[AdsClientExtensions Class \[► 1249\]](#)

[WhenNotification Overload \[► 1263\]](#)

[TwinCAT.Ads.Reactive Namespace \[► 1249\]](#)

6.3.1.1.4.5 AdsClientExtensions.WhenNotification Method (IAdsConnection, IList.ISymbol., NotificationSettings)

Gets an observable sequence of [Notification \[► 1100\]](#) objects.

Namespace: [TwinCAT.Ads.Reactive \[► 1249\]](#)

Assembly: TwinCAT.Ads.Reactive (in TwinCAT.Ads.Reactive.dll) Version: 6.0.328+39e3229

Syntax

C#

```

public static IObservable<SymbolValueNotification> WhenNotification(
    this IAdsConnection client,
    IList<ISymbol> symbols,
    NotificationSettings settings
)

```

Parameters

client	Type: TwinCAT.Ads.IAdsConnection [► 876] The client.
symbols	Type: System.Collections.Generic.IList.ISymbol [► 2691] . The symbols to observe.
settings	Type: TwinCAT.Ads.NotificationSettings [► 1106] The Notification settings.

Return Value

Type: [IObservable.SymbolValueNotification \[► 1331\]](#).
IObservable<NotificationValue>.

Usage Note

In Visual Basic and C#, you can call this method as an instance method on any object of type [IAdsConnection \[► 876\]](#). When you use instance method syntax to call this method, omit the first parameter. For more information, see [Extension Methods \(Visual Basic\)](#) or [Extension Methods \(C# Programming Guide\)](#).

Examples

The following sample shows how observe Value changed Notifications with the reactive [AdsClientExtensions \[► 1249\]](#)

Observe changing ADS Symbols with reactive extensions.

```
// To Test the Observer run a project on the local PLC System (Port 851)

using (AdsClient client = new AdsClient())
{
    // Connect to target
    client.Connect(new AmsAddress(AmsNetId.Local, 851));

    // Create Symbol information
    var symbolLoader = SymbolLoaderFactory.Create(client, SymbolLoaderSettings.Default);

    int eventCount = 1;

    // Reactive Notification Handler
    var valueObserver = Observer.Create<SymbolValueNotification>(not =>
    {
        Console.WriteLine(string.Format("{0} {1:u} {2} = '{3}' ({4})", eventCount+
+, not.TimeStamp, not.Symbol.InstancePath, not.Value, not.Symbol.DataType));
    }
    );

    // Collect the symbols that are registered as Notification sources for their changed values.

    SymbolCollection notificationSymbols = new SymbolCollection();
    IArrayInstance taskInfo = (IArrayInstance)symbolLoader.Symbols["TwinCAT_SystemInfoVarList._TaskI
nfo"];

    foreach(ISymbol element in taskInfo.Elements)
    {
        ISymbol cycleCount = element.SubSymbols["CycleCount"];
        ISymbol lastExecTime = element.SubSymbols["LastExecTime"];

        notificationSymbols.Add(cycleCount);
        notificationSymbols.Add(lastExecTime);
    }

    // Create a subscription for the first 200 Notifications on Symbol Value changes.
    IDisposable subscription = client.WhenNotification(notificationSymbols,NotificationSettings.Defa
ult).Take(200).Subscribe(valueObserver);

    Console.ReadKey(); // Wait for Key press
    subscription.Dispose(); // Dispose the Subscription
}
```

	Name	Description
 	PollValues(IAdsCon nection, ISymbol, Type, .Int32., TimeSpan, Func.Exception, Object.) [▶ 1322]	Polls the symbol as value sequence of object values with a specified period time.
 	PollValues.T. (IAdsConnection, String, IObservable.Unit.) [▶ 1294]	Polls the symbol values on timepoints where the polling observable streams data / triggers
 	PollValues.T. (IAdsConnection, String, TimeSpan) [▶ 1295]	Polls the symbol as value sequence of object values with a specified period time.
 	PollValues.T. (IAdsConnection, ISymbol, IObservable.Unit.) [▶ 1308]	Polls the symbol values on timepoints where the polling observable streams data / triggers
 	PollValues.T. (IAdsConnection, ISymbol, TimeSpan) [▶ 1309]	Polls the symbol as value sequence of object values with a specified period time.
 	PollValues.T. (IAdsConnection, String, .Int32., IObservable.Unit.) [▶ 1296]	Polls the symbol values on time points where the polling observable streams data / triggers
  	PollValues.T. (IAdsConnection, String, .Int32., TimeSpan) [▶ 1297]	Polls the symbol as value sequence of object values with a specified period time.
 	PollValues.T. (IAdsConnection, String, IObservable.Unit., Func.Exception, T.) [▶ 1298]	Polls the symbol values on timepoints where the polling observable streams data / triggers
 	PollValues.T. (IAdsConnection, String, TimeSpan, Func.Exception, T.) [▶ 1299]	Polls the symbol as value sequence of object values with a specified period time.
 	PollValues.T. (IAdsConnection, ISymbol, .Int32., IObservable.Unit.) [▶ 1312]	Polls the symbol values on time points where the polling observable streams data / triggers

	Name	Description
  	PollValues.T. (IAdsConnection , ISymbol , .Int32 , TimeSpan) [▶ 1313]	Polls the symbol as value sequence of object values with a specified period time.
 	PollValues.T. (IAdsConnection , ISymbol , IObservable.Unit , Func.Exception , T .) [▶ 1314]	Polls the symbol values on timepoints where the polling observable streams data / triggers
 	PollValues.T. (IAdsConnection , ISymbol , TimeSpan , Func.Exception , T .) [▶ 1315]	Polls the symbol as value sequence of object values with a specified period time.
 	PollValues.T. (IAdsConnection , String , .Int32 , IObservable.Unit , Func.Exception , T .) [▶ 1302]	Polls the symbol values on timepoints where the polling observable streams data / triggers
  	PollValues.T. (IAdsConnection , String , .Int32 , TimeSpan , Func.Exception , T .) [▶ 1303]	Polls the symbol as value sequence of object values with a specified period time.
 	PollValues.T. (IAdsConnection , ISymbol , .Int32 , IObservable.Unit , Func.Exception , T .) [▶ 1318]	Polls the symbol values on timepoints where the polling observable streams data / triggers
  	PollValues.T. (IAdsConnection , ISymbol , .Int32 , TimeSpan , Func.Exception , T .) [▶ 1319]	Polls the symbol as value sequence of object values with a specified period time.
 	PollValues2.T. (IAdsConnection , String , .Int32 , IObservable.Unit .) [▶ 1329]	Polls the symbol values on time points where the polling observable streams data / triggers
 	PollValues2.T. (IAdsConnection , ISymbol , .Int32 , IObservable.Unit .) [▶ 1330]	Polls the symbol values on timepoints where the polling observable streams data / triggers

	Name	Description
  	<u>WhenNotification(AdsConnection, String, Type, NotificationSettings)</u> [▶ 1324]	Creates an observable sequence of values that are created by ADS Notifications.
  	<u>WhenNotification.T.(IAdsConnection, String, NotificationSettings)</u> [▶ 1323]	Creates an observable sequence of values that are created by ADS Notifications.
  	<u>WriteValues.T.(IAdsConnection, String, IObservable.T.)</u> [▶ 1326]	Writes the sequence of values to the symbol specified by the instance path.
  	<u>WriteValues.T.(IAdsConnection, String, IObservable.T., Action.Exception.)</u> [▶ 1327]	Writes the sequence of values to the symbol specified by the instance path.

Remarks

Reactive Extensions (Rx) are a library for composing asynchronous and event-based programs using observable sequences and LINQ-style query operators. Using Rx, developers represent asynchronous data streams with Observables, query asynchronous data streams using LINQ operators, and parameterize the concurrency in the asynchronous data streams using Schedulers. Simply put, Rx = Observables + LINQ + Schedulers. The ADS reactive extensions are build on top of this library to enable ADS Symbol and State Observables, seamlessly bound to the reactive extensions. To use the ADS reactive extensions the TwinCAT.Ads.Reactive Nuget package (or the included TwinCAT.Ads.Reactive.dll) must be referenced. ([Beckhoff.TwinCAT.Ads.Reactive package on Nuget](#)).

Examples

Example1: Observe Value changed Notifications with the reactive AnyTypeExtensions

Observe a single changing ADS Symbols (Extended AdsNotifications, ANY_TYPE)

```
// To Test the Observer run a project on the local PLC System (Port 851)
using (AdsClient client = new AdsClient())
{
    // Connect to target
    client.Connect(new AmsAddress(AmsNetId.Local, 851));

    // Reactive Notification Handler
    var valueObserver = Observer.Create<ushort>(val =>
    {
        Console.WriteLine(string.Format("Value: {0}", val.ToString()));
    });

    // Turning ADS Notifications into sequences of Value Objects (Taking 20 Values)
    // and subscribe to them.
    IDisposable subscription = client.WhenNotification<ushort>("TwinCAT_SystemInfoVarList._TaskInfo.CycleCount", NotificationSettings.Default).Take(20).Subscribe(valueObserver);

    Console.ReadKey(); // Wait for Key press
    subscription.Dispose(); // Dispose the Subscription
}
```

Examples

Example2: Polling ANY_TYPE values.

Observe changing ADS Symbols by polling (Read Polling) (ANY_TYPE)

```
// To Test the Observer run a project on the local PLC System (Port 851)
using (AdsClient client = new AdsClient())
{
    // Connect to target
    client.Connect(new AmsAddress(AmsNetId.Local, 851));

    // Create Symbol information
    var symbolLoader = SymbolLoaderFactory.Create(client, SymbolLoaderSettings.Default);
    IValueSymbol cycleCount = (IValueSymbol)symbolLoader.Symbols["TwinCAT_SystemInfoVarList._TaskInfo.CycleCount"];

    // Reactive Notification Handler
    var valueObserver = Observer.Create<object>(val =>
    {
        Console.WriteLine(string.Format("Instance: {0}, Value: {1}", cycleCount.InstancePath, val.ToString()));
    });

    // Take 20 Values in an Interval of 500ms
    IDisposable subscription = cycleCount.PollValues(TimeSpan.FromMilliseconds(500)).Take(20).Subscribe(valueObserver);

    Console.ReadKey(); // Wait for Key press
    subscription.Dispose(); // Dispose the Subscription
}
```

Examples

Write values sequentially.

Write sequences of values to the target (ANY_TYPE)

```
using (AdsClient client = new AdsClient())
{
    // Connect to target
    client.Connect(new AmsAddress(AmsNetId.Local, 851));

    // Create Symbol information (Symbol 'i : INT' in PLC Global Variables list.
    var symbolLoader = SymbolLoaderFactory.Create(client, SymbolLoaderSettings.Default);
    IValueSymbol gvlIntSymbol = (IValueSymbol)symbolLoader.Symbols["GVL.i"];

    // Produces object (short) Values 0,1,2,3 ... in seconds period
    IObservable<object> timerObservable = Observable.Interval(TimeSpan.FromSeconds(1.0)).Select(i => (object)(short)i);

    // Take 10 Values (0..9) and write them to GVL.i
    IDisposable dispose = gvlIntSymbol.WriteValues(timerObservable.Take(10));

    Console.ReadKey(); // Wait for Key press
    dispose.Dispose(); // Dispose the Subscription
}
```

[TwinCAT.Ads.Reactive Namespace \[► 1249\]](#)

6.3.2.1.1.1 AnyTypeExtensions.PollValues.T. Method (IAdsConnection, String, IObservable.Unit.)

Polls the symbol values on timepoints where the polling observable streams data / triggers

Namespace: [TwinCAT.Ads.Reactive \[► 1249\]](#)

Assembly: TwinCAT.Ads.Reactive (in TwinCAT.Ads.Reactive.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public static IObservable<T> PollValues<T>(
    this IAdsConnection connection,
    string instancePath,
    IObservable<Unit> trigger
)
```

Parameters

connection	Type: TwinCAT.Ads.IAdsConnection [► 876] The connection.
instancePath	Type: System.String The instance path.
trigger	Type: System.IObservable.Unit . The Polling trigger

Type Parameters

T	The ANY_TYPE compatible .NET Type.
---	------------------------------------

Return Value

Type: [IObservable.T](#).
[IObservable<System.Object>](#).

Usage Note

In Visual Basic and C#, you can call this method as an instance method on any object of type [IAdsConnection](#) [► 876]. When you use instance method syntax to call this method, omit the first parameter. For more information, see [Extension Methods \(Visual Basic\)](#) or [Extension Methods \(C# Programming Guide\)](#).

6.3.2.1.1.5 AnyTypeExtensions.PollValues.T. Method (IAdsConnection, String, IObservable.Unit., Func.Exception, T.)

Polls the symbol values on timepoints where the polling observable streams data / triggers

Namespace: [TwinCAT.Ads.Reactive](#) [[▶ 1249](#)]

Assembly: TwinCAT.Ads.Reactive (in TwinCAT.Ads.Reactive.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public static IObservable<T> PollValues<T>(
    this IAdsConnection connection,
    string instancePath,
```

```
IObservable<Unit> trigger,
Func<Exception, T>? errorHandler
)
```

Parameters

connection	Type: TwinCAT.Ads.IAdsConnection [▶ 876] The connection.
instancePath	Type: System.String The instance path.
trigger	Type: System.IObservable.Unit . The Polling trigger
errorHandler	Type: System.Func.Exception, T . The error handler.

Type Parameters

T	The ANY_TYPE compatible .NET Type.
---	------------------------------------

Return Value

Type: [IObservable.T](#).
[IObservable<System.Object>](#).

Usage Note

In Visual Basic and C#, you can call this method as an instance method on any object of type [IAdsConnection](#) [▶ 876]. When you use instance method syntax to call this method, omit the first parameter. For more information, see [Extension Methods \(Visual Basic\)](#) or [Extension Methods \(C# Programming Guide\)](#).

Examples

Polling ANY_TYPE values.

Observe changing ADS Symbols by polling (Read Polling) (ANY_TYPE)

```
// To Test the Observer run a project on the local PLC System (Port 851)
using (AdsClient client = new AdsClient())
{
    // Connect to target
    client.Connect(new AmsAddress(AmsNetId.Local, 851));

    // Create Symbol information
```

```

var symbolLoader = SymbolLoaderFactory.Create(client, SymbolLoaderSettings.Default);
IValueSymbol cycleCount = (IValueSymbol)symbolLoader.Symbols["TwinCAT_SystemInfoVarList._TaskInfo.CycleCount"];

// Reactive Notification Handler
var valueObserver = Observer.Create<object>(val =>
{
    Console.WriteLine(string.Format("Instance: {0}, Value: {1}", cycleCount.InstancePath, val.ToString()));
}
);

// Take 20 Values in an Interval of 500ms
IDisposable subscription = cycleCount.PollValues(TimeSpan.FromMilliseconds(500)).Take(20).Subscribe(valueObserver);

Console.ReadKey(); // Wait for Key press
subscription.Dispose(); // Dispose the Subscription
}

```

)
```

Parameters

connection	Type: TwinCAT.Ads.IAdsConnection [▶ 876] The connection.
symbol	Type: TwinCAT.TypeSystem.ISymbol [▶ 2691] The symbol.
args	Type: .System.Int32 . ANY_TYPE arguments.
period	Type: System.TimeSpan The period.

Type Parameters

T	The ANY_TYPE compatible .NET Type.
---	------------------------------------

Return Value

Type: [IObservable.T](#).
[IObservable<System.Object>](#).

Usage Note

In Visual Basic and C#, you can call this method as an instance method on any object of type [IAdsConnection](#) [▶ 876]. When you use instance method syntax to call this method, omit the first parameter. For more information, see [Extension Methods \(Visual Basic\)](#) or [Extension Methods \(C# Programming Guide\)](#).

Examples

Polling ANY_TYPE values.

Observe changing ADS Symbols by polling (Read Polling) (ANY_TYPE)

```
// To Test the Observer run a project on the local PLC System (Port 851)
using (AdsClient client = new AdsClient())
{
    // Connect to target
```

```

client.Connect(new AmsAddress(AmsNetId.Local, 851));

// Create Symbol information
var symbolLoader = SymbolLoaderFactory.Create(client, SymbolLoaderSettings.Default);
IValueSymbol cycleCount = (IValueSymbol)symbolLoader.Symbols["TwinCAT_SystemInfoVarList._TaskInfo.CycleCount"];

// Reactive Notification Handler
var valueObserver = Observer.Create<object>(val =>
{
    Console.WriteLine(string.Format("Instance: {0}, Value: {1}", cycleCount.InstancePath, val.ToString()));
}
);

// Take 20 Values in an Interval of 500ms
IDisposable subscription = cycleCount.PollValues(TimeSpan.FromMilliseconds(500)).Take(20).Subscribe(valueObserver);

Console.ReadKey(); // Wait for Key press
subscription.Dispose(); // Dispose the Subscription
}

```

6.3.2.1.1.22 AnyTypeExtensions.PollValues.T. Method (IAdsConnection, ISymbol, IObservable.Unit., Func.Exception, T.)

Polls the symbol values on timepoints where the polling observable streams data / triggers

Namespace: [TwinCAT.Ads.Reactive \[► 1249\]](#)

Assembly: TwinCAT.Ads.Reactive (in TwinCAT.Ads.Reactive.dll) Version: 6.0.328+39e3229

Syntax

C#

```

public static IObservable<T> PollValues<T>(
    this IAdsConnection connection,
    ISymbol symbol,
    IObservable<Unit> trigger,
    Func<Exception, T>? errorHandler
)

```

Parameters

connection	Type: TwinCAT.Ads.IAdsConnection [► 876] The connection.
symbol	Type: TwinCAT.TypeSystem.ISymbol [► 2691] The symbol.
trigger	Type: System.IObservable.Unit. The Polling trigger
errorHandler	Type: System.Func.Exception, T. The error handler.

Type Parameters

T	The ANY_TYPE compatible .NET Type.
---	------------------------------------

Return Value

Type: [IObservable.T](#).
IObservable<System.Object>.

Usage Note

In Visual Basic and C#, you can call this method as an instance method on any object of type [IAdsConnection](#) [[▶ 876](#)]. When you use instance method syntax to call this method, omit the first parameter. 6.3.2.1.2 AnyTypeExtensions.WhenNotification Method

Overload List

	Name	Description
	WhenNotification.T . (IAdsConnection , String , NotificationSettings) [▶ 1323]	Creates an observable sequence of values that are created by ADS Notifications.
	WhenNotification (IAdsConnection , String , Type , NotificationSettings) [▶ 1324]	Creates an observable sequence of values that are created by ADS Notifications.

Reference

[AnyTypeExtensions Class](#) [[▶ 1281](#)]

[TwinCAT.Ads.Reactive Namespace](#) [[▶ 1249](#)]

6.3.2.1.2.1 AnyTypeExtensions.WhenNotification.T Method (IAdsConnection, String, NotificationSettings)

Creates an observable sequence of values that are created by ADS Notifications.

Namespace: [TwinCAT.Ads.Reactive](#) [[▶ 1249](#)]

Assembly: TwinCAT.Ads.Reactive (in TwinCAT.Ads.Reactive.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public static IObservable<T> WhenNotification<T>(
    this IAdsConnection connection,
    string instancePath,
    NotificationSettings settings
)
```

Parameters

connection	Type: TwinCAT.Ads.IAdsConnection [▶ 876] The connection.
instancePath	Type: System.String The instance path.
settings	Type: TwinCAT.Ads.NotificationSettings [▶ 1106] The settings.

Type Parameters

T	The .NET Type representation of the specified symbols type.
---	---

Return Value

Type: [IObservable.T](#).
[IObservable<T>](#).

Usage Note

In Visual Basic and C#, you can call this method as an instance method on any object of type [IAdsConnection](#) [► 876]. When you use instance method syntax to call this method, omit the first parameter. For more information, see [Extension Methods \(Visual Basic\)](#) or [Extension Methods \(C# Programming Guide\)](#).

Remarks

The values will be cast to the specified type. The .NET type must fit the Symbol type like all ANYTYPES.

Examples

The following sample shows how to observe Value changed Notifications with the reactive [AnyTypeExtensions](#) [► 1281]

Observe changing ADS Symbols with reactive extensions (Extended AdsNotification, ANY_TYPE)

```
// To Test the Observer run a project on the local PLC System (Port 851)
using (AdsClient client = new AdsClient())
{
    // Connect to target
    client.Connect(new AmsAddress(AmsNetId.Local, 851));

    // Reactive Notification Handler
    var valueObserver = Observer.Create<ushort>(val =>
    {
        Console.WriteLine(string.Format("Value: {0}", val.ToString()));
    }
    );

    // Turning ADS Notifications into sequences of Value Objects (Taking 20 Values)
    // and subscribe to them.
    IDisposable subscription = client.WhenNotification<ushort>("TwinCAT_SystemInfoVarList._TaskInfo.CycleCount", NotificationSettings.Default).Take(20).Subscribe(valueObserver);

    Console.ReadKey(); // Wait for Key press
    subscription.Dispose(); // Dispose the Subscription
}
```

6.3.2.1.3.1 AnyTypeExtensions.WriteValues.T. Method (IAdsConnection, String, IObservable.T.)

Writes the sequence of values to the symbol specified by the instance path.

Namespace: [TwinCAT.Ads.Reactive](#) [▶ 1249]

Assembly: TwinCAT.Ads.Reactive (in TwinCAT.Ads.Reactive.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public static IDisposable WriteValues<T>(
    this IAdsConnection connection,
    string instancePath,
    IObservable<T> valueSequence
)
```

Parameters

connection	Type: TwinCAT.Ads.IAdsConnection [▶ 876] The connection.
instancePath	Type: System.String The instance path.
valueSequence	Type: System.IObservable.T. Value sequence (Any type).

Type Parameters

T

Return Value

Type: [IDisposable](#)
IDisposable.

Usage Note

In Visual Basic and C#, you can call this method as an instance method on any object of type [IAdsConnection](#) [► 876]. When you use instance method syntax to call this method, omit the first parameter. For more information, see [Extension Methods \(Visual Basic\)](#) or [Extension Methods \(C# Programming Guide\)](#).

Examples

Write values sequentially.

Write sequences of values to the target (ANY_TYPE)

```
using (AdsClient client = new AdsClient())
{
    // Connect to target
    client.Connect(new AmsAddress(AmsNetId.Local, 851));

    // Create Symbol information (Symbol 'i : INT' in PLC Global Variables list.
    var symbolLoader = SymbolLoaderFactory.Create(client, SymbolLoaderSettings.Default);
    IValueSymbol gvlIntSymbol = (IValueSymbol)symbolLoader.Symbols["GVL.i"];

    // Produces object (short) Values 0,1,2,3 ... in seconds period
    IObservable<object> timerObservable = Observable.Interval(TimeSpan.FromSeconds(1.0)).Select(i =>
(object) (short)i);

    // Take 10 Values (0..9) and write them to GVL.i
    IDisposable dispose = gvlIntSymbol.WriteValues(timerObservable.Take(10));

    Console.ReadKey(); // Wait for Key press
    dispose.Dispose(); // Dispose the Subscription
}
```

Type Parameters

T

Return Value

Type: [IDisposable](#)
IDisposable.

Usage Note

In Visual Basic and C#, you can call this method as an instance method on any object of type [IAdsConnection](#) [[▶ 876](#)]. When you use instance method syntax to call this method, omit the first parameter. For more information, see [Extension Methods \(Visual Basic\)](#) or [Extension Methods \(C# Programming Guide\)](#).

Examples

Write values sequentially.

Write sequences of values to the target (ANY_TYPE)

```
using (AdsClient client = new AdsClient())
{
    // Connect to target
    client.Connect(new AmsAddress(AmsNetId.Local, 851));

    // Create Symbol information (Symbol 'i : INT' in PLC Global Variables list.
    var symbolLoader = SymbolLoaderFactory.Create(client, SymbolLoaderSettings.Default);
    IValueSymbol gvlIntSymbol = (IValueSymbol)symbolLoader.Symbols["GVL.i"];

    // Produces object (short) Values 0,1,2,3 ... in seconds period
    IObservable<object> timerObservable = Observable.Interval(TimeSpan.FromSeconds(1.0)).Select(i =>
(object)(short)i);

    // Take 10 Values (0..9) and write them to GVL.i
    IDisposable dispose = gvlIntSymbol.WriteValues(timerObservable.Take(10));

    Console.ReadKey(); // Wait for Key press
    dispose.Dispose(); // Dispose the Subscription
}
```

[TwinCAT.Ads.Reactive Namespace](#) [▶ [1249](#)]

6.3.2.1.4.1 AnyTypeExtensions.PollValues2.T. Method (IAdsConnection, String, .Int32., IObservable.Unit.)

Polls the symbol values on time points where the polling observable streams data / triggers

Namespace: [TwinCAT.Ads.Reactive](#) [▶ [1249](#)]

Assembly: TwinCAT.Ads.Reactive (in TwinCAT.Ads.Reactive.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public static IObservable<ResultReadValueAccess<T>> PollValues2<T>(
    this IAdsConnection connection,
    string instancePath,
    int[]? args,
    IObservable<Unit> trigger
)
```

Parameters

connection	Type: TwinCAT.Ads.IAdsConnection [▶ 876] The connection.
instancePath	Type: System.String The instance path.
args	Type: .System.Int32. The ANY_TYPE arguments.
trigger	Type: System.IObservable.Unit. The Polling trigger

Type Parameters

T

Return Value

Type: [IObservable.ResultReadValueAccess](#) [▶ [3211](#)].T..
IObservable<System.Object>.

Usage Note

In Visual Basic and C#, you can call this method as an instance method on any object of type [IAdsConnection](#) [▶ [876](#)]. When you use instance method syntax to call this method, omit the first parameter. For more information, see [Extension Methods \(Visual Basic\)](#) or [Extension Methods \(C# Programming Guide\)](#).

Exceptions

Exception	Condition
ArgumentNullException	connection

6.3.2.1.4.2 AnyTypeExtensions.PollValues2.T. Method (IAdsConnection, ISymbol, .Int32., IObservable.Unit.)

Polls the symbol values on timepoints where the polling observable streams data / triggers

Namespace: [TwinCAT.Ads.Reactive](#) [► 1249]

Assembly: TwinCAT.Ads.Reactive (in TwinCAT.Ads.Reactive.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public static IObservable<ResultReadValueAccess2<ISymbol, T>> PollValues2<T>(
    this IAdsConnection connection,
    ISymbol symbol,
    int[]? args,
    IObservable<Unit> trigger
)
```

Parameters

connection	Type: TwinCAT.Ads.IAdsConnection [► 876] The connection.
symbol	Type: TwinCAT.TypeSystem.ISymbol [► 2691] The symbol.
args	Type: .System.Int32 . The arguments.
trigger	Type: System.IObservable.Unit . The Polling trigger

Type Parameters

T	The ANY_TYPE compatible .NET Type.
---	------------------------------------

Return Value

Type: [IObservable.ResultReadValueAccess2](#) [► 3226].[ISymbol](#) [► 2691], T..
[IObservable<System.Object>](#).

Usage Note

In Visual Basic and C#, you can call this method as an instance method on any object of type [IAdsConnection](#) [► 876]. When you use instance method syntax to call this method, omit the first parameter. 6.3.3 SymbolValueNotification Class

Symbol Notification class

Inheritance Hierarchy

[System.Object](#)

[TwinCAT.Ads.Notification \[► 1100\]](#)

[ValueNotification](#)

[TwinCAT.Ads.Reactive.SymbolValueNotification](#)

Namespace: [TwinCAT.Ads.Reactive \[► 1249\]](#)

Assembly: TwinCAT.Ads.Reactive (in TwinCAT.Ads.Reactive.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public sealed class SymbolValueNotification : ValueNotification
```

The SymbolValueNotification type exposes the following members.

Properties

	Name	Description
	Data [► 1104]	The notification Data. (Inherited from Notification [► 1100] .)
	Handle [► 1105]	The notification handle (Inherited from Notification [► 1100] .)
	Symbol [► 1332]	Gets the symbol of the SymbolValueNotification.
	TimeStamp [► 1105]	Gets the time stamp of the INotification [► 1096] (Inherited from Notification [► 1100] .)
	UserData [► 1105]	Attached UserData/Tag at the INotification [► 1096] (Inherited from Notification [► 1100] .)

Methods

	Name	Description
	Equals	Determines whether the specified object is equal to the current object. (Inherited from Object .)
	GetHashCode	Serves as the default hash function. (Inherited from Object .)
	GetType	Gets the Type of the current instance. (Inherited from Object .)
	ToString	Returns a string that represents the current object. (Inherited from Object .)

Remarks

Extends the ValueNotification class by symbol specific information.

6.3.4 ValueSymbolExtensions Class

Extension class for [IAdsConnection](#) [▶ 876] to provide reactive ADS extensions for accessing symbols that are loaded by the [IAdsSymbolLoaderFactory](#)

Inheritance Hierarchy

[System.Object](#)

 TwinCAT.Ads.Reactive.ValueSymbolExtensions

Namespace: [TwinCAT.Ads.Reactive](#) [▶ 1249]

Assembly: TwinCAT.Ads.Reactive (in TwinCAT.Ads.Reactive.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public static class ValueSymbolExtensions
```

Methods

	Name	Description
  	PollValues(IAdsRead, IObservable.Unit.) [▶ 1359]	Polls a series of symbols via a IAdsRead [▶ 1596] command. The SumCommand will read all contained values with every trigger.
  	PollValues(IAdsRead, TimeSpan) [▶ 1361]	Polls a series of symbols via a IAdsRead2.S. [▶ 1601] command. The SumCommand will read all contained values with every trigger in one roundtrip.
 	PollValues(IValueSymbol, IObservable.Unit.) [▶ 1355]	Poll symbol values on trigger signals.
  	PollValues(IValueSymbol, TimeSpan) [▶ 1356]	Polls the symbol as value sequence of object values with a specified period time.
 	PollValues(IValueSymbol, IObservable.Unit., Boolean) [▶ 1357]	Polls symbol values on trigger signals.

	Name	Description
  	PollValues(IValueSymbol, TimeSpan, Boolean) [▶ 1358]	Polls the symbol as value sequence of object values with a specified period time.
 	PollValues.T.(IValueSymbol, IObservable.Unit.) [▶ 1362]	Poll symbol values as a value sequence on trigger signals (typed)
  	PollValues.T.(IValueSymbol, TimeSpan) [▶ 1363]	Polls the symbol as value sequence of object values with a specified period time (typed)
 	PollValues.T.(IValueSymbol, IObservable.Unit., Boolean) [▶ 1364]	Poll symbol values on trigger signals (typed)
  	PollValues.T.(IValueSymbol, IObservable.Unit., Func.ResultReadValueAccess2.IValueSymbol, Object., T.) [▶ 1365]	Poll symbol values on trigger signals (typed)
 	PollValues.T.(IValueSymbol, TimeSpan, Boolean) [▶ 1367]	Polls the symbol as value sequence of object values with a specified period time (typed)
 	PollValues2(IValueSymbol, IObservable.Unit.) [▶ 1368]	Poll symbol values as a sequence of annotated results (Value + ErrorCode)
 	PollValues2(IValueSymbol, TimeSpan) [▶ 1369]	Poll symbol values with communication return codes.
  	PollValues2.S.(ISumRead2.S., IObservable.Unit.) [▶ 1370]	Polls a series of symbols via a ISumRead2.S. [▶ 1601] command. The SumCommand will read all contained values with every trigger in one roundtrip.
  	PollValues2.S.(ISumRead2.S., TimeSpan) [▶ 1372]	Polls a series of symbols via a ISumRead2.S. [▶ 1601] command. The SumCommand will read all contained values with every trigger.
 	WhenValueChanged(IValueSymbol) [▶ 1344]	Gets an observable sequence when the value of the IValueSymbol [▶ 2775] has changed.

	Name	Description
		
  	WhenValueChanged (IAdsConnection , IEnumerable.ISymbol .) [▶ 1345]	Observable sequence of Values driven by ADS Notifications on the specified symbol.
  	WriteValues(IValueSymbol, IObservable.Object.) [▶ 1347]	Subscribes the IValueSymbol [▶ 2775] to an observable sequence of values and writes them to the IValueSymbol [▶ 2775].
 	WriteValues(IValueSymbol, IObservable.Object., Action.Exception.) [▶ 1348]	Subscribes the IValueSymbol [▶ 2775] to an observable sequence of values and writes them to the IValueSymbol [▶ 2775].
 	WriteValues(IValueSymbol, IObservable.Object., Cancellation.Token) [▶ 1349]	Subscribes the IValueSymbol [▶ 2775] to an observable sequence of values and writes them to the IValueSymbol [▶ 2775].
 	WriteValues(IValueSymbol, IObservable.Object., Action.Exception., Cancellation.Token) [▶ 1350]	Subscribes the IValueSymbol [▶ 2775] to an observable sequence of values and writes them to the IValueSymbol [▶ 2775].

Remarks

Reactive Extensions (Rx) are a library for composing asynchronous and event-based programs using observable sequences and LINQ-style query operators. Using Rx, developers represent asynchronous data streams with Observables, query asynchronous data streams using LINQ operators, and parameterize the concurrency in the asynchronous data streams using Schedulers. Simply put, Rx = Observables + LINQ + Schedulers. The ADS reactive extensions are build on top of this library to enable ADS Symbol and State Observables, seamlessly bound to the reactive extensions. To use the ADS reactive extensions the TwinCAT.Ads.Reactive Nuget package (or the included TwinCAT.Ads.Reactive.dll) must be referenced from All types within are contained in the ADS companion package "Beckhoff.TwinCAT.Ads.Reactive" which must be referenced separately. ([Beckhoff.TwinCAT.Ads.Reactive package on Nuget](#)).

Examples

The following sample shows how to observe Value changed Notifications with the reactive ValueSymbolExtensions from an [IValueSymbol](#) [[▶ 2775](#)].

Observe a single changing ADS Symbol (ADS Notifications)

```
// To Test the Observer run a project on the local PLC System (Port 851)
using (AdsClient client = new AdsClient())
{
    // Connect to target
    client.Connect(new AmsAddress(AmsNetId.Local, 851));

    // Create Symbol information
```

```

var symbolLoader = SymbolLoaderFactory.Create(client, SymbolLoaderSettings.Default);
IValueSymbol cycleCount = (IValueSymbol)symbolLoader.Symbols["TwinCAT_SystemInfoVarList._TaskInfo[1].CycleCount"];

// Reactive Notification Handler
var valueObserver = Observer.Create<object>(val =>
{
    Console.WriteLine(string.Format("Instance: {0}, Value: {1}", cycleCount.InstancePath, val.ToString()));
}
);

cycleCount.NotificationSettings = new NotificationSettings(AdsTransMode.OnChange, 500, 5000); // optional: Change NotificationSettings on Symbol

// Turning ADS Notifications into sequences of Value Objects (Taking 20 Values)
// and subscribe to them.
IDisposable subscription = cycleCount.WhenValueChanged().Take(20).Subscribe(valueObserver);

Console.ReadKey(); // Wait for Key press
subscription.Dispose(); // Dispose the Subscription
}

```

Examples

The following sample shows how to observe Value changed Notifications with the reactive ValueSymbolExtensions from an **DynamicSymbol**.

Observe a single changing ADS Symbol (ADS Notifications) with the dynamic language runtime (.NET DLR)

```

// To Test the Observer run a project on the local PLC System (Port 851)
using (AdsClient client = new AdsClient())
{
    // Connect to target
    client.Connect(new AmsAddress(AmsNetId.Local, 851));

    // Create Symbol information
    var symbolLoader = SymbolLoaderFactory.Create(client, SymbolLoaderSettings.Default);
    IValueSymbol cycleCount = (IValueSymbol)symbolLoader.Symbols["TwinCAT_SystemInfoVarList._TaskInfo[1].CycleCount"];

    // Reactive Notification Handler
    var valueObserver = Observer.Create<object>(val =>
    {
        Console.WriteLine(string.Format("Instance: {0}, Value: {1}", cycleCount.InstancePath, val.ToString()));
    }
    );

    cycleCount.NotificationSettings = new NotificationSettings(AdsTransMode.OnChange, 500, 5000); // optional: Change NotificationSettings on Symbol

    // Turning ADS Notifications into sequences of Value Objects (Taking 20 Values)
    // and subscribe to them.
    IDisposable subscription = cycleCount.WhenValueChanged().Take(20).Subscribe(valueObserver);

    Console.ReadKey(); // Wait for Key press
    subscription.Dispose(); // Dispose the Subscription
}

```

Examples

The same for more than one [IValueSymbol](#) [[▶ 2775](#)].

Observe changing ADS Symbols (ADS Notifications)

```

// To Test the Observer run a project on the local PLC System (Port 851)
using (AdsClient client = new AdsClient())
{
    // Connect to target
    client.Connect(new AmsAddress(AmsNetId.Local, 851));

    // Create Symbol information
    var symbolLoader = SymbolLoaderFactory.Create(client, SymbolLoaderSettings.Default);
    IValueSymbol cycleCount = (IValueSymbol)symbolLoader.Symbols["TwinCAT_SystemInfoVarList._TaskInfo

```

```

o.CycleCount"]; // UShort Type
    IValueSymbol lastExecTime = (IValueSymbol)symbolLoader.Symbols["TwinCAT_SystemInfoVarList._TaskI
nfo.LastExecTime"]; // UInt Type

    SymbolCollection symbols = new SymbolCollection();
    symbols.Add(cycleCount);
    symbols.Add(lastExecTime);

