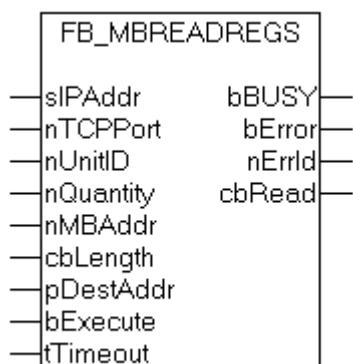

After a rising edge of "bExecute" and successful execution of the ReadInputs command, the content of digital inputs 30 - 49 is written into the arrData array:

Digital outputs	Array offset	Status
29-36	1	0x34 The status of inputs 36 is the MSB of this byte (left) The status of inputs 29 is the LSB of this byte (right)
37-44	2	0x56 The status of inputs 44 is the MSB of this byte (left) The status of inputs 37 is the LSB of this byte (right)
45-49	3	0x07 Since only 20 outputs are to be read, the remaining bits (5-8) are set to 0.

Requirements

Development environment	Target system type	PLC libraries to be linked
TwinCAT v2.8.0	PC (i386)	TcModbusSrv.Lib

7.1.3 FB_MBReadRegs (Modbus function 3)

This function is used for reading 1 to 128 output registers (16 bit). The first byte contains the lower eight bits and the second byte the upper eight bits.

VAR_INPUT

```

VAR_INPUT
  sIPAddr      : STRING(15);
  nTCPPort     : UINT:= MODBUS_TCP_PORT;
  nUnitID      : BYTE:=16#FF;
  nQuantity    : WORD;
  
```

```

nMBAddr      : WORD;
cbLength     : UDINT;
pDestAddr    : UDINT;
bExecute     : BOOL;
tTimeout     : TIME;
END_VAR

```

sIPAddr: Is a string containing the IP address of the target device.

nTCPPort: Port number of the target device.

nUnitID: Identification number of a serial sub-network device. If a device is addressed directly via TCP/IP, this value must be 16#FF.

nQuantity: Number of output registers (data words) to be read. The value of *nQuantity* must be > 0.

nMBAddr: Start address of the output registers to be read (word offset).

cbLength: Contains the max. byte size of the destination buffer. The minimum buffer byte size must be: *nQuantity* * 2.

pDestAddr: Contains the address of the destination buffer into which the data are to be read. The buffer can be a single variable, an array or a structure, whose address can be found with the ADR operator.

bExecute: The function block is activated by a rising edge at this input.

tTimeout: States the length of the timeout that may not be exceeded by execution of the ADS command.

VAR_OUTPUT

```

VAR_OUTPUT
  bBUSY      : BOOL;
  bError     : BOOL;
  nErrId    : UDINT;
  cbRead    : UDINT;
END_VAR

```

bBusy : When the function block is activated this output is set. It remains set until an acknowledgement is received.

bError : If an ADS error should occur during the transfer of the command, then this output is set once the bBusy output is reset.

nErrId : Supplies the [ADS error number](#) when the bError output is set.

cbRead: Contains the number of bytes currently read.

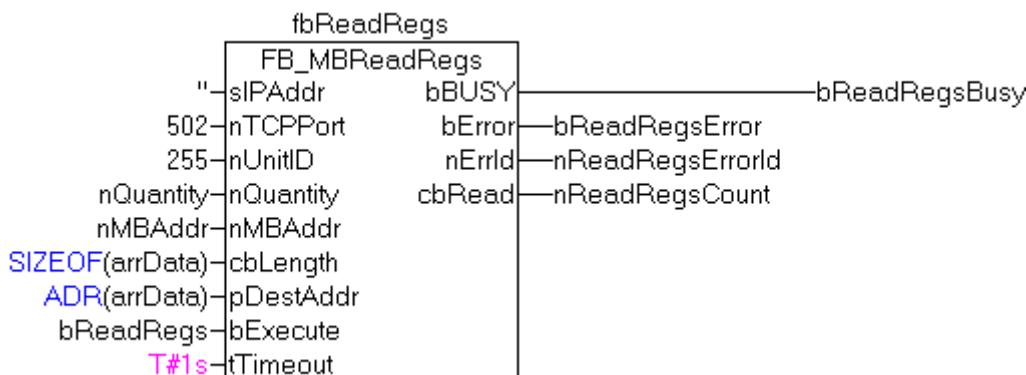

Function specific ADS error code	Possible reason
0x8001	Modbus function not implemented
0x8002	Invalid address or length
0x8003	Invalid parameters: - wrong number of registers
0x8004	Modbus server error

Example of calling the block in FBD:

```

PROGRAM Test
VAR
  fbReadRegs      : FB_MBReadRegs;
  bReadRegs       : BOOL;
  bReadRegsBusy   : BOOL;
  bReadRegsError  : BOOL;
  nReadRegsErrorId : UDINT;
  nReadRegsCount  : UDINT;
  nQuantity        : WORD:=2;
  nMBAddr         : WORD:=24;
  arrData         : ARRAY [1..2] OF WORD;
END_VAR

```

After a rising edge of "bExecute" and successful execution of the ReadRegs command, the content of registers 25 and 26 is in the arrData array:

Register	Array offset	Status
25	1	0x1234 (as byte 0x34 0x12)
26	2	0x5563 (as byte 0x63 0x55)

Requirements

Development environment	Target system type	PLC libraries to be linked
TwinCAT v2.8.0	PC (i386)	TcModbusSrv.Lib

7.1.4 FB_MBReadInputRegs (Modbus function 4)

This function is used for reading 1 to 128 input registers (16 bit). Endian

VAR_INPUT

```

VAR_INPUT
    sIPAddr      : STRING(15);
    nTCPPort     : UINT:= MODBUS_TCP_PORT;
    nUnitID      : BYTE:=16#FF;
    nQuantity    : WORD;
    nMBAAddr     : WORD;
    cbLength     : UDINT;
    pDestAddr    : UDINT;
    bExecute     : BOOL;
    tTimeout     : TIME;
END_VAR

```

sIPAddr: Is a string containing the IP address of the target device.

nTCPPort: Port number of the target device.

nUnitId: Identification number of a serial sub-network device. If a device is addressed directly via TCP/IP, this value must be 16#FF.

nQuantity: Number of input registers (data words) to be read. The value of *nQuantity* must be > 0.

nMBAddr: Start address of the input register to be read (word offset).

cbLength: Contains the max. byte size of the destination buffer. The minimum buffer byte size must be: *nQuantity* * 2.

pDestAddr: Contains the address of the destination buffer into which the data are to be read. The buffer can be a single variable, an array or a structure, whose address can be found with the ADR operator.

bExecute: The function block is activated by a rising edge at this input.

tTimeout: States the length of the timeout that may not be exceeded by execution of the ADS command.

VAR_OUTPUT

```
VAR_OUTPUT
  bBusy      : BOOL;
  bError     : BOOL;
  nErrId    : UDINT;
  cbRead    : UDINT;
END_VAR
```

bBusy : When the function block is activated this output is set. It remains set until an acknowledgement is received.

bError : If an ADS error should occur during the transfer of the command, then this output is set once the bBusy output is reset.

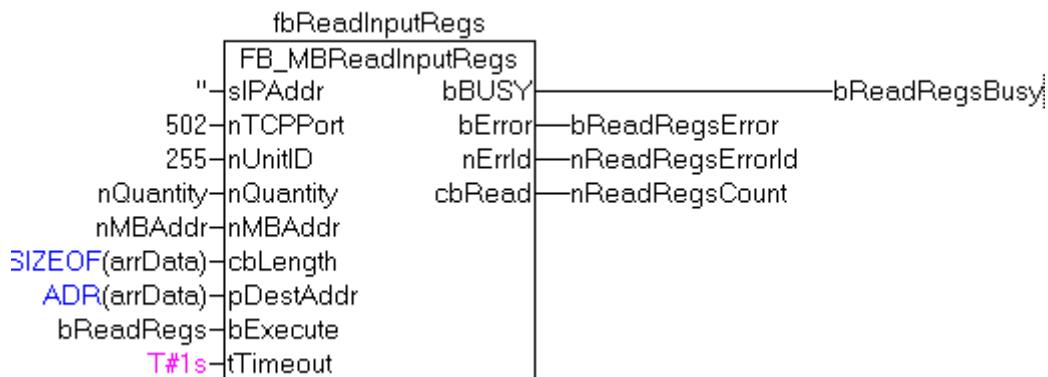

nErrId : Supplies the [ADS error number](#) when the bError output is set.

cbRead: Contains the number of bytes currently read.