    // Reactive Notification Handler
    var valueObserver = Observer.Create<object>(val =>
    {
        Console.WriteLine(string.Format("Instance: {0}, Value: {1}", cycleCount.InstancePath, val.ToStri
ng()));
    }
    );

    cycleCount.NotificationSettings = new NotificationSettings(AdsTransMode.OnChange,500,5000); // o
ptional: Change NotificationSettings on Symbol

    // Turning ADS Notifications into sequences of Value Objects (Taking 20 Values)
    // and subscribe to them.
    IDisposable subscription = client.WhenValueChanged(symbols).Take(20).Subscribe(valueObserver);

    Console.ReadKey(); // Wait for Key press
    subscription.Dispose(); // Dispose the Subscription
}

```

Examples

Here, the values are polled in a specific time period and sequential Reads are triggered (in opposite to ADS Notification in the latter example)

Observe changing ADS Symbols by polling (Read Polling)

```

// To Test the Observer run a project on the local PLC System (Port 851)
using (AdsClient client = new AdsClient())
{
    // Connect to target
    client.Connect(new AmsAddress(AmsNetId.Local, 851));

    // Create Symbol information
    var symbolLoader = SymbolLoaderFactory.Create(client, SymbolLoaderSettings.Default);
    IValueSymbol cycleCount = (IValueSymbol)symbolLoader.Symbols["TwinCAT_SystemInfoVarList._TaskInf
o[1].CycleCount"];

    // Reactive Notification Handler
    var valueObserver = Observer.Create<object>(val =>
    {
        Console.WriteLine(string.Format("Instance: {0}, Value: {1}", cycleCount.InstancePath, val.ToStri
ng()));
    }
    );

    // Take 20 Values in an Interval of 500ms
    IDisposable subscription = cycleCount.PollValues(TimeSpan.FromMilliseconds(500)).Take(20).Subscr
ibe(valueObserver);

    Console.ReadKey(); // Wait for Key press
    subscription.Dispose(); // Dispose the Subscription
}

```

Examples

In the following example it is demonstrated how to write Values sequentially to a [IValueSymbol](#) [▶ 2775](#) with the help of the reactive extensions.

Write sequences of values to the target

```

using (AdsClient client = new AdsClient())
{
    // Connect to target
    client.Connect(new AmsAddress(AmsNetId.Local, 851));

    // Create Symbol information (Symbol 'i : INT' in PLC Global Variables list.
    var symbolLoader = SymbolLoaderFactory.Create(client, SymbolLoaderSettings.Default);
    IValueSymbol cycleCount = (IValueSymbol)symbolLoader.Symbols["GVL.i"];
}

```

```

// Produces object Values 0,1,2,3 ... in seconds period
IObservable<object> timerObservable = Observable.Interval(TimeSpan.FromSeconds(1.0)).Select(i =>
(object) (short)i);

// Take 10 Values (0..9) and write them to GVL.i
IDisposable dispose = cycleCount.WriteValues(timerObservable.Take(10));

Console.ReadKey(); // Wait for Key press
dispose.Dispose(); // Dispose the Subscription
}

```

Examples

Polling of values as SumCommands (reading of multiple symbols/values in one ADS roundtrip)

SumCommand polling (Symbols)

```

// To Test the Observer run a project on the local PLC System (Port 851)
using (AdsClient client = new AdsClient())
{
    // Connect to target
    client.Connect(new AmsAddress(AmsNetId.Local, 851));

    // Create Symbol information
    var symbolLoader = SymbolLoaderFactory.Create(client, SymbolLoaderSettings.Default);
    IValueSymbol cycleCount = (IValueSymbol)symbolLoader.Symbols["TwinCAT_SystemInfoVarList._TaskInfo[1].CycleCount"];
    IValueSymbol lastExecTime = (IValueSymbol)symbolLoader.Symbols["TwinCAT_SystemInfoVarList._TaskInfo.LastExecTime"];
    List<ISymbol> symbols = new List<ISymbol>() { cycleCount, lastExecTime };

    //Create the SumCommand
    SumSymbolRead sumRead = new SumSymbolRead(client, symbols);

    // Reactive Notification Handler
    var sumCommandObserver = Observer.Create<ResultSumValues2<ISymbol>>(result =>
    {
        Console.WriteLine($"SumCommand ErrorCode: {result.ErrorCode}");

        if (result.Succeeded)
        {
            Console.WriteLine($"SumCommand OverallSucceeded: {result.OverallSucceeded}");
            foreach (var subResult in result.ValueResults)
            {
                Console.WriteLine($"Source: {subResult.Source}, ErrorCode: {subResult.ErrorCode}, Value: {subResult.Value}");
            }
        }
    });

    // Take 20 Values/Result in an Interval of 500ms
    IDisposable subscription = sumRead.PollValues2(TimeSpan.FromMilliseconds(500)).Take(20).Subscribe(sumCommandObserver);

    Console.ReadKey(); // Wait for Key press
    subscription.Dispose(); // Dispose the Subscription
}

```

SumCommand polling (via InstancePath)

```

// To Test the Observer run a project on the local PLC System (Port 851)
using (AdsClient client = new AdsClient())
{
    // Connect to target
    client.Connect(new AmsAddress(AmsNetId.Local, 851));

    // Create Symbol information
    var symbolLoader = SymbolLoaderFactory.Create(client, SymbolLoaderSettings.Default);
    IValueSymbol cycleCount = (IValueSymbol)symbolLoader.Symbols["TwinCAT_SystemInfoVarList._TaskInfo[1].CycleCount"];
    IValueSymbol lastExecTime = (IValueSymbol)symbolLoader.Symbols["TwinCAT_SystemInfoVarList._TaskInfo.LastExecTime"];
    List<ISymbol> symbols = new List<ISymbol>() { cycleCount, lastExecTime };

    //Create the SumCommand
    SumSymbolRead sumRead = new SumSymbolRead(client, symbols);
}

```

```
// Reactive Notification Handler
var sumCommandObserver = Observer.Create<ResultSumValues>(result =>
{
    Console.WriteLine($"SumCommand Succeeded: {result.OverallSucceeded}, CycleCount: {result.Values[0]}, LastExecTime: {result.Values[1]}");
})
);

// Take 20 Values/Result in an Interval of 500ms
IDisposable subscription = sumRead.PollValues(TimeSpan.FromMilliseconds(500)).Take(20).Subscribe(sumCommandObserver);

Console.ReadKey(); // Wait for Key press
subscription.Dispose(); // Dispose the Subscription
}
```

6.3.4.1 ValueSymbolExtensions Methods

Methods

	Name	Description
  	PollValues(ISumRead, IObservable.Unit.) [▶ 1359]	Polls a series of symbols via a ISumRead [▶ 1596] command. The SumCommand will read all contained values with every trigger.
  	PollValues(ISumRead, TimeSpan) [▶ 1361]	Polls a series of symbols via a ISumRead2.S. [▶ 1601] command. The SumCommand will read all contained values with every trigger in one roundtrip.
 	PollValues(IValueSymbol, IObservable.Unit.) [▶ 1355]	Poll symbol values on trigger signals.
  	PollValues(IValueSymbol, TimeSpan) [▶ 1356]	Polls the symbol as value sequence of object values with a specified period time.
 	PollValues(IValueSymbol, IObservable.Unit, Boolean) [▶ 1357]	Polls symbol values on trigger signals.

	Name	Description
  	PollValues(IValueSymbol, TimeSpan, Boolean) [▶ 1358]	Polls the symbol as value sequence of object values with a specified period time.
 	PollValues.T.(IValueSymbol, IObservable.Unit.) [▶ 1362]	Poll symbol values as a value sequence on trigger signals (typed)
  	PollValues.T.(IValueSymbol, TimeSpan) [▶ 1363]	Polls the symbol as value sequence of object values with a specified period time (typed)
 	PollValues.T.(IValueSymbol, IObservable.Unit., Boolean) [▶ 1364]	Poll symbol values on trigger signals (typed)
  	PollValues.T.(IValueSymbol, IObservable.Unit., Func.ResultReadValueAccess2.IValueSymbol, Object., T.) [▶ 1365]	Poll symbol values on trigger signals (typed)
 	PollValues.T.(IValueSymbol, TimeSpan, Boolean) [▶ 1367]	Polls the symbol as value sequence of object values with a specified period time (typed)
 	PollValues2(IValueSymbol, IObservable.Unit.) [▶ 1368]	Poll symbol values as a sequence of annotated results (Value + ErrorCode)
 	PollValues2(IValueSymbol, TimeSpan) [▶ 1369]	Poll symbol values with communication return codes.
  	PollValues2.S.(ISumRead2.S., IObservable.Unit.) [▶ 1370]	Polls a series of symbols via a ISumRead2.S. [▶ 1601] command. The SumCommand will read all contained values with every trigger in one roundtrip.
  	PollValues2.S.(ISumRead2.S., TimeSpan) [▶ 1372]	Polls a series of symbols via a ISumRead2.S. [▶ 1601] command. The SumCommand will read all contained values with every trigger.
 	WhenValueChanged(IValueSymbol) [▶ 1344]	Gets an observable sequence when the value of the IValueSymbol [▶ 2775] has changed.

	Name	Description
 	WhenValueChanged (IAdsConnection , IEnumerable.ISymbol .) [▶ 1345]	Observable sequence of Values driven by ADS Notifications on the specified symbol.
 	WriteValues(IValueSymbol, IObservable.Object.) [▶ 1347]	Subscribes the IValueSymbol [▶ 2775] to an observable sequence of values and writes them to the IValueSymbol [▶ 2775].
 	WriteValues(IValueSymbol, IObservable.Object., Action.Exception.) [▶ 1348]	Subscribes the IValueSymbol [▶ 2775] to an observable sequence of values and writes them to the IValueSymbol [▶ 2775].

[TwinCAT.Ads.Reactive Namespace](#) [► 1249]

6.3.4.1.1.1 ValueSymbolExtensions.PollValuesAnnotated Method (IValueSymbol, IObservable.Unit.)

Polls the values as [ValueChangedEventArgs](#) [► 2971] sequence annotated value on trigger sequence

Namespace: [TwinCAT.Ads.Reactive](#) [► 1249]

Assembly: TwinCAT.Ads.Reactive (in TwinCAT.Ads.Reactive.dll) Version: 5.0.294+Branch.releases-5.0.Sha.90bb9a1b43b6095934 addedca3e72bc0ea15da1c14

Syntax

C#

```
public static IObservable<ValueChangedEventArgs> PollValuesAnnotated(
    this IValueSymbol symbol,
    IObservable<Unit> trigger
)
```

Parameters

symbol	Type: TwinCAT.TypeSystem.IValueSymbol [► 2775] The symbol.
trigger	Type: System.IObservable.Unit . The polling Trigger.

Return Value

Type: [IObservable.ValueChangedEventArgs](#) [► 2971].
[IObservable<ValueChangedArgs>](#).

Usage Note

In Visual Basic and C#, you can call this method as an instance method on any object of type [IValueSymbol](#) [► 2775]. When you use instance method syntax to call this method, omit the first parameter. For more information, see [Extension Methods \(Visual Basic\)](#) or [Extension Methods \(C# Programming Guide\)](#).

Polls the values as [ValueChangedEventArgs](#) [► 2971] sequence with a specified period time.

Namespace: [TwinCAT.Ads.Reactive](#) [▶ 1249]

Assembly: TwinCAT.Ads.Reactive (in TwinCAT.Ads.Reactive.dll) Version: 5.0.294+Branch.releases-5.0.Sha.90bb9a1b43b6095934fddca3e72bc0ea15da1c14

Syntax

C#

```
public static IObservable<ValueChangedEventArgs> PollValuesAnnotated(
    this IValueSymbol symbol,
    TimeSpan period
)
```

Parameters

- symbol Type: [TwinCAT.TypeSystem.IValueSymbol](#) [▶ 2775]
The symbol.
- period Type: [System.TimeSpan](#)
The polling period/interval.

Return Value

Type: [IObservable.ValueChangedEventArgs](#) [▶ 2971].
IObservable<ValueChangedArgs>.

Usage Note

In Visual Basic and C#, you can call this method as an instance method on any object of type [IValueSymbol](#) [▶ 2775]. When you use instance method syntax to call this method, omit the first parameter. For more information, see [Extension Methods \(Visual Basic\)](#) or [Extension Methods \(C# Programming Guide\)](#).

6.3.4.1.2.1 ValueSymbolExtensions.WhenValueChanged Method (IValueSymbol)

Gets an observable sequence when the value of the [IValueSymbol](#) [▸ 2775] has changed.

Namespace: [TwinCAT.Ads.Reactive](#) [▸ 1249]

Assembly: [TwinCAT.Ads.Reactive](#) (in [TwinCAT.Ads.Reactive.dll](#)) Version: 6.0.328+39e3229

Syntax

C#

```
public static IObservable<Object> WhenValueChanged(
    this IValueSymbol symbol
)
```

Parameters

symbol	Type: TwinCAT.TypeSystem.IValueSymbol [▸ 2775] The symbol.
--------	---

Return Value

Type: [IObservable.Object](#).
[IObservable<System.Object>](#).

Usage Note

In Visual Basic and C#, you can call this method as an instance method on any object of type [IValueSymbol](#) [▸ 2775]. When you use instance method syntax to call this method, omit the first parameter. For more information, see [Extension Methods \(Visual Basic\)](#) or [Extension Methods \(C# Programming Guide\)](#).

Examples

The following sample shows how to observe Value changed Notifications with the reactive [ValueSymbolExtensions](#) [▸ 1333] from an [IValueSymbol](#) [▸ 2775].

Observe a single changing ADS Symbols (ADS Notifications)

```
// To Test the Observer run a project on the local PLC System (Port 851)
using (AdsClient client = new AdsClient())
{
    // Connect to target
    client.Connect(new AmsAddress(AmsNetId.Local, 851));

    // Create Symbol information
    var symbolLoader = SymbolLoaderFactory.Create(client, SymbolLoaderSettings.Default);
    IValueSymbol cycleCount = (IValueSymbol)symbolLoader.Symbols["TwinCAT_SystemInfoVarList._TaskInfo[1].CycleCount"];

    // Reactive Notification Handler
    var valueObserver = Observer.Create<object>(val =>
    {
        Console.WriteLine(string.Format("Instance: {0}, Value: {1}", cycleCount.InstancePath, val.ToString()));
    });

    cycleCount.NotificationSettings = new NotificationSettings(AdsTransMode.OnChange, 500, 5000); // optional: Change NotificationSettings on Symbol

    // Turning ADS Notifications into sequences of Value Objects (Taking 20 Values)
    // and subscribe to them.
    IDisposable subscription = cycleCount.WhenValueChanged().Take(20).Subscribe(valueObserver);

    Console.ReadKey(); // Wait for Key press
    subscription.Dispose(); // Dispose the Subscription
}
```

Reference

[WhenValueChanged Overload](#) [► 1343]

[TwinCAT.Ads.Reactive Namespace](#) [► 1249]

6.3.4.1.2.2 ValueSymbolExtensions.WhenValueChanged Method (IAdsConnection, IEnumerable.ISymbol.)

Observable sequence of Values driven by ADS Notifications on the specified symbol.

Namespace: [TwinCAT.Ads.Reactive](#) [► 1249]

Assembly: TwinCAT.Ads.Reactive (in TwinCAT.Ads.Reactive.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public static IObservable<Object> WhenValueChanged(
    this IAdsConnection connection,
    IEnumerable<ISymbol> symbols
)
```

Parameters

connection	Type: TwinCAT.Ads.IAdsConnection [► 876] The ADS connection / ADS Client
symbols	Type: System.Collections.Generic.IEnumerable.ISymbol [► 2691]. The symbols to observe.

Return Value

Type: [IObservable.Object](#).
[IObservable<ValueChangedArgs>](#).

Usage Note

In Visual Basic and C#, you can call this method as an instance method on any object of type [IAdsConnection](#) [► 876]. When you use instance method syntax to call this method, omit the first parameter. For more information, see [Extension Methods \(Visual Basic\)](#) or [Extension Methods \(C# Programming Guide\)](#).

Examples

The same for more than one [IValueSymbol](#) [► 2775].

Observe changing ADS Symbols (ADS Notifications)

```
// To Test the Observer run a project on the local PLC System (Port 851)
using (AdsClient client = new AdsClient())
{
    // Connect to target
    client.Connect(new AmsAddress(AmsNetId.Local, 851));

    // Create Symbol information
    var symbolLoader = SymbolLoaderFactory.Create(client, SymbolLoaderSettings.Default);
    IValueSymbol cycleCount = (IValueSymbol)symbolLoader.Symbols["TwinCAT_SystemInfoVarList._TaskInfo.CycleCount"]; // UShort Type
    IValueSymbol lastExecTime = (IValueSymbol)symbolLoader.Symbols["TwinCAT_SystemInfoVarList._TaskInfo.LastExecTime"]; // UInt Type

    SymbolCollection symbols = new SymbolCollection();
    symbols.Add(cycleCount);
    symbols.Add(lastExecTime);
}
```

```
// Reactive Notification Handler
var valueObserver = Observer.Create<object>(val =>
{
    Console.WriteLine(string.Format("Instance: {0}, Value: {1}", cycleCount.InstancePath, val.ToString()));
}
);

cycleCount.NotificationSettings = new NotificationSettings(AdsTransMode.OnChange,500,5000); // optional: Change NotificationSettings on Symbol

// Turning ADS Notifications into sequences of Value Objects (Taking 20 Values)
// and subscribe to them.
IDisposable subscription = client.WhenValueChanged(symbols).Take(20).Subscribe(valueObserver);

Console.ReadKey(); // Wait for Key press
subscription.Dispose(); // Dispose the Subscription
}
```

Examples

The following sample shows how to observe Value changed Notifications with the reactive [ValueSymbolExtensions \[► 1333\]](#) from an **DynamicSymbol**.

Observe a single changing ADS Symbol (ADS Notifications) with the dynamic language runtime (.NET DLR)

```
// To Test the Observer run a project on the local PLC System (Port 851)
using (AdsClient client = new AdsClient())
{
    // Connect to target
    client.Connect(new AmsAddress(AmsNetId.Local, 851));

    // Create Symbol information
    var symbolLoader = SymbolLoaderFactory.Create(client, SymbolLoaderSettings.Default);
    IValueSymbol cycleCount = (IValueSymbol)symbolLoader.Symbols["TwinCAT_SystemInfoVarList._TaskInfo[1].CycleCount"];

    // Reactive Notification Handler
    var valueObserver = Observer.Create<object>(val =>
    {
        Console.WriteLine(string.Format("Instance: {0}, Value: {1}", cycleCount.InstancePath, val.ToString()));
    }
    );

    cycleCount.NotificationSettings = new NotificationSettings(AdsTransMode.OnChange, 500, 5000); // optional: Change NotificationSettings on Symbol

    // Turning ADS Notifications into sequences of Value Objects (Taking 20 Values)
    // and subscribe to them.
    IDisposable subscription = cycleCount.WhenValueChanged().Take(20).Subscribe(valueObserver);

    Console.ReadKey(); // Wait for Key press
    subscription.Dispose(); // Dispose the Subscription
}
```

[TwinCAT.Ads.Reactive Namespace](#) [[1249](#)]

6.3.4.1.3.1 ValueSymbolExtensions.WriteValues Method (IValueSymbol, IObservable.Object.)

Subscribes the [IValueSymbol](#) [[2775](#)] to an observable sequence of values and writes them to the [IValueSymbol](#) [[2775](#)].

Namespace: [TwinCAT.Ads.Reactive](#) [[1249](#)]

Assembly: TwinCAT.Ads.Reactive (in TwinCAT.Ads.Reactive.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public static IDisposable WriteValues(
    this IValueSymbol symbol,
    IObservable<Object> valueObservable
)
```

Parameters

symbol	Type: TwinCAT.TypeSystem.IValueSymbol [2775] The symbol.
--------	---

valueObservable	Type: System.IObservable.Object . Observable of Values.
-----------------	--

Return Value

Type: [IDisposable](#)
IDisposable.

Usage Note

In Visual Basic and C#, you can call this method as an instance method on any object of type [IValueSymbol](#) [[▶ 2775](#)]. When you use instance method syntax to call this method, omit the first parameter. For more information, see [Extension Methods \(Visual Basic\)](#) or [Extension Methods \(C# Programming Guide\)](#).

Examples

In the following example it is demonstrated how to write Values sequentially to a [IValueSymbol](#) [[▶ 2775](#)] with the help of the reactive extensions.

Write sequences of values to the target

```
using (AdsClient client = new AdsClient())
{
    // Connect to target
    client.Connect(new AmsAddress(AmsNetId.Local, 851));

    // Create Symbol information (Symbol 'i : INT' in PLC Global Variables list.
    var symbolLoader = SymbolLoaderFactory.Create(client, SymbolLoaderSettings.Default);
    IValueSymbol cycleCount = (IValueSymbol)symbolLoader.Symbols["GVL.i"];

    // Produces object Values 0,1,2,3 ... in seconds period
    IObservable<object> timerObservable = Observable.Interval(TimeSpan.FromSeconds(1.0)).Select(i =>
(object) (short)i);

    // Take 10 Values (0..9) and write them to GVL.i
    IDisposable dispose = cycleCount.WriteValues(timerObservable.Take(10));

    Console.ReadKey(); // Wait for Key press
    dispose.Dispose(); // Dispose the Subscription
}
```

- 📖 [ISumSymbolRead Interface](#) [▶ [1587](#)]
- 📖 [ValueSymbolExtensions.PollValues Method \(ISumSymbolRead, TimeSpan\)](#) [▶ [1353](#)]

6.3.4.1.4.1 ValueSymbolExtensions.PollValues Method (ISumSymbolRead, IObservable.Unit.)

Polls a series of symbols via a [ISumSymbolRead](#) [▶ [1587](#)] command. The SumCommand will read all contained values with every trigger.

Namespace: [TwinCAT.Ads.Reactive](#) [▶ [1249](#)]

Assembly: TwinCAT.Ads.Reactive (in TwinCAT.Ads.Reactive.dll) Version: 6.0.116+a71ced3

Syntax

C#

```
public static IObservable<ResultSumValues> PollValues (
    this ISumSymbolRead sumRead,
    IObservable<Unit> trigger
)
```

Parameters

- | | |
|---------|---|
| sumRead | Type: TwinCAT.Ads.SumCommand.ISumSymbolRead [▶ 1587]
The SumSymbolRead command. |
| trigger | Type: System.IObservable.Unit .
The Polling trigger. |

Return Value

Type: [IObservable.ResultSumValues](#) [▶ [1547](#)].
IObservable<ResultSumValues>.

Usage Note

In Visual Basic and C#, you can call this method as an instance method on any object of type [ISumSymbolRead](#) [▶ [1587](#)]. When you use instance method syntax to call this method, omit the first parameter. For more information, see [Extension Methods \(Visual Basic\)](#) or [Extension Methods \(C# Programming Guide\)](#).

Remarks

The characteristic of this overload is that more than one values can be read with one trigger signal. Each trigger produces only one Read call to the SumSymbolRead. Dependant on the configuration of the SumSymbolRead this could mean only one ADS Roundtrip (Request/Response). So the advantages are:

- Usage of one trigger (could be a Background thread resource) for all values
- Getting the values of all values in one ADS roundtrip
- Values inside the SumSymbolRead are more consistant dependant of target realtime task configuration.

Examples

Demonstration of polling values efficiently via SumSymbolRead command.

Observe multiple ADS Symbols via Polling of SumCommand

```
// To Test the Observer run a project on the local PLC System (Port 851)
using (AdsClient client = new AdsClient())
{
    // Connect to target
    client.Connect(new AmsAddress(AmsNetId.Local, 851));

    // Create Symbol information
    var symbolLoader = SymbolLoaderFactory.Create(client, SymbolLoaderSettings.Default);
    IValueSymbol cycleCount = (IValueSymbol)symbolLoader.Symbols["TwinCAT_SystemInfoVarList._TaskInfo[1].CycleCount"];
    IValueSymbol lastExecTime = (IValueSymbol)symbolLoader.Symbols["TwinCAT_SystemInfoVarList._TaskInfo.LastExecTime"];
    List<ISymbol> symbols = new List<ISymbol>() { cycleCount, lastExecTime };

    //Create the SumCommand
    SumSymbolRead sumRead = new SumSymbolRead(client, symbols);

    // Reactive Notification Handler
    var sumCommandObserver = Observer.Create<ResultSumValues>(result =>
    {
        Console.WriteLine($"SumCommand Succeeded: {result.OverallSucceeded}, CycleCount: {result.Values[0]}, LastExecTime: {result.Values[1]}");
    });

    // Take 20 Values/Result in an Interval of 500ms
    IDisposable subscription = sumRead.PollValues(TimeSpan.FromMilliseconds(500)).Take(20).Subscribe(sumCommandObserver);

    Console.ReadKey(); // Wait for Key press
    subscription.Dispose(); // Dispose the Subscription
}
```

6.3.4.1.4.3 ValueSymbolExtensions.PollValues Method (IValueSymbol, IObservable.Unit.)

Poll symbol values on trigger signals.

Namespace: [TwinCAT.Ads.Reactive \[▶ 1249\]](#)

Assembly: TwinCAT.Ads.Reactive (in TwinCAT.Ads.Reactive.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public static IObservable<Object> PollValues(
    this IValueSymbol symbol,
    IObservable<Unit> trigger
)
```

Parameters

symbol	Type: TwinCAT.TypeSystem.IValueSymbol [▶ 2775] The symbol.
trigger	Type: System.IObservable.Unit. The polling trigger.

Return Value

Type: [IObservable.Object.](#)
IObservable<System.Object>.

Usage Note

In Visual Basic and C#, you can call this method as an instance method on any object of type [IValueSymbol \[▶ 2775\]](#). When you use instance method syntax to call this method, omit the first parameter. For more information, see [Extension Methods \(Visual Basic\)](#) or [Extension Methods \(C# Programming Guide\)](#).

Remarks

If ReadRequest errors occur, the observable will be closed with and [AdsException \[▶ 61\]](#)./>

- [ValueSymbolExtensions.PollValues2 Method \(IValueSymbol, TimeSpan\) \[▶ 1369\]](#)

6.3.4.1.4.4 ValueSymbolExtensions.PollValues Method (IValueSymbol, TimeSpan)

Polls the symbol as value sequence of object values with a specified period time.

Namespace: [TwinCAT.Ads.Reactive \[▶ 1249\]](#)

Assembly: TwinCAT.Ads.Reactive (in TwinCAT.Ads.Reactive.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public static IObservable<Object> PollValues(
    this IValueSymbol symbol,
    TimeSpan period
)
```

Parameters

symbol	Type: TwinCAT.TypeSystem.IValueSymbol [▶ 2775] The symbol.
period	Type: System.TimeSpan The period.

Return Value

Type: [IObservable.Object](#).
[IObservable<System.Object>](#).

Usage Note

In Visual Basic and C#, you can call this method as an instance method on any object of type [IValueSymbol \[▶ 2775\]](#). When you use instance method syntax to call this method, omit the first parameter. For more information, see [Extension Methods \(Visual Basic\)](#) or [Extension Methods \(C# Programming Guide\)](#).

Examples

Here, the values are polled in a specific time period and sequential Reads are triggered (in opposite to ADS Notification in the latter example)

Observe changing ADS Symbols (Read Polling)

```
// To Test the Observer run a project on the local PLC System (Port 851)
using (AdsClient client = new AdsClient())
{
    // Connect to target
    client.Connect(new AmsAddress(AmsNetId.Local, 851));

    // Create Symbol information
    var symbolLoader = SymbolLoaderFactory.Create(client, SymbolLoaderSettings.Default);
    IValueSymbol cycleCount = (IValueSymbol)symbolLoader.Symbols["TwinCAT_SystemInfoVarList._TaskInfo[1].CycleCount"];
}
```

```
// Reactive Notification Handler
var valueObserver = Observer.Create<object>(val =>
{
    Console.WriteLine(string.Format("Instance: {0}, Value: {1}", cycleCount.InstancePath, val.ToString()));
}
);

// Take 20 Values in an Interval of 500ms
IDisposable subscription = cycleCount.PollValues(TimeSpan.FromMilliseconds(500)).Take(20).Subscribe(valueObserver);

Console.ReadKey(); // Wait for Key press
subscription.Dispose(); // Dispose the Subscription
}
```

6.3.4.1.4.5 ValueSymbolExtensions.PollValues Method (IValueSymbol, IObservable.Unit., Boolean)

Polls symbol values on trigger signals.

Namespace: [TwinCAT.Ads.Reactive \[▶ 1249\]](#)

Assembly: TwinCAT.Ads.Reactive (in TwinCAT.Ads.Reactive.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public static IObservable<Object?> PollValues(
    this IValueSymbol symbol,
    IObservable<Unit> trigger,
    bool ignoreErrors
)
```

Parameters

symbol	Type: TwinCAT.TypeSystem.IValueSymbol [▶ 2775] The symbol.
trigger	Type: System.IObservable.Unit. The Polling trigger
ignoreErrors	Type: System.Boolean if set to true ADS errors are ignored and a NULL value is returned.

Return Value

Type: [IObservable.Object.](#)
IObservable<System.Object>.

Usage Note

In Visual Basic and C#, you can call this method as an instance method on any object of type [IValueSymbol \[▶ 2775\]](#). When you use instance method syntax to call this method, omit the first parameter. For more information, see [Extension Methods \(Visual Basic\)](#) or [Extension Methods \(C# Programming Guide\)](#).

Remarks

If ignoreErrors is not set and ReadRequest errors occur, the observable will be closed with error./> If errors are ignored, the observable will return **NULL** values on erroneous requests.

```

Reference

[ValueSymbolExtensions Class](#) [▶ 1333]

[PollValues Overload](#) [▶ 1351]

[TwinCAT.Ads.Reactive Namespace](#) [▶ 1249]

[ValueSymbolExtensions.PollValues\(IValueSymbol, IObservable.Unit., Boolean\)](#) [▶ 1357]

[ValueSymbolExtensions.PollValues\(IValueSymbol, TimeSpan\)](#) [▶ 1356]

6.3.4.1.4.7 ValueSymbolExtensions.PollValues Method (ISumRead, IObservable.Unit.)

Polls a series of symbols via a [ISumRead](#) [▶ 1596] command. The SumCommand will read all contained values with every trigger.

Namespace: [TwinCAT.Ads.Reactive](#) [▶ 1249]

Assembly: TwinCAT.Ads.Reactive (in TwinCAT.Ads.Reactive.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public static IObservable<ResultSumValues> PollValues(
    this ISumRead sumRead,
    IObservable<Unit> trigger
)
```

Parameters

sumRead	Type: TwinCAT.Ads.SumCommand.ISumRead [▶ 1596] The SumRead command.
trigger	Type: System.IObservable.Unit . The Polling trigger.

Return Value

Type: [IObservable.ResultSumValues](#) [[▶ 1547](#)].
IObservable<ResultSumValues>.

Usage Note

In Visual Basic and C#, you can call this method as an instance method on any object of type [ISumRead](#) [[▶ 1596](#)]. When you use instance method syntax to call this method, omit the first parameter. For more information, see [Extension Methods \(Visual Basic\)](#) or [Extension Methods \(C# Programming Guide\)](#).

Remarks

The characteristic of this overload is that more than one values can be read with one trigger signal. Each trigger produces only one Read call to the SumRead. Dependent on the configuration of the SumRead this could mean only one ADS Roundtrip (Request/Response). So the advantages are:

- Usage of one trigger (could be a Background thread resource) for all values
- Getting the values of all values in one ADS roundtrip
- Values inside the SumRead are more consistant dependant of target realtime task configuration.

Examples

Demonstration of polling values efficiently via SumRead command.

Observe multiple ADS Symbols via Polling of SumCommand

```
// To Test the Observer run a project on the local PLC System (Port 851)
using (AdsClient client = new AdsClient())
{
    // Connect to target
    client.Connect(new AmsAddress(AmsNetId.Local, 851));

    // Create Symbol information
    var symbolLoader = SymbolLoaderFactory.Create(client, SymbolLoaderSettings.Default);
    IValueSymbol cycleCount = (IValueSymbol)symbolLoader.Symbols["TwinCAT_SystemInfoVarList._TaskInfo[1].CycleCount"];
    IValueSymbol lastExecTime = (IValueSymbol)symbolLoader.Symbols["TwinCAT_SystemInfoVarList._TaskInfo.LastExecTime"];
    List<ISymbol> symbols = new List<ISymbol>() { cycleCount, lastExecTime };

    //Create the SumCommand
    SumSymbolRead sumRead = new SumSymbolRead(client, symbols);

    // Reactive Notification Handler
    var sumCommandObserver = Observer.Create<ResultSumValues>(result =>
    {
        Console.WriteLine($"SumCommand Succeeded: {result.OverallSucceeded}, CycleCount: {result.Values[0]}, LastExecTime: {result.Values[1]}");
    });

    // Take 20 Values/Result in an Interval of 500ms
    IDisposable subscription = sumRead.PollValues(TimeSpan.FromMilliseconds(500)).Take(20).Subscribe(sumCommandObserver);

    Console.ReadKey(); // Wait for Key press
    subscription.Dispose(); // Dispose the Subscription
}
```

6.3.4.1.4.11 ValueSymbolExtensions.PollValues.T. Method (IValueSymbol, IObservable.Unit., Boolean)

Poll symbol values on trigger signals (typed)

Namespace: [TwinCAT.Ads.Reactive](#) [[▶ 1249](#)]

Assembly: TwinCAT.Ads.Reactive (in TwinCAT.Ads.Reactive.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public static IObservable<T> PollValues<T>(
    this IValueSymbol symbol,
    IObservable<Unit> trigger,
    bool ignoreErrors
)
```

Parameters

symbol	Type: TwinCAT.TypeSystem.IValueSymbol [▶ 2775] The symbol.
trigger	Type: System.IObservable.Unit . The Polling trigger
ignoreErrors	Type: System.Boolean Ignore errors.

Type Parameters

T	The type of the values.
---	-------------------------

Return Value

Type: [IObservable.T](#).
[IObservable<System.Object>](#).

Usage Note

In Visual Basic and C#, you can call this method as an instance method on any object of type [IValueSymbol](#) [[▶ 2775](#)]. When you use instance method syntax to call this method, omit the first parameter. For more information, see [Extension Methods \(Visual Basic\)](#) or [Extension Methods \(C# Programming Guide\)](#).

Remarks

If ignoreErrors is not set and ReadRequest errors occur, the observable will be closed with error ([AdsException](#) [[▶ 61](#)])./> If errors are ignored, the observable will return **NULL** values on erroneous requests.

6.3.4.1.4.12 ValueSymbolExtensions.PollValues.T. Method (IValueSymbol, IObservable.Unit., Func.ResultReadValueAccess2.IValueSymbol, Object., T.)

Poll symbol values on trigger signals (typed)

Namespace: [TwinCAT.Ads.Reactive](#) [[▶ 1249](#)]

Assembly: TwinCAT.Ads.Reactive (in TwinCAT.Ads.Reactive.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public static IObservable<T> PollValues<T>(
    this IValueSymbol symbol,
    IObservable<Unit> trigger,
    Func<ResultReadValueAccess2<IValueSymbol, Object?>, T?> errorHandler
)
```

Parameters

symbol	Type: TwinCAT.TypeSystem.IValueSymbol [► 2775] The symbol.
trigger	Type: System.IObservable.Unit . The Polling trigger
errorHandler	Type: System.Func.ResultReadValueAccess2 [► 3226].IValueSymbol [► 2775] , Object. , T. The error handler

Type Parameters

T	The type of the values
---	------------------------

Return Value

Type: [IObservable.T](#).
[IObservable<System.Object>](#).

Usage Note

In Visual Basic and C#, you can call this method as an instance method on any object of type [IValueSymbol \[► 2775\]](#). When you use instance method syntax to call this method, omit the first parameter. For more information, see [Extension Methods \(Visual Basic\)](#) or [Extension Methods \(C# Programming Guide\)](#).

Remarks

If an read error occurs an optional error handler will be called. This decides the return value. If no errorHandler is specified, an [AdsException \[► 61\]](#) is thrown on error.

Examples

Example for polling typed values and usage of an error handler.

Observe changing ADS Symbols (Read Polling)

```
// To Test the Observer run a project on the local PLC System (Port 851)
using (AdsClient client = new AdsClient())
{
    // Connect to target
    client.Connect(new AmsAddress(AmsNetId.Local, 851));

    // Create Symbol information
    var symbolLoader = SymbolLoaderFactory.Create(client, SymbolLoaderSettings.Default);
    IValueSymbol cycleCount = (IValueSymbol)symbolLoader.Symbols["TwinCAT_SystemInfoVarList._TaskInfo[1].CycleCount"];

    // Reactive Notification Handler
    var valueObserver = Observer.Create<ushort>(val =>
    {
        Console.WriteLine($"Instance: {cycleCount}, Value: {val}");
    });

    // Creating an interval trigger.
    IObservable<Unit> interval = Observable.Interval(TimeSpan.FromMilliseconds(500)).StartWith(-1L).
    Select(1 => Unit.Default);
```

```

// Take 20 Values in an Interval of 500ms
IDisposable subscription = cycleCount.PollValues<ushort>(interval,
// Usage of an error handler
(e) =>
{
if (e.ErrorCode == (int) AdsErrorCode.ClientSyncTimeOut)
{
// On Timeout return Value 0!
return 0;
}
else
{
// Finish observer
throw new AdsException($"Internal Error Code: {e.ErrorCode} (Source: {e.Source})");
}
}
)
.Take(20).Subscribe(valueObserver);

Console.ReadKey(); // Wait for Key press
subscription.Dispose(); // Dispose the Subscription
}

```

    TimeSpan period,
    bool ignoreErrors
)

```

Parameters

symbol	Type: TwinCAT.TypeSystem.IValueSymbol [► 2775] The symbol.
period	Type: System.TimeSpan The period.
ignoreErrors	Type: System.Boolean Ignore read errors (default values will be returned).

Type Parameters

T

Return Value

Type: [IObservable.T](#).
[IObservable<System.Object>](#).

Usage Note

In Visual Basic and C#, you can call this method as an instance method on any object of type [IValueSymbol](#) [[▶ 2775](#)]. When you use instance method syntax to call this method, omit the first parameter. For more information, see [Extension Methods \(Visual Basic\)](#) or [Extension Methods \(C# Programming Guide\)](#).

Remarks

If ignoreErrors is not set and ReadRequest errors occur, the observable will be closed with error ([AdsException](#) [[▶ 61](#)]).> If errors are ignored, the observable will return **NULL** values on erroneous requests.

[PollValues Overload](#) [[▶ 1351](#)]

[TwinCAT.Ads.Reactive Namespace](#) [[▶ 1249](#)]

6.3.4.1.5 ValueSymbolExtensions.PollValues2 Method

Overload List

	Name	Description
	PollValues2.S. (ISumRead2.S. , IObservable.Unit.) [▶ 1370]	Polls a series of symbols via a ISumRead2.S. [▶ 1601] command. The SumCommand will read all contained values with every trigger in one roundtrip.
	PollValues2.S. (ISumRead2.S. , TimeSpan) [▶ 1372]	Polls a series of symbols via a ISumRead2.S. [▶ 1601] command. The SumCommand will read all contained values with every trigger.
	PollValues2(IValueS ymbol, IObservable.Unit.) [▶ 1368]	Poll symbol values as a sequence of annotated results (Value + ErrorCode)
	PollValues2(IValueS ymbol, TimeSpan) [▶ 1369]	Poll symbol values with communication return codes.

Reference

[ValueSymbolExtensions Class](#) [[▶ 1333](#)]

[TwinCAT.Ads.Reactive Namespace](#) [[▶ 1249](#)]

6.3.4.1.5.1 ValueSymbolExtensions.PollValues2 Method (IValueSymbol, IObservable.Unit.)

Poll symbol values as a sequence of annotated results (Value + ErrorCode)

Namespace: [TwinCAT.Ads.Reactive](#) [[▶ 1249](#)]

Assembly: TwinCAT.Ads.Reactive (in TwinCAT.Ads.Reactive.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public static IObservable<ResultReadValueAccess2<IValueSymbol, Object?>> PollValues2(
    this IValueSymbol symbol,
    IObservable<Unit> trigger
)
```

Parameters

symbol	Type: TwinCAT.TypeSystem.IValueSymbol [▶ 2775] The symbol to poll
trigger	Type: System.IObservable.Unit . The Polling trigger

Return Value

Type: [IObservable.ResultReadValueAccess2](#) [[▶ 3226](#)].[IValueSymbol](#) [[▶ 2775](#)], [Object](#)..
[IObservable<ResultReadValueAccess>](#).

Usage Note

In Visual Basic and C#, you can call this method as an instance method on any object of type [IValueSymbol](#) [[▶ 2775](#)]. When you use instance method syntax to call this method, omit the first parameter. For more information, see [Extension Methods \(Visual Basic\)](#) or [Extension Methods \(C# Programming Guide\)](#).

Remarks

This reactive method polls the symbol version together with additional information. The distinct result data is [ResultReadValueAccess](#) [[▶ 3209](#)] which contains the value (if succeeded) together with the communication return code. If the ErrorCode is > 0, then the Value property will return the default value. This has the advantage, that the Observable doesn't produces Errors when communication requests return Errors and the Observer can continue. Internally for optimization reasons because it is expected that the polling occurs many times, this reactive method creates the symbol handle before the first polling trigger (one roundtrip), reads the value with each trigger and unregisters the handle on finalize. So the number of communication roundtrips are Triggers + 2.

6.3.4.1.5.2 ValueSymbolExtensions.PollValues2 Method (IValueSymbol, TimeSpan)

Poll symbol values with communication return codes.

Namespace: [TwinCAT.Ads.Reactive](#) [[▶ 1249](#)]

Assembly: TwinCAT.Ads.Reactive (in TwinCAT.Ads.Reactive.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public static IObservable<ResultReadValueAccess2<IValueSymbol, Object?>> PollValues2(
    this IValueSymbol symbol,
    TimeSpan period
)
```

Parameters

symbol	Type: TwinCAT.TypeSystem.IValueSymbol [▶ 2775] The symbol to poll.
period	Type: System.TimeSpan The polling interval.

Return Value

Type: [IObservable.ResultReadValueAccess2](#) [[▶ 3226](#)].[IValueSymbol](#) [[▶ 2775](#)], [Object](#)..
[IObservable<ResultReadValueAccess>](#).

Usage Note

In Visual Basic and C#, you can call this method as an instance method on any object of type [IValueSymbol](#) [[▶ 2775](#)]. When you use instance method syntax to call this method, omit the first parameter. For more information, see [Extension Methods \(Visual Basic\)](#) or [Extension Methods \(C# Programming Guide\)](#).

Remarks

This reactive method polls the symbol version together with additional information. The distinct result data is [ResultReadValueAccess](#) [[▶ 3209](#)] which contains the value (if succeeded) together with the communication return code. If the ErrorCode is > 0, then the Value property will return the default value. This has the advantage, that the Observable doesn't produces Errors when communication requests return Errors and the Observer can continue. Internally for optimization reasons because it is expected that the polling occurs many times, this reactive method creates the symbol handle before the first polling trigger (one roundtrip), reads the value with each trigger and unregisters the handle on finalize. So the number of communication roundtrips is Triggers + 2.

[ValueSymbolExtensions.PollValues Method \(IValueSymbol, TimeSpan, Boolean\)](#) [[▶ 1358](#)]

6.3.4.1.5.3 ValueSymbolExtensions.PollValues2.S. Method (ISumRead2.S., IObservable.Unit.)

Polls a series of symbols via a [ISumRead2.S.](#) [[▶ 1601](#)] command. The SumCommand will read all contained values with every trigger in one roundtrip.

Namespace: [TwinCAT.Ads.Reactive](#) [[▶ 1249](#)]

Assembly: TwinCAT.Ads.Reactive (in TwinCAT.Ads.Reactive.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public static IObservable<ResultSumValues2<S>> PollValues2<S>(
    this ISumRead2<S> sumRead,
    IObservable<Unit> trigger
)
```

Parameters

sumRead	Type: TwinCAT.Ads.SumCommand.ISumRead2 [► 1601].S . The SumRead command.
trigger	Type: System.IObservable.Unit . The Polling trigger.

Type Parameters

S	The source specifier, this could be an ISymbol or InstancePath (string) for example to reference the single values with their source.
---	---

Return Value

Type: [IObservable.ResultSumValues2 \[► 1605\].S](#)..
[IObservable<ResultSumValues>](#).

Usage Note

In Visual Basic and C#, you can call this method as an instance method on any object of type [ISumRead2 \[► 1601\].S](#).. When you use instance method syntax to call this method, omit the first parameter. For more information, see [Extension Methods \(Visual Basic\)](#) or [Extension Methods \(C# Programming Guide\)](#).

Remarks

The characteristic of this overload is that more than one values can be read with one trigger signal. Each trigger produces only one Read call to the SumRead. Dependent on the configuration of the SumRead this could mean only one ADS Roundtrip (Request/Response). So the advantages are:

- Usage of one trigger (could be a Background thread resource) for all values
- Getting the values of all values in one ADS roundtrip
- Values inside the SumRead are more consistant dependant of target realtime task configuration.

Examples

Demonstration of polling values efficiently via SumRead command.

Observe multiple ADS Symbols via Polling of SumCommand

```
// To Test the Observer run a project on the local PLC System (Port 851)
using (AdsClient client = new AdsClient())
{
    // Connect to target
    client.Connect(new AmsAddress(AmsNetId.Local, 851));

    // Create Symbol information
    var symbolLoader = SymbolLoaderFactory.Create(client, SymbolLoaderSettings.Default);
    IValueSymbol cycleCount = (IValueSymbol)symbolLoader.Symbols["TwinCAT_SystemInfoVarList._TaskInfo[1].CycleCount"];
    IValueSymbol lastExecTime = (IValueSymbol)symbolLoader.Symbols["TwinCAT_SystemInfoVarList._TaskInfo.LastExecTime"];
    List<ISymbol> symbols = new List<ISymbol>() { cycleCount, lastExecTime };

    //Create the SumCommand
    SumSymbolRead sumRead = new SumSymbolRead(client, symbols);

    // Reactive Notification Handler
    var sumCommandObserver = Observer.Create<ResultSumValues2<ISymbol>>(result =>
```

```

    {
        Console.WriteLine($"SumCommand ErrorCode: {result.ErrorCode}");

        if (result.Succeeded)
        {
            Console.WriteLine($"SumCommand OverallSucceeded: {result.OverallSucceeded}");
            foreach (var subResult in result.ValueResults)
            {
                Console.WriteLine($"Source: {subResult.Source}, ErrorCode: {subResult.ErrorCode}, Value:
{subResult.Value}");
            }
        }
    }
);

// Take 20 Values/Result in an Interval of 500ms
IDisposable subscription = sumRead.PollValues2(TimeSpan.FromMilliseconds(500)).Take(20).Subscribe
(sumCommandObserver);

Console.ReadKey(); // Wait for Key press
subscription.Dispose(); // Dispose the Subscription
}

```

6.4 TwinCAT.Ads.Server Namespace

This framework can be used to build custom ADS server application.

Important note: Please contact Beckhoff to receive a reserved ADS port number. Namespace for the TwinCAT ADS Server Component.

Classes

	Class	Description
	AdsServer [► 1375]	Base implementation for an ADS Server.
	AdsServerException [► 1443]	An AdsServerException [► 1443] is thrown on communication errors in the AdsServer [► 1375] class.
	AdsSymbolicServer [► 1468]	AdsServer class that supports Symbolic information and Notifications. Implements the AdsServer [► 1375]
	BaseTickTrigger [► 1513]	Class NotificationTimer. Implements the INotificationTrigger [► 1516]
	ErrorEventArgs [► 1448]	This class implements the event arguments passed by the TcAdsServerExEvent.
	LoopbackNotConnectedException [► 1523]	The Tcp Loopback client is not connected. Implements the AdsServerException [► 1443]
	LoopbackNotRegisteredException [► 1450]	The Tcp Loopback client is not registered. Implements the AdsServerException [► 1443]
	NotificationDataSample [► 1453]	This class implements an ADS Notification Sample. It contains the notification handle and the variable data.
	NotificationSamplesStamp [► 1456]	This class implements an ADS Stamp Header containing multiple ADS Notification Samples (TcAdsStampHeader)
	NotificationTriggerSource [► 1517]	Class NotificationTriggerSource. Implements the IAddNotificationTrigger [► 1515] Implements the IDisposable
	ServerConnectionStateChangedEventArgs [► 1462]	Class ConnectionStateChangedEventArgs (Server Connections)

	Class	Description
	ServerNotConnectedException [▶ 1465]	The AdsServer is not connected. Implements the AdsServerException [▶ 1443]

Interfaces

	Interface	Description
	IAddNotificationTrigger [▶ 1515]	Interface IAddNotificationTrigger
	INotificationTrigger [▶ 1516]	Interface INotificationTrigger

Enumerations

	Enumeration	Description
	ServerConnectionState [▶ 1461]	The Server Connection State

6.4.1 AdsServer Class

Base implementation for an ADS Server.

Inheritance Hierarchy

[System.Object](#)
 TwinCAT.Ads.Server.AdsServer
 TwinCAT.Ads.Server.AdsSymbolicServer [[▶ 1468](#)]

Namespace: [TwinCAT.Ads.Server](#) [[▶ 1374](#)]

Assembly: TwinCAT.Ads.Server (in TwinCAT.Ads.Server.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public abstract class AdsServer : IDisposable
```

The AdsServer type exposes the following members.

Properties

	Name	Description
	AmsServer [▶ 1384]	Gets the the internal AmsServer [▶ 1384] object.
	IsConnected [▶ 1384]	Gets a value indicating whether AdsServer is connected.
	IsDisconnecting [▶ 1384]	Indicates, that the AdsServer is actually disconnecting.
	IsDisposed [▶ 1385]	Gets a value indicating whether this instance is disposed.
	IsDynamicPort [▶ 1387]	Gets a value indicating this AdsServer has a dynamic/unfixed port.
	Logger [▶ 1385]	Gets the logger object.

	Name	Description
	<u>ServerAddress</u> [▶ 1386]	The AMS address of this server.
	<u>ServerName</u> [▶ 1386]	Gets the name of the server.
	<u>ServerPort</u> [▶ 1387]	Gets the server port.
	<u>ServerVersion</u> [▶ 1387]	Gets the Version of the Server.

Methods

	Name	Description
	<u>AddDeviceNotificationRequest</u> [▶ 1393]	Sends an ADS Add Device Notification request (synchronous).
	<u>AddDeviceNotificationRequestAsync</u> [▶ 1394]	Sends an ADS Add Device Notification request (async)
	<u>AddDeviceNotificationResponseAsync</u> [▶ 1395]	Sends an ADS Add Device Notification response.
	<u>ConnectServer</u> [▶ 1396]	Connect this ADS server to the local ADS router.
	<u>ConnectServerAndWaitAsync</u> [▶ 1396]	Registers the AdsServer at the router asynchronously.
	<u>DeleteDeviceNotificationRequest</u> [▶ 1398]	Sends an ADS Delete Device Notification request (synchronous).
	<u>DeleteDeviceNotificationRequestAsync</u> [▶ 1399]	Sends an ADS Delete Device Notification request (async).
	<u>DeleteDeviceNotificationResponseAsync</u> [▶ 1400]	Sends an ADS Delete Device Notification response.
	<u>DeviceNotificationRequestAsync</u> [▶ 1400]	Sends an ADS Device Notification request asynchronously
	<u>DeviceNotificationRequestSync</u> [▶ 1401]	Sends an ADS Device Notification request (sync)
	<u>Disconnect</u> [▶ 1402]	Disconnects this ADS server from the local ADS router.
	<u>Dispose.</u> [▶ 1403]	Performs application-defined tasks associated with freeing, releasing, or resetting unmanaged resources.
	<u>Dispose(Boolean)</u> [▶ 1403]	Releases unmanaged and - optionally - managed resources.

	Name	Description
	Equals	Determines whether the specified object is equal to the current object. (Inherited from Object .)
	Finalize [▶ 1403]	Finalizes an instance of the AdsServer class. (Overrides Object.Finalize .)
	GetHashCode	Serves as the default hash function. (Inherited from Object .)
	GetServerName [▶ 1441]	Gets the name of the server.
	GetType	Gets the Type of the current instance. (Inherited from Object .)
	MemberwiseClone	Creates a shallow copy of the current Object . (Inherited from Object .)
	OnAddDeviceNotificationAsync [▶ 1429]	Called when an ADS Add Device Notification indication is received.
	OnAddDeviceNotificationConfirmationAsync [▶ 1404]	Called when an ADS Add Device Notification confirmation is received.
	OnBeforeConnected [▶ 1430]	Handler function that is called, when the AdsServer is connected, but before calling OnConnected . [▶ 1405].
	OnConnected [▶ 1405]	Handler function that is called, when the AdsServer is connected.
	OnDeleteDeviceNotificationAsync [▶ 1430]	Called when an ADS Delete Device Notification indication is received.
	OnDeleteDeviceNotificationConfirmationAsync [▶ 1431]	Called when an ADS Delete Device Notification confirmation is received.
	OnDisconnect [▶ 1405]	Called when the AdsServer is about to be disconnected.
	OnReadAsync [▶ 1432]	Called when an ADS Read indication is received.
	OnReadConfirmationAsync [▶ 1433]	Called when an ADS Read confirmation is received.
	OnReadDeviceInfoConfirmationAsync [▶ 1434]	Called when an ADS Read Device Info confirmation is received.
	OnReadDeviceStateAsync [▶ 1435]	Called when an ADS Read State indication is received.
	OnReadDeviceStateConfirmationAsync [▶ 1435]	Called when an ADS Read State confirmation is received.
	OnReadWriteAsync [▶ 1436]	Called when an ADS Read Write indication is received.

	Name	Description
	OnReadWriteConfirmationAsync [▶ 1437]	Called when an ADS Read Write confirmation is received.
	OnRouterNotification [▶ 1405]	Handler Function for a Router Notification.
	OnServerConnectionStateChanged [▶ 1406]	Handles the ServerConnectionStateChanged [▶ 1442] event.
	OnWriteAsync [▶ 1438]	Called when an ADS Write indication is received.
	OnWriteConfirmationAsync [▶ 1439]	Called when an ADS Write confirmation is received.
	OnWriteControlAsync [▶ 1440]	Called when an ADS Write Control indication is received.
	OnWriteControlConfirmationAsync [▶ 1441]	Called when an ADS Write Control confirmation is received.
	ReadDeviceInfoRequestAsync [▶ 1409]	Sends an ADS Read Device Info request asynchronously
	ReadDeviceInfoRequestSync [▶ 1409]	Sends an ADS Read Device Info request synchronously.
	ReadDeviceInfoResponseAsync [▶ 1410]	Sends an ADS Read Device Info response.
	ReadDeviceStateRequestAsync [▶ 1412]	Sends an ADS Read State request (asynchronous)
	ReadDeviceStateRequestSync [▶ 1413]	Sends an ADS Read State request (synchronous)
	ReadDeviceStateResponseAsync [▶ 1413]	Sends an ADS Read State response.
	ReadRequest [▶ 1415]	Sends an ADS Read Request.
	ReadRequestAsync [▶ 1416]	Sends an ADS Read Request asynchronously.
	ReadResponseAsync [▶ 1416]	Sends an ADS Read response.
	ReadWriteRequestAsync [▶ 1419]	Sends an ADS Read Write request.

	Name	Description
	ReadWriteRequestSync [▶ 1419]	Sends an ADS Read Write request synchronously
	ReadWriteResponseAsync [▶ 1420]	Sends an ADS Read Write Response.
	ToString	Returns a string that represents the current object. (Inherited from Object .)
	WriteControlRequest [▶ 1423]	Sends an ADS Write Control request (synchronous)
	WriteControlRequestAsync [▶ 1424]	Sends an ADS Write Control request (asynchronous).
	WriteControlRequestSync [▶ 1425]	Sends an ADS Write Control request (synchronous).
	WriteControlResponseAsync [▶ 1425]	Sends an ADS Write Control response.
	WriteRequest [▶ 1427]	Sends an ADS Write request synchronously.
	WriteRequestAsync [▶ 1428]	Sends an ADS Write request asynchronously.
	WriteResponseAsync [▶ 1428]	Sends an ADS Write response.

Events

	Name	Description
	ServerConnectionStateChanged [▶ 1442]	The connection status has changed

Fields

	Name	Description
	serverVersion [▶ 1443]	The version of the AdsServer

Remarks

Derived classes should overwrite the AMS indication methods to react on incoming requests. AMS The confirmation methods should be overwritten to receive replies on asynchronous requests sent by this ADS server.

Examples

The following sample shows how to derive from the AdsServer class and create your own Customized ADS Server.

C#

```

class Program
{
    public static void Main(string[] args)
    {
        CreateHostBuilder(args).Build().Run();
    }

    public static IHostBuilder CreateHostBuilder(string[] args) =>
    Host.CreateDefaultBuilder(args)
        .ConfigureServices((hostContext, services) =>
        {
            services.AddHostedService<ServerWorker>();
        });
}

```

C#

```

public class ServerWorker : BackgroundService
{
    private readonly ILogger<ServerWorker> _logger;

    public ServerWorker(ILogger<ServerWorker> logger)
    {
        _logger = logger;
    }

    protected override async Task ExecuteAsync(CancellationToken cancel)
    {
        // Instantiate the server
        AdsSampleServer server = new AdsSampleServer(_logger);
        // Connect the server and wait for cancel
        await server.ConnectServerAndWaitAsync(cancel);
    }
}

```

C#

```

/*
 * Extend the AdsServer class to implement your own ADS server.
 */
public class AdsSampleServer : AdsServer
{
    /// <summary>
    /// Fixed ADS Port (to be changed ...)
    /// </summary>
    const ushort ADS_PORT = 42;

    /// <summary>
    /// Fixed Name for the ADS Port (change this ...)
    /// </summary>
    const string ADS_PORT_NAME = "AdsSampleServer_Port42";

    /// <summary>
    /// Some simple data / ProcessImage
    /// </summary>
    private byte[] _dataBuffer = {1, 2, 3, 4};

    /// <summary>
    /// Ads State
    /// </summary>
    private AdsState _adsState = AdsState.Config;
    /// <summary>
    /// Device State
    /// </summary>
    private ushort _deviceState = 0;

    /// <summary>
    /// Notification dictionary, thread safe
    /// </summary>
    private ConcurrentDictionary<uint, NotificationRequestEntry> _notificationTable = new Concurrent
Dictionary<uint, NotificationRequestEntry>();

    /// <summary>
    /// Simple counter for different Notification handles here.
    /// </summary>
    private uint _currentNotificationHandle = 0;

    /// <summary>

```

```

/// Logger
/// </summary>
private ILogger _logger;

/* Instantiate an ADS server with a fix ADS port assigned by the ADS router.
*/

public AdsSampleServer()
: this(null)
{
}

public AdsSampleServer(ILogger logger) : base(ADS_PORT, ADS_PORT_NAME)
{
base.serverVersion = new Version(0, 0, 1);
_logger = logger;
}

/* Overwrite the indication handlers of the AdsServer class for the services your ADS server
* provides. They are called upon incoming requests. Indications that are not overwritten in
* this class return the ADS DeviceServiceNotSupported error code to the requester.
*/

/* Handler function for Write Indication */
protected override Task<ResultWrite> OnWriteAsync(AmsAddress target, uint invokeId, uint indexGr
oup, uint indexOffset, ReadOnlyMemory<byte> writeData, CancellationToken cancel)
{
ResultWrite result;

switch (indexGroup) /* use index group (and offset) to distinguish between the services
of this server */
{
case 0x10000:
if (writeData.Length == 4)
{

6.4.1.1 AdsServer Properties

The [AdsServer |> 1375](#) type exposes the following members.

Properties

	Name	Description
	AmsServer > 1384	Gets the the internal AmsServer > 1384 object.
	IsConnected > 1384	Gets a value indicating whether AdsServer > 1375 is connected.
	IsDisconnecting > 1384	Indicates, that the AdsServer > 1375 is actually disconnecting.
	IsDisposed > 1385	Gets a value indicating whether this instance is disposed.
	IsDynamicPort > 1387	Gets a value indicating this AdsServer > 1375 has a dynamic/unfixed port.
	Logger > 1385	Gets the logger object.
	ServerAddress > 1386	The AMS address of this server.
	ServerName > 1386	Gets the name of the server.
	ServerPort > 1387	Gets the server port.

	Name	Description
	ServerVersion [▶ 1387]	Gets the Version of the Server.

Reference

[AdsServer Class](#) [▶ 1375]

[TwinCAT.Ads.Server Namespace](#) [▶ 1374]

6.4.1.1.1 AdsServer.AmsServer Property

Gets the the internal AmsServer object.

Namespace: [TwinCAT.Ads.Server](#) [▶ 1374]

Assembly: TwinCAT.Ads.Server (in TwinCAT.Ads.Server.dll) Version: 6.0.328+39e3229

Syntax

C#

```
protected AmsServer AmsServer { get; }
```

Property Value

Type: AmsServer
The ams server.

Reference

[AdsServer Class](#) [▶ 1375]

[TwinCAT.Ads.Server Namespace](#) [▶ 1374]

6.4.1.1.2 AdsServer.IsConnected Property

Gets a value indicating whether [AdsServer](#) [▶ 1375] is connected.

Namespace: [TwinCAT.Ads.Server](#) [▶ 1374]

Assembly: TwinCAT.Ads.Server (in TwinCAT.Ads.Server.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public bool IsConnected { get; }
```

Property Value

Type: [Boolean](#)
true if this instance is connected; otherwise, false.

Reference

[AdsServer Class](#) [▶ 1375]

[TwinCAT.Ads.Server Namespace](#) [▶ 1374]

6.4.1.1.3 AdsServer.IsDisconnecting Property

Indicates, that the [AdsServer](#) [▶ 1375] is actually disconnecting.

Namespace: [TwinCAT.Ads.Server](#) [[▶ 1374](#)]

Assembly: TwinCAT.Ads.Server (in TwinCAT.Ads.Server.dll) Version: 6.0.328+39e3229

Syntax

C#

```
protected bool IsDisconnecting { get; }
```

Property Value

Type: [Boolean](#)

Reference

[AdsServer Class](#) [[▶ 1375](#)]

[TwinCAT.Ads.Server Namespace](#) [[▶ 1374](#)]

6.4.1.1.4 **AdsServer.IsDisposed Property**

Gets a value indicating whether this instance is disposed.

Namespace: [TwinCAT.Ads.Server](#) [[▶ 1374](#)]

Assembly: TwinCAT.Ads.Server (in TwinCAT.Ads.Server.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public bool IsDisposed { get; }
```

Property Value

Type: [Boolean](#)

true if this instance is disposed; otherwise, false.

Reference

[AdsServer Class](#) [[▶ 1375](#)]

[TwinCAT.Ads.Server Namespace](#) [[▶ 1374](#)]

6.4.1.1.5 **AdsServer.Logger Property**

Gets the logger object.

Namespace: [TwinCAT.Ads.Server](#) [[▶ 1374](#)]

Assembly: TwinCAT.Ads.Server (in TwinCAT.Ads.Server.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public ILogger? Logger { get; }
```

Property Value

Type: [ILogger](#)

The logger.

Reference

[AdsServer Class](#) [► 1375]

[TwinCAT.Ads.Server Namespace](#) [► 1374]

6.4.1.1.6 AdsServer.ServerAddress Property

The AMS address of this server.

Namespace: [TwinCAT.Ads.Server](#) [► 1374]

Assembly: TwinCAT.Ads.Server (in TwinCAT.Ads.Server.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public virtual AmsAddress? ServerAddress { get; }
```

Property Value

Type: [AmsAddress](#) [► 752]

Remarks

The Address consists of [AmsNetId](#) [► 767] and [AmsPort](#) [► 795]. While the [AmsNetId](#) [► 767] is defined by the System, where the **AmsTcplpRouter** is running, the [AmsPort](#) [► 795] is specified by the [AdsServer](#) [► 1375] constructor. By default, the router is running on the same system, but can be configured by [RouterEndPoint](#) [► 2006].

6.4.1.1.7 AdsServer.ServerName Property

Gets the name of the server.

Namespace: [TwinCAT.Ads.Server](#) [► 1374]

Assembly: TwinCAT.Ads.Server (in TwinCAT.Ads.Server.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public string ServerName { get; }
```

Property Value

Type: [String](#)

The name of the server.

Reference

[AdsServer Class](#) [► 1375]

[TwinCAT.Ads.Server Namespace](#) [► 1374]

6.4.1.1.8 AdsServer.ServerPort Property

Gets the server port.

Namespace: [TwinCAT.Ads.Server](#) [► 1374]

Assembly: TwinCAT.Ads.Server (in TwinCAT.Ads.Server.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public ushort ServerPort { get; }
```

Property Value

Type: [UInt16](#)

The server port.

Reference

[AdsServer Class](#) [► 1375]

[TwinCAT.Ads.Server Namespace](#) [► 1374]

6.4.1.1.9 AdsServer.ServerVersion Property

Gets the Version of the Server.

Namespace: [TwinCAT.Ads.Server](#) [► 1374]

Assembly: TwinCAT.Ads.Server (in TwinCAT.Ads.Server.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public Version ServerVersion { get; }
```

Property Value

Type: [Version](#)

The version.

Reference

[AdsServer Class](#) [► 1375]

[TwinCAT.Ads.Server Namespace](#) [► 1374]

6.4.1.1.10 AdsServer.IsDynamicPort Property

Gets a value indicating this [AdsServer](#) [► 1375] has a dynamic/unfixed port.

Namespace: [TwinCAT.Ads.Server](#) [► 1374]

Assembly: TwinCAT.Ads.Server (in TwinCAT.Ads.Server.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public bool IsDynamicPort { get; }
```

Property Value

Type: [Boolean](#)

true if dynamic/unfixed port; otherwise, false.

Remarks

In general all Clients have dynamic ports and inherit from AdsServer.

6.4.1.2 AdsServer Methods

The [AdsServer](#) [► 1375] type exposes the following members.

Methods

	Name	Description
	AddDeviceNotificationRequest [► 1393]	Sends an ADS Add Device Notification request (synchronous).
	AddDeviceNotificationRequestAsync [► 1394]	Sends an ADS Add Device Notification request (async)
	AddDeviceNotificationResponseAsync [► 1395]	Sends an ADS Add Device Notification response.
	ConnectServer [► 1396]	Connect this ADS server to the local ADS router.
	ConnectServerAndWaitAsync [► 1396]	Registers the AdsServer [► 1375] at the router asynchronously.
	DeleteDeviceNotificationRequest [► 1398]	Sends an ADS Delete Device Notification request (synchronous).
	DeleteDeviceNotificationRequestAsync [► 1399]	Sends an ADS Delete Device Notification request (async).
	DeleteDeviceNotificationResponseAsync [► 1400]	Sends an ADS Delete Device Notification response.

	Name	Description
	DeviceNotificationRequestAsync [▶ 1400]	Sends an ADS Device Notification request asynchronously
	DeviceNotificationRequestSync [▶ 1401]	Sends an ADS Device Notification request (sync)
	Disconnect [▶ 1402]	Disconnects this ADS server from the local ADS router.
	Dispose [▶ 1403]	Performs application-defined tasks associated with freeing, releasing, or resetting unmanaged resources.
	Dispose(Boolean) [▶ 1403]	Releases unmanaged and - optionally - managed resources.
	Equals	Determines whether the specified object is equal to the current object. (Inherited from Object .)
	Finalize [▶ 1403]	Finalizes an instance of the AdsServer [▶ 1375] class. (Overrides Object.Finalize .)
	GetHashCode	Serves as the default hash function. (Inherited from Object .)
	GetServerName [▶ 1441]	Gets the name of the server.
	GetType	Gets the Type of the current instance. (Inherited from Object .)
	MemberwiseClone	Creates a shallow copy of the current Object . (Inherited from Object .)
	OnAddDeviceNotificationAsync [▶ 1429]	Called when an ADS Add Device Notification indication is received.
	OnAddDeviceNotificationConfirmationAsync [▶ 1404]	Called when an ADS Add Device Notification confirmation is received.
	OnBeforeConnected [▶ 1430]	Handler function that is called, when the AdsServer [▶ 1375] is connected, but before calling OnConnected . [▶ 1405].
	OnConnected [▶ 1405]	Handler function that is called, when the AdsServer [▶ 1375] is connected.
	OnDeleteDeviceNotificationAsync [▶ 1430]	Called when an ADS Delete Device Notification indication is received.
	OnDeleteDeviceNotificationConfirmationAsync [▶ 1431]	Called when an ADS Delete Device Notification confirmation is received.
	OnDisconnect [▶ 1405]	Called when the AdsServer [▶ 1375] is about to be disconnected.
	OnReadAsync [▶ 1432]	Called when an ADS Read indication is received.
	OnReadConfirmationAsync [▶ 1433]	Called when an ADS Read confirmation is received.

	Name	Description
	OnReadDeviceInfoConfirmationAsync [▶ 1434]	Called when an ADS Read Device Info confirmation is received.
	OnReadDeviceStateAsync [▶ 1435]	Called when an ADS Read State indication is received.
	OnReadDeviceStateConfirmationAsync [▶ 1435]	Called when an ADS Read State confirmation is received.
	OnReadWriteAsync [▶ 1436]	Called when an ADS Read Write indication is received.
	OnReadWriteConfirmationAsync [▶ 1437]	Called when an ADS Read Write confirmation is received.
	OnRouterNotification [▶ 1405]	Handler Function for a Router Notification.
	OnServerConnectionStateChanged [▶ 1406]	Handles the ServerConnectionStateChanged [▶ 1442] event.
	OnWriteAsync [▶ 1438]	Called when an ADS Write indication is received.
	OnWriteConfirmationAsync [▶ 1439]	Called when an ADS Write confirmation is received.
	OnWriteControlAsync [▶ 1440]	Called when an ADS Write Control indication is received.
	OnWriteControlConfirmationAsync [▶ 1441]	Called when an ADS Write Control confirmation is received.
	ReadDeviceInfoRequestAsync [▶ 1409]	Sends an ADS Read Device Info request asynchronously
	ReadDeviceInfoRequestSync [▶ 1409]	Sends an ADS Read Device Info request synchronously.
	ReadDeviceInfoResponseAsync [▶ 1410]	Sends an ADS Read Device Info response.
	ReadDeviceStateRequestAsync [▶ 1412]	Sends an ADS Read State request (asynchronous)
	ReadDeviceStateRequestSync [▶ 1413]	Sends an ADS Read State request (synchronous)

	Name	Description
	ReadDeviceStateResponseAsync [▶ 1413]	Sends an ADS Read State response.
	ReadRequest [▶ 1415]	Sends an ADS Read Request.
	ReadRequestAsync [▶ 1416]	Sends an ADS Read Request asynchronously.
	ReadResponseAsync [▶ 1416]	Sends an ADS Read response.
	ReadWriteRequestAsync [▶ 1419]	Sends an ADS Read Write request.
	ReadWriteRequestSync [▶ 1419]	Sends an ADS Read Write request synchronously
	ReadWriteResponseAsync [▶ 1420]	Sends an ADS Read Write Response.
	ToString	Returns a string that represents the current object. (Inherited from Object .)
	WriteControlRequest [▶ 1423]	Sends an ADS Write Control request (synchronous)
	WriteControlRequestAsync [▶ 1424]	Sends an ADS Write Control request (asynchronous).
	WriteControlRequestSync [▶ 1425]	Sends an ADS Write Control request (synchronous).
	WriteControlResponseAsync [▶ 1425]	Sends an ADS Write Control response.
	WriteRequest [▶ 1427]	Sends an ADS Write request synchronously.
	WriteRequestAsync [▶ 1428]	Sends an ADS Write request asynchronously.
	WriteResponseAsync [▶ 1428]	Sends an ADS Write response.

Reference

[AdsServer Class](#) [[▶ 1375](#)]

[TwinCAT.Ads.Server Namespace](#) [[▶ 1374](#)]

6.4.1.2.1 `AdsServer.AddDeviceNotificationConfirmationAsync` Method

Called when an ADS Add Device Notification confirmation is received.

Namespace: [TwinCAT.Ads.Server](#) [[▶ 1374](#)]

Assembly: TwinCAT.Ads.Server (in TwinCAT.Ads.Server.dll) Version: 5.0.294+Branch.releases-5.0.Sha.90bb9a1b43b6095934fddca3e72bc0ea15da1c14

Syntax

C#

```
protected virtual Task<AdsErrorCode> AddDeviceNotificationConfirmationAsync(
    AmsAddress sender,
    uint invokeId,
    AdsErrorCode result,
    uint notificationHandle,
    CancellationToken cancel
)
```

Parameters

sender	Type: TwinCAT.Ads.AmsAddress [▶ 752] The sender's AMS address
invokeId	Type: System.UInt32 The invoke id provided by this server during the corresponding request
result	Type: TwinCAT.Ads.AdsErrorCode [▶ 664] The ADS error code provided by the sender
notificationHandle	Type: System.UInt32 The notification handle provided by the sender
cancel	Type: System.Threading.CancellationToken The cancellation token.

Return Value

Type: [Task.AdsErrorCode](#) [[▶ 664](#)].

A task that represents the asynchronous `AddDeviceNotificationConfirmationAsync(AmsAddress, UInt32, AdsErrorCode, UInt32, CancellationToken)` operation. The `Task.TResult` parameter contains the [AdsErrorCode](#) [[▶ 664](#)] as `Result`.

Remarks

Overwrite this method in derived classes to react on ADS Add Device Notification confirmations.

Reference

[AdsServer Class](#) [[▶ 1375](#)]

[TwinCAT.Ads.Server Namespace](#) [[▶ 1374](#)]

6.4.1.2.2 **AdsServer.AddDeviceNotificationIndicationAsync Method**

Called when an ADS Add Device Notification indication is received.

Namespace: [TwinCAT.Ads.Server](#) [[▶ 1374](#)]

Assembly: TwinCAT.Ads.Server (in TwinCAT.Ads.Server.dll) Version: 5.0.294+Branch.releases-5.0.Sha.90bb9a1b43b6095934fddca3e72bc0ea15da1c14

Syntax

C#

```
protected virtual Task<AdsErrorCode> AddDeviceNotificationIndicationAsync(
    AmsAddress sender,
    uint invokeId,
    uint indexGroup,
    uint indexOffset,
```

```

    int dataLength,
    NotificationSettings settings,
    CancellationToken cancel
)

```

Parameters

sender	Type: TwinCAT.Ads.AmsAddress [► 752] The sender's AMS address
invokeld	Type: System.UInt32 The invokeld provided by the sender
indexGroup	Type: System.UInt32 The index group of the requested ADS service
indexOffset	Type: System.UInt32 The index offset of the requested ADS service
dataLength	Type: System.Int32 Number of bytes to be transmitted
settings	Type: TwinCAT.Ads.NotificationSettings [► 1106] The Notification settings.
cancel	Type: System.Threading.CancellationToken The cancellation token.

Return Value

Type: [Task.AdsErrorCode](#) [► 664].