Function specific ADS error code	Possible reason
0x8001	Modbus function not implemented
0x8002	Invalid address or length
0x8003	Invalid parameters: - wrong number of registers
0x8004	Modbus server error

Example of calling the block in FBD:

```
PROGRAM Test
VAR
  fbReadInputRegs   : FB_MBReadInputRegs;
  bReadRegs         : BOOL;
  bReadRegsBusy    : BOOL;
  bReadRegsError   : BOOL;
  nReadRegsErrorId : UDINT;
  nReadRegsCount   : UDINT;
  nQuantity        : WORD := 3;
  nMBAddr          : WORD:= 2;
  arrData          : ARRAY [1..3] OF WORD;
END_VAR
```

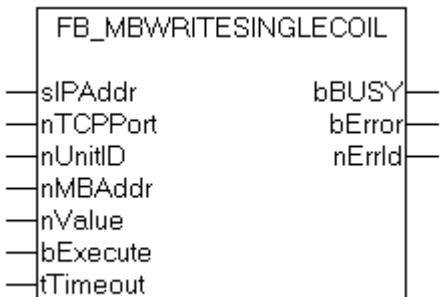

After a rising edge of "bExecute" and successful execution of the ReadRegs command, the content of registers 3-5 is in the `arrData` array:

Register	Array offset	Status
3	1	0x4543 (as byte 0x43 0x45)
4	2	0x5234 (as byte 0x34 0x52)
5	3	0x1235 (as byte 0x35 0x12)

Requirements

Development environment	Target system type	PLC libraries to be linked
TwinCAT v2.8.0	PC (i386)	TcModbusSrv.Lib

7.1.5 FB_MBWriteSingleCoil (Modbus function 5)

This function is used for writing a single digital output (coil). Bit access is used.

VAR_INPUT

```

VAR_INPUT
  sIPAddr      : STRING(15);
  nTCPPort     : UINT:= MODBUS_TCP_PORT;
  nUnitID      : BYTE:=16#FF;
  nMBAddr      : WORD;
  nValue       : WORD;
  bExecute     : BOOL;
  tTimeout     : TIME;
END_VAR
  
```

sIPAddr: Is a string containing the IP address of the target device.

nTCPPort: Port number of the target device.

nUnitID: Identification number of a serial sub-network device. If a device is addressed directly via TCP/IP, this value must be 16#FF.

nMBAddr: Address of the digital output (bit offset).

nValue: Value to be written into the digital output. The value 16#FF00 switches the output on, 16#0000 switches it off.

bExecute: The function block is activated by a rising edge at this input.

tTimeout: States the length of the timeout that may not be exceeded by execution of the ADS command.

VAR_OUTPUT

```
VAR_OUTPUT
  bBUSY      : BOOL;
  bError     : BOOL;
  nErrId     : UDINT;
END_VAR
```

bBusy : When the function block is activated this output is set. It remains set until an acknowledgement is received.

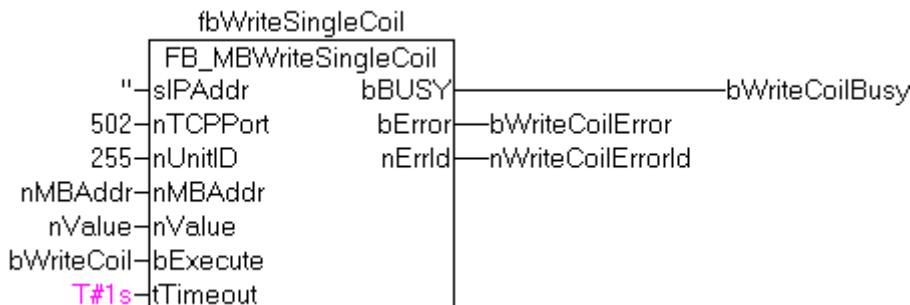

bError : If an ADS error should occur during the transfer of the command, then this output is set once the bBusy output is reset.

nErrId : Supplies the ADS error number when the bError output is set.

Function specific ADS error code	Possible reason
0x8001	Modbus function not implemented
0x8002	Invalid address or length
0x8003	Invalid parameters: - wrong number of registers
0x8004	Modbus server error

Example of calling the block in FBD:

```
PROGRAM Test
VAR
  fbWriteSingleCoil      : FB_MBWriteSingleCoil;
  bWriteCoil             : BOOL;
  bWriteCoilBusy         : BOOL;
  bWriteCoilError        : BOOL;
  nWriteCoilErrorId     : UDINT;
  nMBAddr                : WORD := 3;
  nValue                 : WORD := 16#FF00;
END_VAR
```

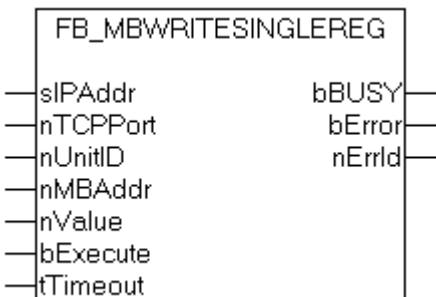

After a rising edge of "bExecute" and successful execution of the WriteSingleCoil command, digital output 4 is switched on.

Requirements

Development environment	Target system type	PLC libraries to be linked
TwinCAT v2.8.0	PC (i386)	TcModbusSrv.Lib

7.1.6 FB_MBWriteSingleReg (Modbus function 6)

This function is used for writing an individual output register. 16 bit access is used.

VAR_INPUT

```

VAR_INPUT
  sIPAddr      : STRING(15);
  nTCPPort     : UINT:= MODBUS_TCP_PORT;
  nUnitID      : BYTE:=16#FF;
  nMBAddr      : WORD;
  nValue       : WORD;
  bExecute     : BOOL;
  tTimeout     : TIME;
END_VAR
  
```

sIPAddr: Is a string containing the IP address of the target device.

nTCPPort: Port number of the target device.

nUnitID: Identification number of a serial sub-network device. If a device is addressed directly via TCP/IP, this value must be 16#FF.

nMBAddr: Address of the output register (word offset).

nValue: Value to be written into the register (word value).

bExecute: The function block is activated by a rising edge at this input.

tTimeout: States the length of the timeout that may not be exceeded by execution of the ADS command.

VAR_OUTPUT

```

VAR_OUTPUT
  bBUSY      : BOOL;
  bError     : BOOL;
  nErrId     : UDINT;
END_VAR
  
```

bBusy : When the function block is activated this output is set. It remains set until an acknowledgement is received.

bError : If an ADS error should occur during the transfer of the command, then this output is set once the bBusy output is reset.

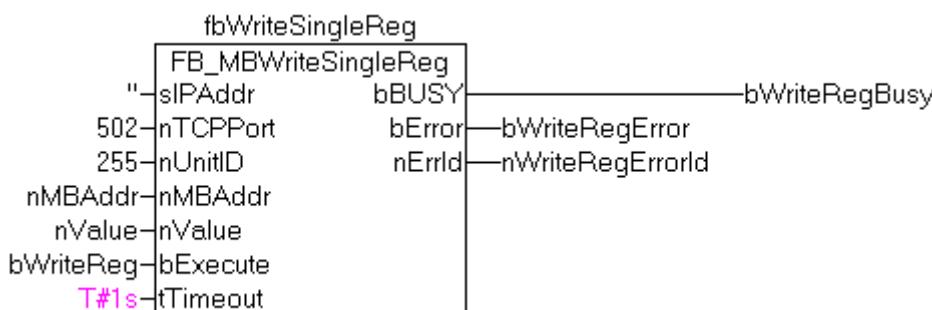

nErrId : Supplies the [ADS error number](#) when the bError output is set.

Function specific ADS error code	Possible reason
0x8001	Modbus function not implemented

Function specific ADS error code	Possible reason
0x8002	Invalid address or length
0x8003	Invalid parameters: - wrong number of registers
0x8004	Modbus server error

Example of calling the block in FBD:

```
PROGRAM Test
VAR
    fbWriteSingleReg : FB_MBWriteSingleReg;
    bWriteReg        : BOOL;
    bWriteRegBusy   : BOOL;
    bWriteRegError  : BOOL;
    nWriteRegErrorId : UDINT;
    nMBAddr         : WORD := 4;
    nValue          : WORD := 16#1234;
END_VAR
```

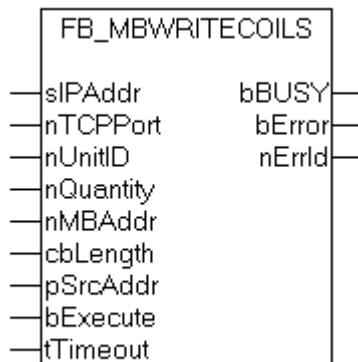

After a rising edge of "bExecute" and successful execution of the WriteSingleReg command, the value 16#1234 is written into register 5.