A task that represents the asynchronous 'AddDeviceNotificationIndication' operation. The [Task.TResult](#) parameter contains the [AdsErrorCode](#) [► 664] as [Result](#).

Remarks

Overwrite this method in derived classes to react on ADS Add Device Notification indications. The default implementation replies with an ADS ServiceNotSupported error code (0x701).

Reference

[TwinCAT.Ads.Server Namespace](#) [► 1374]

6.4.1.2.3 **AdsServer.AddDeviceNotificationRequest Method**

Sends an ADS Add Device Notification request (synchronous).

Namespace: [TwinCAT.Ads.Server](#) [► 1374]

Assembly: TwinCAT.Ads.Server (in TwinCAT.Ads.Server.dll) Version: 6.0.328+39e3229

Syntax

C#

```

protected AdsErrorCode AddDeviceNotificationRequest(
    AmsAddress target,
    uint invokeId,
    uint indexGroup,
    uint indexOffset,
    int dataLength,
    NotificationSettings settings
)

```

Parameters

target	Type: TwinCAT.Ads.AmsAddress [► 752] The receiver's AMS address
invokeld	Type: System.UInt32 The invokeld for this call. Used to find the matching ADS Confirmation
indexGroup	Type: System.UInt32 The index group of the requested ADS service
indexOffset	Type: System.UInt32 The index group of the requested ADS service
dataLength	Type: System.Int32 The number of bytes to be transmitted
settings	Type: TwinCAT.Ads.NotificationSettings [► 1106] The notification settings.

Return Value

Type: [AdsErrorCode](#) [► 664]
The ADS error code for this call.

Reference

6.4.1.2.4 AdsServer.AddDeviceNotificationRequestAsync Method

Sends an ADS Add Device Notification request (async)

Namespace: [TwinCAT.Ads.Server](#) [► 1374]

Assembly: [TwinCAT.Ads.Server](#) (in [TwinCAT.Ads.Server.dll](#)) Version: 6.0.328+39e3229

Syntax**C#**

```
protected Task<AdsErrorCode> AddDeviceNotificationRequestAsync (
    AmsAddress target,
    uint invokeId,
    uint indexGroup,
    uint indexOffset,
    int dataLength,
    NotificationSettings settings,
    CancellationToken cancel
)
```

Parameters

target	Type: TwinCAT.Ads.AmsAddress [► 752] The receiver's AMS address
invokeld	Type: System.UInt32 The invokeld for this call. Used to find the matching ADS Confirmation
indexGroup	Type: System.UInt32 The index group of the requested ADS service
indexOffset	Type: System.UInt32 The index group of the requested ADS service
dataLength	Type: System.Int32 The number of bytes to be transmitted

settings	Type: TwinCAT.Ads.NotificationSettings [▶ 1106] The notification settings.
cancel	Type: System.Threading.CancellationToken The cancellation token.

Return Value

Type: [Task.AdsErrorCode](#) [▶ 664].

A task that represents the asynchronous `AddDeviceNotificationRequestAsync(AmsAddress, UInt32, UInt32, UInt32, Int32, NotificationSettings, CancellationToken)` operation. The [Task.TResult](#). parameter contains the [AdsErrorCode](#) [▶ 664] as [Result](#).

Reference

6.4.1.2.5 AdsServer.AddDeviceNotificationResponseAsync Method

Sends an ADS Add Device Notification response.

Namespace: [TwinCAT.Ads.Server](#) [▶ 1374]

Assembly: `TwinCAT.Ads.Server` (in `TwinCAT.Ads.Server.dll`) Version: 6.0.328+39e3229

Syntax

C#

```
protected Task<AdsErrorCode> AddDeviceNotificationResponseAsync(
    AmsAddress target,
    uint invokeId,
    AdsErrorCode result,
    uint handle,
    CancellationToken cancel
)
```

Parameters

target	Type: TwinCAT.Ads.AmsAddress [▶ 752] The receiver's AMS address
invokeld	Type: System.UInt32 The invoke ID provided by the receiver
result	Type: TwinCAT.Ads.AdsErrorCode [▶ 664] The ADS error code for the response
handle	Type: System.UInt32 The notification handle for the added notification
cancel	Type: System.Threading.CancellationToken The cancellation token.

Return Value

Type: [Task.AdsErrorCode](#) [▶ 664].

A task that represents the asynchronous `AddDeviceNotificationResponseAsync(AmsAddress, UInt32, AdsErrorCode, UInt32, CancellationToken)` operation. The [Task.TResult](#). parameter contains the [AdsErrorCode](#) [▶ 664] as [Result](#).

Reference

Namespace: [TwinCAT.Ads.Server \[► 1374\]](#)

Assembly: TwinCAT.Ads.Server (in TwinCAT.Ads.Server.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public Task<AdsErrorCode> ConnectServerAndWaitAsync (
    CancellationToken cancel
)
```

Parameters

cancel	Type: System.Threading.CancellationToken
--------	--

Return Value

Type: [Task.AdsErrorCode \[► 664\]](#).

Returns a task object that represents the ConnectServerAndWaitAsync(CancellationToken) operation which returns an [AdsErrorCode \[► 664\]](#)" as result..

Remarks

The connection is hold until a cancel is requested, that means this method will wait until disconnect.

Reference

[AdsServer Class](#) [► 1375]

[TwinCAT.Ads.Server Namespace](#) [► 1374]

6.4.1.2.8 AdsServer.DeleteDeviceNotificationConfirmationAsync Method

Called when an ADS Delete Device Notification confirmation is received.

Namespace: [TwinCAT.Ads.Server](#) [► 1374]

Assembly: TwinCAT.Ads.Server (in TwinCAT.Ads.Server.dll) Version:

5.0.294+Branch.releases-5.0.Sha.90bb9a1b43b6095934fddca3e72bc0ea15da1c14

Syntax

C#

```
protected virtual Task<AdsErrorCode> DeleteDeviceNotificationConfirmationAsync(  
    AmsAddress sender,  
    uint invokeId,  
    AdsErrorCode result,  
    CancellationToken cancel  
)
```

Parameters

sender	Type: TwinCAT.Ads.AmsAddress [► 752] The sender's AMS address
invokeId	Type: System.UInt32 The invoke id provided by this server during the corresponding request
result	Type: TwinCAT.Ads.AdsErrorCode [► 664] The ADS error code provided by the sender
cancel	Type: System.Threading.CancellationToken The cancellation token.

Return Value

Type: [Task.AdsErrorCode](#) [► 664].

A task that represents the asynchronous `DeleteDeviceNotificationConfirmationAsync(AmsAddress, UInt32, AdsErrorCode, CancellationToken)` operation. The [Task.TResult](#) parameter contains the [AdsErrorCode](#) [► 664] as [Result](#).

Remarks

Overwrite this method in derived classes to react on ADS Delete Device Notification confirmations.

Reference

[TwinCAT.Ads.Server Namespace](#) [► 1374]

6.4.1.2.9 AdsServer.DeleteDeviceNotificationIndicationAsync Method

Called when an ADS Delete Device Notification indication is received.

Namespace: [TwinCAT.Ads.Server](#) [► 1374]

Assembly: TwinCAT.Ads.Server (in TwinCAT.Ads.Server.dll) Version:

5.0.294+Branch.releases-5.0.Sha.90bb9a1b43b6095934fddca3e72bc0ea15da1c14

Syntax

C#

```
protected virtual Task<AdsErrorCode> DeleteDeviceNotificationIndicationAsync(
    AmsAddress sender,
    uint invokeId,
    uint hNotification,
    CancellationToken cancel
)
```

Parameters

sender	Type: TwinCAT.Ads.AmsAddress [► 752] The sender's AMS address
invokeld	Type: System.UInt32 The invokeld provided by the sender
hNotification	Type: System.UInt32 The notification handle to be deleted
cancel	Type: System.Threading.CancellationToken The cancellation token.

Return Value

Type: [Task.AdsErrorCode](#) [► 664].

A task that represents the asynchronous `DeleteDeviceNotificationIndicationAsync(AmsAddress, UInt32, UInt32, CancellationToken)` operation. The `Task.TResult` parameter contains the [AdsErrorCode](#) [► 664] as `Result`.

Remarks

Overwrite this method in derived classes to react on ADS Delete Device Notification indications. The default implementation replies with an ADS ServiceNotSupported error code (0x701).

6.4.1.2.16 AdsServer.Dispose Method**Overload List**

	Name	Description
	Dispose. [▶ 1403]	Performs application-defined tasks associated with freeing, releasing, or resetting unmanaged resources.
	Dispose(Boolean) [▶ 1403]	Releases unmanaged and - optionally - managed resources.

Reference

[AdsServer Class](#) [[▶ 1375](#)]

[TwinCAT.Ads.Server Namespace](#) [[▶ 1374](#)]

6.4.1.2.16.1 AdsServer.Dispose Method

Performs application-defined tasks associated with freeing, releasing, or resetting unmanaged resources.

Namespace: [TwinCAT.Ads.Server](#) [[▶ 1374](#)]

Assembly: TwinCAT.Ads.Server (in TwinCAT.Ads.Server.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public void Dispose()
```

Implements

[IDisposable.Dispose.](#)

Reference

[AdsServer Class](#) [[▶ 1375](#)]

[Dispose Overload](#) [[▶ 1402](#)]

[TwinCAT.Ads.Server Namespace](#) [[▶ 1374](#)]

6.4.1.2.16.2 AdsServer.Dispose Method (Boolean)

Releases unmanaged and - optionally - managed resources.

Namespace: [TwinCAT.Ads.Server](#) [[▶ 1374](#)]

Assembly: TwinCAT.Ads.Server (in TwinCAT.Ads.Server.dll) Version: 6.0.328+39e3229

Syntax

C#

```
protected virtual void Dispose(  
    bool disposing  
)
```

Parameters

disposing	Type: System.Boolean true to release both managed and unmanaged resources; false to release only unmanaged resources.
-----------	--

Reference

[AdsServer Class](#) [[▶ 1375](#)]

[Dispose Overload](#) [[▶ 1402](#)]

[TwinCAT.Ads.Server Namespace](#) [[▶ 1374](#)]

6.4.1.2.17 AdsServer.Finalize Method

Finalizes an instance of the [AdsServer](#) [[▶ 1375](#)] class.

Namespace: [TwinCAT.Ads.Server](#) [[▶ 1374](#)]

Assembly: TwinCAT.Ads.Server (in TwinCAT.Ads.Server.dll) Version: 6.0.328+39e3229

Syntax

C#

```
protected override void Finalize()
```

Implements

[Object.Finalize.](#)

Reference

[AdsServer Class](#) [► 1375]

[TwinCAT.Ads.Server Namespace](#) [► 1374]

6.4.1.2.18 AdsServer.OnAddDeviceNotificationConfirmationAsync Method

Called when an ADS Add Device Notification confirmation is received.

Namespace: [TwinCAT.Ads.Server](#) [► 1374]

Assembly: TwinCAT.Ads.Server (in TwinCAT.Ads.Server.dll) Version: 6.0.328+39e3229

Syntax

C#

```
protected virtual Task<AdsErrorCode> OnAddDeviceNotificationConfirmationAsync (
    AmsAddress sender,
    uint invokeId,
    AdsErrorCode result,
    uint notificationHandle,
    CancellationToken cancel
)
```

Parameters

sender	Type: TwinCAT.Ads.AmsAddress [► 752] The sender's AMS address
invokeld	Type: System.UInt32 The invoke id provided by this server during the corresponding request
result	Type: TwinCAT.Ads.AdsErrorCode [► 664] The ADS error code provided by the sender
notificationHandle	Type: System.UInt32 The notification handle provided by the sender
cancel	Type: System.Threading.CancellationToken The cancellation token.

Return Value

Type: [Task.AdsErrorCode](#) [► 664].

A task that represents the asynchronous `OnAddDeviceNotificationConfirmationAsync(AmsAddress, UInt32, AdsErrorCode, UInt32, CancellationToken)` operation. The [Task.TResult](#) parameter contains the [AdsErrorCode](#) [► 664] as [Result](#).

Remarks

Overwrite this method in derived classes to react on ADS Add Device Notification confirmations. The Default implementaton just returns [NoError](#) [► 664]. Because the Confirmation is the last step in the ADS communication an Error will just be logged, but not processed any further. For a functional [AdsServer](#) [► 1375], this confirmation handler doesn't need to be overloaded!

Reference

Namespace: [TwinCAT.Ads.Server](#) [► 1374]

Assembly: TwinCAT.Ads.Server (in TwinCAT.Ads.Server.dll) Version: 5.0.294+Branch.releases-5.0.Sha.90bb9a1b43b6095934 addedca3e72bc0ea15da1c14

Syntax

C#

```
protected virtual Task<AdsErrorCode> ReadDeviceInfoConfirmationAsync(
    AmsAddress sender,
    uint invokeId,
    AdsErrorCode result,
    string name,
    AdsVersion version,
    CancellationToken cancel
)
```

Parameters

sender	Type: TwinCAT.Ads.AmsAddress [► 752] The sender's AMS address
invokeld	Type: System.UInt32 The invoke id provided by this server during the corresponding request
result	Type: TwinCAT.Ads.AdsErrorCode [► 664] The ADS error code provided by the sender
name	Type: System.String The sender's name
version	Type: TwinCAT.Ads.AdsVersion [► 743] The sender's version

cancel Type: [System.Threading.CancellationToken](#)
The cancellation token.

Return Value

Type: [Task.AdsErrorCode](#) [▶ 664].

A task that represents the asynchronous `ReadDeviceInfoConfirmationAsync(AmsAddress, UInt32, AdsErrorCode, String, AdsVersion, CancellationToken)` operation. The [Task.TResult](#) parameter contains the [AdsErrorCode](#) [▶ 664] as [Result](#).

Remarks

Overwrite this method in derived classes to react on ADS Read Device Info confirmations.

Reference

cancel	Type: System.Threading.CancellationToken The cancellation token.

Return Value

Type: [Task.AdsErrorCode](#) [► 664].

A task that represents the asynchronous `ReadDeviceStateIndicationAsync(AmsAddress, UInt32, CancellationToken)` operation. The `Task.TResult` parameter contains the [AdsErrorCode](#) [► 664] as `Result`.

Remarks

Overwrite this method in derived classes to react on ADS Read State indications. The default implementation replies with an ADS `ServiceNotSupported` error code (0x701).

6.4.1.2.31 AdsServer.ReadDeviceStateRequestAsync Method

Sends an ADS Read State request (asynchronous)

Namespace: [TwinCAT.Ads.Server](#) [► 1374]

Assembly: `TwinCAT.Ads.Server` (in `TwinCAT.Ads.Server.dll`) Version: 6.0.328+39e3229

Syntax

C#

```
protected Task<AdsErrorCode> ReadDeviceStateRequestAsync (
    AmsAddress target,
    uint invokeId,
    CancellationToken cancel
)
```

Parameters

target	Type: TwinCAT.Ads.AmsAddress [► 752] The receiver's AMS address
invokeld	Type: System.UInt32 The invokeld for this call. Used to find the matching ADS Confirmation
cancel	Type: System.Threading.CancellationToken The cancellation token.

Return Value

Type: [Task.AdsErrorCode](#) [▶ 664].

A task that represents the asynchronous `ReadDeviceStateRequestAsync(AmsAddress, UInt32, CancellationToken)` operation. The `Task.TResult` parameter contains the [AdsErrorCode](#) [▶ 664] as `Result`.

```

Parameters

target	Type: TwinCAT.Ads.AmsAddress [▶ 752] The receiver's AMS address
invokeld	Type: System.UInt32 The invokeld for this call. Used to find the matching ADS Confirmation
indexGroup	Type: System.UInt32 The index group of the requested ADS service
indexOffset	Type: System.UInt32 The index group of the requested ADS service
data	Type: System.ReadOnlySpan.Byte . The data to be written

Return Value

Type: [AdsErrorCode](#) [▶ 664]
The ADS error code for this call.

Reference

[AdsServer Class](#) [▶ 1375]

[TwinCAT.Ads.Server Namespace](#) [► 1374]

6.4.1.2.52 **AdsServer.WriteRequestAsync Method**

Sends an ADS Write request asynchronously.

Namespace: [TwinCAT.Ads.Server](#) [► 1374]

Assembly: TwinCAT.Ads.Server (in TwinCAT.Ads.Server.dll) Version: 6.0.328+39e3229

Syntax

C#

```
protected Task<AdsErrorCode> WriteRequestAsync (
    AmsAddress target,
    uint invokeId,
    uint indexGroup,
    uint indexOffset,
    ReadOnlyMemory<byte> data,
    CancellationToken cancel
)
```

Parameters

target	Type: TwinCAT.Ads.AmsAddress [► 752] The receiver's AMS address
invokeld	Type: System.UInt32 The invokeld for this call. Used to find the matching ADS Confirmation
indexGroup	Type: System.UInt32 The index group of the requested ADS service
indexOffset	Type: System.UInt32 The index group of the requested ADS service
data	Type: System.ReadOnlyMemory.Byte . The data to be written
cancel	Type: System.Threading.CancellationToken The cancellation token.

Return Value

Type: [Task.AdsErrorCode](#) [► 664].

A task that represents the asynchronous 'WriteRequest' operation. The [Task.TResult](#) parameter contains the [AdsErrorCode](#) [► 664] as [Result](#).

Reference

[AdsServer Class](#) [► 1375]

[TwinCAT.Ads.Server Namespace](#) [► 1374]

6.4.1.2.53 **AdsServer.WriteResponseAsync Method**

Sends an ADS Write response.

Namespace: [TwinCAT.Ads.Server](#) [► 1374]

Assembly: TwinCAT.Ads.Server (in TwinCAT.Ads.Server.dll) Version: 6.0.328+39e3229

Syntax

C#

```
protected Task<AdsErrorCode> WriteResponseAsync (
    AmsAddress target,
    uint invokeId,
    AdsErrorCode result,
    CancellationToken cancel
)
```

Parameters

target	Type: TwinCAT.Ads.AmsAddress [▶ 752] The receiver's AMS address
invokeld	Type: System.UInt32 The invoke ID provided by the receiver
result	Type: TwinCAT.Ads.AdsErrorCode [▶ 664] The ADS error code for the response
cancel	Type: System.Threading.CancellationToken The cancellation token.

Return Value

Type: [Task.AdsErrorCode \[▶ 664\]](#).
A task that represents the asynchronous WriteResponseAsync(AmsAddress, UInt32, AdsErrorCode, CancellationToken) operation. The [Task.TResult](#) parameter contains the [AdsErrorCode \[▶ 664\]](#) as [Result](#).

Reference

6.4.1.2.54 AdsServer.OnAddDeviceNotificationAsync Method

Called when an ADS Add Device Notification indication is received.

Namespace: [TwinCAT.Ads.Server \[▶ 1374\]](#)

Assembly: TwinCAT.Ads.Server (in TwinCAT.Ads.Server.dll) Version: 6.0.328+39e3229

Syntax

C#

```
protected virtual Task<ResultHandle> OnAddDeviceNotificationAsync (
    AmsAddress sender,
    uint invokeId,
    uint indexGroup,
    uint indexOffset,
    int dataLength,
    AmsAddress receiver,
    NotificationSettings settings,
    CancellationToken cancel
)
```

Parameters

sender	Type: TwinCAT.Ads.AmsAddress [▶ 752] The sender address of the request.
invokeld	Type: System.UInt32 The invoke identifier of the request.

indexGroup	Type: System.UInt32 The index group of the requested ADS service
indexOffset	Type: System.UInt32 The index offset of the requested ADS service
dataLength	Type: System.Int32 Number of bytes to be transmitted
receiver	Type: TwinCAT.Ads.AmsAddress [▶ 752] The receiver of the notifications (the requester of this message)
settings	Type: TwinCAT.Ads.NotificationSettings [▶ 1106] The Notification settings.
cancel	Type: System.Threading.CancellationToken The cancellation token.

Return Value

Type: [Task.ResultHandle](#) [[▶ 1136](#)].

A task that represents the asynchronous 'AddDeviceNotificationIndication' operation. The [Task.TResult](#) parameter contains the [AdsErrorCode](#) [[▶ 664](#)] as [Result](#).

Remarks

Overwrite this method in derived classes to react on ADS Add Device Notification indications. The default implementation replies with an ADS ServiceNotSupported error code (0x701).

6.4.1.2.56 **AdsServer.OnDeleteDeviceNotificationAsync Method**

Called when an ADS Delete Device Notification indication is received.

Namespace: [TwinCAT.Ads.Server](#) [[▶ 1374](#)]

Assembly: TwinCAT.Ads.Server (in TwinCAT.Ads.Server.dll) Version: 6.0.328+39e3229

Syntax

C#

```
protected virtual Task<ResultAds> OnDeleteDeviceNotificationAsync(
    AmsAddress sender,
    uint invokeId,
    uint hNotification,
    CancellationToken cancel
)
```

Parameters

sender	Type: TwinCAT.Ads.AmsAddress [► 752] The sender address of the request.
invokeld	Type: System.UInt32 The invoke identifier of the request.
hNotification	Type: System.UInt32 The notification handle to be deleted
cancel	Type: System.Threading.CancellationToken The cancellation token.

Return Value

Type: [Task.ResultAds](#) [► 1116].

A task that represents the asynchronous `DeleteDeviceNotificationIndicationAsync(AmsAddress, UInt32, UInt32, CancellationToken)` operation. The `Task.TResult` parameter contains the [AdsErrorCode](#) [► 664] as `Result`.

Remarks

Overwrite this method in derived classes to react on ADS Delete Device Notification indications. The default implementation replies with an ADS ServiceNotSupported error code (0x701).

Reference

6.4.1.2.57 AdsServer.OnDeleteDeviceNotificationConfirmationAsync Method

Called when an ADS Delete Device Notification confirmation is received.

Namespace: [TwinCAT.Ads.Server](#) [► 1374]

Assembly: TwinCAT.Ads.Server (in TwinCAT.Ads.Server.dll) Version: 6.0.328+39e3229

Syntax

C#

```
protected virtual Task<AdsErrorCode> OnDeleteDeviceNotificationConfirmationAsync(
    AmsAddress sender,
    uint invokeId,
    AdsErrorCode result,
    CancellationToken cancel
)
```

Parameters

sender	Type: TwinCAT.Ads.AmsAddress [► 752] The sender's AMS address
--------	--

invokeld	Type: System.UInt32 The invoke id provided by this server during the corresponding request
result	Type: TwinCAT.Ads.AdsErrorCode [▶ 664] The ADS error code provided by the sender
cancel	Type: System.Threading.CancellationToken The cancellation token.

Return Value

Type: [Task.AdsErrorCode](#) [[▶ 664](#)].

A task that represents the asynchronous [OnDeleteDeviceNotificationConfirmationAsync\(AmsAddress, UInt32, AdsErrorCode, CancellationToken\)](#) operation. The [Task.TResult](#). parameter contains the [AdsErrorCode](#) [[▶ 664](#)] as [Result](#).

Remarks

Overwrite this method in derived classes to react on ADS Delete Device Notification confirmations. The Default implementaton just returns [NoError](#) [[▶ 664](#)]. Because the Confirmation is the last step in the ADS communication an Error will just be logged, but not processed any further. For a functional [AdsServer](#) [[▶ 1375](#)], this confirmation handler doesn't need to be overloaded!

6.4.1.4 AdsServer Fields

The [AdsServer](#) [▶ 1375] type exposes the following members.

Fields

	Name	Description
	serverVersion [▶ 1443]	The version of the AdsServer

Reference

[AdsServer Class](#) [▶ 1375]

[TwinCAT.Ads.Server Namespace](#) [▶ 1374]

6.4.1.4.1 AdsServer.serverVersion Field

The version of the AdsServer

Namespace: [TwinCAT.Ads.Server](#) [▶ 1374]

Assembly: TwinCAT.Ads.Server (in TwinCAT.Ads.Server.dll) Version: 6.0.328+39e3229

Syntax

C#

```
protected Version serverVersion
```

Field Value

Type: [Version](#)

Reference

[AdsServer Class](#) [▶ 1375]

[TwinCAT.Ads.Server Namespace](#) [▶ 1374]

6.4.2 AdsServerException Class

An AdsServerException is thrown on communication errors in the [AdsServer](#) [▶ 1375] class.

Inheritance Hierarchy

[System.Object](#)

[System.Exception](#)

[TwinCAT.Ads.Server.AdsServerException](#)

[TwinCAT.Ads.Server.LoopbackNotConnectedException](#) [▶ 1523]

[TwinCAT.Ads.Server.LoopbackNotRegisteredException](#) [▶ 1450]

[TwinCAT.Ads.Server.ServerNotConnectedException](#) [▶ 1465]

Namespace: [TwinCAT.Ads.Server](#) [▶ 1374]

Assembly: TwinCAT.Ads.Server (in TwinCAT.Ads.Server.dll) Version: 6.0.328+39e3229

Syntax

C#

```
[SerializableAttribute]  
public class AdsServerException : Exception
```

The AdsServerException type exposes the following members.

Constructors

	Name	Description
	AdsServerException [▶ 1445]	Initializes a new instance of the AdsServerException class.

Properties

	Name	Description
	Data	Gets a collection of key/value pairs that provide additional user-defined information about the exception. (Inherited from Exception .)
	ErrorCode [▶ 1446]	Gets or sets the error code.
	HelpLink	Gets or sets a link to the help file associated with this exception. (Inherited from Exception .)
	HResult	Gets or sets HRESULT, a coded numerical value that is assigned to a specific exception. (Inherited from Exception .)
	InnerException	Gets the Exception instance that caused the current exception. (Inherited from Exception .)
	Message	Gets a message that describes the current exception. (Inherited from Exception .)
	Source	Gets or sets the name of the application or the object that causes the error. (Inherited from Exception .)
	StackTrace	Gets a string representation of the immediate frames on the call stack. (Inherited from Exception .)
	TargetSite	Gets the method that throws the current exception. (Inherited from Exception .)

Methods

	Name	Description
	Equals	Determines whether the specified object is equal to the current object. (Inherited from Object .)
	Finalize	Allows an object to try to free resources and perform other cleanup operations before it is reclaimed by garbage collection. (Inherited from Object .)
	GetBaseException	When overridden in a derived class, returns the Exception that is the root cause of one or more subsequent exceptions. (Inherited from Exception .)
	GetHashCode	Serves as the default hash function. (Inherited from Object .)
	GetObjectData [▶ 1447]	When overridden in a derived class, sets the SerializationInfo with information about the exception. (Overrides Exception.GetObjectData(SerializationInfo, StreamingContext) .)
	GetType	Gets the runtime type of the current instance. (Inherited from Exception .)
	MemberwiseClone	Creates a shallow copy of the current Object . (Inherited from Object .)
	ToString	Creates and returns a string representation of the current exception. (Inherited from Exception .)

Events

	Name	Description
	SerializeObjectState	Obsolete. Occurs when an exception is serialized to create an exception state object that contains serialized data about the exception. (Inherited from Exception .)

Reference

[TwinCAT.Ads.Server Namespace](#) [▶ 1374]

6.4.2.1 **AdsServerException Constructor**

Initializes a new instance of the [AdsServerException](#) [▶ 1443] class.

Namespace: [TwinCAT.Ads.Server](#) [▶ 1374]

Assembly: TwinCAT.Ads.Server (in TwinCAT.Ads.Server.dll) Version: 6.0.328+39e3229

Syntax

C#

```
protected AdsServerException (
    SerializationInfo serializationInfo,
    StreamingContext streamingContext
)
```

Parameters

serializationInfo	Type: System.Runtime.Serialization.SerializationInfo The serialization information.
streamingContext	Type: System.Runtime.Serialization.StreamingContext The streaming context.

Reference

[AdsServerException Class](#) [▶ 1443]

[TwinCAT.Ads.Server Namespace](#) [▶ 1374]

6.4.2.2 **AdsServerException Properties**

The [AdsServerException](#) [▶ 1443] type exposes the following members.

Properties

	Name	Description
	Data	Gets a collection of key/value pairs that provide additional user-defined information about the exception. (Inherited from Exception .)
	ErrorCode [▶ 1446]	Gets or sets the error code.
	HelpLink	Gets or sets a link to the help file associated with this exception. (Inherited from Exception .)
	HResult	Gets or sets HRESULT, a coded numerical value that is assigned to a specific exception. (Inherited from Exception .)
	InnerException	Gets the Exception instance that caused the current exception. (Inherited from Exception .)

	Name	Description
	Message	Gets a message that describes the current exception. (Inherited from Exception .)
	Source	Gets or sets the name of the application or the object that causes the error. (Inherited from Exception .)
	StackTrace	Gets a string representation of the immediate frames on the call stack. (Inherited from Exception .)
	TargetSite	Gets the method that throws the current exception. (Inherited from Exception .)

Reference

[AdsServerException Class](#) [▶ 1443]

[TwinCAT.Ads.Server Namespace](#) [▶ 1374]

6.4.2.3.1 AdsServerException.GetObjectData Method

When overridden in a derived class, sets the [SerializationInfo](#) with information about the exception.

Namespace: [TwinCAT.Ads.Server](#) [▶ 1374]

Assembly: [TwinCAT.Ads.Server](#) (in [TwinCAT.Ads.Server.dll](#)) Version: 6.0.328+39e3229

Syntax

C#

```
public override void GetObjectData(
    SerializationInfo info,
    StreamingContext context
)
```

Parameters

info	Type: System.Runtime.Serialization.SerializationInfo The SerializationInfo that holds the serialized object data about the exception being thrown.
context	Type: System.Runtime.Serialization.StreamingContext The StreamingContext that contains contextual information about the source or destination.

Implements

[ISerializable.GetObjectData\(SerializationInfo, StreamingContext\)](#)

Exceptions

Exception	Condition
ArgumentNullException	info

Reference

6.4.3 ErrorEventArgs Class

This class implements the event arguments passed by the TcAdsServerExEvent.

Inheritance Hierarchy

[System.Object](#)

[System.EventArgs](#)

[TwinCAT.Ads.Server.ErrorEventArgs](#)

Namespace: [TwinCAT.Ads.Server](#) [▶ 1374]

Assembly: TwinCAT.Ads.Server (in TwinCAT.Ads.Server.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public class ErrorEventArgs : EventArgs
```

The [ErrorEventArgs](#) type exposes the following members.

Properties

	Name	Description
	Exception [▶ 1449]	Returns the exception that caused the event.
	Message [▶ 1449]	Returns the exception message.

Methods

	Name	Description
	Equals	Determines whether the specified object is equal to the current object. (Inherited from Object .)
	Finalize	Allows an object to try to free resources and perform other cleanup operations before it is reclaimed by garbage collection. (Inherited from Object .)
	GetHashCode	Serves as the default hash function. (Inherited from Object .)
	GetType	Gets the Type of the current instance. (Inherited from Object .)
	MemberwiseClone	Creates a shallow copy of the current Object . (Inherited from Object .)

	Name	Description
	ToString	Returns a string that represents the current object. (Inherited from Object .)

6.4.4 LoopbackNotRegisteredException Class

The Tcp Loopback client is not registered. Implements the [AdsServerException \[► 1443\]](#)

Inheritance Hierarchy

[System.Object](#)

[System.Exception](#)

[TwinCAT.Ads.Server.AdsServerException \[► 1443\]](#)

[TwinCAT.Ads.Server.LoopbackNotRegisteredException](#)

Namespace: [TwinCAT.Ads.Server \[► 1374\]](#)

Assembly: TwinCAT.Ads.Server (in TwinCAT.Ads.Server.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public class LoopbackNotRegisteredException : AdsServerException
```

The LoopbackNotRegisteredException type exposes the following members.

Properties

	Name	Description
	Data	Gets a collection of key/value pairs that provide additional user-defined information about the exception. (Inherited from Exception .)
	ErrorCode [▶ 1446]	Gets or sets the error code. (Inherited from AdsServerException [▶ 1443].)
	HelpLink	Gets or sets a link to the help file associated with this exception. (Inherited from Exception .)
	HResult	Gets or sets HRESULT, a coded numerical value that is assigned to a specific exception. (Inherited from Exception .)
	InnerException	Gets the Exception instance that caused the current exception. (Inherited from Exception .)
	Message	Gets a message that describes the current exception. (Inherited from Exception .)
	Source	Gets or sets the name of the application or the object that causes the error. (Inherited from Exception .)
	StackTrace	Gets a string representation of the immediate frames on the call stack. (Inherited from Exception .)
	TargetSite	Gets the method that throws the current exception. (Inherited from Exception .)

Methods

	Name	Description
	Equals	Determines whether the specified object is equal to the current object. (Inherited from Object .)
	Finalize	Allows an object to try to free resources and perform other cleanup operations before it is reclaimed by garbage collection. (Inherited from Object .)

6.4.5 NotificationDataSample Class

This class implements an ADS Notification Sample. It contains the notification handle and the variable data.

Inheritance Hierarchy

[System.Object](#)

 TwinCAT.Ads.Server.NotificationDataSample

Namespace: [TwinCAT.Ads.Server](#) [▶ 1374]

Assembly: TwinCAT.Ads.Server (in TwinCAT.Ads.Server.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public sealed class NotificationDataSample
```

The NotificationDataSample type exposes the following members.

Constructors

	Name	Description
	NotificationDataSample [▶ 1454]	Initializes a new instance of the NotificationDataSample class.

Properties

	Name	Description
	NotificationHandle [▶ 1455]	Gets the notification handle.
	SampleData [▶ 1455]	Gets the Sample Data.
	SampleSize [▶ 1456]	Gets the Sample Size.

Methods

	Name	Description
	Equals	Determines whether the specified object is equal to the current object. (Inherited from Object .)
	GetHashCode	Serves as the default hash function. (Inherited from Object .)
	GetType	Gets the Type of the current instance. (Inherited from Object .)
	ToString	Returns a string that represents the current object. (Inherited from Object .)

6.4.6.2.1 NotificationSamplesStamp.NotificationSamples Property

Get the array of notification samples contained in this header.

Namespace: [TwinCAT.Ads.Server \[▸ 1374\]](#)

Assembly: TwinCAT.Ads.Server (in TwinCAT.Ads.Server.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public NotificationDataSample[] NotificationSamples { get; }
```

Property Value

Type: [.NotificationDataSample](#) [▶ 1453].

Reference

[NotificationSamplesStamp Class](#) [▶ 1456]

[TwinCAT.Ads.Server Namespace](#) [▶ 1374]

6.4.6.2.2 NotificationSamplesStamp.NumSamples Property

Get the number of notification samples contained in this header.

Namespace: [TwinCAT.Ads.Server](#) [▶ 1374]

Assembly: TwinCAT.Ads.Server (in TwinCAT.Ads.Server.dll) Version: 6.0.116+a71ced3

Syntax

C#

```
public int NumSamples { get; }
```

Property Value

Type: [Int32](#)

Reference

[NotificationSamplesStamp Class](#) [▶ 1456]

[TwinCAT.Ads.Server Namespace](#) [▶ 1374]

6.4.6.2.3 NotificationSamplesStamp.TimeStamp Property

Gets the time stamp of the [NotificationSamplesStamp](#) [▶ 1456].

Namespace: [TwinCAT.Ads.Server](#) [▶ 1374]

Assembly: TwinCAT.Ads.Server (in TwinCAT.Ads.Server.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public DateTimeOffset TimeStamp { get; }
```

Property Value

Type: [DateTimeOffset](#)
The time stamp.

Reference

[NotificationSamplesStamp Class](#) [▶ 1456]

[TwinCAT.Ads.Server Namespace](#) [▶ 1374]

6.4.6.2.4 NotificationSamplesStamp.SamplesCount Property

Get the number of notification samples contained in this header.

Namespace: [TwinCAT.Ads.Server](#) [[▶ 1374](#)]

Assembly: TwinCAT.Ads.Server (in TwinCAT.Ads.Server.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public int SamplesCount { get; }
```

Property Value

Type: [Int32](#)

Reference

[NotificationSamplesStamp Class](#) [[▶ 1456](#)]

[TwinCAT.Ads.Server Namespace](#) [[▶ 1374](#)]

6.4.6.3 NotificationSamplesStamp Methods

The [NotificationSamplesStamp](#) [[▶ 1456](#)] type exposes the following members.

Methods

	Name	Description
	Equals	Determines whether the specified object is equal to the current object. (Inherited from Object .)
	GetHashCode	Serves as the default hash function. (Inherited from Object .)
	GetType	Gets the Type of the current instance. (Inherited from Object .)
	ToString	Returns a string that represents the current object. (Inherited from Object .)

Reference

[NotificationSamplesStamp Class](#) [[▶ 1456](#)]

[TwinCAT.Ads.Server Namespace](#) [[▶ 1374](#)]

6.4.7 ServerConnectionState Enumeration

The Server Connection State

Namespace: [TwinCAT.Ads.Server](#) [[▶ 1374](#)]

Assembly: TwinCAT.Ads.Server (in TwinCAT.Ads.Server.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public enum ServerConnectionState
```

Members

	Member name	Value	Description
	None	0	None / Uninitialized / Disconnect

	Member name	Value	Description
	Disconnected	1	Disconnected State.
	Connected	2	Connected state.

Reference

[TwinCAT.Ads.Server Namespace \[► 1374\]](#)

6.4.8 ServerConnectionStateChangedEventArgs Class

Class ConnectionStateChangedEventArgs (Server Connections)

Inheritance Hierarchy

[System.Object](#)

[System.EventArgs](#)

[TwinCAT.Ads.Server.ServerConnectionStateChangedEventArgs](#)

Namespace: [TwinCAT.Ads.Server \[► 1374\]](#)

Assembly: TwinCAT.Ads.Server (in TwinCAT.Ads.Server.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public class ServerConnectionStateChangedEventArgs : EventArgs
```

The ServerConnectionStateChangedEventArgs type exposes the following members.

Constructors

	Name	Description
	ServerConnectionStateChangedEventArgs [► 1463]	Initializes a new instance of the ServerConnectionStateChangedEventArgs class.

Properties

	Name	Description
	Address [► 1463]	The Server address
	State [► 1464]	The Connection state

Methods

	Name	Description
	Equals	Determines whether the specified object is equal to the current object. (Inherited from Object .)
	Finalize	Allows an object to try to free resources and perform other cleanup operations before it is reclaimed by garbage collection. (Inherited from Object .)
	GetHashCode	Serves as the default hash function. (Inherited from Object .)
	GetType	Gets the Type of the current instance. (Inherited from Object .)
	MemberwiseClone	Creates a shallow copy of the current Object . (Inherited from Object .)

	Name	Description
	ToString	Returns a string that represents the current object. (Inherited from Object .)

6.4.8.1 ServerConnectionStateChangedEventArgs Constructor

Initializes a new instance of the [ServerConnectionStateChangedEventArgs](#) [▶ 1462] class.

Namespace: [TwinCAT.Ads.Server](#) [▶ 1374]

Assembly: TwinCAT.Ads.Server (in TwinCAT.Ads.Server.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public ServerConnectionStateChangedEventArgs (
    AmsAddress address,
    ServerConnectionState state
)
```

Parameters

address	Type: TwinCAT.Ads.AmsAddress [▶ 752] The address.
state	Type: TwinCAT.Ads.Server.ServerConnectionState [▶ 1461] The state.

Reference

[ServerConnectionStateChangedEventArgs Class](#) [▶ 1462]

6.4.9 ServerNotConnectedException Class

The AdsServer is not connected. Implements the [AdsServerException \[► 1443\]](#)

Inheritance Hierarchy

[System.Object](#)

[System.Exception](#)

[TwinCAT.Ads.Server.AdsServerException \[► 1443\]](#)

[TwinCAT.Ads.Server.ServerNotConnectedException](#)

Namespace: [TwinCAT.Ads.Server \[► 1374\]](#)

Assembly: TwinCAT.Ads.Server (in TwinCAT.Ads.Server.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public class ServerNotConnectedException : AdsServerException
```

The ServerNotConnectedException type exposes the following members.

Constructors

	Name	Description
	ServerNotConnectedException [► 1468]	Initializes a new instance of the ServerNotConnectedException class.

Properties

	Name	Description
	Data	Gets a collection of key/value pairs that provide additional user-defined information about the exception. (Inherited from Exception .)
	ErrorCode [► 1446]	Gets or sets the error code. (Inherited from AdsServerException [► 1443] .)
	HelpLink	Gets or sets a link to the help file associated with this exception. (Inherited from Exception .)
	HRESULT	Gets or sets HRESULT, a coded numerical value that is assigned to a specific exception. (Inherited from Exception .)
	InnerException	Gets the Exception instance that caused the current exception. (Inherited from Exception .)
	Message	Gets a message that describes the current exception. (Inherited from Exception .)
	Source	Gets or sets the name of the application or the object that causes the error. (Inherited from Exception .)
	StackTrace	Gets a string representation of the immediate frames on the call stack. (Inherited from Exception .)

	Name	Description
	<u>TargetSite</u>	Gets the method that throws the current exception. (Inherited from <u>Exception</u> .)

Methods

	Name	Description
	<u>Equals</u>	Determines whether the specified object is equal to the current object. (Inherited from <u>Object</u> .)
	<u>Finalize</u>	Allows an object to try to free resources and perform other cleanup operations before it is reclaimed by garbage collection. (Inherited from <u>Object</u> .)
	<u>GetBaseException</u>	When overridden in a derived class, returns the <u>Exception</u> that is the root cause of one or more subsequent exceptions. (Inherited from <u>Exception</u> .)
	<u>GetHashCode</u>	Serves as the default hash function. (Inherited from <u>Object</u> .)
	<u>GetObjectData</u> [▶ 1447]	When overridden in a derived class, sets the <u>SerializationInfo</u> with information about the exception. (Inherited from <u>AdsServerException</u> [▶ 1443].)
	<u>GetType</u>	Gets the runtime type of the current instance. (Inherited from <u>Exception</u> .)
	<u>MemberwiseClone</u>	Creates a shallow copy of the current <u>Object</u> . (Inherited from <u>Object</u> .)
	<u>ToString</u>	Creates and returns a string representation of the current exception. (Inherited from <u>Exception</u> .)

Events

	Name	Description
	<u>SerializeObjectState</u>	Obsolete. Occurs when an exception is serialized to create an exception state object that contains serialized data about the exception. (Inherited from <u>Exception</u> .)

Reference

6.4.9.4 ServerNotConnectedException Constructor

Initializes a new instance of the [ServerNotConnectedException](#) [► 1465] class.

Namespace: [TwinCAT.Ads.Server](#) [► 1374]

Assembly: TwinCAT.Ads.Server (in TwinCAT.Ads.Server.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public ServerNotConnectedException()
```

Reference

[ServerNotConnectedException Class](#) [► 1465]

[TwinCAT.Ads.Server Namespace](#) [► 1374]

6.4.10 AdsSymbolicServer Class

AdsServer class that supports Symbolic information and Notifications. Implements the [AdsServer](#) [► 1375]

Inheritance Hierarchy

[System.Object](#)

[TwinCAT.Ads.Server.AdsServer](#) [► 1375]

[TwinCAT.Ads.Server.AdsSymbolicServer](#)

Namespace: [TwinCAT.Ads.Server](#) [► 1374]

Assembly: TwinCAT.Ads.SymbolicServer (in TwinCAT.Ads.SymbolicServer.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public abstract class AdsSymbolicServer : AdsServer,
    ISymbolProvider, ISymbolServer
```

The AdsSymbolicServer type exposes the following members.

Properties

	Name	Description
	AmsServer [► 1384]	Gets the the internal AmsServer [► 1384] object. (Inherited from AdsServer [► 1375].)
	DataTypes [► 1482]	Gets the data types

Name	Description
DefaultValueEncoding [▶ 1482]	Gets/Sets the default value encoding.
InstancePathEncoding [▶ 1483]	Gets or sets the instance path encoding (Default is the Windows CodePage)
IsConnected [▶ 1384]	Gets a value indicating whether AdsServer [▶ 1375] is connected. (Inherited from AdsServer [▶ 1375].)
IsDisconnecting [▶ 1384]	Indicates, that the AdsServer [▶ 1375] is actually disconnecting. (Inherited from AdsServer [▶ 1375].)
IsDisposed [▶ 1385]	Gets a value indicating whether this instance is disposed. (Inherited from AdsServer [▶ 1375].)
IsDynamicPort [▶ 1387]	Gets a value indicating this AdsServer [▶ 1375] has a dynamic/unfixed port. (Inherited from AdsServer [▶ 1375].)
Logger [▶ 1385]	Gets the logger object. (Inherited from AdsServer [▶ 1375].)
PlatformPointerSize [▶ 1483]	Gets the Platform pointer size of this Server
RootNamespaceName [▶ 1484]	Gets the name of the root namespace
ServerAddress [▶ 1386]	The AMS address of this server. (Inherited from AdsServer [▶ 1375].)
ServerName [▶ 1386]	Gets the name of the server. (Inherited from AdsServer [▶ 1375].)
ServerPort [▶ 1387]	Gets the server port. (Inherited from AdsServer [▶ 1375].)
ServerVersion [▶ 1387]	Gets the Version of the Server. (Inherited from AdsServer [▶ 1375].)
Symbols [▶ 1484]	Gets the symbols.

Methods

Name	Description
AddDeviceNotificationRequest [▶ 1393]	Sends an ADS Add Device Notification request (synchronous). (Inherited from AdsServer [▶ 1375].)
AddDeviceNotificationRequestAsync [▶ 1394]	Sends an ADS Add Device Notification request (async) (Inherited from AdsServer [▶ 1375].)
AddDeviceNotificationResponseAsync [▶ 1395]	Sends an ADS Add Device Notification response. (Inherited from AdsServer [▶ 1375].)
ConnectServer [▶ 1396]	Connect this ADS server to the local ADS router. (Inherited from AdsServer [▶ 1375].)
ConnectServerAndWaitAsync [▶ 1396]	Registers the AdsServer [▶ 1375] at the router asynchronously. (Inherited from AdsServer [▶ 1375].)

	Name	Description
	DeleteDeviceNotificationRequest [▶ 1398]	Sends an ADS Delete Device Notification request (synchronous). (Inherited from AdsServer [▶ 1375].)
	DeleteDeviceNotificationRequestAsync [▶ 1399]	Sends an ADS Delete Device Notification request (async). (Inherited from AdsServer [▶ 1375].)
	DeleteDeviceNotificationResponseAsync [▶ 1400]	Sends an ADS Delete Device Notification response. (Inherited from AdsServer [▶ 1375].)
	DeviceNotificationRequestAsync [▶ 1400]	Sends an ADS Device Notification request asynchronously (Inherited from AdsServer [▶ 1375].)
	DeviceNotificationRequestSync [▶ 1401]	Sends an ADS Device Notification request (sync) (Inherited from AdsServer [▶ 1375].)
	Disconnect [▶ 1402]	Disconnects this ADS server from the local ADS router. (Inherited from AdsServer [▶ 1375].)
	Dispose . [▶ 1403]	Performs application-defined tasks associated with freeing, releasing, or resetting unmanaged resources. (Inherited from AdsServer [▶ 1375].)
	Dispose(Boolean) [▶ 1403]	Releases unmanaged and - optionally - managed resources. (Inherited from AdsServer [▶ 1375].)
	Equals	Determines whether the specified object is equal to the current object. (Inherited from Object .)
	Finalize [▶ 1403]	Finalizes an instance of the AdsServer [▶ 1375] class. (Inherited from AdsServer [▶ 1375].)
	FireNotificationAsync [▶ 1490]	Fires a single notification to the specified Address.
	FireNotifications [▶ 1490]	Fires outstanding cyclic notifications.
	FireNotificationsAsync [▶ 1491]	Check internal tables for outstanding cyclic Notifications and fire them asynchronously.
	GetDataTypesAsync [▶ 1491]	Gets the data types asynchronously.
	GetHashCode	Serves as the default hash function. (Inherited from Object .)
	GetServerName [▶ 1441]	Gets the name of the server. (Inherited from AdsServer [▶ 1375].)
	GetSymbolsAsync [▶ 1492]	Gets the symbols asynchronously
	GetType	Gets the Type of the current instance. (Inherited from Object .)
	HasValueChanged [▶ 1493]	Determines whether the value of the Symbol has changed.
	MemberwiseClone	Creates a shallow copy of the current Object . (Inherited from Object .)

	Name	Description
	OnAddDeviceNotificationAsync [▶ 1493]	Called when an ADS Add Device Notification indication is received. (Overrides AdsServer.OnAddDeviceNotificationAsync(AmsAddress, UInt32, UInt32, UInt32, Int32, AmsAddress, NotificationSettings, CancellationToken) [▶ 1429].)
	OnAddDeviceNotificationConfirmationAsync [▶ 1404]	Called when an ADS Add Device Notification confirmation is received. (Inherited from AdsServer [▶ 1375].)
	OnBeforeConnected [▶ 1494]	Handler function that is called, when the AdsServer [▶ 1375] is connected, but before calling OnConnected . [▶ 1405]. (Overrides AdsServer.OnBeforeConnected . [▶ 1430].)
	OnConnected [▶ 1495]	Handler function that is called, when the AdsServer [▶ 1375] is connected. (Overrides AdsServer.OnConnected . [▶ 1405].)
	OnCreateSymbols [▶ 1509]	Handler function to create the Initial Symbols of the server.
	OnDeleteDeviceNotificationAsync [▶ 1495]	Called when a DeleteDeviceNotification request is indicated. (Overrides AdsServer.OnDeleteDeviceNotificationAsync(AmsAddress, UInt32, UInt32, CancellationToken) [▶ 1430].)
	OnDeleteDeviceNotificationConfirmationAsync [▶ 1431]	Called when an ADS Delete Device Notification confirmation is received. (Inherited from AdsServer [▶ 1375].)
	OnDisconnect [▶ 1496]	Called when the AdsServer [▶ 1375] is about to be disconnected. (Overrides AdsServer.OnDisconnect . [▶ 1405].)
	OnFireNotifications [▶ 1496]	Handler function for firing notifications to the specified targets.
	OnFireNotificationsAsync [▶ 1497]	Handler function for firing notifications to the specified targets.
	OnGetValue [▶ 1497]	Handler function to determine the (stored) value of the symbol from the internal caches of the AdsSymbolicServer .
	OnReadAsync [▶ 1498]	Called when an ADS Read indication is received. (Overrides AdsServer.OnReadAsync(AmsAddress, UInt32, UInt32, UInt32, Int32, CancellationToken) [▶ 1432].)
	OnReadConfirmationAsync [▶ 1433]	Called when an ADS Read confirmation is received. (Inherited from AdsServer [▶ 1375].)
	OnReadDeviceInfoConfirmationAsync [▶ 1434]	Called when an ADS Read Device Info confirmation is received. (Inherited from AdsServer [▶ 1375].)
	OnReadDeviceStateAsync [▶ 1435]	Called when an ADS Read State indication is received. (Inherited from AdsServer [▶ 1375].)
	OnReadDeviceStateConfirmationAsync [▶ 1435]	Called when an ADS Read State confirmation is received. (Inherited from AdsServer [▶ 1375].)
	OnReadIglloAsync [▶ 1499]	Handler function for handling pure IG/IO Read indications

	Name	Description
	OnReadRawValue [▶ 1500]	Handler function for Reading the internal value data in raw format.
	OnReadWriteAsync [▶ 1500]	Called when an ADS Read Write indication is received. (Overrides AdsServer.OnReadWriteAsync(AmsAddress, UInt32, UInt32, UInt32, Int32, ReadOnlyMemory.Byte., CancellationToken) [▶ 1436].)
	OnReadWriteConfirmationAsync [▶ 1437]	Called when an ADS Read Write confirmation is received. (Inherited from AdsServer [▶ 1375].)
	OnReadWritelgloAsync [▶ 1501]	Handler function for handling of pure IG/IO calls.
	OnRouterNotification [▶ 1405]	Handler Function for a Router Notification. (Inherited from AdsServer [▶ 1375].)
	OnRpcInvoke [▶ 1502]	Handler function called when an RpcInvoke occurs.
	OnServerConnectionStateChanged [▶ 1406]	Handles the ServerConnectionStateChanged [▶ 1442] event. (Inherited from AdsServer [▶ 1375].)
	OnSetValue [▶ 1503]	Handler function to store a new Symbol value within internal caches of the AdsSymbolicServer .
	OnWriteAsync [▶ 1503]	Called when an ADS Write indication is received. (Overrides AdsServer.OnWriteAsync(AmsAddress, UInt32, UInt32, UInt32, ReadOnlyMemory.Byte., CancellationToken) [▶ 1438].)
	OnWriteConfirmationAsync [▶ 1439]	Called when an ADS Write confirmation is received. (Inherited from AdsServer [▶ 1375].)
	OnWriteControlAsync [▶ 1440]	Called when an ADS Write Control indication is received. (Inherited from AdsServer [▶ 1375].)
	OnWriteControlConfirmationAsync [▶ 1441]	Called when an ADS Write Control confirmation is received. (Inherited from AdsServer [▶ 1375].)
	OnWritelgloAsync [▶ 1504]	Handler function for handling of pure Write IG/IO Indications.
	OnWriteRawValue [▶ 1505]	Handler function for writing the symbol value data in raw format.
	ReadDeviceInfoRequestAsync [▶ 1409]	Sends an ADS Read Device Info request asynchronously (Inherited from AdsServer [▶ 1375].)
	ReadDeviceInfoRequestSync [▶ 1409]	Sends an ADS Read Device Info request synchronously. (Inherited from AdsServer [▶ 1375].)
	ReadDeviceInfoResponseAsync [▶ 1410]	Sends an ADS Read Device Info response. (Inherited from AdsServer [▶ 1375].)

	Name	Description
	ReadDeviceStateRequestAsync [► 1412]	Sends an ADS Read State request (asynchronous) (Inherited from AdsServer [► 1375].)
	ReadDeviceStateRequestSync [► 1413]	Sends an ADS Read State request (synchronous) (Inherited from AdsServer [► 1375].)
	ReadDeviceStateResponseAsync [► 1413]	Sends an ADS Read State response. (Inherited from AdsServer [► 1375].)
	ReadRequest [► 1415]	Sends an ADS Read Request. (Inherited from AdsServer [► 1375].)
	ReadRequestAsync [► 1416]	Sends an ADS Read Request asynchronously. (Inherited from AdsServer [► 1375].)
	ReadResponseAsync [► 1416]	Sends an ADS Read response. (Inherited from AdsServer [► 1375].)
	ReadWriteRequestAsync [► 1419]	Sends an ADS Read Write request. (Inherited from AdsServer [► 1375].)
	ReadWriteRequestSync [► 1419]	Sends an ADS Read Write request synchronously (Inherited from AdsServer [► 1375].)
	ReadWriteResponseAsync [► 1420]	Sends an ADS Read Write Response. (Inherited from AdsServer [► 1375].)
	ResetCachedSymbolicData [► 1506]	Resets the cached symbolic data.
	SetValue(ISymbol, Object) [► 1507]	Sets the value of the symbol.
	SetValue(String, Object) [► 1507]	Sets the value of the symbol.
	ToString	Returns a string that represents the current object. (Inherited from Object .)
	TryGetDataTypes [► 1508]	Tries to get the symbols from the device target.
	TryGetSymbols [► 1509]	Tries to geth the symbols from the device target.
	WriteControlRequest [► 1423]	Sends an ADS Write Control request (synchronous) (Inherited from AdsServer [► 1375].)
	WriteControlRequestAsync [► 1424]	Sends an ADS Write Control request (asynchronous). (Inherited from AdsServer [► 1375].)
	WriteControlRequestSync [► 1425]	Sends an ADS Write Control request (synchronous). (Inherited from AdsServer [► 1375].)
	WriteControlResponseAsync [► 1425]	Sends an ADS Write Control response. (Inherited from AdsServer [► 1375].)

	Name	Description
	WriteRequest [▶ 1427]	Sends an ADS Write request synchronously. (Inherited from AdsServer [▶ 1375].)
	WriteRequestAsync [▶ 1428]	Sends an ADS Write request asynchronously. (Inherited from AdsServer [▶ 1375].)
	WriteResponseAsync [▶ 1428]	Sends an ADS Write response. (Inherited from AdsServer [▶ 1375].)

Events

	Name	Description
	ServerConnectionStateChanged [▶ 1442]	The connection status has changed (Inherited from AdsServer [▶ 1375].)

Fields

	Name	Description
	handleTable [▶ 1510]	The handle table (InstancePath --> Symbol handle)
	notificationTable [▶ 1511]	The notification table
	notificationTrigger [▶ 1511]	The notification trigger Source
	serverVersion [▶ 1443]	The version of the AdsServer (Inherited from AdsServer [▶ 1375].)
	symbolFactory [▶ 1511]	The symbol factory
	symbolNameMarshaller [▶ 1512]	The SymbolName marshaler
	symbolVersion [▶ 1512]	The symbol version as respond by SymbolVersion [▶ 1231]

Remarks

DataTypes and hierarchical trees of symbols can be downloaded from this by symbolic information access. The symbolic access is necessary for the following functionality:

- Browsing of Symbols and DataTypes
- Type Safe Read/Write access of Process Values of AdsServers

This symbolic access is for example used by the following TwinCAT tools:

- TwinCAT Scope
- TwinCAT Powershell Management module [TcXaeMgmt](#)

Examples

The following sample shows how to derive from the [AdsServer](#) [▶ 1375] class and create your own Customized ADS Server.

C#

```

public class SymbolicTestServer : AdsSymbolicServer
{
    /// <summary>
    /// AmsPort of the SymbolicTestServer
    /// </summary>
    /// <remarks>
    /// User Server Ports must be in between
    /// AmsPort.CUSTOMER_FIRST (25000) <= PORT <= AmsPort.CUSTOMER_LAST (25999)
    /// to not conflict with Beckhoff prerreserved servers!
    /// </remarks>
    static ushort s_Port = 25000;

    /// <summary>
    /// Dictionary containing the Values of the Symbols (Symbol -- Value)
    /// </summary>
    Dictionary<ISymbol, object> _symbolValues = new Dictionary<ISymbol, object>();

    /// <summary>
    /// Gets the SymbolValue Dictionary of the <see cref="SymbolicTestServer"/>.
    /// </summary>
    /// <value>The symbol values.</value>
    public IDictionary<ISymbol, object> SymbolValues => _symbolValues;

    /// <summary>
    /// Symbolic Marshaler for Values
    /// </summary>
    SymbolicAnyTypeMarshaler _symbolMarshaler = new SymbolicAnyTypeMarshaler();

    /// <summary>
    /// Initializes a new instance of the <see cref="SymbolicTestServer"/> class.
    /// </summary>
    public SymbolicTestServer()
    : base(s_Port, "SymbolicTestServer", null)
    {
        /// AMS Router endpoint can be changed via environment variables which is
        /// beneficial in containerized setups where the AMS router is not listening
        /// at the default loopback address and port
        IPAddress ipEndpoint;
        if (!
IPAddress.TryParse(System.Environment.GetEnvironmentVariable("ENV_AmsConfiguration__LoopbackAddress"
), out ipEndpoint))
        {
            ipEndpoint = IPAddress.Loopback;
        }

        int port;
        if (!
int.TryParse(System.Environment.GetEnvironmentVariable("ENV_AmsConfiguration__LoopbackPort"), out po
rt))
        {
            port = 48898;
        }

        AmsConfiguration.RouterEndPoint = new IPEndPoint(ipEndpoint, port);
    }

    IDisposable _changeValueObserver = null;

[TwinCAT.Ads.Server.AdsServer \[▶ 1375\]](#)

6.4.10.1 AdsSymbolicServer Properties

The [AdsSymbolicServer \[▶ 1468\]](#) type exposes the following members.

Properties

Name	Description
AmsServer [▶ 1384]	Gets the the internal AmsServer [▶ 1384] object. (Inherited from AdsServer [▶ 1375] .)
DataTypes [▶ 1482]	Gets the data types
DefaultValueEncoding [▶ 1482]	Gets/Sets the default value encoding.
InstancePathEncoding [▶ 1483]	Gets or sets the instance path encoding (Default is the Windows CodePage)
IsConnected [▶ 1384]	Gets a value indicating whether AdsServer [▶ 1375] is connected. (Inherited from AdsServer [▶ 1375] .)
IsDisconnecting [▶ 1384]	Indicates, that the AdsServer [▶ 1375] is actually disconnecting. (Inherited from AdsServer [▶ 1375] .)
IsDisposed [▶ 1385]	Gets a value indicating whether this instance is disposed. (Inherited from AdsServer [▶ 1375] .)
IsDynamicPort [▶ 1387]	Gets a value indicating this AdsServer [▶ 1375] has a dynamic/unfixed port. (Inherited from AdsServer [▶ 1375] .)
Logger [▶ 1385]	Gets the logger object. (Inherited from AdsServer [▶ 1375] .)
PlatformPointerSize [▶ 1483]	Gets the Platform pointer size of this Server
RootNamespaceName [▶ 1484]	Gets the name of the root namespace
ServerAddress [▶ 1386]	The AMS address of this server. (Inherited from AdsServer [▶ 1375] .)

	Name	Description
	ServerName [▶ 1386]	Gets the name of the server. (Inherited from AdsServer [▶ 1375] .)
	ServerPort [▶ 1387]	Gets the server port. (Inherited from AdsServer [▶ 1375] .)
	ServerVersion [▶ 1387]	Gets the Version of the Server. (Inherited from AdsServer [▶ 1375] .)
	Symbols [▶ 1484]	Gets the symbols.

Reference

[AdsSymbolicServer Class](#) [\[▶ 1468\]](#)

[TwinCAT.Ads.Server Namespace](#) [\[▶ 1374\]](#)

6.4.10.1.1 AdsSymbolicServer.DataTypes Property

Gets the data types

Namespace: [TwinCAT.Ads.Server](#) [\[▶ 1374\]](#)

Assembly: TwinCAT.Ads.SymbolicServer (in TwinCAT.Ads.SymbolicServer.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public IDataValueCollection<IDataType> DataTypes { get; }
```

Property Value

Type: [IDataValueCollection](#) [\[▶ 2486\]](#).[IDataType](#) [\[▶ 2475\]](#).

The data types.

Implements

[ISymbolServer.DataTypes](#) [\[▶ 2720\]](#)

Remarks

This property reads the DataTypes synchronously, if the data is not available yet. For performance reasons, the asynchronous counterpart [GetDataTypesAsync\(CancellationToken\)](#) [\[▶ 2722\]](#) should be preferred for the first call.

[ISymbolServer.GetDataTypesAsync\(CancellationToken\)](#) [\[▶ 2722\]](#)

6.4.10.1.2 AdsSymbolicServer.DefaultValueEncoding Property

Gets/Sets the default value encoding.

Namespace: [TwinCAT.Ads.Server](#) [\[▶ 1374\]](#)

Assembly: TwinCAT.Ads.SymbolicServer (in TwinCAT.Ads.SymbolicServer.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public Encoding DefaultValueEncoding { get; set; }
```

Property Value

Type: [Encoding](#)

The default value encoding.

Implements

[ISymbolServer.DefaultValueEncoding](#) [[▶ 2721](#)]

Remarks

This property must be set/changed before the Server is connected to have an effect!

[TwinCAT.Ads.Server Namespace](#) [[▶ 1374](#)]

6.4.10.1.3 **AdsSymbolicServer.InstancePathEncoding Property**

Gets or sets the instance path encoding (Default is the Windows CodePage)

Namespace: [TwinCAT.Ads.Server](#) [[▶ 1374](#)]

Assembly: TwinCAT.Ads.SymbolicServer (in TwinCAT.Ads.SymbolicServer.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public Encoding InstancePathEncoding { get; set; }
```

Property Value

Type: [Encoding](#)

The instance path encoding.

Remarks

This property must be set/changed before the Server is connected to have an effect!

Reference

[AdsSymbolicServer Class](#) [[▶ 1468](#)]

[TwinCAT.Ads.Server Namespace](#) [[▶ 1374](#)]

6.4.10.1.4 **AdsSymbolicServer.PlatformPointerSize Property**

Gets the Platform pointer size of this Server

Namespace: [TwinCAT.Ads.Server](#) [[▶ 1374](#)]

Assembly: TwinCAT.Ads.SymbolicServer (in TwinCAT.Ads.SymbolicServer.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public int PlatformPointerSize { get; }
```

Property Value

Type: [Int32](#)

The size of the platform pointer.

Reference

[AdsSymbolicServer Class](#) [[▶ 1468](#)]

[TwinCAT.Ads.Server Namespace](#) [[▶ 1374](#)]

6.4.10.1.5 **AdsSymbolicServer.RootNamespaceName** Property

Gets the name of the root namespace

Namespace: [TwinCAT.Ads.Server](#) [[▶ 1374](#)]

Assembly: TwinCAT.Ads.SymbolicServer (in TwinCAT.Ads.SymbolicServer.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public string RootNamespaceName { get; }
```

Property Value

Type: [String](#)

The namespace.

Implements

[ISymbolProvider.RootNamespaceName](#) [[▶ 2718](#)]

Reference

[AdsSymbolicServer Class](#) [[▶ 1468](#)]

[TwinCAT.Ads.Server Namespace](#) [[▶ 1374](#)]

6.4.10.1.6 **AdsSymbolicServer.Symbols** Property

Gets the symbols.

Namespace: [TwinCAT.Ads.Server](#) [[▶ 1374](#)]

Assembly: TwinCAT.Ads.SymbolicServer (in TwinCAT.Ads.SymbolicServer.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public ISymbolCollection<ISymbol> Symbols { get; }
```

Property Value

Type: [ISymbolCollection](#) [[▶ 2700](#)].[ISymbol](#) [[▶ 2691](#)].

The symbols.

Implements

[ISymbolServer.Symbols](#) [[▶ 2721](#)]

Remarks

This property reads the Symbol information synchronously, if the data is not available yet. For performance reasons, the asynchronous counterpart [GetSymbolsAsync\(CancellationToken\)](#) [[▶ 2723](#)] should be preferred for the first call.

Reference

[ISymbolServer.GetSymbolsAsync\(CancellationToken\)](#) [[▶ 2723](#)]

6.4.10.2 AdsSymbolicServer Methods

The [AdsSymbolicServer](#) [[▶ 1468](#)] type exposes the following members.

Methods

	Name	Description
	AddDeviceNotificationRequest [▶ 1393]	Sends an ADS Add Device Notification request (synchronous). (Inherited from AdsServer [▶ 1375].)
	AddDeviceNotificationRequestAsync [▶ 1394]	Sends an ADS Add Device Notification request (async) (Inherited from AdsServer [▶ 1375].)
	AddDeviceNotificationResponseAsync [▶ 1395]	Sends an ADS Add Device Notification response. (Inherited from AdsServer [▶ 1375].)
	ConnectServer [▶ 1396]	Connect this ADS server to the local ADS router. (Inherited from AdsServer [▶ 1375].)
	ConnectServerAndWaitAsync [▶ 1396]	Registers the AdsServer [▶ 1375] at the router asynchronously. (Inherited from AdsServer [▶ 1375].)
	DeleteDeviceNotificationRequest [▶ 1398]	Sends an ADS Delete Device Notification request (synchronous). (Inherited from AdsServer [▶ 1375].)
	DeleteDeviceNotificationRequestAsync [▶ 1399]	Sends an ADS Delete Device Notification request (async). (Inherited from AdsServer [▶ 1375].)
	DeleteDeviceNotificationResponseAsync [▶ 1400]	Sends an ADS Delete Device Notification response. (Inherited from AdsServer [▶ 1375].)

	Name	Description
	DeviceNotificationRequestAsync [▶ 1400]	Sends an ADS Device Notification request asynchronously (Inherited from AdsServer [▶ 1375].)
	DeviceNotificationRequestSync [▶ 1401]	Sends an ADS Device Notification request (sync) (Inherited from AdsServer [▶ 1375].)
	Disconnect [▶ 1402]	Disconnects this ADS server from the local ADS router. (Inherited from AdsServer [▶ 1375].)
	Dispose. [▶ 1403]	Performs application-defined tasks associated with freeing, releasing, or resetting unmanaged resources. (Inherited from AdsServer [▶ 1375].)
	Dispose(Boolean) [▶ 1403]	Releases unmanaged and - optionally - managed resources. (Inherited from AdsServer [▶ 1375].)
	Equals	Determines whether the specified object is equal to the current object. (Inherited from Object .)
	Finalize [▶ 1403]	Finalizes an instance of the AdsServer [▶ 1375] class. (Inherited from AdsServer [▶ 1375].)
	FireNotificationAsync [▶ 1490]	Fires a single notification to the specified Address.
	FireNotifications [▶ 1490]	Fires outstanding cyclic notifications.
	FireNotificationsAsync [▶ 1491]	Check internal tables for outstanding cyclic Notifications and fire them asynchronously.
	GetDataTypesAsync [▶ 1491]	Gets the data types asynchronously.
	GetHashCode	Serves as the default hash function. (Inherited from Object .)
	GetServerName [▶ 1441]	Gets the name of the server. (Inherited from AdsServer [▶ 1375].)
	GetSymbolsAsync [▶ 1492]	Gets the symbols asynchronously
	GetType	Gets the Type of the current instance. (Inherited from Object .)
	HasValueChanged [▶ 1493]	Determines whether the value of the Symbol has changed.
	MemberwiseClone	Creates a shallow copy of the current Object . (Inherited from Object .)
	OnAddDeviceNotificationAsync [▶ 1493]	Called when an ADS Add Device Notification indication is received. (Overrides AdsServer.OnAddDeviceNotificationAsync(AmsAddress, UInt32, UInt32, UInt32, Int32, AmsAddress, NotificationSettings, CancellationToken) [▶ 1429].)
	OnAddDeviceNotificationConfirmationAsync [▶ 1404]	Called when an ADS Add Device Notification confirmation is received. (Inherited from AdsServer [▶ 1375].)
	OnBeforeConnected [▶ 1494]	Handler function that is called, when the AdsServer [▶ 1375] is connected, but before calling OnConnected . [▶ 1405]. (Overrides AdsServer.OnBeforeConnected . [▶ 1430].)
	OnConnected [▶ 1495]	Handler function that is called, when the AdsServer [▶ 1375] is connected. (Overrides AdsServer.OnConnected . [▶ 1405].)

	Name	Description
	OnCreateSymbols [▶ 1509]	Handler function to create the Initial Symbols of the server.
	OnDeleteDeviceNotificationAsync [▶ 1495]	Called when a DeleteDeviceNotification request is indicated. (Overrides AdsServer.OnDeleteDeviceNotificationAsync(AmsAddress, UInt32, UInt32, CancellationToken) [▶ 1430].)
	OnDeleteDeviceNotificationConfirmationAsync [▶ 1431]	Called when an ADS Delete Device Notification confirmation is received. (Inherited from AdsServer [▶ 1375].)
	OnDisconnect [▶ 1496]	Called when the AdsServer [▶ 1375] is about to be disconnected. (Overrides AdsServer.OnDisconnect. [▶ 1405].)
	OnFireNotifications [▶ 1496]	Handler function for firing notifications to the specified targets.
	OnFireNotificationsAsync [▶ 1497]	Handler function for firing notifications to the specified targets.
	OnGetValue [▶ 1497]	Handler function to determine the (stored) value of the symbol from the internal caches of the AdsSymbolicServer [▶ 1468].
	OnReadAsync [▶ 1498]	Called when an ADS Read indication is received. (Overrides AdsServer.OnReadAsync(AmsAddress, UInt32, UInt32, UInt32, Int32, CancellationToken) [▶ 1432].)
	OnReadConfirmationAsync [▶ 1433]	Called when an ADS Read confirmation is received. (Inherited from AdsServer [▶ 1375].)
	OnReadDeviceInfoConfirmationAsync [▶ 1434]	Called when an ADS Read Device Info confirmation is received. (Inherited from AdsServer [▶ 1375].)
	OnReadDeviceStateAsync [▶ 1435]	Called when an ADS Read State indication is received. (Inherited from AdsServer [▶ 1375].)
	OnReadDeviceStateConfirmationAsync [▶ 1435]	Called when an ADS Read State confirmation is received. (Inherited from AdsServer [▶ 1375].)
	OnReadIglloAsync [▶ 1499]	Handler function for handling pure IG/IO Read indications
	OnReadRawValue [▶ 1500]	Handler function for Reading the internal value data in raw format.
	OnReadWriteAsync [▶ 1500]	Called when an ADS Read Write indication is received. (Overrides AdsServer.OnReadWriteAsync(AmsAddress, UInt32, UInt32, UInt32, Int32, ReadOnlyMemory<Byte>, CancellationToken) [▶ 1436].)
	OnReadWriteConfirmationAsync [▶ 1437]	Called when an ADS Read Write confirmation is received. (Inherited from AdsServer [▶ 1375].)
	OnReadWriteIglloAsync [▶ 1501]	Handler function for handling of pure IG/IO calls.

Name	Description
OnRouterNotification [▶ 1405]	Handler Function for a Router Notification. (Inherited from AdsServer [▶ 1375].)
OnRpclInvoke [▶ 1502]	Handler function called when an RpclInvoke occurs.
OnServerConnectionStateChanged [▶ 1406]	Handles the ServerConnectionStateChanged [▶ 1442] event. (Inherited from AdsServer [▶ 1375].)
OnSetValue [▶ 1503]	Handler function to store a new Symbol value within internal caches of the AdsSymbolicServer [▶ 1468].
OnWriteAsync [▶ 1503]	Called when an ADS Write indication is received. (Overrides AdsServer.OnWriteAsync(AmsAddress, UInt32, UInt32, UInt32, ReadOnlyMemory.Byte., CancellationToken) [▶ 1438].)
OnWriteConfirmationAsync [▶ 1439]	Called when an ADS Write confirmation is received. (Inherited from AdsServer [▶ 1375].)
OnWriteControlAsync [▶ 1440]	Called when an ADS Write Control indication is received. (Inherited from AdsServer [▶ 1375].)
OnWriteControlConfirmationAsync [▶ 1441]	Called when an ADS Write Control confirmation is received. (Inherited from AdsServer [▶ 1375].)
OnWriteIglloAsync [▶ 1504]	Handler function for handling of pure Write IG/IO Indications.
OnWriteRawValue [▶ 1505]	Handler function for writing the symbol value data in raw format.
ReadDeviceInfoRequestAsync [▶ 1409]	Sends an ADS Read Device Info request asynchronously (Inherited from AdsServer [▶ 1375].)
ReadDeviceInfoRequestSync [▶ 1409]	Sends an ADS Read Device Info request synchronously. (Inherited from AdsServer [▶ 1375].)
ReadDeviceInfoResponseAsync [▶ 1410]	Sends an ADS Read Device Info response. (Inherited from AdsServer [▶ 1375].)
ReadDeviceStateRequestAsync [▶ 1412]	Sends an ADS Read State request (asynchronous) (Inherited from AdsServer [▶ 1375].)
ReadDeviceStateRequestSync [▶ 1413]	Sends an ADS Read State request (synchronous) (Inherited from AdsServer [▶ 1375].)
ReadDeviceStateResponseAsync [▶ 1413]	Sends an ADS Read State response. (Inherited from AdsServer [▶ 1375].)
ReadRequest [▶ 1415]	Sends an ADS Read Request. (Inherited from AdsServer [▶ 1375].)