Requirements

Development environment	Target system type	PLC libraries to be linked
TwinCAT v2.8.0	PC (i386)	TcModbusSrv.Lib

7.1.7 FB_MBWriteCoils (Modbus function 15)

This function is used for writing 1 to 2048 digital outputs (coils). One digital output corresponds to one bit of the write data bytes.

VAR_INPUT

```
VAR_INPUT
    sIPAddr      : STRING(15);
    nTCPPort     : UINT:= MODBUS_TCP_PORT;
    nUnitID      : BYTE:=16#FF;
    nQuantity    : WORD;
    nMBAddr      : WORD;
    cbLength     : UDINT;
    pSrcAddr     : UDINT;
    bExecute     : BOOL;
    tTimeout     : TIME;
END_VAR
```

sIPAddr: Is a string containing the IP address of the target device.

nTCPPort: Port number of the target device.

nUnitID: Identification number of a serial sub-network device. If a device is addressed directly via TCP/IP, this value must be 16#FF.

nQuantity: Number of digital outputs to be written (data bits). *nQuantity* must be > 0.

nMBAddr: Start address of the digital outputs to be written (bit offset).

cbLength: Contains the max. byte size of the source buffer containing the data to be written. The minimum buffer byte size must be: (*nQuantity* + 7) / 8.

pSrcAddr: Contains the address of the source buffer containing the data to be written. The buffer can be a single variable, an array or a structure, whose address can be found with the ADR operator.

bExecute: The function block is activated by a rising edge at this input.

tTimeout: States the length of the timeout that may not be exceeded by execution of the ADS command.

VAR_OUTPUT

```
VAR_OUTPUT
    bBUSY      : BOOL;
    bError     : BOOL;
    nErrId     : UDINT;
END_VAR
```

bBusy : When the function block is activated this output is set. It remains set until an acknowledgement is received.

bError : If an ADS error should occur during the transfer of the command, then this output is set once the bBusy output is reset.

nErrId : Supplies the ADS error number when the bError output is set.

Function specific ADS error code	Possible reason
0x8001	Modbus function not implemented
0x8002	Invalid address or length
0x8003	Invalid parameters: - wrong number of registers
0x8004	Modbus server error

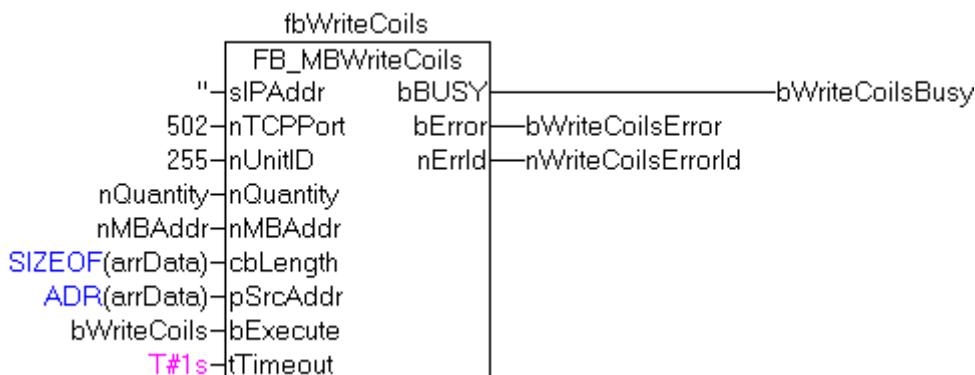

Example of calling the block in FBD:

```
PROGRAM Test
VAR
    fbWriteCoils      : FB_MBWriteCoils;
    bWriteCoils       : BOOL;
    bWriteCoilsBusy   : BOOL;
    bWriteCoilsError  : BOOL;
    nWriteCoilsErrorId : UDINT;
    nWriteCoilsCount  : UDINT;
    nQuantity         : WORD := 10;
```

```

nMBAddr          : WORD := 14;
arrData          : ARRAY [1..2] OF BYTE := 16#75,16#03;
END_VAR

```

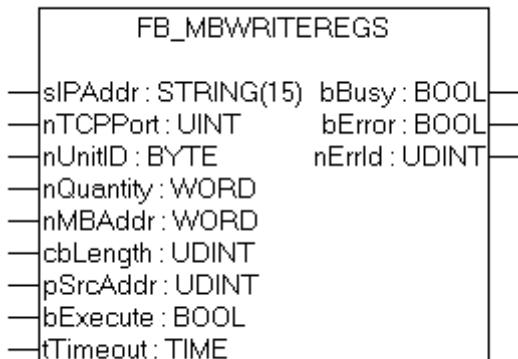

After a rising edge of "bExecute" and successful execution of the ReadCoils command, the content of the arrData array is written to digital outputs 15 - 24:

Bit	0	1	1	1	0	1	0	1	0	0	0	0	0	0	1	1
Outp ut	22	21	20	19	18	17	16	15	X	X	X	X	X	X	24	23

Requirements

Development environment	Target system type	PLC libraries to be linked
TwinCAT v2.8.0	PC (i386)	TcModbusSrv.Lib

7.1.8 FB_MBWriteRegs(Modbus function 16)

This function is used for writing 1 to 128 output registers (16 bit).

VAR_INPUT

```

VAR_INPUT
  sIPAddr      : STRING(15);
  nTCPPort     : UINT:= MODBUS_TCP_PORT;
  nUnitID      : BYTE:=16#FF;
  nQuantity    : WORD;
  nMBAddr      : WORD;
  cbLength     : UDINT;
  pSrcAddr     : UDINT;
  bExecute     : BOOL;
  tTimeout     : TIME;
END_VAR

```

sIPAddr: Is a string containing the IP address of the target device.

nTCPPort: Port number of the target device.

nUnitID: Identification number of a serial sub-network device. If a device is addressed directly via TCP/IP, this value must be 16#FF.

nQuantity: Number of output registers (data words) to be written.

nMBAddr: Start address of the output registers to be written (word offset).

cbLength: Contains the max. byte size of the source buffer. The minimum buffer byte size must be: *nQuantity* * 2.

pSrcAddr: Contains the address of the source buffer containing the data to be written. The buffer can be a single variable, an array or a structure, whose address can be found with the ADR operator.

bExecute The function block is activated by a rising edge at this input.

tTimeout: States the length of the timeout that may not be exceeded by execution of the ADS command.

VAR_OUTPUT

```
VAR_OUTPUT
  bBUSY      : BOOL;
  bError     : BOOL;
  nErrId    : UDINT;
END_VAR
```

bBusy: When the function block is activated this output is set. It remains set until an acknowledgement is received.

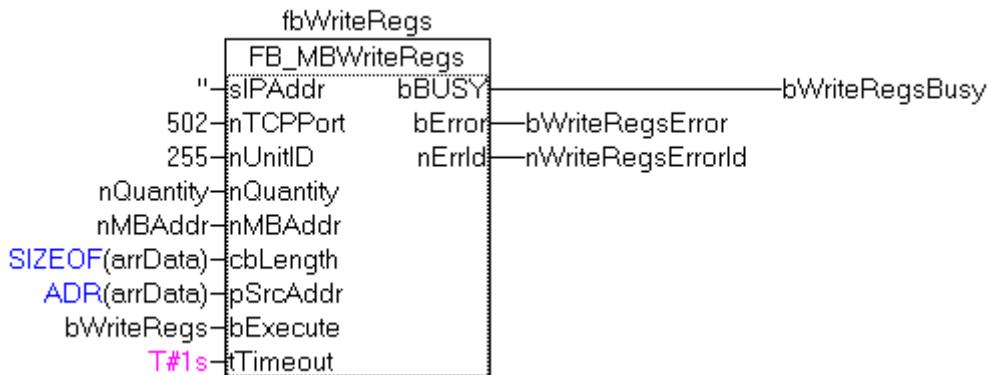

bError: If an ADS error should occur during the transfer of the command, then this output is set once the bBusy output is reset.

nErrId: Supplies the [ADS error number](#) when the bError output is set.