	Name	Description
	ReadRequestAsync [▶ 1416]	Sends an ADS Read Request asynchronously. (Inherited from AdsServer [▶ 1375].)
	ReadResponseAsync [▶ 1416]	Sends an ADS Read response. (Inherited from AdsServer [▶ 1375].)
	ReadWriteRequestAsync [▶ 1419]	Sends an ADS Read Write request. (Inherited from AdsServer [▶ 1375].)
	ReadWriteRequestSync [▶ 1419]	Sends an ADS Read Write request synchronously (Inherited from AdsServer [▶ 1375].)
	ReadWriteResponseAsync [▶ 1420]	Sends an ADS Read Write Response. (Inherited from AdsServer [▶ 1375].)
	ResetCachedSymbolicData [▶ 1506]	Resets the cached symbolic data.
	SetValue(ISymbol, Object) [▶ 1507]	Sets the value of the symbol.
	SetValue(String, Object) [▶ 1507]	Sets the value of the symbol.
	ToString	Returns a string that represents the current object. (Inherited from Object .)
	TryGetDataTypes [▶ 1508]	Tries to get the symbols from the device target.
	TryGetSymbols [▶ 1509]	Tries to geth the symbols from the device target.
	WriteControlRequest [▶ 1423]	Sends an ADS Write Control request (synchronous) (Inherited from AdsServer [▶ 1375].)
	WriteControlRequestAsync [▶ 1424]	Sends an ADS Write Control request (asynchronous). (Inherited from AdsServer [▶ 1375].)
	WriteControlRequestSync [▶ 1425]	Sends an ADS Write Control request (synchronous). (Inherited from AdsServer [▶ 1375].)
	WriteControlResponseAsync [▶ 1425]	Sends an ADS Write Control response. (Inherited from AdsServer [▶ 1375].)
	WriteRequest [▶ 1427]	Sends an ADS Write request synchronously. (Inherited from AdsServer [▶ 1375].)
	WriteRequestAsync [▶ 1428]	Sends an ADS Write request asynchronously. (Inherited from AdsServer [▶ 1375].)
	WriteResponseAsync [▶ 1428]	Sends an ADS Write response. (Inherited from AdsServer [▶ 1375].)

[TwinCAT.Ads.Server Namespace](#) [▶ 1374]

6.4.10.2.1 **AdsSymbolicServer.FireNotificationAsync** Method

Fires a single notification to the specified Address.

Namespace: [TwinCAT.Ads.Server](#) [[▶ 1374](#)]

Assembly: TwinCAT.Ads.SymbolicServer (in TwinCAT.Ads.SymbolicServer.dll) Version: 6.0.328+39e3229

Syntax

C#

```
protected Task<AdsErrorCode> FireNotificationAsync(
    AmsAddress address,
    uint handle,
    CancellationToken cancel
)
```

Parameters

address	Type: TwinCAT.Ads.AmsAddress [▶ 752] The address.
handle	Type: System.UInt32 The handle.
cancel	Type: System.Threading.CancellationToken The cancel.

Return Value

Type: [Task.AdsErrorCode](#) [[▶ 664](#)].
AdsErrorCode.

Reference

[TwinCAT.Ads.Server Namespace](#) [[▶ 1374](#)]

6.4.10.2.2 **AdsSymbolicServer.FireNotifications** Method

Fires outstanding cyclic notifications.

Namespace: [TwinCAT.Ads.Server](#) [[▶ 1374](#)]

Assembly: TwinCAT.Ads.SymbolicServer (in TwinCAT.Ads.SymbolicServer.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public AdsErrorCode[] FireNotifications(
    long tick
)
```

Parameters

tick	Type: System.Int64 The tick.
------	---

Return Value

Type: [.AdsErrorCode](#) [[▶ 664](#)].
AdsErrorCode[].

Reference[AdsSymbolicServer Class \[► 1468\]](#)[TwinCAT.Ads.Server Namespace \[► 1374\]](#)**6.4.10.2.3 AdsSymbolicServer.FireNotificationsAsync Method**

Check internal tables for outstanding cyclic Notifications and fire them asynchronously.

Namespace: [TwinCAT.Ads.Server \[► 1374\]](#)**Assembly:** TwinCAT.Ads.SymbolicServer (in TwinCAT.Ads.SymbolicServer.dll) Version: 6.0.328+39e3229**Syntax****C#**

```
public Task<AdsErrorCode[]> FireNotificationsAsync(
    long tick,
    CancellationToken cancel
)
```

Parameters

tick	Type: System.Int64 The tick.
cancel	Type: System.Threading.CancellationToken The cancel.

Return ValueType: [Task..AdsErrorCode \[► 664\]](#)..

Task.

Reference[AdsSymbolicServer Class \[► 1468\]](#)[TwinCAT.Ads.Server Namespace \[► 1374\]](#)**6.4.10.2.4 AdsSymbolicServer.GetDataTypesAsync Method**

Gets the data types asynchronously.

Namespace: [TwinCAT.Ads.Server \[► 1374\]](#)**Assembly:** TwinCAT.Ads.SymbolicServer (in TwinCAT.Ads.SymbolicServer.dll) Version: 6.0.328+39e3229**Syntax****C#**

```
public Task<ResultDataTypes> GetDataTypesAsync(
    CancellationToken cancel
)
```

Parameters

cancel	Type: System.Threading.CancellationToken The cancellation token.
--------	---

Return Value

Type: [Task.ResultDataTypes](#) [▸ 2872].

A task that represents the asynchronous 'GetDataTypes' operation. The [ResultDataTypes](#) [▸ 2872] parameter contains the data types ([DataTypes](#) [▸ 2874]) and the [ErrorCode](#) [▸ 1120] after execution.

Implements

[ISymbolServer.GetDataTypesAsync\(CancellationTokens\)](#) [▸ 2722]

Exceptions

Exception	Condition
NotImplementedException	

Reference

[AdsSymbolicServer Class](#) [▸ 1468]

6.4.10.2.5 AdsSymbolicServer.GetSymbolsAsync Method

Gets the symbols asynchronously

Namespace: [TwinCAT.Ads.Server](#) [▸ 1374]

Assembly: [TwinCAT.Ads.SymbolicServer](#) (in [TwinCAT.Ads.SymbolicServer.dll](#)) Version: 6.0.328+39e3229

Syntax

C#

```
public Task<ResultSymbols> GetSymbolsAsync(
    CancellationToken cancel
)
```

Parameters

cancel	Type: System.Threading.CancellationToken The cancellation token.
--------	---

Return Value

Type: [Task.ResultSymbols](#) [▸ 2880].

A task that represents the asynchronous 'GetDataTypes' operation. The [ResultSymbols](#) [▸ 2880] parameter contains the data types ([Symbols](#) [▸ 2886]) and the [ErrorCode](#) [▸ 1120] after execution.

Implements

[ISymbolServer.GetSymbolsAsync\(CancellationTokens\)](#) [▸ 2723]

Exceptions

Exception	Condition
NotImplementedException	

Reference

[AdsSymbolicServer Class](#) [▶ 1468]

[TwinCAT.Ads.Server Namespace](#) [▶ 1374]

[ISymbolServer.Symbols](#) [▶ 2721]

6.4.10.2.6 AdsSymbolicServer.HasValueChanged Method

Determines whether the value of the Symbol has changed.

Namespace: [TwinCAT.Ads.Server](#) [▶ 1374]

Assembly: TwinCAT.Ads.SymbolicServer (in TwinCAT.Ads.SymbolicServer.dll) Version: 6.0.328+39e3229

Syntax

C#

```
protected virtual bool HasValueChanged(
    ISymbol symbol
)
```

Parameters

symbol	Type: TwinCAT.TypeSystem.ISymbol [▶ 2691] The symbol.
--------	--

Return Value

Type: [Boolean](#)

true if the value has changed; otherwise, false.

Remarks

This Method is used internally to find out, if a symbol was changed since the last notification trigger. Collecting Notifications and send them in cycles enforces that the information about changed values is cached somehow. In the case of the [AdsSymbolicServer](#) [▶ 1468] Symbols with outstanding notifications will have a flag in the internal notification tables.

Reference

[AdsSymbolicServer Class](#) [▶ 1468]

[TwinCAT.Ads.Server Namespace](#) [▶ 1374]

6.4.10.2.7 AdsSymbolicServer.OnAddDeviceNotificationAsync Method

Called when an ADS Add Device Notification indication is received.

Namespace: [TwinCAT.Ads.Server](#) [▶ 1374]

Assembly: TwinCAT.Ads.SymbolicServer (in TwinCAT.Ads.SymbolicServer.dll) Version: 6.0.328+39e3229

Syntax

C#

```
protected override Task<ResultHandle> OnAddDeviceNotificationAsync (
    AmsAddress sender,
    uint invokeId,
    uint indexGroup,
    uint indexOffset,
    int dataLength,
    AmsAddress receiver,
    NotificationSettings settings,
    CancellationToken cancel
)
```

Parameters

sender	Type: TwinCAT.Ads.AmsAddress [▶ 752] The sender address of the request.
invokeld	Type: System.UInt32 The invoke identifier of the request.
indexGroup	Type: System.UInt32 The index group of the requested ADS service
indexOffset	Type: System.UInt32 The index offset of the requested ADS service
dataLength	Type: System.Int32 Number of bytes to be transmitted
receiver	Type: TwinCAT.Ads.AmsAddress [▶ 752] The receiver of the notifications (the requester of this message)
settings	Type: TwinCAT.Ads.NotificationSettings [▶ 1106] The Notification settings.
cancel	Type: System.Threading.CancellationToken The cancellation token.

Return Value

Type: [Task.ResultHandle](#) [▶ 1136].

A task that represents the asynchronous 'AddDeviceNotificationIndication' operation. The [Task.TResult](#) parameter contains the [AdsErrorCode](#) [▶ 664] as [Result](#).

Remarks

Overwrite this method in derived classes to react on ADS Add Device Notification indications. The default implementation replies with an ADS ServiceNotSupported error code (0x701).

Called when a DeleteDeviceNotification request is indicated.

Namespace: [TwinCAT.Ads.Server \[► 1374\]](#)

Assembly: TwinCAT.Ads.SymbolicServer (in TwinCAT.Ads.SymbolicServer.dll) Version: 6.0.328+39e3229

Syntax

C#

```
protected override Task<ResultAds> OnDeleteDeviceNotificationAsync(
    AmsAddress sender,
    uint invokeId,
    uint notificationHandle,
    CancellationToken cancel
)
```

Parameters

sender	Type: TwinCAT.Ads.AmsAddress [► 752] The sender address of the request.
invokeId	Type: System.UInt32 The invoke identifier of the request.
notificationHandle	Type: System.UInt32 The notification handle.
cancel	Type: System.Threading.CancellationToken The cancellation token that can be used by other objects or threads to receive notice of cancellation.

Return Value

Type: [Task.ResultAds \[▸ 1116\]](#).
Task<ResultAds>.

6.4.10.2.15 AdsSymbolicServer.OnReadAsync Method

Called when an ADS Read indication is received.

Namespace: [TwinCAT.Ads.Server](#) [[▶ 1374](#)]

Assembly: TwinCAT.Ads.SymbolicServer (in TwinCAT.Ads.SymbolicServer.dll) Version: 6.0.328+39e3229

Syntax**C#**

```
protected override Task<ResultReadBytes> OnReadAsync (
    AmsAddress sender,
    uint invokeId,
    uint indexGroup,
    uint indexOffset,
    int readLength,
    CancellationToken cancel
)
```

Parameters

sender	Type: TwinCAT.Ads.AmsAddress [▶ 752] The sender address of the request.
invokeld	Type: System.UInt32 The invoke identifier of the request.
indexGroup	Type: System.UInt32 The index group of the requested ADS service
indexOffset	Type: System.UInt32 The index offset of the requested ADS service
readLength	Type: System.Int32 The number of bytes to be read
cancel	Type: System.Threading.CancellationToken The cancellation token.

Return Value

Type: [Task.ResultReadBytes](#) [[▶ 1150](#)].

A task that represents the asynchronous ReadIndicationAsync(AmsAddress, UInt32, UInt32, UInt32, Int32, CancellationToken) operation. The [Task.TResult](#) parameter contains the [AdsErrorCode](#) [[▶ 664](#)] as [Result](#).

Remarks

Overwrite this method in derived classes to react on ADS Read indications. The default implementation replies with an ADS ServiceNotSupported error code (0x701).

6.4.10.2.16 AdsSymbolicServer.OnReadIgoAsync Method

Handler function for handling pure IG/IO Read indications

Namespace: [TwinCAT.Ads.Server \[► 1374\]](#)

Assembly: TwinCAT.Ads.SymbolicServer (in TwinCAT.Ads.SymbolicServer.dll) Version: 6.0.328+39e3229

Syntax**C#**

```
protected virtual Task<ResultReadBytes> OnReadIgoAsync(
    AmsAddress sender,
    uint invokeId,
    uint indexGroup,
    uint indexOffset,
    int readLength,
    CancellationToken cancel
)
```

Parameters

sender	Type: TwinCAT.Ads.AmsAddress [► 752] The sender address of the request.
invokeld	Type: System.UInt32 The invoke identifier of the request.
indexGroup	Type: System.UInt32 The index group of the requested ADS service
indexOffset	Type: System.UInt32 The index offset of the requested ADS service
readLength	Type: System.Int32 The number of bytes to be read
cancel	Type: System.Threading.CancellationToken The cancellation token.

Return Value

Type: [Task.ResultReadBytes \[► 1150\]](#).

A task that represents the asynchronous ReadIndicationAsync(AmsAddress, UInt32, UInt32, UInt32, Int32, CancellationToken) operation. The [Task.TResult](#) parameter contains the [AdsErrorCode \[► 664\]](#) as [Result](#).

Remarks

Overwrite this method in derived classes to react on pure IG/IO ADS Read indications.

[TwinCAT.Ads.Server Namespace \[► 1374\]](#)

6.4.10.2.17 AdsSymbolicServer.OnReadRawValue Method

Handler function for Reading the internal value data in raw format.

Namespace: [TwinCAT.Ads.Server](#) [[▶ 1374](#)]

Assembly: TwinCAT.Ads.SymbolicServer (in TwinCAT.Ads.SymbolicServer.dll) Version: 6.0.328+39e3229

Syntax

C#

```
protected abstract AdsErrorCode OnReadRawValue (
    ISymbol symbol,
    Span<byte> span
)
```

Parameters

symbol	Type: TwinCAT.TypeSystem.ISymbol [▶ 2691] The symbol.
span	Type: System.Span.Byte . The span.

Return Value

Type: [AdsErrorCode](#) [[▶ 664](#)]

AdsErrorCode.

Remarks

This method is called, when a Read request was received to read the symbols value. Implement this handler to Read and marshal the value data.

Reference

[AdsSymbolicServer Class](#) [[▶ 1468](#)]

[TwinCAT.Ads.Server Namespace](#) [[▶ 1374](#)]

6.4.10.2.18 AdsSymbolicServer.OnReadWriteAsync Method

Called when an ADS Read Write indication is received.

Namespace: [TwinCAT.Ads.Server](#) [[▶ 1374](#)]

Assembly: TwinCAT.Ads.SymbolicServer (in TwinCAT.Ads.SymbolicServer.dll) Version: 6.0.328+39e3229

Syntax

C#

```
protected override Task<ResultReadWriteBytes> OnReadWriteAsync (
    AmsAddress sender,
    uint invokeId,
    uint indexGroup,
    uint indexOffset,
    int readLength,
    ReadOnlyMemory<byte> writeData,
    CancellationToken cancel
)
```

Parameters

sender	Type: TwinCAT.Ads.AmsAddress [▶ 752] The sender address of the request.
--------	--

invokeld	Type: System.UInt32 The invoke identifier of the request.
indexGroup	Type: System.UInt32 The index group of the requested ADS service
indexOffset	Type: System.UInt32 The index offset of the requested ADS service
readLength	Type: System.Int32 Number of bytes to be read
writeData	Type: System.ReadOnlyMemory.Byte . The data to be written
cancel	Type: System.Threading.CancellationToken The cancellation token.

Return Value

Type: [Task.ResultReadWriteBytes](#) [▶ 1170].

A task that represents the asynchronous 'ReadWriteIndication' operation. The [Task.TResult](#). parameter contains the [AdsErrorCode](#) [▶ 664] as Result.

Remarks

Overwrite this method in derived classes to react on ADS Read Write indications. The default implementation replies with an ADS ServiceNotSupported error code (0x701).

Reference

[TwinCAT.Ads.Server Namespace](#) [▶ 1374]

6.4.10.2.19 AdsSymbolicServer.OnReadWriteIgIoAsync Method

Handler function for handling of pure IG/IO calls.

Namespace: [TwinCAT.Ads.Server](#) [▶ 1374]

Assembly: TwinCAT.Ads.SymbolicServer (in TwinCAT.Ads.SymbolicServer.dll) Version: 6.0.328+39e3229

Syntax

C#

```
protected virtual Task<ResultReadWriteBytes> OnReadWriteIgIoAsync(
    AmsAddress sender,
    uint invokeId,
    uint indexGroup,
    uint indexOffset,
    int readLength,
    ReadOnlyMemory<byte> writeData,
    CancellationToken cancel
)
```

Parameters

sender	Type: TwinCAT.Ads.AmsAddress [▶ 752] The sender address of the request.
invokeld	Type: System.UInt32 The invoke identifier of the request.
indexGroup	Type: System.UInt32 The index group of the requested ADS service

indexOffset	Type: System.UInt32 The index offset of the requested ADS service
readLength	Type: System.Int32 Number of bytes to be read
writeData	Type: System.ReadOnlyMemory.Byte . The data to be written
cancel	Type: System.Threading.CancellationToken The cancellation token.

Return Value

Type: [Task.ResultReadWriteBytes](#) [► 1170].

A task that represents the asynchronous 'OnReadWriteIgcloAsync' operation. The [Task.TResult](#) parameter contains the [AdsErrorCode](#) [► 664] as [Result](#).

Exceptions

Exception	Condition
NotImplementedException	

Remarks

Overwrite this method in derived classes to react on pure IG/IO ADS ReadWrite indications. To send the ADS answer/response back to the sender, the base class implementation must be called after

6.4.10.2.20 AdsSymbolicServer.OnRpcInvoke Method

Handler function called when an RpcInvoke occurs.

Namespace: [TwinCAT.Ads.Server](#) [► 1374]

Assembly: [TwinCAT.Ads.SymbolicServer](#) (in [TwinCAT.Ads.SymbolicServer.dll](#)) Version: 6.0.328+39e3229

Syntax

C#

```
protected virtual AdsErrorCode OnRpcInvoke(
    IInterfaceInstance structInstance,
    IRpcMethod method,
    Object[] values,
    out Object?? returnValue
)
```

Parameters

structInstance	Type: TwinCAT.TypeSystem.IInterfaceInstance [► 3014] The structure instance.
method	Type: TwinCAT.TypeSystem.IRpcMethod [► 2625] The method.
values	Type: .System.Object . The values.

returnValue	Type: System.Object . The return value.
-------------	--

Return Value

Type: [AdsErrorCode](#) [[▶ 664](#)]
AdsErrorCode.

Remarks

Overwrite this method to react on RpcInvokes within your custom [AdsSymbolicServer](#) [[▶ 1468](#)]. The default implementation returns [DeviceServiceNotSupported](#) [[▶ 664](#)].

6.4.10.2.22 AdsSymbolicServer.OnWriteAsync Method

Called when an ADS Write indication is received.

Namespace: [TwinCAT.Ads.Server \[► 1374\]](#)

Assembly: TwinCAT.Ads.SymbolicServer (in TwinCAT.Ads.SymbolicServer.dll) Version: 6.0.328+39e3229

Syntax

C#

```
protected override Task<ResultWrite> OnWriteAsync(
    AmsAddress sender,
    uint invokeId,
    uint indexGroup,
    uint indexOffset,
    ReadOnlyMemory<byte> writeData,
    CancellationToken cancel
)
```

Parameters

sender	Type: TwinCAT.Ads.AmsAddress [► 752] The sender address of the request.
invokeld	Type: System.UInt32 The invoke identifier of the request.
indexGroup	Type: System.UInt32 The index group of the requested ADS service
indexOffset	Type: System.UInt32 The index offset of the requested ADS service
writeData	Type: System.ReadOnlyMemory.Byte. The data to be written
cancel	Type: System.Threading.CancellationToken The cancellation token.

Return Value

Type: [Task.ResultWrite \[► 1187\]](#).

A task that represents the asynchronous WriteIndicationAsync(AmsAddress, UInt32, UInt32, UInt32, ReadOnlyMemory.Byte., CancellationToken) operation. The [Task.TResult.](#) parameter contains the [AdsErrorCode \[► 664\]](#) as Result.

Remarks

Overwrite this method in derived classes to react on ADS Write indications. The default implementation replies with an ADS ServiceNotSupported error code (0x701).

6.4.11 BaseTickTrigger Class

Class NotificationTimer. Implements the [INotificationTrigger](#) [[▶ 1516](#)]

Inheritance Hierarchy

[System.Object](#)

[TwinCAT.Ads.Server.BaseTickTrigger](#)

Namespace: [TwinCAT.Ads.Server](#) [[▶ 1374](#)]

Assembly: TwinCAT.Ads.SymbolicServer (in TwinCAT.Ads.SymbolicServer.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public class BaseTickTrigger : INotificationTrigger,
    IObservable<long>
```

The BaseTickTrigger type exposes the following members.

Constructors

	Name	Description
	BaseTickTrigger [▶ 1513]	Initializes a new instance of the BaseTickTrigger class.

Methods

	Name	Description
	Equals	Determines whether the specified object is equal to the current object. (Inherited from Object .)
	Finalize	Allows an object to try to free resources and perform other cleanup operations before it is reclaimed by garbage collection. (Inherited from Object .)
	GetHashCode	Serves as the default hash function. (Inherited from Object .)
	GetType	Gets the Type of the current instance. (Inherited from Object .)
	MemberwiseClone	Creates a shallow copy of the current Object . (Inherited from Object .)
	Subscribe [▶ 1514]	Subscribes the specified observer.
	ToString	Returns a string that represents the current object. (Inherited from Object .)

Remarks

This observable creates a BaseTick Trigger for the [AdsSymbolicServer](#) [[▶ 1468](#)]. The observable long parameter is just a tick counter. The fired ticks are aquidistant as defined in the constructor.

Reference

Interface INotificationTrigger

Namespace: [TwinCAT.Ads.Server \[► 1374\]](#)**Assembly:** TwinCAT.Ads.SymbolicServer (in TwinCAT.Ads.SymbolicServer.dll) Version: 6.0.328+39e3229**Syntax****C#**

```
public interface INotificationTrigger : IObservable<long>
```

The INotificationTrigger type exposes the following members.

Methods

	Name	Description
	Subscribe	Notifies the provider that an observer is to receive notifications. (Inherited from IObservable.Int64..)

Remarks

The notification trigger produces observable events, when the [AdsSymbolicServer \[► 1468\]](#) has to be checked for sending actual notifications. It can be realised e.g. as a base tick.

Syntax

C#

```
public class LoopbackNotConnectedException : AdsServerException
```

The LoopbackNotConnectedException type exposes the following members.

Properties

Name	Description
Data	Gets a collection of key/value pairs that provide additional user-defined information about the exception. (Inherited from Exception .)
ErrorCode [▶ 1446]	Gets or sets the error code. (Inherited from AdsServerException [▶ 1443].)
HelpLink	Gets or sets a link to the help file associated with this exception. (Inherited from Exception .)
HResult	Gets or sets HRESULT, a coded numerical value that is assigned to a specific exception. (Inherited from Exception .)
InnerException	Gets the Exception instance that caused the current exception. (Inherited from Exception .)
Message	Gets a message that describes the current exception. (Inherited from Exception .)
Source	Gets or sets the name of the application or the object that causes the error. (Inherited from Exception .)
StackTrace	Gets a string representation of the immediate frames on the call stack. (Inherited from Exception .)
TargetSite	Gets the method that throws the current exception. (Inherited from Exception .)

Methods

Name	Description
Equals	Determines whether the specified object is equal to the current object. (Inherited from Object .)
Finalize	Allows an object to try to free resources and perform other cleanup operations before it is reclaimed by garbage collection. (Inherited from Object .)
GetBaseException	When overridden in a derived class, returns the Exception that is the root cause of one or more subsequent exceptions. (Inherited from Exception .)
GetHashCode	Serves as the default hash function. (Inherited from Object .)
GetObjectData [▶ 1447]	When overridden in a derived class, sets the SerializationInfo with information about the exception. (Inherited from AdsServerException [▶ 1443].)

	Name	Description
	GetType	Gets the runtime type of the current instance. (Inherited from Exception .)
	MemberwiseClone	Creates a shallow copy of the current Object . (Inherited from Object .)
	ToString	Creates and returns a string representation of the current exception. (Inherited from Exception .)

Events

	Name	Description
	SerializeObjectState	Obsolete. Occurs when an exception is serialized to create an exception state object that contains serialized data about the exception. (Inherited from Exception .)

6.5 TwinCAT.Ads.SumCommand Namespace

ADS offers powerful and fast communication to exchange any kind of information. It's possible to read single variables or complete arrays and structures with each one single ADS-API call. ADS Sum-Commands offer to read/write with one single ADS call multiple variables which are not structured within a linear memory, effectively reducing roundtrips.

Classes

	Class	Description
	ISumCommandExtension [▶ 1591]	Extension class for ISumCommand [▶ 1527] derived classes.
	ResultSumCommand [▶ 1533]	Result class for an asynchronous TwinCAT.Ads.SumCommand:
	ResultSumHandles [▶ 1538]	Result class for an asynchronous SumCreateHandles>.
	ResultSumHandles2 [▶ 1540]	Result class for an asynchronous SumCreateHandles.
	ResultSumReadRaw [▶ 1544]	Result class for an asynchronous SumRead that contains blocks of raw memory data (unmarshaled data).
	ResultSumValues [▶ 1547]	Result class for an asynchronous ISumRead [▶ 1596]. The Values are returned as objects.
	ResultSumValues2.S [▶ 1605]	Extended result class for an asynchronous ISumRead2.S [▶ 1601].
 	SumAnyTypeRead [▶ 1608]	Symbolic ADS Sum read access (ANY_TYPE marshalling) on already loaded symbols.
 	SumCreateHandles [▶ 1550]	SumCommandBase for getting variable handles by a set of InstancePaths
 	SumHandleRead [▶ 1557]	Read (primitive, Any) values by Handle SumCommandBase.
 	SumHandleWrite [▶ 1561]	Write any (primitive) values by Handle SumCommandBase.
 	SumInstancePathAnyTypeRead [▶ 1615]	SumRead Command that uses the instancePath as symbol ID / Address and returns objects as Values (ANY Type marshaling)
 	SumReleaseHandles [▶ 1565]	Release Handles SumCommandBase.
 	SumSymbolRead [▶ 1572]	Symbolic ADS Sum read access (automatic marshalling)
 	SumSymbolWrite [▶ 1582]	Class for ADS Sum symbolic Write Access.

Interfaces

	Interface	Description
	ISumCommand [▶ 1527]	Interface for SumCommands (Combined commands)
	ISumRead [▶ 1596]	Interface ISumRead Implements the ISumCommand [▶ 1527]
	ISumRead2.S. [▶ 1601]	Interface ISumRead2 (supports extended Sum SubResults) Implements the ISumCommand [▶ 1527]

Enumerations

	Enumeration	Description
	SumAccessMode [▶ 1608]	Indicates how to handle each single sub-sum-command (IGIO, ByHandle, ByName)
	SumCommandErrorStrategy [▶ 1614]	The Error strategy for ISumCommand [▶ 1527]
	SumCommandMode [▶ 1615]	Indicates, which (extended) SumCommand to use.

6.5.1 ISumCommand Interface

Interface for SumCommands (Combined commands)

Namespace: [TwinCAT.Ads.SumCommand](#) [▶ 1525]

Assembly: [TwinCAT.Ads.Abstractions](#) (in [TwinCAT.Ads.Abstractions.dll](#)) Version: 6.0.328+39e3229

Syntax

C#

```
public interface ISumCommand
```

The ISumCommand type exposes the following members.

Properties

	Name	Description
	Connection [▶ 1531]	The connection used for communication.
	ErrorStrategy [▶ 1531]	Gets the error strategy of the ISumCommand
	Executed [▶ 1529]	Gets a value indicating whether this ISumCommand was already executed.
	Failed [▶ 1529]	Gets a value indicating whether this ISumCommand failed.
	FailedCount [▶ 1532]	Gets the count of failed subcommands.
	Result [▶ 1530]	Gets the AdsErrorCode [▶ 664] of the main SumCommandBase ADS Request
	SubResults [▶ 1530]	Gets the sub results of the single Sub Requests.

	Name	Description
	Succeeded [► 1531]	Gets a value indicating whether this ISumCommand is succeeded.
	SucceededCount [► 1532]	Gets the count of succeeded subcommands.

Extension Methods

	Name	Description
	AllFailed [► 1592]	Gets a value indicating, that all SubCommands failed. (Defined by ISumCommandExtension [► 1591].)
	AllSucceeded [► 1593]	Gets a value indicating, that all SubCommands succeeded. (Defined by ISumCommandExtension [► 1591].)
	FirstSubError [► 1594]	Gets the first SubError that is not NoError [► 664] (Defined by ISumCommandExtension [► 1591].)
	OneFailed [► 1594]	Gets a value indicating, whether the overall Sumcommand failed (checking all subcommand results). (Defined by ISumCommandExtension [► 1591].)
	OneSucceeded [► 1595]	Gets a value indicating, whether the overall SumCommand succeeded (including all subcommands) (Defined by ISumCommandExtension [► 1591].)
	OverallError [► 1595]	Gets the Overall (combined error) from SumCommand AND SubCommands. (Defined by ISumCommandExtension [► 1591].)

Remarks

ADS offers powerful and fast communication to exchange any kind of information. It's possible to read single variables or complete arrays and structures with each one single ADS-API call. The ADS Sum Command command offers to read with one single ADS call multiple variables which are not structured within a linear memory. As a result the ADS caller application (like scada Systems etc.) can extremely speed up cyclic polling : Sample :

- Until now : Polling 4000 single variables which are not in a linear area (like array / structure / fixed PLC address) would cause 4000 single Ads-ReadReq with each 1-2 ms protocol time. As a result the scanning of these variables take 4000ms-8000ms.
- New Ads-Command allows to read multiple variables with one single ADS-ReadReq : 4000 single variables are handled with e.g. 8 single Ads-ReadReq (each call requesting 500 variables) with each 1-2 ms protocol time. As a result the scanning of these variables take just few 10ms.

REQUIREMENTS AND IMPORTANT LIMITATIONS: Note that ADS is just a transport layer, but there could be important side effects. So read this requirements and take care on limitations:

- **Version of target ADS Device** - - ADS itself is just the transport layer, but the requested ADS device has to support the ADS-Command.
- **Bytes length of requested data** - - Requesting a large list of values from variables is fine, but the requested data of the Ads-response (the data-byte-length) have to pass the AMS Router (size by default a 2048kb) So the caller has to limit the requested variables based on calculation of requested data-byte-length.
- **Number of Sub-ADS calls : Highly recommended to max. 500 !** - - If the PLC is processing one ADS request, it will completely work on this single ADS request BEFORE starting next PLC cycle. As a result one single ADS request with 200.000 sub-Ads-requests would cause that PLC would collect and copy 200.000 variables into one single ADS response, before starting next PLC. So this large number of ads-sub-commands will jitter the PLC execution ! **We highly recommend to not request more than 500 Ads-Sub commands**

6.5.1.2 ISumCommand Methods

The [ISumCommand \[▸ 1527\]](#) type exposes the following members.

Extension Methods

	Name	Description
	AllFailed [▸ 1592]	Gets a value indicating, that all SubCommands failed. (Defined by ISumCommandExtension [▸ 1591] .)
	AllSucceeded [▸ 1593]	Gets a value indicating, that all SubCommands succeeded. (Defined by ISumCommandExtension [▸ 1591] .)
	FirstSubError [▸ 1594]	Gets the first SubError that is not NoError [▸ 664] (Defined by ISumCommandExtension [▸ 1591] .)
	OneFailed [▸ 1594]	Gets a value indicating, whether the overall Sumcommand failed (checking all subcommand results). (Defined by ISumCommandExtension [▸ 1591] .)
	OneSucceeded [▸ 1595]	Gets a value indicating, whether the overall SumCommand succeeded (including all subcommands) (Defined by ISumCommandExtension [▸ 1591] .)
	OverallError [▸ 1595]	Gets the Overall (combined error) from SumCommand AND SubCommands. (Defined by ISumCommandExtension [▸ 1591] .)

6.5.2 ResultSumCommand Class

Result class for an asynchronous [TwinCAT.Ads.SumCommand \[▸ 1525\]](#):

Inheritance Hierarchy

[System.Object](#)

[TwinCAT.Ads.ResultAds \[▸ 1116\]](#)

[TwinCAT.Ads.SumCommand.ResultSumCommand](#)

[TwinCAT.Ads.SumCommand.ResultSumHandles \[▸ 1538\]](#)

[TwinCAT.Ads.SumCommand.ResultSumReadRaw \[▸ 1544\]](#)

[TwinCAT.Ads.SumCommand.ResultSumValues \[▸ 1547\]](#)

[TwinCAT.Ads.SumCommand.ResultSumValues2.S. \[▸ 1605\]](#)

Namespace: [TwinCAT.Ads.SumCommand \[▸ 1525\]](#)

Assembly: TwinCAT.Ads.Abstractions (in TwinCAT.Ads.Abstractions.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public class ResultSumCommand : ResultAds
```

The [ResultSumCommand](#) type exposes the following members.

Properties

	Name	Description
	ErrorCode [▶ 1120]	Gets the ADS Error code bound to this Result [▶ 1116] object. (Inherited from ResultAds [▶ 1116].)
	Failed [▶ 1121]	Gets a value indicating whether the ResultAds [▶ 1116] state is failed. (Inherited from ResultAds [▶ 1116].)
	FirstSubError [▶ 1535]	Gets the first SubError that is not NoError [▶ 664]
	Invokeld [▶ 1121]	Gets the ADS requests invoke identifier (or 0 if not supported) (Inherited from ResultAds [▶ 1116].)
	OverallError [▶ 1536]	Gets the Overall (combined error) from SumCommand AND SubCommands.
	OverallFailed [▶ 1536]	Gets a value indicating, whether the overall Sumcommand failed (checking all subcommand results).
	OverallSucceeded [▶ 1537]	Gets a value indicating, whether the overall SumCommand succeeded (including all subcommands)
	SubErrors [▶ 1535]	Gets the Error codes [▶ 664] for the single SumCommands.
	Succeeded [▶ 1121]	Gets a value indicating whether the ResultAds [▶ 1116] state is succeeded. (Inherited from ResultAds [▶ 1116].)

Methods

	Name	Description
	Equals	Determines whether the specified object is equal to the current object. (Inherited from Object .)
	Finalize	Allows an object to try to free resources and perform other cleanup operations before it is reclaimed by garbage collection. (Inherited from Object .)
	GetHashCode	Serves as the default hash function. (Inherited from Object .)
	GetType	Gets the Type of the current instance. (Inherited from Object .)
	MemberwiseClone	Creates a shallow copy of the current Object . (Inherited from Object .)
	SetError [▶ 1128]	Sets the error state of this ResultAds [▶ 1116] (Inherited from ResultAds [▶ 1116].)
	ToString	Returns a string that represents the current object. (Inherited from Object .)

Remarks

The result contains the overall ErrorCode of the SumCommand [OverallError](#) [[▶ 1536](#)] and all the Suberrors of the SubRequests [SubErrors](#) [[▶ 1535](#)].

Reference

[TwinCAT.Ads.SumCommand Namespace](#) [[▶ 1525](#)]

6.5.2.1 ResultSumCommand Properties

The [ResultSumCommand](#) [[▶ 1533](#)] type exposes the following members.

Properties

	Name	Description
	ErrorCode [▶ 1120]	Gets the ADS Error code bound to this Result [▶ 1116] object. (Inherited from ResultAds [▶ 1116].)
	Failed [▶ 1121]	Gets a value indicating whether the ResultAds [▶ 1116] state is failed. (Inherited from ResultAds [▶ 1116].)
	FirstSubError [▶ 1535]	Gets the first SubError that is not NoError [▶ 664]
	Invokeld [▶ 1121]	Gets the ADS requests invoke identifier (or 0 if not supported) (Inherited from ResultAds [▶ 1116].)
	OverallError [▶ 1536]	Gets the Overall (combined error) from SumCommand AND SubCommands.
	OverallFailed [▶ 1536]	Gets a value indicating, whether the overall Sumcommand failed (checking all subcommand results).
	OverallSucceeded [▶ 1537]	Gets a value indicating, whether the overall SumCommand succeeded (including all subcommands)
	SubErrors [▶ 1535]	Gets the Error codes [▶ 664] for the single SumCommands.
	Succeeded [▶ 1121]	Gets a value indicating whether the ResultAds [▶ 1116] state is succeeded. (Inherited from ResultAds [▶ 1116].)

Reference

[ResultSumCommand Class](#) [[▶ 1533](#)]

6.5.2.1.1 ResultSumCommand.SubErrors Property

Gets the [Error codes](#) [[▶ 664](#)] for the single SumCommands.

Namespace: [TwinCAT.Ads.SumCommand](#) [[▶ 1525](#)]

Assembly: TwinCAT.Ads.Abstractions (in TwinCAT.Ads.Abstractions.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public AdsErrorCode[]? SubErrors { get; protected set; }
```

Property Value

Type: [.AdsErrorCode](#) [[▶ 664](#)].

Reference

[ResultSumCommand Class](#) [[▶ 1533](#)]

[TwinCAT.Ads.SumCommand Namespace](#) [[▶ 1525](#)]

6.5.2.1.2 ResultSumCommand.FirstSubError Property

Gets the first SubError that is not [NoError](#) [[▶ 664](#)]

Namespace: [TwinCAT.Ads.SumCommand](#) [[▶ 1525](#)]

Assembly: TwinCAT.Ads.Abstractions (in TwinCAT.Ads.Abstractions.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public AdsErrorCode FirstSubError { get; }
```

Property Value

Type: [AdsErrorCode](#) [[▶ 664](#)]

The first subError.

Reference

[ResultSumCommand Class](#) [[▶ 1533](#)]

[TwinCAT.Ads.SumCommand Namespace](#) [[▶ 1525](#)]

6.5.2.1.3 ResultSumCommand.OverallError Property

Gets the Overall (combined error) from SumCommand AND SubCommands.

Namespace: [TwinCAT.Ads.SumCommand](#) [[▶ 1525](#)]

Assembly: TwinCAT.Ads.Abstractions (in TwinCAT.Ads.Abstractions.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public AdsErrorCode OverallError { get; }
```

Property Value

Type: [AdsErrorCode](#) [[▶ 664](#)]

The combined error or [NoError](#) [[▶ 664](#)]

Remarks

This will return the ErrorCode of the Sumcommand (if failed) or the first failed subcommand.

Reference

[ResultSumCommand Class](#) [[▶ 1533](#)]

6.5.4.1 ResultSumHandles2 Constructor

Initializes a new instance of the [ResultSumHandles2](#) [[▶ 1540](#)] class.

Namespace: [TwinCAT.Ads.SumCommand](#) [[▶ 1525](#)]

Assembly: [TwinCAT.Ads.Abstractions](#) (in [TwinCAT.Ads.Abstractions.dll](#)) Version: 6.0.328+39e3229

Syntax

C#

```
public ResultSumHandles2(
    AdsErrorCode complete,
    AdsErrorCode[]? subErrors,
    uint[]? handles,
    string[]? instancePaths
)
```

Parameters

complete	Type: TwinCAT.Ads.AdsErrorCode [▶ 664] The overall ADS error codes.
subErrors	Type: .TwinCAT.Ads.AdsErrorCode [▶ 664]. The single ADS SubErrors.
handles	Type: .System.UInt32 . The registered handles.
instancePaths	Type: .System.String . The instance paths.

[TwinCAT.Ads.SumCommand.ResultSumReadRaw](#)

Namespace: [TwinCAT.Ads.SumCommand](#) [[▶ 1525](#)]

Assembly: TwinCAT.Ads.Abstractions (in TwinCAT.Ads.Abstractions.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public class ResultSumReadRaw : ResultSumCommand
```

The ResultSumReadRaw type exposes the following members.

Properties

	Name	Description
	ErrorCode [▶ 1120]	Gets the ADS Error code bound to this Result [▶ 1116] object. (Inherited from ResultAds [▶ 1116].)
	Failed [▶ 1121]	Gets a value indicating whether the ResultAds [▶ 1116] state is failed. (Inherited from ResultAds [▶ 1116].)
	FirstSubError [▶ 1535]	Gets the first SubError that is not NoError [▶ 664] (Inherited from ResultSumCommand [▶ 1533].)
	Invokeld [▶ 1121]	Gets the ADS requests invoke identifier (or 0 if not supported) (Inherited from ResultAds [▶ 1116].)

	Name	Description
	OverallError [▶ 1536]	Gets the Overall (combined error) from SumCommand AND SubCommands. (Inherited from ResultSumCommand [▶ 1533].)
	OverallFailed [▶ 1536]	Gets a value indicating, whether the overall Sumcommand failed (checking all subcommand results). (Inherited from ResultSumCommand [▶ 1533].)
	OverallSucceeded [▶ 1537]	Gets a value indicating, whether the overall SumCommand succeeded (including all subcommands) (Inherited from ResultSumCommand [▶ 1533].)
	ReadBlocks [▶ 1546]	List of the read raw memory blocks read.
	SubErrors [▶ 1535]	Gets the Error codes [▶ 664] for the single SumCommands. (Inherited from ResultSumCommand [▶ 1533].)
	Succeeded [▶ 1121]	Gets a value indicating whether the ResultAds [▶ 1116] state is succeeded. (Inherited from ResultAds [▶ 1116].)

Methods

	Name	Description
	Equals	Determines whether the specified object is equal to the current object. (Inherited from Object .)
	Finalize	Allows an object to try to free resources and perform other cleanup operations before it is reclaimed by garbage collection. (Inherited from Object .)
	GetHashCode	Serves as the default hash function. (Inherited from Object .)
	GetType	Gets the Type of the current instance. (Inherited from Object .)
	MemberwiseClone	Creates a shallow copy of the current Object . (Inherited from Object .)
	SetError [▶ 1128]	Sets the error state of this ResultAds [▶ 1116] (Inherited from ResultAds [▶ 1116].)
	ToString	Returns a string that represents the current object. (Inherited from Object .)

6.5.5.1 ResultSumReadRaw Properties

The [ResultSumReadRaw](#) [▶ 1544] type exposes the following members.

Properties

	Name	Description
	ErrorCode [▶ 1120]	Gets the ADS Error code bound to this Result [▶ 1116] object. (Inherited from ResultAds [▶ 1116].)
	Failed [▶ 1121]	Gets a value indicating whether the ResultAds [▶ 1116] state is failed. (Inherited from ResultAds [▶ 1116].)
	FirstSubError [▶ 1535]	Gets the first SubError that is not NoError [▶ 664] (Inherited from ResultSumCommand [▶ 1533].)
	Invokeld [▶ 1121]	Gets the ADS requests invoke identifier (or 0 if not supported) (Inherited from ResultAds [▶ 1116].)
	OverallError [▶ 1536]	Gets the Overall (combined error) from SumCommand AND SubCommands. (Inherited from ResultSumCommand [▶ 1533].)

	Name	Description
	OverallFailed [▶ 1536]	Gets a value indicating, whether the overall Sumcommand failed (checking all subcommand results). (Inherited from ResultSumCommand [▶ 1533].)
	OverallSucceeded [▶ 1537]	Gets a value indicating, whether the overall SumCommand succeeded (including all subcommands) (Inherited from ResultSumCommand [▶ 1533].)
	ReadBlocks [▶ 1546]	List of the read raw memory blocks read.
	SubErrors [▶ 1535]	Gets the Error codes [▶ 664] for the single SumCommands. (Inherited from ResultSumCommand [▶ 1533].)
	Succeeded [▶ 1121]	Gets a value indicating whether the ResultAds [▶ 1116] state is succeeded. (Inherited from ResultAds [▶ 1116].)

6.5.7 SumCreateHandles Class

SumCommandBase for getting variable handles by a set of InstancePaths

Inheritance Hierarchy

[System.Object](#)

SumCommandWrapper.SumReadWrite.

TwinCAT.Ads.SumCommand.SumCreateHandles

Namespace: [TwinCAT.Ads.SumCommand \[▶ 1525\]](#)

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public class SumCreateHandles : SumCommandWrapper<SumReadWrite>
```

The SumCreateHandles type exposes the following members.

Constructors

	Name	Description
	SumCreateHandles(IAdsConnection, IList.String.) [▶ 1552]	Initializes a new instance of the SumCreateHandles class.
	SumCreateHandles(IAdsConnection, .String.) [▶ 1553]	Initializes a new instance of the SumCreateHandles class.
	SumCreateHandles(IAdsConnection, IList.String., SumCommandErrorStrategy) [▶ 1554]	Initializes a new instance of the SumCreateHandles class.
	SumCreateHandles(IAdsConnection, .String., SumCommandErrorStrategy) [▶ 1554]	Initializes a new instance of the SumCreateHandles class.

Methods

	Name	Description
	CreateHandles [▶ 1555]	Creates the ADS handles.
	CreateHandlesAsync [▶ 1556]	Create handles asynchronously.

	Name	Description
	<u>Equals</u>	Determines whether the specified object is equal to the current object. (Inherited from <u>Object</u> .)
	<u>Finalize</u>	Allows an object to try to free resources and perform other cleanup operations before it is reclaimed by garbage collection. (Inherited from <u>Object</u> .)
	<u>GetHashCode</u>	Serves as the default hash function. (Inherited from <u>Object</u> .)
	<u>GetType</u>	Gets the <u>Type</u> of the current instance. (Inherited from <u>Object</u> .)
	<u>MemberwiseClone</u>	Creates a shallow copy of the current <u>Object</u> . (Inherited from <u>Object</u> .)
	<u>ToString</u>	Returns a string that represents the current object. (Inherited from <u>Object</u> .)

Examples

Usage of Sum commands with handles (CreateHandles, Read, Write, ReleaseHandles)

```

/// <summary>
/// Defines the entry point of the application.
/// </summary>
/// <param name="args">The arguments.</param>
static async void Main(string[] args)
{
    Console.WriteLine("");
    Console.WriteLine("Press [Enter] for start:");
    Console.ReadLine();

    // Parse the command-line arguments
    AmsAddress address = ArgParser.Parse(args);

    CancellationTokenSource cancelSource = new CancellationTokenSource();
    CancellationToken cancel = cancelSource.Token;

    using (AdsClient client = new AdsClient())
    {
        // Connect the AdsClient to the device target.
        client.Connect(address);

        string[] instancePathList = {
            "GVL.bVar",
            "GVL.iCount",
            "TwinCAT_SystemInfoVarList._AppInfo.ProjectName"
        };
        SumCreateHandles createHandlesCommand = new SumCreateHandles(client, instancePathList);

        var resultCreateHandles = await createHandlesCommand.CreateHandlesAsync(cancel);

        if (resultCreateHandles.Succeeded)
        {
            uint[] handles = resultCreateHandles.Handles;
            Type[] valueTypes = new Type[]
            {
                typeof(bool),
                typeof(short),
                typeof(string)
            };
            SumHandleRead readCommand = new SumHandleRead(client, handles, valueTypes);
            var resultRead = await readCommand.ReadAsync(cancel);

            if (resultRead.Succeeded)
            {
                object[] readValues = resultRead.Values;

                for (int i = 0; i < instancePathList.Length; i++)
                {
                    Console.WriteLine("Symbol: {0} (Value: {1}, Type: {2})", instancePathList[i], readValues[i].ToString(), valueTypes[i].Name);
                }

                // Sum Command Write
                SumHandleWrite writeCommand = new SumHandleWrite(client, handles, valueTypes);
                object[] writeValues = new object[] { true, (short)42, "MyNewProjectName" };

```

```

        await writeCommand.WriteAsync(writeValues, cancel);
    }

    SumReleaseHandles releaseCommand = new SumReleaseHandles(client, handles);
    await releaseCommand.ReleaseHandlesAsync(cancel);
}
}

Console.WriteLine("");
Console.WriteLine("Press [Enter] for leave:");
Console.ReadLine();
}

```

6.5.8 SumHandleRead Class

Read (primitive, Any) values by Handle SumCommandBase.

Inheritance Hierarchy

```
System.Object
  SumCommandBase
    SumRead
      TwinCAT.Ads.SumCommand.SumHandleRead
```

Namespace: [TwinCAT.Ads.SumCommand](#) [[▶ 1525](#)]

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public class SumHandleRead : SumRead
```

The SumHandleRead type exposes the following members.

Methods

	Name	Description
	Equals	Determines whether the specified object is equal to the current object. (Inherited from Object .)
	Finalize	Allows an object to try to free resources and perform other cleanup operations before it is reclaimed by garbage collection. (Inherited from Object .)
	GetHashCode	Serves as the default hash function. (Inherited from Object .)
	GetType	Gets the Type of the current instance. (Inherited from Object .)
	MemberwiseClone	Creates a shallow copy of the current Object . (Inherited from Object .)
	Read [▶ 1559]	Reads the values.
	ReadAsync [▶ 1560]	Read the values asynchronously.
	ToString	Returns a string that represents the current object. (Inherited from Object .)
	TryRead [▶ 1560]	Tries to read the values of the .

Remarks

This is an ADS Sum Command to access values by handle information. It is always used in combination with `.` By design (and in contrast to the symbolic access in `SumRead`, [SumSymbolWrite](#) [[▶ 1582](#)]) this access method can act only with ADS ANY Type (Primitive) values (disadvantage). The Advantage is, that no symbolic information must be loaded before accessing the values, see samples:

Examples

Usage of Sum commands with handles (CreateHandles, Read, Write, ReleaseHandles)

```
/// <summary>
/// Defines the entry point of the application.
/// </summary>
/// <param name="args">The arguments.</param>

6.5.9 SumHandleWrite Class

Write any (primitive) values by Handle SumCommandBase.

Inheritance Hierarchy

- [System.Object](#)
- SumCommandBase
- SumWrite
- TwinCAT.Ads.SumCommand.SumHandleWrite

Namespace: [TwinCAT.Ads.SumCommand](#) [▶ 1525]
Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public class SumHandleWrite : SumWrite
```

The SumHandleWrite type exposes the following members.

Methods

	Name	Description
	Equals	Determines whether the specified object is equal to the current object. (Inherited from Object.)
	Finalize	Allows an object to try to free resources and perform other cleanup operations before it is reclaimed by garbage collection. (Inherited from Object.)
	GetHashCode	Serves as the default hash function. (Inherited from Object.)
	GetType	Gets the Type of the current instance. (Inherited from Object.)
	MemberwiseClone	Creates a shallow copy of the current Object. (Inherited from Object.)
	ToString	Returns a string that represents the current object. (Inherited from Object.)

	Name	Description
	TryWrite [► 1564]	Tries to write the values.
	Write [► 1564]	Writes the values to the Symbols.
	WriteAsync [► 1565]	Write the values asynchronously.

Remarks

This is an ADS Sum Command to access values by handle information. It is always used in combination with `and`. By design (and in contrast to the symbolic access in `SumRead`, [SumSymbolWrite \[► 1582\]](#)) this access method can act only with ADS ANY Type (Primitive) values (disadvantage). The Advantage is, that no symbolic information must be loaded before accessing the values, see samples:

Examples

Usage of Sum commands with handles (CreateHandles, Read, Write, ReleaseHandles)

```

/// <summary>
/// Defines the entry point of the application.
/// </summary>
/// <param name="args">The arguments.</param>
static async void Main(string[] args)
{
    Console.WriteLine("");
    Console.WriteLine("Press [Enter] for start:");
    Console.ReadLine();

    // Parse the command-line arguments
    AmsAddress address = ArgParser.Parse(args);

    CancellationTokensource cancelSource = new CancellationTokensource();
    CancellationToken cancel = cancelSource.Token;

    using (AdsClient client = new AdsClient())
    {
        // Connect the AdsClient to the device target.
        client.Connect(address);

        string[] instancePathList = {
            "GVL.bVar",
            "GVL.iCount",
            "TwinCAT_SystemInfoVarList._AppInfo.ProjectName"
        };
        SumCreateHandles createHandlesCommand = new SumCreateHandles(client, instancePathList);

        var resultCreateHandles = await createHandlesCommand.CreateHandlesAsync(cancel);

        if (resultCreateHandles.Succeeded)
        {
            uint[] handles = resultCreateHandles.Handles;
            Type[] valueTypes = new Type[]
            {
                typeof(bool),
                typeof(short),
                typeof(string)
            };
            SumHandleRead readCommand = new SumHandleRead(client, handles, valueTypes);
            var resultRead = await readCommand.ReadAsync(cancel);

            if (resultRead.Succeeded)
            {
                object[] readValues = resultRead.Values;

                for (int i = 0; i < instancePathList.Length; i++)
                {
                    Console.WriteLine("Symbol: {0} (Value: {1}, Type: {2})", instancePathList[i], readValues
[i].ToString(), valueTypes[i].Name);
                }

                // Sum Command Write
                SumHandleWrite writeCommand = new SumHandleWrite(client, handles, valueTypes);
                object[] writeValues = new object[] { true, (short)42, "MyNewProjectName" };

```

```

        await writeCommand.WriteAsync(writeValues, cancel);
    }

    SumReleaseHandles releaseCommand = new SumReleaseHandles(client, handles);
    await releaseCommand.ReleaseHandlesAsync(cancel);
}
}

Console.WriteLine("");
Console.WriteLine("Press [Enter] for leave.");
Console.ReadLine();
}

```

Write the values asynchronously.

Namespace: [TwinCAT.Ads.SumCommand](#) [[▶ 1525](#)]

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public Task<ResultSumCommand> WriteAsync(
    Object[] values,
    CancellationToken cancel
)
```

Parameters

values	Type: System.Object . The values.
cancel	Type: System.Threading.CancellationToken The cancellation token.

Return Value

Type: [Task.ResultSumCommand](#) [[▶ 1533](#)].

An asynchronous task that represents the 'ReadWriteRaw' operation and returns a [ResultSumCommand](#) [[▶ 1533](#)]. The overall error return code is contained in the [ErrorCode](#) [[▶ 1120](#)] property.

6.5.10 SumReleaseHandles Class

Release Handles SumCommandBase.

Inheritance Hierarchy

[System.Object](#)

SumCommandWrapper.SumWrite.

TwinCAT.Ads.SumCommand.SumReleaseHandles

Namespace: [TwinCAT.Ads.SumCommand](#) [[▶ 1525](#)]

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public class SumReleaseHandles : SumCommandWrapper<SumWrite>
```

The SumReleaseHandles type exposes the following members.

Constructors

	Name	Description
	SumReleaseHandles (IAdsConnection , .UInt32 .) [▶ 1568]	Initializes a new instance of the SumReleaseHandles class.
	SumReleaseHandles (IAdsConnection , .UInt32 , SumCommandErrorStrategy) [▶ 1569]	Initializes a new instance of the SumReleaseHandles class.

Methods

	Name	Description
	Equals	Determines whether the specified object is equal to the current object. (Inherited from Object .)
	Finalize	Allows an object to try to free resources and perform other cleanup operations before it is reclaimed by garbage collection. (Inherited from Object .)
	GetHashCode	Serves as the default hash function. (Inherited from Object .)
	GetType	Gets the Type of the current instance. (Inherited from Object .)
	MemberwiseClone	Creates a shallow copy of the current Object . (Inherited from Object .)
	ReleaseHandles [▶ 1570]	Releases the handles.
	ReleaseHandlesAsync [▶ 1570]	Releases the handles asynchronously.
	ToString	Returns a string that represents the current object. (Inherited from Object .)
	TryReleaseHandles [▶ 1571]	Tries to Release the Handles

Remarks

Releases the specified ADS handles. Usually used in conjunction with the [SumCreateHandles](#) [[▶ 1550](#)] and the [SumHandleRead](#) [[▶ 1557](#)] / [SumHandleWrite](#) [[▶ 1561](#)] commands.

Examples

Usage of Sum commands with handles (CreateHandles, Read, Write, ReleaseHandles)

```

/// <summary>
/// Defines the entry point of the application.
/// </summary>
/// <param name="args">The arguments.</param>
static async void Main(string[] args)
{
    Console.WriteLine("");
    Console.WriteLine("Press [Enter] for start:");
    Console.ReadLine();

    // Parse the command-line arguments
    AmsAddress address = ArgParser.Parse(args);

    CancellationTokenSource cancelSource = new CancellationTokenSource();
    CancellationToken cancel = cancelSource.Token;

    using (AdsClient client = new AdsClient())
    {

Namespace: [TwinCAT.Ads.SumCommand](#) [[▶ 1525](#)]

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public AdsErrorCode TryReleaseHandles(
    out AdsErrorCode[]?? returnCodes
)
```

Parameters

returnCodes	Type: .TwinCAT.Ads.AdsErrorCode [▶ 664].. The return codes.
-------------	--

Return Value

Type: [AdsErrorCode](#) [[▶ 664](#)]

AdsErrorCode.

Reference

[SumReleaseHandles Class](#) [[▶ 1565](#)]

[TwinCAT.Ads.SumCommand Namespace](#) [[▶ 1525](#)]

6.5.11 SumSymbolRead Class

Symbolic ADS Sum read access (automatic marshalling)

Inheritance Hierarchy

System.Object

SumCommandWrapper.SumReadWrite.

SumSymbolCommand.SumReadWrite.

SumSymbolReadBase

TwinCAT.Ads.SumCommand.SumSymbolRead

Namespace: [TwinCAT.Ads.SumCommand](#) [[▶ 1525](#)]

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public class SumSymbolRead : SumSymbolReadBase,
    ISumRead, ISumCommand, ISumRead2<ISymbol>
```

The SumSymbolRead type exposes the following members.

Methods

	Name	Description
	createResults [▶ 1579]	Creates the SumCommand results (abstract) (Overrides SumSymbolReadBase.createResults(IList.SumDataEntity., IList.ReadOnlyMemory.Byte..., .AdsErrorCode..))
	Equals	Determines whether the specified object is equal to the current object. (Inherited from Object .)
	Finalize	Allows an object to try to free resources and perform other cleanup operations before it is reclaimed by garbage collection. (Inherited from Object .)
	GetHashCode	Serves as the default hash function. (Inherited from Object .)
	GetType	Gets the Type of the current instance. (Inherited from Object .)
	MemberwiseClone	Creates a shallow copy of the current Object . (Inherited from Object .)
	Read [▶ 1577]	Reads the combined (Sum) Symbols and returns them as value array.
	Read2 [▶ 1580]	Reads the Values.
	Read2Async [▶ 1581]	Read2 as an asynchronous operation.
	ReadAsResult [▶ 1581]	Reads the combined (Sum) Symbols and returns them as Result [▶ 1547] object.
	ReadAsync [▶ 1578]	Reads Symbol values as an asynchronous operation.
	ToString	Returns a string that represents the current object. (Inherited from Object .)
	TryRead [▶ 1579]	Reads the specified symbols.

Extension Methods

	Name	Description
	AllFailed [▶ 1592]	Gets a value indicating, that all SubCommands failed. (Defined by ISumCommandExtension [▶ 1591].)
	AllSucceeded [▶ 1593]	Gets a value indicating, that all SubCommands succeeded. (Defined by ISumCommandExtension [▶ 1591].)

Name	Description
FirstSubError [▶ 1594]	Gets the first SubError that is not NoError [▶ 664] (Defined by ISumCommandExtension [▶ 1591].)
OneFailed [▶ 1594]	Gets a value indicating, whether the overall Sumcommand failed (checking all subcommand results). (Defined by ISumCommandExtension [▶ 1591].)
OneSucceeded [▶ 1595]	Gets a value indicating, whether the overall SumCommand succeeded (including all subcommands) (Defined by ISumCommandExtension [▶ 1591].)
OverallError [▶ 1595]	Gets the Overall (combined error) from SumCommand AND SubCommands. (Defined by ISumCommandExtension [▶ 1591].)
PollValues(IObservable.Unit.) [▶ 1359]	Overloaded. Polls a series of symbols via a ISumRead [▶ 1596] command. The SumCommand will read all contained values with every trigger. (Defined by ValueSymbolExtensions [▶ 1333].)
PollValues(TimeSpan) [▶ 1361]	Overloaded. Polls a series of symbols via a ISumRead2.S. [▶ 1601] command. The SumCommand will read all contained values with every trigger in one roundtrip. (Defined by ValueSymbolExtensions [▶ 1333].)
PollValues2.ISymbol.(IObservable.Unit.) [▶ 1370]	Overloaded. Polls a series of symbols via a ISumRead2.S. [▶ 1601] command. The SumCommand will read all contained values with every trigger in one roundtrip. (Defined by ValueSymbolExtensions [▶ 1333].)
PollValues2.ISymbol.(TimeSpan) [▶ 1372]	Overloaded. Polls a series of symbols via a ISumRead2.S. [▶ 1601] command. The SumCommand will read all contained values with every trigger. (Defined by ValueSymbolExtensions [▶ 1333].)

Remarks

The SumSymbolRead implements symbolic read access with automatic (dynamic) value marshalling. The advantage of the symbolic access is (in contrast to the handle access classes [SumHandleRead](#) [[▶ 1557](#)], [SumHandleWrite](#) [[▶ 1561](#)]) that all type information is available when using this ADS Sum Command. The disadvantage is, that the Symbolic information must be loaded beforehand, see examples. The [SumSymbolWrite](#) [[▶ 1582](#)] defaults to an InstancePath/SymbolName read ([ValueByName](#) [[▶ 1608](#)]).

Examples

Usage of SumSymbolRead/SumSymbolWrite with AdsSession

```

/// <summary>
/// Defines the entry point of the application.
/// </summary>
/// <param name="args">The arguments.</param>
static async void Main(string[] args)
{
    Console.WriteLine("");
    Console.WriteLine("Press [Enter] for start:");
    Console.ReadLine();

    // Parse the command-line arguments
    AmsAddress address = ArgParser.Parse(args);

    CancellationTokenSource cancelSource = new CancellationTokenSource();
    CancellationToken cancel = cancelSource.Token;

    using (AdsSession session = new AdsSession(address))
    {
        // Connect to the device target.
        AdsConnection connection = (AdsConnection)session.Connect();

        // Load symbolic information
        var resultSymbols = await session.SymbolServer.GetSymbolsAsync(cancel);
        resultSymbols.ThrowOnError();
    }
}

```

```

ISymbolCollection<ISymbol> symbols = resultSymbols.Symbols;

ISymbol bVar1 = symbols["GVL.bVar1"];
ISymbol bVar2 = symbols["GVL.bVar2"];
ISymbol projectName = symbols["TwinCAT_SystemInfoVarList._AppInfo.ProjectName"];

SymbolCollection coll = new SymbolCollection() {bVar1, bVar2, projectName};

// Sum Command Read
SumSymbolRead readCommand = new SumSymbolRead(connection,coll);
var resultReadValues = await readCommand.ReadAsync(cancel);

if (resultReadValues.Succeeded)
{
    object[] values = resultReadValues.Values;

    for (int i = 0; i < coll.Count; i++)
    {
        Console.WriteLine("Symbol: {0} (Value: {1}, Type: {2})", coll[i].InstancePath, values[i].ToString(), values[i].GetType().Name);
    }
}
// Sum Command Write

SumSymbolWrite writeCommand = new SumSymbolWrite(connection,coll);
object[] writeValues = new object[] {true, (short) 42, "MyNewProjectName"};

var resultWrite = await writeCommand.WriteAsync(writeValues,cancel);
}

Console.WriteLine("");
Console.WriteLine("Press [Enter] for leave:");
Console.ReadLine();
}

```

Examples

Usage of SumSymbolRead/SumSymbolWrite with AdsClient

```

/// <summary>
/// Defines the entry point of the application.
/// </summary>
/// <param name="args">The arguments.</param>
static async void Main(string[] args)
{
    Console.WriteLine("");
    Console.WriteLine("Press [Enter] for start:");
    Console.ReadLine();

    CancellationTokenSource cancelSource = new CancellationTokenSource();
    CancellationToken cancel = cancelSource.Token;

    // Parse the command-line arguments
    AmsAddress address = ArgParser.Parse(args);

    using (AdsClient client = new AdsClient())
    {
        // Connect the AdsClient to the device target.
        client.Connect(address);

        // Load symbolic information
        ISymbolLoader loader = SymbolLoaderFactory.Create(client, SymbolLoaderSettings.Default);
        var resultReadSymbols = await loader.GetSymbolsAsync(cancel);

        resultReadSymbols.ThrowOnError();

        ISymbolCollection<ISymbol> allSymbols = resultReadSymbols.Symbols;

        ISymbol bVar1 = allSymbols["GVL.bVar1"];
        ISymbol bVar2 = allSymbols["GVL.iCount"];
        ISymbol projectName = allSymbols["TwinCAT_SystemInfoVarList._AppInfo.ProjectName"];

        SymbolCollection symbols = new SymbolCollection() {bVar1, bVar2, projectName};

        // Sum Command Read
        SumSymbolRead readCommand = new SumSymbolRead(client,symbols);
        var resultSumRead = await readCommand.ReadAsync(cancel);
    }
}

```

```
if (resultSumRead.Succeeded)
{
    object[] values = resultSumRead.Values;

    for (int i = 0; i < symbols.Count; i++)
    {
        Console.WriteLine("Symbol: {0} (Value: {1}, Type: {2})", symbols[i].InstancePath, values[i].
ToString(), values[i].GetType().Name);
    }

    // Sum Command Write
    SumSymbolWrite writeCommand = new SumSymbolWrite(client, symbols);
    object[] writeValues = new object[] { true, (short)42, "MyNewProjectName" };

    var resultSumWrite = await writeCommand.WriteAsync(writeValues, cancel);
}
}

Console.WriteLine("");
Console.WriteLine("Press [Enter] for leave:");
Console.ReadLine();
}
```

6.5.11.2 SumSymbolRead Methods

The [SumSymbolRead \[► 1572\]](#) type exposes the following members.

Methods

	Name	Description
	createResults [► 1579]	Creates the SumCommand results (abstract) (Overrides SumSymbolReadBase.createResults(IList.SumDataEntity., IList.ReadOnlyMemory.Byte..., .AdsErrorCode.) .)
	Equals	Determines whether the specified object is equal to the current object. (Inherited from Object .)
	Finalize	Allows an object to try to free resources and perform other cleanup operations before it is reclaimed by garbage collection. (Inherited from Object .)
	GetHashCode	Serves as the default hash function. (Inherited from Object .)
	GetType	Gets the Type of the current instance. (Inherited from Object .)
	MemberwiseClone	Creates a shallow copy of the current Object . (Inherited from Object .)
	Read [► 1577]	Reads the combined (Sum) Symbols and returns them as value array.
	Read2 [► 1580]	Reads the Values.
	Read2Async [► 1581]	Read2 as an asynchronous operation.
	ReadAsResult [► 1581]	Reads the combined (Sum) Symbols and returns them as Result [► 1547] object.
	ReadAsync [► 1578]	Reads Symbol values as an asynchronous operation.
	ToString	Returns a string that represents the current object. (Inherited from Object .)
	TryRead [► 1579]	Reads the specified symbols.

Extension Methods

	Name	Description
	AllFailed [► 1592]	Gets a value indicating, that all SubCommands failed. (Defined by ISumCommandExtension [► 1591] .)
	AllSucceeded [► 1593]	Gets a value indicating, that all SubCommands succeeded. (Defined by ISumCommandExtension [► 1591] .)
	FirstSubError [► 1594]	Gets the first SubError that is not NoError [► 664] (Defined by ISumCommandExtension [► 1591] .)
	OneFailed [► 1594]	Gets a value indicating, whether the overall Sumcommand failed (checking all subcommand results). (Defined by ISumCommandExtension [► 1591] .)
	OneSucceeded [► 1595]	Gets a value indicating, whether the overall SumCommand succeeded (including all subcommands) (Defined by ISumCommandExtension [► 1591] .)
	OverallError [► 1595]	Gets the Overall (combined error) from SumCommand AND SubCommands. (Defined by ISumCommandExtension [► 1591] .)

6.5.11.2.1 SumSymbolRead.Read Method

Reads the combined (Sum) Symbols and returns them as value array.

Namespace: [TwinCAT.Ads.SumCommand \[▶ 1525\]](#)

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public Object[] Read()
```

Return Value

Type: [.Object](#).
The value array.

Implements

[ISumRead.Read. \[▶ 1599\]](#)

Exceptions

Exception	Condition
AdsSumCommandException [▶ 735]	SumSymbolRead failed!

Remarks

The return values are automatically marshalled to their appropriate .NET types. This method throws Exceptions, when the Read access fails.

Reference

6.5.11.2 SumSymbolRead.ReadAsync Method

Reads Symbol values as an asynchronous operation.

Namespace: [TwinCAT.Ads.SumCommand](#) [► 1525]

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax**C#**

```
public Task<ResultSumValues> ReadAsync(
    CancellationTokens cancel
)
```

Parameters

cancel	Type: System.Threading.CancellationTokens The cancellation token.
--------	--

Return Value

Type: [Task.ResultSumValues](#) [► 1547].

An asynchronous task that represents the 'Read' operation and returns a [ResultSumValues](#) [► 1547]. The overall error return code is contained in the [ErrorCode](#) [► 1120] property.

Implements

[ISumRead.ReadAsync\(CancellationTokens\)](#) [► 1600]

The Result object.

Implements

[ISumRead.ReadAsResult. \[▸ 1600\]](#)

Reference

[SumSymbolRead Class \[► 1572\]](#)

[TwinCAT.Ads.SumCommand Namespace \[► 1525\]](#)

6.5.12 SumSymbolWrite Class

Class for ADS Sum symbolic Write Access.

Inheritance Hierarchy

[System.Object](#)

SumCommandWrapper.SumWrite.

SumSymbolCommand.SumWrite.

TwinCAT.Ads.SumCommand.SumSymbolWrite

Namespace: [TwinCAT.Ads.SumCommand \[► 1525\]](#)

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public class SumSymbolWrite : SumSymbolCommand<SumWrite>
```

The SumSymbolWrite type exposes the following members.

Methods

	Name	Description
	Equals	Determines whether the specified object is equal to the current object. (Inherited from Object .)
	Finalize	Allows an object to try to free resources and perform other cleanup operations before it is reclaimed by garbage collection. (Inherited from Object .)
	GetHashCode	Serves as the default hash function. (Inherited from Object .)
	GetType	Gets the Type of the current instance. (Inherited from Object .)
	MemberwiseClone	Creates a shallow copy of the current Object . (Inherited from Object .)
	ToString	Returns a string that represents the current object. (Inherited from Object .)
	TryWrite [► 1585]	Writes the specified values.
	Write [► 1586]	Writes the specified values.
	WriteAsync [► 1587]	Reads the symbol values asynchronously.

Remarks

The SumSymbolWrite implements symbolic write access with automatic (dynamic) value marshalling. The advantage of the symbolic access is (in contrast to the handle access classes [SumHandleRead \[► 1557\]](#), [SumHandleWrite \[► 1561\]](#)) that all type information is available when using this ADS Sum Command. The disadvantage is, that the Symbolic information must be loaded beforehand, see examples. The SumSymbolWrite defaults to an IndexGroup/IndexOffset read ([IndexGroupIndexOffset \[► 1608\]](#)), because the the write access by InstancePath/SymbolName is not supported. The disadvantage of this mode is, that dereferencing References/Pointers don't work and their values cannot be resolved. An option is to use the [ValueByHandle \[► 1608\]](#), but that means to use more ADS roundtrips because the handles have to be requested first!

Examples

Usage of SumRead/SumSymbolWrite with AdsSession

```

/// <summary>
/// Defines the entry point of the application.
/// </summary>
/// <param name="args">The arguments.</param>
static async void Main(string[] args)
{
    Console.WriteLine("");
    Console.WriteLine("Press [Enter] for start:");
    Console.ReadLine();

    // Parse the command-line arguments
    AmsAddress address = ArgParser.Parse(args);

    CancellationTokenSource cancelSource = new CancellationTokenSource();
    CancellationToken cancel = cancelSource.Token;

    using (AdsSession session = new AdsSession(address))
    {
        // Connect to the device target.
        AdsConnection connection = (AdsConnection)session.Connect();

        // Load symbolic information
        var resultSymbols = await session.SymbolServer.GetSymbolsAsync(cancel);
        resultSymbols.ThrowOnError();

        ISymbolCollection<ISymbol> symbols = resultSymbols.Symbols;

        ISymbol bVar1 = symbols["GVL.bVar1"];
        ISymbol bVar2 = symbols["GVL.bVar2"];
        ISymbol projectName = symbols["TwinCAT_SystemInfoVarList._AppInfo.ProjectName"];

        SymbolCollection coll = new SymbolCollection() {bVar1, bVar2, projectName};

        // Sum Command Read
        SumSymbolRead readCommand = new SumSymbolRead(connection,coll);
        var resultReadValues = await readCommand.ReadAsync(cancel);

        if (resultReadValues.Succeeded)
        {
            object[] values = resultReadValues.Values;

            for (int i = 0; i < coll.Count; i++)
            {
                Console.WriteLine("Symbol: {0} (Value: {1}, Type: {2})", coll[i].InstancePath, values[i].ToString(), values[i].GetType().Name);
            }
        }
        // Sum Command Write

        SumSymbolWrite writeCommand = new SumSymbolWrite(connection,coll);
        object[] writeValues = new object[] {true, (short) 42, "MyNewProjectName"};

        var resultWrite = await writeCommand.WriteAsync(writeValues,cancel);
    }

    Console.WriteLine("");
    Console.WriteLine("Press [Enter] for leave:");
    Console.ReadLine();
}

```

Examples

Usage of SumRead/SumSymbolWrite with AdsClient

```

/// <summary>
/// Defines the entry point of the application.
/// </summary>
/// <param name="args">The arguments.</param>
static async void Main(string[] args)
{
    Console.WriteLine("");
    Console.WriteLine("Press [Enter] for start:");
    Console.ReadLine();
}

```

```

CancellationTokenSource cancelSource = new CancellationTok...
CancellationToken cancel = cancelSource.Token;

// Parse the command-line arguments
AmsAddress address = ArgParser.Parse(args);

using (AdsClient client = new AdsClient())
{

TwinCAT.Ads.SumCommand.SumSymbolWrite

6.5.12.1 SumSymbolWrite Constructor

Initializes a new instance of the [SumSymbolWrite \[► 1582\]](#) class.

Namespace: [TwinCAT.Ads.SumCommand \[► 1525\]](#)

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version:

5.0.294+Branch.releases-5.0.Sha.90bb9a1b43b6095934fddca3e72bc0ea15da1c14

Syntax

C#

```
public SumSymbolWrite(
    IAdsConnection connection,
    IList<ISymbol> symbols
)
```

Parameters

- connection Type: [TwinCAT.Ads.IAdsConnection](#) [▶ 876]
The ADS Connection.
- symbols Type: [System.Collections.Generic.IList.ISymbol](#) [▶ 2691].
The symbols to read

Reference

- [SumSymbolWrite Class](#) [▶ 1582]
- [TwinCAT.Ads.SumCommand Namespace](#) [▶ 1525]

6.5.12.2 SumSymbolWrite Methods

The [SumSymbolWrite](#) [▶ 1582] type exposes the following members.

Methods

	Name	Description
	Equals	Determines whether the specified object is equal to the current object. (Inherited from Object .)
	Finalize	Allows an object to try to free resources and perform other cleanup operations before it is reclaimed by garbage collection. (Inherited from Object .)
	GetHashCode	Serves as the default hash function. (Inherited from Object .)
	GetType	Gets the Type of the current instance. (Inherited from Object .)
	MemberwiseClone	Creates a shallow copy of the current Object . (Inherited from Object .)
	ToString	Returns a string that represents the current object. (Inherited from Object .)
	TryWrite [▶ 1585]	Writes the specified values.
	Write [▶ 1586]	Writes the specified values.
	WriteAsync [▶ 1587]	Reads the symbol values asynchronously.

Reference

- [SumSymbolWrite Class](#) [▶ 1582]
- [TwinCAT.Ads.SumCommand Namespace](#) [▶ 1525]

6.5.12.2.1 SumSymbolWrite.TryWrite Method

Writes the specified values.

Namespace: [TwinCAT.Ads.SumCommand](#) [▶ 1525]
Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public AdsErrorCode TryWrite(
    Object[] values,
    out AdsErrorCode[]?? returnCodes
)
```

Parameters

values	Type: .System.Object . The values.
returnCodes	Type: .TwinCAT.Ads.AdsErrorCode [▶ 664].. The return codes.