Function specific ADS error code	Possible reason
0x8001	Modbus function not implemented
0x8002	Invalid address or length
0x8003	Invalid parameters: - wrong number of registers
0x8004	Modbus server error

Example of calling the block in FBD:

```
PROGRAM Test
VAR
  fbWriteRegs      : FB_MBWriteRegs;
  bWriteRegs       : BOOL;
  bWriteRegsBusy   : BOOL;
  bWriteRegsError  : BOOL;
  nWriteRegsErrorId : UDINT;
  nWriteRegsCount  : UDINT;
  nQuantity        : WORD := 3;
  nMBAddr          : WORD := 4;
  arrData          : ARRAY [1..3] OF WORD;
END_VAR
```

After a rising edge of "bExecute" and successful execution of the ReadRegs command, the content of the arrData array is written to registers 5-7.

Requirements

Development environment	Target system type	PLC libraries to be linked
TwinCAT v2.8.0	PC (i386)	TcModbusSrv.Lib

7.1.9 FB_MBReadWriteRegs (Modbus function 23)

This function first reads 1 to 128 output registers (16 bit) and then writes 1 to 128 output registers (16 bit).

VAR_INPUT

```

VAR_INPUT
  sIPAddr      : STRING(15);
  nTCPPort     : UINT:= MODBUS_TCP_PORT;
  nUnitID      : BYTE:=16#FF;
  nReadQuantity : WORD;
  nMBReadAddr  : WORD;
  nWriteQuantity : WORD;
  nMBWriteAddr  : WORD;
  cbDestLength : UDINT;
  pDestAddr    : UDINT;
  cbSrcLength  : UDINT;
  pSrcAddr     : UDINT;
  bExecute      : BOOL;
  tTimeout      : TIME;
END_VAR
  
```

sIPAddr : Is a string containing the IP address of the target device.

nTCPPort : Port number of the target device.

nUnitId: Identification number of a serial sub-network device. If a device is addressed directly via TCP/IP, this value must be 16#FF.

nReadQuantity : Number of output registers (data words) to be read. The value of *nReadQuantity* must be > 0.

nMBReadAddr : Start address of the output registers to be read (word offset).

nWriteQuantity : Number of output registers (data words) to be written. The value of *nWriteQuantity* must be > 0.

nMBWriteAddr : Start address of the output registers to be written (word offset).

cbDestLength : Contains the max. byte size of the destination buffer. The minimum destination buffer byte size must be *nReadQuantity* * 2.

pDestAddr : Contains the address of the destination buffer into which the data are to be read. The buffer can be a single variable, an array or a structure, whose address can be found with the ADR operator.

cbSrcLength : Contains the max. byte size of the source buffer. The minimum source buffer byte size must be *nWriteQuantity* * 2.

pSrcAddr : Contains the address of the source buffer containing the data to be written. The buffer can be a single variable, an array or a structure, whose address can be found with the ADR operator.

bExecute: The function block is activated by a rising edge at this input.

tTimeout: States the length of the timeout that may not be exceeded by execution of the ADS command.

VAR_OUTPUT

```
VAR_OUTPUT
  bBusy      : BOOL;
  bError     : BOOL;
  nErrId    : UDINT;
  cbRead    : UDINT;
END_VAR
```

bBusy : When the function block is activated this output is set. It remains set until an acknowledgement is received.

bError : If an ADS error should occur during the transfer of the command, then this output is set once the bBusy output is reset.

nErrId : Supplies the [ADS error number](#) when the bError output is set.

cbRead: Contains the number of bytes currently read.

Function specific ADS error code	Possible reason
0x8001	Modbus function not implemented
0x8002	Invalid address or length
0x8003	Invalid parameters: - wrong number of registers
0x8004	Modbus server error

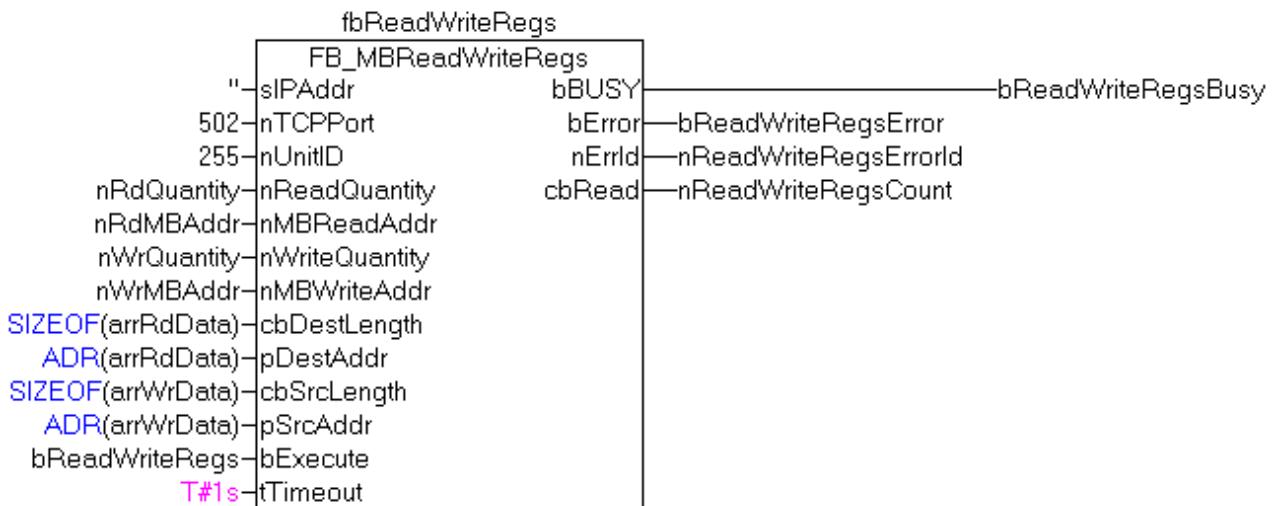

Example of calling the block in FBD:

```
PROGRAM Test
VAR
  fbReadWriteRegs      : FB_MBReadWriteRegs;
  bReadWriteRegs       : BOOL;
  bReadWriteRegsBusy   : BOOL;
  bReadWriteRegsError  : BOOL;
  nReadWriteRegsErrorId : UDINT;
  nReadWriteRegsCount  : UDINT;
  nRdQuantity         : WORD;
  nRdMBAAddr          : WORD;
```

```

nWrQuantity      : WORD;
nWrMBAddr        : WORD;
arrRdData         : ARRAY [1..9] OF WORD;
arrWrData         : ARRAY [1..9] OF WORD;
END_VAR

```

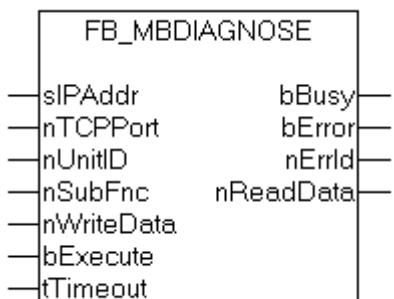

After a rising edge of "bExecute" and successful execution of the ReadWriteRegs command, arrRdData contains the read register data, and the data from arrWrData are written to the registers.

Requirements

Development environment	Target system type	PLC libraries to be linked
TwinCAT v2.8.0	PC (i386)	TcModbusSrv.Lib

7.1.10 FB_MBDiagnose (Modbus function 8)

The diagnosis function provides a series of tests for checking the communication system between the master and the slave and for examining a variety of internal error states within the slave.

VAR_INPUT

```

VAR_INPUT
  sIPAddr      : STRING(15);
  nTCPPort     : UINT:= MODBUS_TCP_PORT;
  nUnitID      : BYTE:=16#FF;
  nSubFnc      : WORD;
  nWriteData   : WORD;
  bExecute     : BOOL;
  tTimeout     : TIME;
END_VAR

```

sIPAddr : Is a string containing the IP address of the target device.

nTCPPort : Port number of the target device.

nUnitID: Identification number of a serial sub-network device. If a device is addressed directly via TCP/IP, this value must be 16#FF.

nSubFnc : The sub-function to be executed.

nWriteData: The data word to be written.

bExecute: The function block is activated by a rising edge at this input.

tTimeout: States the length of the timeout that may not be exceeded by execution of the ADS command.

VAR_OUTPUT

```
VAR_OUTPUT
    bBusy      : BOOL;
    bError     : BOOL;
    nErrId     : UDINT;
    nReadData  : WORD;
END_VAR
```

bBusy : When the function block is activated this output is set. It remains set until an acknowledgement is received.

bError : If an ADS error should occur during the transfer of the command, then this output is set once the bBusy output is reset.

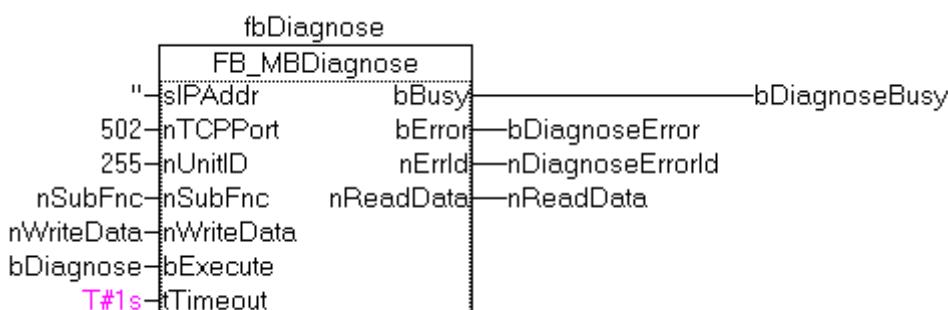

nErrId : Supplies the ADS error number when the bError output is set.

nReadData: Supplies the read data word.

Function specific ADS error code	Possible reason
0x8001	Modbus function not implemented
0x8002	Invalid address or length
0x8003	Invalid parameters: - wrong number of registers
0x8004	Modbus server error

Example of calling the block in FBD:

```
PROGRAM Test
VAR
    fbDiagnose      : FB_MBDiagnose;
    bDiagnose       : BOOL;
    bDiagnoseBusy   : BOOL;
    bDiagnoseError  : BOOL;
    nDiagnoseErrorId : UDINT;
    nSubFnc         : WORD;
    nReadData       : WORD;
    nWriteData      : WORD;
END_VAR
```

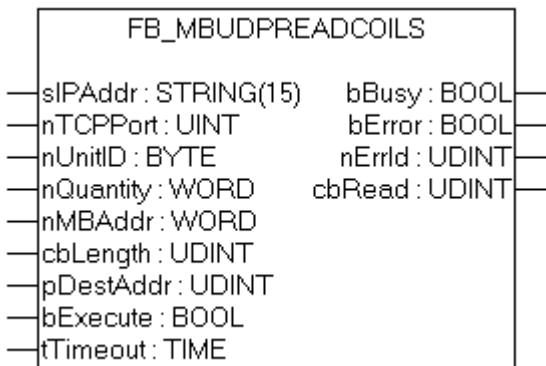

After rising edge of "bExecute" and successful execution of the diagnosis command, nReadData contains the read data word.

Requirements

Development environment	Target system type	PLC libraries to be linked
TwinCAT v2.8.0	PC (i386)	TcModbusSrv.Lib

7.1.11 UDP

7.1.11.1 FB_MBUDpReadCoils (Modbus function 1)

This function is used for reading 1 to 2048 digital outputs (coils). One digital output corresponds to one bit of the read data bytes.

VAR_INPUT

```

VAR_INPUT
  sIPAddr      : STRING(15);
  nTCPPort     : UINT:= MODBUS_TCP_PORT;
  nUnitID      : BYTE:=16#FF;
  nQuantity    : WORD;
  nMBAddr      : WORD;
  cbLength     : UDINT;
  pDestAddr   : UDINT;
  bExecute     : BOOL;
  tTimeout     : TIME;
END_VAR
  
```

sIPAddr : Is a string containing the IP address of the target device.

nTCPPort : Port number of the target device.

nUnitID: Identification number of a serial sub-network device. If a device is addressed directly via TCP/IP, this value must be 16#FF.

nQuantity : Number of digital inputs (data bits) to be read. The value of *nQuantity* must be > 0.

nMBAddr : Start address of the digital inputs to be read (bit offset).

cbLength : Contains the max. byte size of the destination buffer into which the data are to be read. The minimum buffer byte size must be: $(nQuantity + 7) / 8$.

pDestAddr : Contains the address of the destination buffer into which the data are to be read. The buffer can be a single variable, an array or a structure, whose address can be found with the ADR operator.

bExecute: The function block is activated by a rising edge at this input.

tTimeout: States the length of the timeout that may not be exceeded by execution of the ADS command.

VAR_OUTPUT

```
VAR_OUTPUT
  bBusy      : BOOL;
  bError     : BOOL;
  nErrId     : UDINT;
  cbRead     : UDINT;
END_VAR
```

bBusy : When the function block is activated this output is set. It remains set until an acknowledgement is received.

bError : If an ADS error should occur during the transfer of the command, then this output is set once the bBusy output is reset.

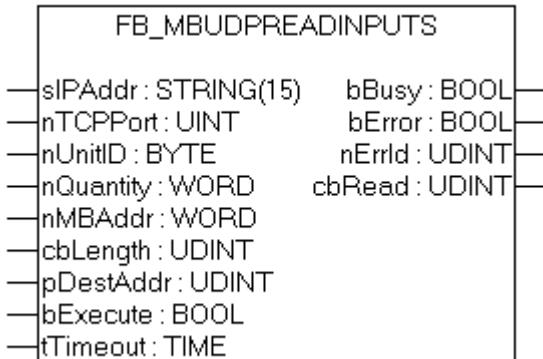

nErrId : Supplies the ADS error number when the bError output is set.

cbRead: Contains the number of bytes currently read.

Function specific ADS error code	Possible reason
0x8001	Modbus function not implemented
0x8002	Invalid address or length
0x8003	Invalid parameters: - wrong number of registers
0x8004	Modbus server error

Requirements

Development environment	Target system type	PLC libraries to be linked
TwinCAT v2.8.0	PC (i386)	TcModbusSrv.Lib

7.1.11.2 FB_MBUDPREADINPUTS (Modbus function 2)

This function is used for reading 1 to 2048 digital inputs. One digital input corresponds to one bit of the read data bytes.

VAR_INPUT

```
VAR_INPUT
  sIPAddr      : STRING(15);
  nTCPPort     : UINT:= MODBUS_TCP_PORT;
  nUnitID      : BYTE:=16#FF;
  nQuantity    : WORD;
  nMBAddr      : WORD;
  cbLength     : UDINT;
  pDestAddr   : UDINT;
  bExecute     : BOOL;
  tTimeout     : TIME;
END_VAR
```

sIPAddr: Is a string containing the IP address of the target device.

nTCPPort: Port number of the target device.

nUnitID: Identification number of a serial sub-network device. If a device is addressed directly via TCP/IP, this value must be 16#FF.

nQuantity: Number of digital inputs (data bits) to be read. The *value of nQuantity* must be > 0.

nMBAddr: Start address of the digital inputs to be read (bit offset).

cbLength: Contains the max. byte size of the destination buffer. The minimum buffer byte size must be: $(nQuantity + 7) / 8$.

pDestAddr: Contains the address of the destination buffer into which the data are to be read. The buffer can be a single variable, an array or a structure, whose address can be found with the ADR operator.

bExecute: The function block is activated by a rising edge at this input.

tTimeout: States the length of the timeout that may not be exceeded by execution of the ADS command.

VAR_OUTPUT

```
VAR_OUTPUT
  bBUSY      : BOOL;
  bError     : BOOL;
  nErrId    : UDINT;
  cbRead    : UDINT;
END_VAR
```

bBusy : When the function block is activated this output is set. It remains set until an acknowledgement is received.

bError : If an ADS error should occur during the transfer of the command, then this output is set once the bBusy output is reset.

nErrId : Supplies the [ADS error number](#) when the bError output is set.

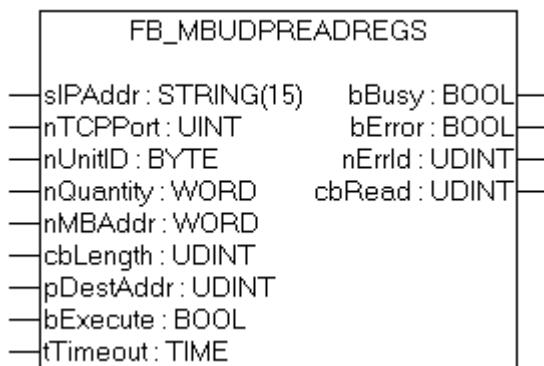

cbRead: Contains the number of bytes currently read.

Function specific ADS error code	Possible reason
0x8001	Modbus function not implemented
0x8002	Invalid address or length
0x8003	Invalid parameters: - wrong number of registers
0x8004	Modbus server error

Requirements

Development environment	Target system type	PLC libraries to be linked
TwinCAT v2.8.0	PC (i386)	TcModbusSrv.Lib

7.1.11.3 FB_MBUpReadRegs (Modbus function 3)

This function is used for reading 1 to 128 output registers (16 bit). The first byte contains the lower eight bits and the second byte the upper eight bits.

VAR_INPUT

```

VAR_INPUT
  sIPAddr      : STRING(15);
  nTCPPort     : UINT:= MODBUS_TCP_PORT;
  nUnitID      : BYTE:=16#FF;
  nQuantity    : WORD;
  nMBAddr      : WORD;
  cbLength     : UDINT;
  pDestAddr    : UDINT;
  bExecute     : BOOL;
  tTimeout     : TIME;
END_VAR
  
```

sIPAddr: Is a string containing the IP address of the target device.

nTCPPort: Port number of the target device.

nUnitID: Identification number of a serial sub-network device. If a device is addressed directly via TCP/IP, this value must be 16#FF.

nQuantity: Number of output registers (data words) to be read. The value of *nQuantity* must be > 0.

nMBAddr: Start address of the output registers to be read (word offset).

cbLength: Contains the max. byte size of the destination buffer. The minimum buffer byte size must be: *nQuantity* * 2.

pDestAddr: Contains the address of the destination buffer into which the data are to be read. The buffer can be a single variable, an array or a structure, whose address can be found with the ADR operator.

bExecute: The function block is activated by a rising edge at this input.

tTimeout: States the length of the timeout that may not be exceeded by execution of the ADS command.

VAR_OUTPUT

```

VAR_OUTPUT
  bBUSY       : BOOL;
  bError      : BOOL;
  nErrId      : UDINT;
  cbRead      : UDINT;
END_VAR
  
```

bBusy: When the function block is activated this output is set. It remains set until an acknowledgement is received.

bError: If an ADS error should occur during the transfer of the command, then this output is set once the bBusy output is reset.

nErrId: Supplies the ADS error number when the bError output is set.

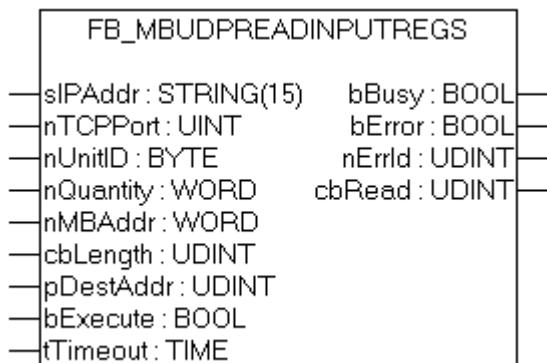

cbRead: Contains the number of bytes currently read.

Function specific ADS error code	Possible reason
0x8001	Modbus function not implemented
0x8002	Invalid address or length
0x8003	Invalid parameters: - wrong number of registers
0x8004	Modbus server error

Requirements

Development environment	Target system type	PLC libraries to be linked
TwinCAT v2.8.0	PC (i386)	TcModbusSrv.Lib

7.1.11.4 FB_MBUDpReadInputRegs (Modbus function 4)

This function is used for reading 1 to 128 input registers (16 bit). Endian

VAR_INPUT

```

VAR_INPUT
  sIPAddr      : STRING(15);
  nTCPPort     : UINT:= MODBUS_TCP_PORT;
  nUnitID      : BYTE:=16#FF;
  nQuantity    : WORD;
  nMBAddr      : WORD;
  cbLength     : UDINT;
  pDestAddr    : UDINT;
  bExecute     : BOOL;
  tTimeout     : TIME;
END_VAR

```

sIPAddr: Is a string containing the IP address of the target device.

nTCPPort: Port number of the target device.

nUnitID: Identification number of a serial sub-network device. If a device is addressed directly via TCP/IP, this value must be 16#FF.

nQuantity: Number of input registers (data words) to be read. The value of *nQuantity* must be > 0.

nMBAddr: Start address of the input register to be read (word offset).

cbLength: Contains the max. byte size of the destination buffer. The minimum buffer byte size must be: *nQuantity* * 2.

pDestAddr: Contains the address of the destination buffer into which the data are to be read. The buffer can be a single variable, an array or a structure, whose address can be found with the ADR operator.

bExecute: The function block is activated by a rising edge at this input.

tTimeout: States the length of the timeout that may not be exceeded by execution of the ADS command.

VAR_OUTPUT

```
VAR_OUTPUT
  bBusy      : BOOL;
  bError     : BOOL;
  nErrId    : UDINT;
  cbRead     : UDINT;
END_VAR
```

bBusy : When the function block is activated this output is set. It remains set until an acknowledgement is received.

bError : If an ADS error should occur during the transfer of the command, then this output is set once the bBusy output is reset.

nErrId : Supplies the ADS error number when the bError output is set.

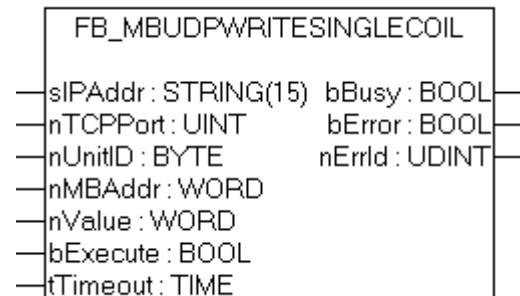

cbRead: Contains the number of bytes currently read.

Function specific ADS error code	Possible reason
0x8001	Modbus function not implemented
0x8002	Invalid address or length
0x8003	Invalid parameters: - wrong number of registers
0x8004	Modbus server error

Requirements

Development environment	Target system type	PLC libraries to be linked
TwinCAT v2.8.0	PC (i386)	TcModbusSrv.Lib

7.1.11.5 FB_MBUDpWriteSingleCoil (Modbus function 5)

This function is used for writing a single digital output (coil). Bit access is used.

VAR_INPUT

```
VAR_INPUT
  sIPAddr      : STRING(15);
  nTCPPort     : UINT:= MODBUS_TCP_PORT;
  nUnitID      : BYTE:=16#FF;
  nMBAddr      : WORD;
  nValue       : WORD;
  bExecute     : BOOL;
  tTimeout     : TIME;
END_VAR
```

sIPAddr: Is a string containing the IP address of the target device.

nTCPPort: Port number of the target device.

nUnitID: Identification number of a serial sub-network device. If a device is addressed directly via TCP/IP, this value must be 16#FF.

nMBAddr: Address of the digital output (bit offset).

nValue: Value to be written into the digital output. The value 16#FF00 switches the output on, 16#0000 switches it off.

bExecute: The function block is activated by a rising edge at this input.

tTimeout: States the length of the timeout that may not be exceeded by execution of the ADS command.

VAR_OUTPUT

```
VAR_OUTPUT
  bBusy      : BOOL;
  bError     : BOOL;
  nErrId    : UDINT;
END_VAR
```

bBusy : When the function block is activated this output is set. It remains set until an acknowledgement is received.

bError : If an ADS error should occur during the transfer of the command, then this output is set once the bBusy output is reset.

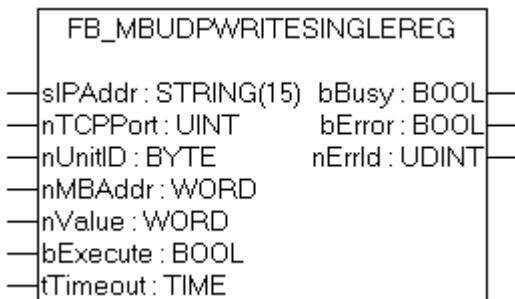

nErrId : Supplies the ADS error number when the bError output is set.

Function specific ADS error code	Possible reason
0x8001	Modbus function not implemented
0x8002	Invalid address or length
0x8003	Invalid parameters: - wrong number of registers
0x8004	Modbus server error

Requirements

Development environment	Target system type	PLC libraries to be linked
TwinCAT v2.8.0	PC (i386)	TcModbusSrv.Lib

7.1.11.6 FB_MBUDpWriteSingleReg (Modbus function 6)

This function is used for writing an individual output register. 16 bit access is used.

VAR_INPUT

```
VAR_INPUT
  sIPAddr      : STRING(15);
  nTCPPort     : UINT:= MODBUS_TCP_PORT;
  nUnitID      : BYTE:=16#FF;
  nMBAddr      : WORD;
  nValue       : WORD;
```

```

bExecute      : BOOL;
tTimeout      : TIME;
END_VAR

```

sIPAddr: Is a string containing the IP address of the target device.

nTCPPort: Port number of the target device.

nUnitID: Identification number of a serial sub-network device. If a device is addressed directly via TCP/IP, this value must be 16#FF.

nMBAddr: Address of the output register (word offset).

nValue: Value to be written into the register (word value).

bExecute: The function block is activated by a rising edge at this input.

tTimeout: States the length of the timeout that may not be exceeded by execution of the ADS command.

VAR_OUTPUT

```

VAR_OUTPUT
  bBUSY      : BOOL;
  bError     : BOOL;
  nErrId     : UDINT;
END_VAR

```

bBusy : When the function block is activated this output is set. It remains set until an acknowledgement is received.

bError : If an ADS error should occur during the transfer of the command, then this output is set once the bBusy output is reset.

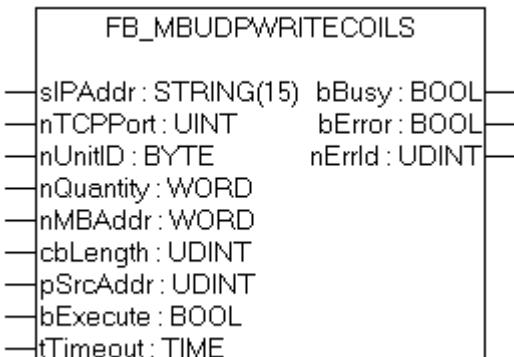

nErrId : Supplies the ADS error number when the bError output is set.

Function specific ADS error code	Possible reason
0x8001	Modbus function not implemented
0x8002	Invalid address or length
0x8003	Invalid parameters: - wrong number of registers
0x8004	Modbus server error

Requirements

Development environment	Target system type	PLC libraries to be linked
TwinCAT v2.8.0	PC (i386)	TcModbusSrv.Lib

7.1.11.7 FB_MBUDPWRITCOILS (Modbus function 15)

This function is used for writing 1 to 2048 digital outputs (coils). One digital output corresponds to one bit of the write data bytes.

VAR_INPUT

```
VAR_INPUT
    sIPAddr          : STRING(15);
    nTCPPort         : UINT:= MODBUS_TCP_PORT;
    nUnitID          : BYTE:=16#FF;
    nQuantity        : WORD;
    nMBAddr          : WORD;
    cbLength         : UDINT;
    pSrcAddr         : UDINT;
    bExecute          : BOOL;
    tTimeout          : TIME;
END_VAR
```

sIPAddr: Is a string containing the IP address of the target device.

nTCPPort: Port number of the target device.

nUnitID: Identification number of a serial sub-network device. If a device is addressed directly via TCP/IP, this value must be 16#FF.

nQuantity: Number of digital outputs to be written (data bits). *nQuantity* must be > 0.

nMBAddr: Start address of the digital outputs to be written (bit offset).

cbLength: Contains the max. byte size of the source buffer containing the data to be written. The minimum buffer byte size must be: (*nQuantity* + 7) / 8.

pSrcAddr: Contains the address of the source buffer containing the data to be written. The buffer can be a single variable, an array or a structure, whose address can be found with the ADR operator.

bExecute: The function block is activated by a rising edge at this input.

tTimeout: States the length of the timeout that may not be exceeded by execution of the ADS command.

VAR_OUTPUT

```
VAR_OUTPUT
    bBUSY           : BOOL;
    bError          : BOOL;
    nErrId          : UDINT;
    cbRead          : UDINT;
END_VAR
```

bBusy : When the function block is activated this output is set. It remains set until an acknowledgement is received.

bError : If an ADS error should occur during the transfer of the command, then this output is set once the bBusy output is reset.

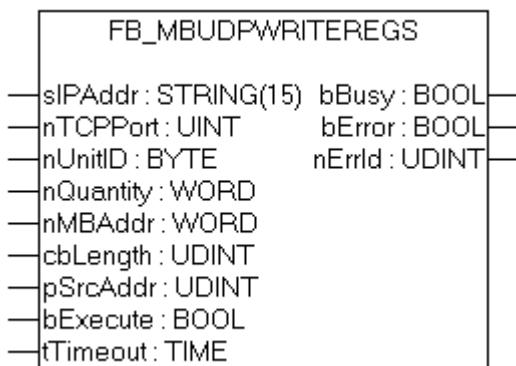

nErrId : Supplies the ADS error number when the bError output is set.

Function specific ADS error code	Possible reason
0x8001	Modbus function not implemented
0x8002	Invalid address or length
0x8003	Invalid parameters: - wrong number of registers
0x8004	Modbus server error

Requirements

Development environment	Target system type	PLC libraries to be linked
TwinCAT v2.8.0	PC (i386)	TcModbusSrv.Lib

7.1.11.8 FB_MBUDpWriteRegs (Modbus function 16)

This function is used for writing 1 to 128 output registers (16 bit).

VAR_INPUT

```

VAR_INPUT
  sIPAddr      : STRING(15);
  nTCPPort     : UINT:= MODBUS_TCP_PORT;
  nUnitID      : BYTE:=16#FF;
  nQuantity    : WORD;
  nMBAddr      : WORD;
  cbLength     : UDINT;
  pSrcAddr     : UDINT;
  bExecute     : BOOL;
  tTimeout     : TIME;
END_VAR
  
```

sIPAddr: Is a string containing the IP address of the target device.

nTCPPort: Port number of the target device.

nUnitID: Identification number of a serial sub-network device. If a device is addressed directly via TCP/IP, this value must be 16#FF.

nQuantity: Number of output registers (data words) to be written.

nMBAddr: Start address of the output registers to be written (word offset).

cbLength: Contains the max. byte size of the source buffer. The minimum buffer byte size must be: $nQuantity * 2$.

pSrcAddr: Contains the address of the source buffer containing the data to be written. The buffer can be a single variable, an array or a structure, whose address can be found with the ADR operator.

bExecute The function block is activated by a rising edge at this input.

tTimeout: States the length of the timeout that may not be exceeded by execution of the ADS command.

VAR_OUTPUT

```

VAR_OUTPUT
  bBUSY      : BOOL;
  bError     : BOOL;
  nErrId     : UDINT;
END_VAR
  
```

bBusy: When the function block is activated this output is set. It remains set until an acknowledgement is received.

bError: If an ADS error should occur during the transfer of the command, then this output is set once the bBusy output is reset.

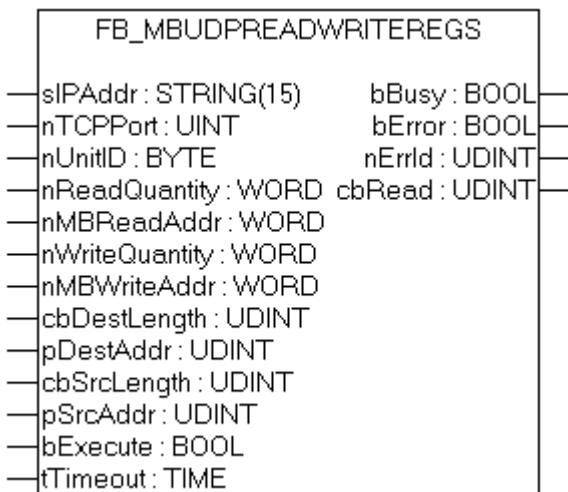

nErrId: Supplies the ADS error number when the bError output is set.

Function specific ADS error code	Possible reason
0x8001	Modbus function not implemented
0x8002	Invalid address or length
0x8003	Invalid parameters: - wrong number of registers
0x8004	Modbus server error

Requirements

Development environment	Target system type	PLC libraries to be linked
TwinCAT v2.8.0	PC (i386)	TcModbusSrv.Lib

7.1.11.9 FB_MBUDpReadWriteRegs (Modbus function 23)

This function first reads 1 to 128 output registers (16 bit) and then writes 1 to 128 output registers (16 bit).

VAR_INPUT

```

VAR_INPUT
  sIPAddr      : STRING(15);
  nTCPPort     : UINT:= MODBUS_TCP_PORT;
  nUnitID      : BYTE:=16#FF;
  nReadQuantity : WORD;
  nMBReadAddr  : WORD;
  nWriteQuantity : WORD;
  nMBWriteAddr  : WORD;
  cbDestLength : UDINT;
  pDestAddr    : UDINT;
  cbSrcLength  : UDINT;
  pSrcAddr     : UDINT;
  bExecute      : BOOL;
  tTimeout      : TIME;
END_VAR
  
```

sIPAddr : Is a string containing the IP address of the target device.

nTCPPort : Port number of the target device.

nUnitID: Identification number of a serial sub-network device. If a device is addressed directly via TCP/IP, this value must be 16#FF.

nReadQuantity : Number of output registers (data words) to be read. The value of *nReadQuantity* must be > 0.

nMBReadAddr : Start address of the output registers to be read (word offset).

nWriteQuantity : Number of output registers (data words) to be written. The value of *nWriteQuantity* must be > 0.

nMBWriteAddr : Start address of the output registers to be written (word offset).

cbDestLength : Contains the max. byte size of the destination buffer. The minimum destination buffer byte size must be *nReadQuantity* * 2.

pDestAddr : Contains the address of the destination buffer into which the data are to be read. The buffer can be a single variable, an array or a structure, whose address can be found with the ADR operator.

cbSrcLength : Contains the max. byte size of the source buffer. The minimum source buffer byte size must be *nWriteQuantity* * 2.

pSrcAddr : Contains the address of the source buffer containing the data to be written. The buffer can be a single variable, an array or a structure, whose address can be found with the ADR operator.

bExecute: The function block is activated by a rising edge at this input.

tTimeout: States the length of the timeout that may not be exceeded by execution of the ADS command.

VAR_OUTPUT

```
VAR_OUTPUT
  bBUSY      : BOOL;
  bError     : BOOL;
  nErrId    : UDINT;
  cbRead    : UDINT;
END_VAR
```

bBusy : When the function block is activated this output is set. It remains set until an acknowledgement is received.

bError : If an ADS error should occur during the transfer of the command, then this output is set once the bBusy output is reset.

nErrId : Supplies the [ADS error number](#) when the bError output is set.

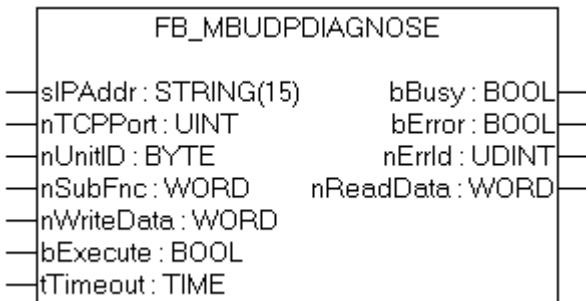

cbRead: Contains the number of bytes currently read.

Function specific ADS error code	Possible reason
0x8001	Modbus function not implemented
0x8002	Invalid address or length
0x8003	Invalid parameters: - wrong number of registers
0x8004	Modbus server error

Requirements

Development environment	Target system type	PLC libraries to be linked
TwinCAT v2.8.0	PC (i386)	TcModbusSrv.Lib

7.1.11.10 FB_MBUDpDiagnose (Modbus function 8)

The diagnosis function provides a series of tests for checking the communication system between the master and the slave and for examining a variety of internal error states within the slave.

VAR_INPUT

```

VAR_INPUT
  sIPAddr      : STRING(15);
  nTCPPort     : UINT:= MODBUS_TCP_PORT;
  nUnitID      : BYTE:=16#FF;
  nSubFnc      : WORD;
  nWriteData   : WORD;
  bExecute     : BOOL;
  tTimeout     : TIME;
END_VAR
  
```

sIPAddr : Is a string containing the IP address of the target device.

nTCPPort : Port number of the target device.

nUnitID: Identification number of a serial sub-network device. If a device is addressed directly via TCP/IP, this value must be 16#FF.

nSubFnc : The sub-function to be executed.

nWriteData: The data word to be written.

bExecute: The function block is activated by a rising edge at this input.

tTimeout: States the length of the timeout that may not be exceeded by execution of the ADS command.

VAR_OUTPUT

```

VAR_OUTPUT
  bBusy       : BOOL;
  bError      : BOOL;
  nErrId      : UDINT;
  nReadData   : WORD;
END_VAR
  
```

bBusy : When the function block is activated this output is set. It remains set until an acknowledgement is received.

bError : If an ADS error should occur during the transfer of the command, then this output is set once the bBusy output is reset.

nErrId : Supplies the [ADS error number](#) when the bError output is set.

nReadData: Supplies the read data word.

Function specific ADS error code	Possible reason
0x8001	Modbus function not implemented
0x8002	Invalid address or length
0x8003	Invalid parameters:

Function specific ADS error code	Possible reason
	- wrong number of registers
0x8004	Modbus server error

Requirements

Development environment	Target system type	PLC libraries to be linked
TwinCAT v2.8.0	PC (i386)	TcModbusSrv.Lib

8 Samples

8.1 Sample: Digital IO Access

This sample explains the access to a TwinCAT system via Modbus.

The [default mapping \[▶ 14\]](#) of the TwinCAT Modbus TCP maps the digital output (coils) to the physical outputs of the PLC.

```
PROGRAM MAIN
VAR
    Q00 AT%QX0.0      : BOOL;
    Q01 AT%QX0.1      : BOOL;
    Q02 AT%QX0.2      : BOOL;
    Q03 AT%QX0.3      : BOOL;
    Q04 AT%QX0.4      : BOOL;
    Q05 AT%QX0.5      : BOOL;
    Q06 AT%QX0.6      : BOOL;
    Q07 AT%QX0.7      : BOOL;

    fbWriteCoils       : FB_MBWriteCoils;
    bWrite              : BOOL;
    nValue              : INT;
END_VAR

IF NOT bWrite THEN
    nValue := nValue + 1;

    bWrite := TRUE;

    fbWriteCoils.nQuantity := 8;
    fbWriteCoils.cbLength := SIZEOF(nValue);
    fbWriteCoils.pSrcAddr := ADR(nValue);
    fbWriteCoils.tTimeout := T#5s;
    fbWriteCoils(bExecute:=TRUE);

ELSE
    IF NOT fbWriteCoils.bBUSY THEN
        bWrite := FALSE;
    END_IF
    fbWriteCoils(bExecute:=FALSE);
END_IF
```

The counter nValue will be written to physical outputs of the plc (Q00-Q07) by a rising edge of bWrite.

The bit ordering is explained in this table:

Bit	8 MSB	7	6	5	4	3	2	1 LSB
Output	7	6	5	4	3	2	1	0

MSB = Most significant bit

LSB = Least significant bit

<https://infosys.beckhoff.com/content/1033/tcmodbussrv/Resources/11379454731/.zip>

8.2 Sample: Multiple register access

This sample explains the access to the register of aTwinCAT system via Modbus.

The Modbusaddress **0x3000** is mapped by the default-configuration to the memory area of the plc (ADS-Indexgroup 0x4020)

```
PROGRAM MAIN
VAR
    ipAddr      : STRING(15) := '';
```

```
M0_AT%MB0      : ARRAY [0..3] OF WORD;
nValue         : ARRAY [0..3] OF WORD :=0,10,100,1000;
fbWriteRegs   : FB_MBWriteRegs;
bWriteRegs    : BOOL;
END_VAR

IF NOT bWriteRegs THEN
  nValue[0]:= nValue[0]+1;
  nValue[1]:= nValue[1]+1;
  nValue[2]:= nValue[2]+1;
  nValue[3]:= nValue[3]+1;
  bWriteRegs :=TRUE;
  fbWriteRegs.sIPAddr :=ipAddr;
  fbWriteRegs.nQuantity := 4;
  fbWriteRegs.nMBAddr := 16#3000;
  fbWriteRegs.cbLength := SIZEOF(nValue);
  fbWriteRegs.pSrcAddr := ADR(nValue);
  fbWriteRegs.tTimeout := T#5s;
  fbWriteRegs(bExecute:=TRUE);
ELSE
  IF NOT fbWriteRegs.bBUSY THEN
    bWriteRegs :=FALSE;
  END_IF
  fbWriteRegs(bExecute:=FALSE);
END_IF
```

The array arrValue will be written to the memory area of the plc (M0) by a rising edge on bWriteRegs.