Return Value

Type: [AdsErrorCode](#) [[▶ 664](#)]
AdsErrorCode.

Remarks

The written values will be marshalled automatically to their appropriate ADS types.

Reference

[SumSymbolWrite.WriteAsync\(Object., CancellationToken\)](#) [[▶ 1587](#)]

6.5.12.2.2 SumSymbolWrite.Write Method

Writes the specified values.

Namespace: [TwinCAT.Ads.SumCommand](#) [[▶ 1525](#)]

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public void Write(
    Object[] values
)
```

Parameters

values	Type: .System.Object . The values.
--------	---

Exceptions

Exception	Condition
AdsSumCommandException [▶ 735]	SumSymbolWrite failed!

Remarks

The values will be marshalled automatically to their appropriate ADS types.

[SumSymbolWrite.WriteAsync\(Object, CancellationToken\) \[► 1587\]](#)

6.5.12.2.3 SumSymbolWrite.WriteAsync Method

Reads the symbol values asynchronously.

Namespace: [TwinCAT.Ads.SumCommand \[► 1525\]](#)

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax**C#**

```
public Task<ResultSumCommand> WriteAsync (
    Object[] values,
    CancellationToken cancel
)
```

Parameters

values	Type: System.Object . The values.
cancel	Type: System.Threading.CancellationToken The cancellation token

Return Value

Type: [Task.ResultSumCommand \[► 1533\]](#).

An asynchronous task that represents the 'Write' operation and returns a [ResultSumCommand \[► 1533\]](#). The overall error return code is contained in the [ErrorCode \[► 1120\]](#) property.

Reference

6.5.13 ISumSymbolRead Interface

Interface [ISumSymbolRead](#) Implements the [ISumCommand \[► 1527\]](#)

Namespace: [TwinCAT.Ads.SumCommand \[► 1525\]](#)

Assembly: TwinCAT.Ads.Abstractions (in TwinCAT.Ads.Abstractions.dll) Version: 6.0.116+a71ced3

Syntax

C#

```
public interface ISumSymbolRead : ISumCommand
```

The ISumSymbolRead type exposes the following members.

Properties

	Name	Description
	Executed [▶ 1529]	Gets a value indicating whether this ISumCommand [▶ 1527] was already executed. (Inherited from ISumCommand [▶ 1527] .)
	Failed [▶ 1529]	Gets a value indicating whether this ISumCommand [▶ 1527] failed. (Inherited from ISumCommand [▶ 1527] .)
	Result [▶ 1530]	Gets the AdsErrorCode [▶ 664] of the main SumCommandBase ADS Request (Inherited from ISumCommand [▶ 1527] .)
	SubResults [▶ 1530]	Gets the sub results of the single Sub Requests. (Inherited from ISumCommand [▶ 1527] .)
	Succeeded [▶ 1531]	Gets a value indicating whether this ISumCommand [▶ 1527] is succeeded. (Inherited from ISumCommand [▶ 1527] .)

Methods

	Name	Description
	Read [▶ 1589]	Reads the Values.
	ReadAsync [▶ 1590]	Reads Symbol values as an asynchronous operation.
	TryRead [▶ 1591]	Reads the specified symbols.

Extension Methods

	Name	Description
	PollValues(IObservable.Unit.) [▶ 1352]	Overloaded. Polls a series of symbols via a ISumSymbolRead command. The SumCommand will read all contained values with every trigger. (Defined by ValueSymbolExtensions [▶ 1333] .)
	PollValues(TimeSpan) [▶ 1353]	Overloaded. Polls a series of symbols via a ISumSymbolRead command. The SumCommand will read all contained values with every trigger. (Defined by ValueSymbolExtensions [▶ 1333] .)

6.5.14.1.1 ISumCommandExtension.AllFailed Method

Gets a value indicating, that all SubCommands failed.

Namespace: [TwinCAT.Ads.SumCommand](#) [[▶ 1525](#)]

Assembly: TwinCAT.Ads.Abstractions (in TwinCAT.Ads.Abstractions.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public static bool AllFailed(  
    this ISumCommand sumCommand  
)
```

Parameters

sumCommand	Type: TwinCAT.Ads.SumCommand.ISumCommand [▸ 1527] The sum command.
------------	---

Return Value

Type: [Boolean](#)

true if the SumCommand and all SubCommands failed, false otherwise.

Usage Note

In Visual Basic and C#, you can call this method as an instance method on any object of type [ISumCommand \[▸ 1527\]](#). When you use instance method syntax to call this method, omit the first parameter. For more information, see [Extension Methods \(Visual Basic\)](#) or [Extension Methods \(C# Programming Guide\)](#).

6.5.15 ISumRead Interface

Interface ISumRead Implements the [ISumCommand](#) [► 1527]

Namespace: [TwinCAT.Ads.SumCommand](#) [► 1525]

Assembly: TwinCAT.Ads.Abstractions (in TwinCAT.Ads.Abstractions.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public interface ISumRead : ISumCommand
```

The ISumRead type exposes the following members.

Properties

	Name	Description
	Connection [► 1531]	The connection used for communication. (Inherited from ISumCommand [► 1527].)
	ErrorStrategy [► 1531]	Gets the error strategy of the ISumCommand [► 1527] (Inherited from ISumCommand [► 1527].)
	Executed [► 1529]	Gets a value indicating whether this ISumCommand [► 1527] was already executed. (Inherited from ISumCommand [► 1527].)
	Failed [► 1529]	Gets a value indicating whether this ISumCommand [► 1527] failed. (Inherited from ISumCommand [► 1527].)

	Name	Description
	FailedCount [▶ 1532]	Gets the count of failed subcommands. (Inherited from ISumCommand [▶ 1527].)
	Result [▶ 1530]	Gets the AdsErrorCode [▶ 664] of the main SumCommandBase ADS Request (Inherited from ISumCommand [▶ 1527].)
	SubResults [▶ 1530]	Gets the sub results of the single Sub Requests. (Inherited from ISumCommand [▶ 1527].)
	Succeeded [▶ 1531]	Gets a value indicating whether this ISumCommand [▶ 1527] is succeeded. (Inherited from ISumCommand [▶ 1527].)
	SucceededCount [▶ 1532]	Gets the count of succeeded subcommands. (Inherited from ISumCommand [▶ 1527].)

Methods

	Name	Description
	Read [▶ 1599]	Reads the combined (Sum) Symbols and returns them as value array.
	ReadAsResult [▶ 1600]	Reads the combined (Sum) Symbols and returns them as Result [▶ 1547] object.
	ReadAsync [▶ 1600]	Reads Symbol values as an asynchronous operation.
	TryRead [▶ 1601]	Reads the specified symbols.

Extension Methods

	Name	Description
	AllFailed [▶ 1592]	Gets a value indicating, that all SubCommands failed. (Defined by ISumCommandExtension [▶ 1591].)
	AllSucceeded [▶ 1593]	Gets a value indicating, that all SubCommands succeeded. (Defined by ISumCommandExtension [▶ 1591].)
	FirstSubError [▶ 1594]	Gets the first SubError that is not NoError [▶ 664] (Defined by ISumCommandExtension [▶ 1591].)
	OneFailed [▶ 1594]	Gets a value indicating, whether the overall Sumcommand failed (checking all subcommand results). (Defined by ISumCommandExtension [▶ 1591].)
	OneSucceeded [▶ 1595]	Gets a value indicating, whether the overall SumCommand succeeded (including all subcommands) (Defined by ISumCommandExtension [▶ 1591].)
	OverallError [▶ 1595]	Gets the Overall (combined error) from SumCommand AND SubCommands. (Defined by ISumCommandExtension [▶ 1591].)
	PollValues(IObservableUnit.) [▶ 1359]	Overloaded. Polls a series of symbols via a ISumRead command. The SumCommand will read all contained values with every trigger. (Defined by ValueSymbolExtensions [▶ 1333].)
	PollValues(TimeSpan) [▶ 1361]	Overloaded. Polls a series of symbols via a ISumRead2.S. [▶ 1601] command. The SumCommand will read all contained values with every trigger in one roundtrip. (Defined by ValueSymbolExtensions [▶ 1333].)

	Connection [▸ 1531]	The connection used for communication. (Inherited from ISumCommand [▸ 1527] .)
	ErrorStrategy [▸ 1531]	Gets the error strategy of the ISumCommand [▸ 1527] (Inherited from ISumCommand [▸ 1527] .)
	Executed [▸ 1529]	Gets a value indicating whether this ISumCommand [▸ 1527] was already executed. (Inherited from ISumCommand [▸ 1527] .)
	Failed [▸ 1529]	Gets a value indicating whether this ISumCommand [▸ 1527] failed. (Inherited from ISumCommand [▸ 1527] .)
	FailedCount [▸ 1532]	Gets the count of failed subcommands. (Inherited from ISumCommand [▸ 1527] .)
	Result [▸ 1530]	Gets the AdsErrorCode [▸ 664] of the main SumCommandBase ADS Request (Inherited from ISumCommand [▸ 1527] .)
	SubResults [▸ 1530]	Gets the sub results of the single Sub Requests. (Inherited from ISumCommand [▸ 1527] .)
	Succeeded [▸ 1531]	Gets a value indicating whether this ISumCommand [▸ 1527] is succeeded. (Inherited from ISumCommand [▸ 1527] .)
	SucceededCount [▸ 1532]	Gets the count of succeeded subcommands. (Inherited from ISumCommand [▸ 1527] .)

Reference

6.5.15.2 ISumRead Methods

The [ISumRead \[▸ 1596\]](#) type exposes the following members.

Methods

	Name	Description
	Read [▸ 1599]	Reads the combined (Sum) Symbols and returns them as value array.
	ReadAsResult [▸ 1600]	Reads the combined (Sum) Symbols and returns them as Result [▸ 1547] object.
	ReadAsync [▸ 1600]	Reads Symbol values as an asynchronous operation.
	TryRead [▸ 1601]	Reads the specified symbols.

Extension Methods

	Name	Description
	AllFailed [▸ 1592]	Gets a value indicating, that all SubCommands failed. (Defined by ISumCommandExtension [▸ 1591] .)
	AllSucceeded [▸ 1593]	Gets a value indicating, that all SubCommands succeeded. (Defined by ISumCommandExtension [▸ 1591] .)

	Name	Description
	FirstSubError [▶ 1594]	Gets the first SubError that is not NoError [▶ 664] (Defined by ISumCommandExtension [▶ 1591].)
	OneFailed [▶ 1594]	Gets a value indicating, whether the overall Sumcommand failed (checking all subcommand results). (Defined by ISumCommandExtension [▶ 1591].)
	OneSucceeded [▶ 1595]	Gets a value indicating, whether the overall SumCommand succeeded (including all subcommands) (Defined by ISumCommandExtension [▶ 1591].)
	OverallError [▶ 1595]	Gets the Overall (combined error) from SumCommand AND SubCommands. (Defined by ISumCommandExtension [▶ 1591].)
	PollValues(IObservable.Unit.) [▶ 1359]	Overloaded. Polls a series of symbols via a ISumRead [▶ 1596] command. The SumCommand will read all contained values with every trigger. (Defined by ValueSymbolExtensions [▶ 1333].)
	PollValues(TimeSpan) [▶ 1361]	Overloaded. Polls a series of symbols via a ISumRead2.S. [▶ 1601] command. The SumCommand will read all contained values with every trigger in one roundtrip. (Defined by ValueSymbolExtensions [▶ 1333].)

Reference

[ISumRead Interface](#) [▶ 1596]

[TwinCAT.Ads.SumCommand Namespace](#) [▶ 1525]

6.5.15.2.1 ISumRead.Read Method

Reads the combined (Sum) Symbols and returns them as value array.

Namespace: [TwinCAT.Ads.SumCommand](#) [▶ 1525]

Assembly: TwinCAT.Ads.Abstractions (in TwinCAT.Ads.Abstractions.dll) Version: 6.0.328+39e3229

Syntax

C#

```
Object[] Read()
```

Return Value

Type: `.Object`.
The value array.

Remarks

The return values are automatically marshalled to their appropriate .NET types. This method throws Exceptions, when the Read access fails.

Reference

[ISumRead.ReadAsync\(Cancellation token\)](#) [▶ 1600]

6.5.15.2.2 ISumRead.ReadAsResult Method

Reads the combined (Sum) Symbols and returns them as [Result \[▸ 1547\]](#) object.

Namespace: [TwinCAT.Ads.SumCommand \[▸ 1525\]](#)

Assembly: TwinCAT.Ads.Abstractions (in TwinCAT.Ads.Abstractions.dll) Version: 6.0.328+39e3229

Syntax

C#

```
ResultSumValues ReadAsResult ()
```

Return Value

Type: [ResultSumValues \[▸ 1547\]](#)

The Result object.

Reference

[ISumRead Interface \[▸ 1596\]](#)

6.5.15.2.3 ISumRead.ReadAsync Method

Reads Symbol values as an asynchronous operation.

Namespace: [TwinCAT.Ads.SumCommand \[▸ 1525\]](#)

Assembly: TwinCAT.Ads.Abstractions (in TwinCAT.Ads.Abstractions.dll) Version: 6.0.328+39e3229

Syntax

C#

```
Task<ResultSumValues> ReadAsync (
    CancellationToken cancel
)
```

Parameters

cancel	Type: System.Threading.CancellationToken The cancellation token.
--------	---

Return Value

Type: [Task.ResultSumValues \[▸ 1547\]](#).

An asynchronous task that represents the 'Read' operation and returns a [ResultSumValues \[▸ 1547\]](#). The overall error return code is contained in the [ErrorCode \[▸ 1120\]](#) property.

Reference

6.5.15.2.4 ISumRead.TryRead Method

Reads the specified symbols.

Namespace: [TwinCAT.Ads.SumCommand](#) [[▶ 1525](#)]

Assembly: TwinCAT.Ads.Abstractions (in TwinCAT.Ads.Abstractions.dll) Version: 6.0.328+39e3229

Syntax

C#

```
AdsErrorCode TryRead(
    out Object[]? values,
    out AdsErrorCode[]?? returnCodes
)
```

Parameters

values	Type: .System.Object. The values.
returnCodes	Type: .TwinCAT.Ads.AdsErrorCode [▶ 664]. The return codes.

Return Value

Type: [AdsErrorCode](#) [[▶ 664](#)]
AdsErrorCode.

Remarks

The returned values are automatically marshalled to their appropriate .NET types.

6.5.16 ISumRead2.S. Interface

Interface ISumRead2 (supports extended Sum SubResults) Implements the [ISumCommand](#) [[▶ 1527](#)]

Namespace: [TwinCAT.Ads.SumCommand](#) [[▶ 1525](#)]

Assembly: TwinCAT.Ads.Abstractions (in TwinCAT.Ads.Abstractions.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public interface ISumRead2<S> : ISumCommand
```

Type Parameters

S

The ISumRead2.S. type exposes the following members.

Properties

Name	Description
Connection [▶ 1531]	The connection used for communication. (Inherited from ISumCommand [▶ 1527].)
ErrorStrategy [▶ 1531]	Gets the error strategy of the ISumCommand [▶ 1527] (Inherited from ISumCommand [▶ 1527].)
Executed [▶ 1529]	Gets a value indicating whether this ISumCommand [▶ 1527] was already executed. (Inherited from ISumCommand [▶ 1527].)
Failed [▶ 1529]	Gets a value indicating whether this ISumCommand [▶ 1527] failed. (Inherited from ISumCommand [▶ 1527].)
FailedCount [▶ 1532]	Gets the count of failed subcommands. (Inherited from ISumCommand [▶ 1527].)
Result [▶ 1530]	Gets the AdsErrorCode [▶ 664] of the main SumCommandBase ADS Request (Inherited from ISumCommand [▶ 1527].)
SubResults [▶ 1530]	Gets the sub results of the single Sub Requests. (Inherited from ISumCommand [▶ 1527].)
Succeeded [▶ 1531]	Gets a value indicating whether this ISumCommand [▶ 1527] is succeeded. (Inherited from ISumCommand [▶ 1527].)
SucceededCount [▶ 1532]	Gets the count of succeeded subcommands. (Inherited from ISumCommand [▶ 1527].)

Methods

Name	Description
Read2 [▶ 1604]	Reads the Values.
Read2Async [▶ 1605]	Reads Symbol values as an asynchronous operation.

Extension Methods

Name	Description
AllFailed [▶ 1592]	Gets a value indicating, that all SubCommands failed. (Defined by ISumCommandExtension [▶ 1591].)
AllSucceeded [▶ 1593]	Gets a value indicating, that all SubCommands succeeded. (Defined by ISumCommandExtension [▶ 1591].)
FirstSubError [▶ 1594]	Gets the first SubError that is not NoError [▶ 664] (Defined by ISumCommandExtension [▶ 1591].)
OneFailed [▶ 1594]	Gets a value indicating, whether the overall Sumcommand failed (checking all subcommand results). (Defined by ISumCommandExtension [▶ 1591].)
OneSucceeded [▶ 1595]	Gets a value indicating, whether the overall SumCommand succeeded (including all subcommands) (Defined by ISumCommandExtension [▶ 1591].)
OverallError [▶ 1595]	Gets the Overall (combined error) from SumCommand AND SubCommands. (Defined by ISumCommandExtension [▶ 1591].)
PollValues2.S. (IObservable.Unit) [▶ 1370]	Overloaded. Polls a series of symbols via a ISumRead2.S. command. The SumCommand will read all contained values with every trigger in one roundtrip. (Defined by ValueSymbolExtensions [▶ 1333].)
PollValues2.S. (TimeSpan) [▶ 1372]	Overloaded. Polls a series of symbols via a ISumRead2.S. command. The SumCommand will read all contained values with every trigger. (Defined by ValueSymbolExtensions [▶ 1333].)

Remarks

Implementations of this interface return enriched SubResults on SumCommand Reads, that include the original sourceId in its result to backtrace.

Assembly: TwinCAT.Ads.Abstractions (in TwinCAT.Ads.Abstractions.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public class ResultSumValues2<S> : ResultSumCommand
```

Type Parameters

S

The ResultSumValues2.S. type exposes the following members.

Properties

Name	Description
ErrorCode [▶ 1120]	Gets the ADS Error code bound to this Result [▶ 1116] object. (Inherited from ResultAds [▶ 1116].)
Failed [▶ 1121]	Gets a value indicating whether the ResultAds [▶ 1116] state is failed. (Inherited from ResultAds [▶ 1116].)
FirstSubError [▶ 1535]	Gets the first SubError that is not NoError [▶ 664] (Inherited from ResultSumCommand [▶ 1533].)
Invokeld [▶ 1121]	Gets the ADS requests invoke identifier (or 0 if not supported) (Inherited from ResultAds [▶ 1116].)
OverallError [▶ 1536]	Gets the Overall (combined error) from SumCommand AND SubCommands. (Inherited from ResultSumCommand [▶ 1533].)
OverallFailed [▶ 1536]	Gets a value indicating, whether the overall Sumcommand failed (checking all subcommand results). (Inherited from ResultSumCommand [▶ 1533].)
OverallSucceeded [▶ 1537]	Gets a value indicating, whether the overall SumCommand succeeded (including all subcommands) (Inherited from ResultSumCommand [▶ 1533].)
SubErrors [▶ 1535]	Gets the Error codes [▶ 664] for the single SumCommands. (Inherited from ResultSumCommand [▶ 1533].)
Succeeded [▶ 1121]	Gets a value indicating whether the ResultAds [▶ 1116] state is succeeded. (Inherited from ResultAds [▶ 1116].)
ValueResults [▶ 1607]	Gets the values results (Values extended by the Symbol reference and error code).

Methods

Name	Description
Equals	Determines whether the specified object is equal to the current object. (Inherited from Object .)
Finalize	Allows an object to try to free resources and perform other cleanup operations before it is reclaimed by garbage collection. (Inherited from Object .)
GetHashCode	Serves as the default hash function. (Inherited from Object .)
GetType	Gets the Type of the current instance. (Inherited from Object .)
MemberwiseClone	Creates a shallow copy of the current Object . (Inherited from Object .)
SetError [▶ 1128]	Sets the error state of this ResultAds [▶ 1116] (Inherited from ResultAds [▶ 1116].)
ToString	Returns a string that represents the current object. (Inherited from Object .)

Remarks

This result class contains additional mapped [ISymbol](#) [[▶ 2691](#)] information foreach subResult of the the SumCommand.

public enum SumAccessMode
```

Members

	Member name	Value	Description
	IndexGroupIndexOffset	0	Access by IndexGroup / IndexOffset
	ValueByHandle	1	Accesses a value by handle
	ValueByName	2	Access a value by name
	AcquireHandleByName	3	Acquire handle by name
	ReleaseHandle	4	Release handle

Reference

[TwinCAT.Ads.SumCommand Namespace \[▸ 1525\]](#)

6.5.19 SumAnyTypeRead Class

Symbolic ADS Sum read access (ANY_TYPE marshalling) on already loaded symbols.

Inheritance Hierarchy

System.Object

SumCommandWrapper.SumReadWrite.

SumSymbolCommand.SumReadWrite.

SumSymbolReadBase

TwinCAT.Ads.SumCommand.SumAnyTypeRead

Namespace: [TwinCAT.Ads.SumCommand](#) [[▶ 1525](#)]

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public class SumAnyTypeRead : SumSymbolReadBase,
    ISumRead2<ISymbol>, ISumCommand
```

The SumAnyTypeRead type exposes the following members.

Constructors

	Name	Description
	SumAnyTypeRead [▶ 1611]	Initializes a new instance of the SumAnyTypeRead class.

Methods

	Name	Description
	createResults [▶ 1612]	Creates the SumCommand results (abstract) (Overrides SumSymbolReadBase.createResults(IList.SumDataEntity., IList.ReadOnlyMemory.Byte., .AdsErrorCode..))
	Equals	Determines whether the specified object is equal to the current object. (Inherited from Object .)
	Finalize	Allows an object to try to free resources and perform other cleanup operations before it is reclaimed by garbage collection. (Inherited from Object .)
	GetHashCode	Serves as the default hash function. (Inherited from Object .)
	GetType	Gets the Type of the current instance. (Inherited from Object .)
	MemberwiseClone	Creates a shallow copy of the current Object . (Inherited from Object .)
	Read2 [▶ 1613]	Reads the Values.
	Read2Async [▶ 1614]	Read as an asynchronous operation.
	ToString	Returns a string that represents the current object. (Inherited from Object .)

Extension Methods

	Name	Description
	AllFailed [▶ 1592]	Gets a value indicating, that all SubCommands failed. (Defined by ISumCommandExtension [▶ 1591].)
	AllSucceeded [▶ 1593]	Gets a value indicating, that all SubCommands succeeded. (Defined by ISumCommandExtension [▶ 1591].)
	FirstSubError [▶ 1594]	Gets the first SubError that is not NoError [▶ 664] (Defined by ISumCommandExtension [▶ 1591].)
	OneFailed [▶ 1594]	Gets a value indicating, whether the overall Sumcommand failed (checking all subcommand results). (Defined by ISumCommandExtension [▶ 1591].)

	Name	Description
	OneSucceeded [▶ 1595]	Gets a value indicating, whether the overall SumCommand succeeded (including all subcommands) (Defined by ISumCommandExtension [▶ 1591].)
	OverallError [▶ 1595]	Gets the Overall (combined error) from SumCommand AND SubCommands. (Defined by ISumCommandExtension [▶ 1591].)
	PollValues2.ISymbol .(IObservable.Unit.) [▶ 1370]	Overloaded. Polls a series of symbols via a ISumRead2.S. [▶ 1601] command. The SumCommand will read all contained values with every trigger in one roundtrip. (Defined by ValueSymbolExtensions [▶ 1333].)
	PollValues2.ISymbol .(TimeSpan) [▶ 1372]	Overloaded. Polls a series of symbols via a ISumRead2.S. [▶ 1601] command. The SumCommand will read all contained values with every trigger. (Defined by ValueSymbolExtensions [▶ 1333].)

Remarks

The `SumAnyTypeRead` implements symbolic read with predefined value marshalling. The requested value types are specified before calling the read operation and must fit to its symbol definition. The advantage of the symbolic access is (in contrast to the handle access classes [SumHandleRead](#) [▶ 1557], [SumHandleWrite](#) [▶ 1561]) or the access by instance path ([SumInstancePathAnyTypeRead](#) [▶ 1615]) that all type information is available when using this ADS Sum Command. The disadvantage is, that the Symbolic information must be loaded before using this SumCommand, see examples. The `SumAnyTypeRead` defaults to an `InstancePath/SymbolName` read ([ValueByName](#) [▶ 1231], [ValueByName](#) [▶ 1608]).

Examples

Usage of the SumAnyTypeRead SumCommand

```
AmsAddress address = new AmsAddress(AmsNetId.Local, AmsPort.PlcRuntime_851);

CancellationTokenSource cancelSource = new CancellationTokSource();
CancellationToken cancel = cancelSource.Token;

using (AdsClient client = new AdsClient())
{
    // Connect the AdsClient to the device target.
    client.Connect(address);

    // Load symbolic information
    ISymbolLoader loader = SymbolLoaderFactory.Create(client, SymbolLoaderSettings.Default);
    var resultReadSymbols = await loader.GetSymbolsAsync(cancel);
    resultReadSymbols.ThrowOnError();

    ISymbolCollection<ISymbol> allSymbols = resultReadSymbols.Symbols;

    ISymbol var1Sym = allSymbols["GVL.bVar1"];
    ISymbol var2Sym = allSymbols["GVL.iCount"];
    ISymbol projectNameSym = allSymbols["TwinCAT_SystemInfoVarList._AppInfo.ProjectName"];

    // Define the ANY_TYPE specifiers
    List<(ISymbol, Type, int[] args)> instancePathList = new List<(ISymbol, Type, int[] args)>() {
        (var1Sym, typeof(bool), null),
        (var2Sym, typeof(short), null),
        (projectNameSym, typeof(string), new int[] {63}) // See ANY_TYPE specifications
    };
    SumAnyTypeRead sumRead = new SumAnyTypeRead(client, instancePathList);

    var resultRead = await sumRead.Read2Async(cancel);

    if (resultRead.Succeeded)
    {
        foreach (var subResult in resultRead.ValueResults)
        {
            Console.WriteLine($"Symbol: {subResult.Source}, Value: {subResult.Value}, ErrorCode: {(AdsError.ErrorCode) subResult.ErrorCode}");
        }
    }
}
```

```
var var1Value = (bool)resultRead.ValueResults[0].Value;
var var2Value = (short)resultRead.ValueResults[1].Value;
var projectName = (string)resultRead.ValueResults[2].Value;
}
```

6.5.19.1 SumAnyTypeRead Constructor

Initializes a new instance of the [SumAnyTypeRead \[▶ 1608\]](#) class.

Namespace: [TwinCAT.Ads.SumCommand \[▶ 1525\]](#)

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public SumAnyTypeRead(
    IAdsConnection connection,
    IList<ISymbol symbol, Type type, int[] > symbolSpec
)
```

Parameters

connection	Type: TwinCAT.Ads.IAdsConnection [▶ 876] The ADS Connection.
symbolSpec	Type: System.Collections.Generic.IList.ValueTuple.ISymbol [▶ 2691] , Type , .Int32... The symbols specifier (ANY_TYPE)

Reference

[SumAnyTypeRead Class \[▶ 1608\]](#)

[TwinCAT.Ads.SumCommand Namespace \[▶ 1525\]](#)

6.5.19.2 SumAnyTypeRead Methods

The [SumAnyTypeRead \[▶ 1608\]](#) type exposes the following members.

Methods

	Name	Description
	createResults [▶ 1612]	Creates the SumCommand results (abstract) (Overrides SumSymbolReadBase.createResults(IList.SumDataEntity., IList.ReadOnlyMemory.Byte..., AdsErrorCode.)
	Equals	Determines whether the specified object is equal to the current object. (Inherited from Object .)

	Name	Description
	Finalize	Allows an object to try to free resources and perform other cleanup operations before it is reclaimed by garbage collection. (Inherited from Object .)
	GetHashCode	Serves as the default hash function. (Inherited from Object .)
	GetType	Gets the Type of the current instance. (Inherited from Object .)
	MemberwiseClone	Creates a shallow copy of the current Object . (Inherited from Object .)
	Read2 [▶ 1613]	Reads the Values.
	Read2Async [▶ 1614]	Read as an asynchronous operation.
	ToString	Returns a string that represents the current object. (Inherited from Object .)

Extension Methods

	Name	Description
	AllFailed [▶ 1592]	Gets a value indicating, that all SubCommands failed. (Defined by ISumCommandExtension [▶ 1591].)
	AllSucceeded [▶ 1593]	Gets a value indicating, that all SubCommands succeeded. (Defined by ISumCommandExtension [▶ 1591].)
	FirstSubError [▶ 1594]	Gets the first SubError that is not NoError [▶ 664] (Defined by ISumCommandExtension [▶ 1591].)
	OneFailed [▶ 1594]	Gets a value indicating, whether the overall Sumcommand failed (checking all subcommand results). (Defined by ISumCommandExtension [▶ 1591].)
	OneSucceeded [▶ 1595]	Gets a value indicating, whether the overall SumCommand succeeded (including all subcommands) (Defined by ISumCommandExtension [▶ 1591].)
	OverallError [▶ 1595]	Gets the Overall (combined error) from SumCommand AND SubCommands. (Defined by ISumCommandExtension [▶ 1591].)
	PollValues2.ISymbol.(IObservable.Unit.) [▶ 1370]	Overloaded. Polls a series of symbols via a ISumRead2.S. [▶ 1601] command. The SumCommand will read all contained values with every trigger in one roundtrip. (Defined by ValueSymbolExtensions [▶ 1333].)
	PollValues2.ISymbol.(TimeSpan) [▶ 1372]	Overloaded. Polls a series of symbols via a ISumRead2.S. [▶ 1601] command. The SumCommand will read all contained values with every trigger. (Defined by ValueSymbolExtensions [▶ 1333].)

6.5.19.2.1 SumAnyTypeRead.createResults Method

Creates the SumCommand results (abstract)

Namespace: [TwinCAT.Ads.SumCommand](#) [[▶ 1525](#)]

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
protected override ResultValue2<ISymbol, Object>[] createResults(
    IList<SumDataEntity> infoList,
    IList<ReadOnlyMemory<byte>> readBlocks,
    AdsErrorCode[] subErrors
)
```

Parameters

infoList	Type: System.Collections.Generic.IList.SumDataEntity . The information list.
readBlocks	Type: System.Collections.Generic.IList.ReadOnlyMemory.Byte.. The read blocks.
subErrors	Type: .TwinCAT.Ads.AdsErrorCode [▶ 664]. The sub errors.

Return Value

Type: [.ResultValue2](#) [▶ 1234].[ISymbol](#) [▶ 2691], [Object..](#)

6.5.22 SumInstancePathAnyTypeRead Class

SumRead Command that uses the instancePath as symbol ID / Address and returns objects as Values (ANY Type marshaling)

Inheritance Hierarchy

[System.Object](#)

SumCommandWrapper.SumReadWrite.

SumInstancePathCommand.SumReadWrite, [String](#).

TwinCAT.Ads.SumCommand.SumInstancePathAnyTypeRead

Namespace: [TwinCAT.Ads.SumCommand \[▶ 1525\]](#)

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public class SumInstancePathAnyTypeRead : SumInstancePathCommand<SumReadWrite, string>
```

The SumInstancePathAnyTypeRead type exposes the following members.

Constructors

	Name	Description
	SumInstancePathAnyTypeRead [▶ 1617]	Initializes a new instance of the SumRead class.

Methods

	Name	Description
	Equals	Determines whether the specified object is equal to the current object. (Inherited from Object .)
	Finalize	Allows an object to try to free resources and perform other cleanup operations before it is reclaimed by garbage collection. (Inherited from Object .)
	GetHashCode	Serves as the default hash function. (Inherited from Object .)
	GetType	Gets the Type of the current instance. (Inherited from Object .)
	MemberwiseClone	Creates a shallow copy of the current Object . (Inherited from Object .)
	Read [▶ 1618]	Reads all the values in one ADS roundtrip and returns an result object containing all the SumCommand SubResults.
	ReadAsync [▶ 1618]	Reads all the values as an asynchronous operation in one ADS roundtrip and returns an result object containing all the SumCommand SubResults.
	ToString	Returns a string that represents the current object. (Inherited from Object .)

Remarks

The return value results will be produced by the AnyTypeMarshaler and must be predefined following the ANY_TYPE concept. Therefore a list of specifiers must be specified for the SumInstancePathAnyTypeRead constructor. The internal single value reads are done by [ValueByName](#) [[▶ 1231](#)] / [ValueByName](#) [[▶ 1608](#)].

Examples

Usage of the SumInstancePathAnyTypeRead SumCommand

```
AmsAddress address = new AmsAddress(AmsNetId.Local, AmsPort.PlcRuntime_851);

CancellationTokenSource cancelSource = new CancellationTokSource();
CancellationToken cancel = cancelSource.Token;

using (AdsClient client = new AdsClient())
{
    // Connect the AdsClient to the device target.
    client.Connect(address);

    // Load symbolic information
    ISymbolLoader loader = SymbolLoaderFactory.Create(client, SymbolLoaderSettings.Default);
    var resultReadSymbols = await loader.GetSymbolsAsync(cancel);
    resultReadSymbols.ThrowOnError();

    ISymbolCollection<ISymbol> allSymbols = resultReadSymbols.Symbols;

    ISymbol var1Sym = allSymbols["GVL.bVar1"];
    ISymbol var2Sym = allSymbols["GVL.iCount"];
    ISymbol projectNameSym = allSymbols["TwinCAT_SystemInfoVarList._AppInfo.ProjectName"];

    // Define the ANY_TYPE specifiers
    List<(ISymbol,Type,int[] args)> instancePathList = new List<(ISymbol, Type, int[] args)>() {
        (var1Sym, typeof(bool), null),
        (var2Sym, typeof(short), null),
        (projectNameSym,typeof(string),new int[] {63}) // See ANY_TYPE specifications
    };
    SumAnyTypeRead sumRead = new SumAnyTypeRead(client, instancePathList);

    var resultRead = await sumRead.Read2Async(cancel);

    if (resultRead.Succeeded)
```

```

{
    foreach (var subResult in resultRead.ValueResults)
    {
        Console.WriteLine($"Symbol: {subResult.Source}, Value: {subResult.Value}, ErrorCode: {(AdsEr
rorCode) subResult.ErrorCode}");
    }

    var var1Value = (bool)resultRead.ValueResults[0].Value;
    var var2Value = (short)resultRead.ValueResults[1].Value;
    var projectName = (string)resultRead.ValueResults[2].Value;
}

```

6.6.1 AmsTcpIpRouter Class

ADS Router class

Inheritance Hierarchy

[System.Object](#)

TwinCAT.Ads.TcpRouter.AmsTcpIpRouter

Namespace: [TwinCAT.Ads.TcpRouter](#) [▶ 1619]

Assembly: [TwinCAT.Ads.TcpRouter](#) (in [TwinCAT.Ads.TcpRouter.dll](#)) Version: 6.0.328+39e3229

Syntax

C#

```
public class AmsTcpIpRouter : IAmsRouter
```

The AmsTcpIpRouter type exposes the following members.

Constructors

	Name	Description
	AmsTcpIpRouter(AmsNetId) [▶ 1627]	Initializes a new instance of the AmsTcpIpRouter class.
	AmsTcpIpRouter(IConfiguration) [▶ 1627]	Initializes a new instance of the AmsTcpIpRouter class.
	AmsTcpIpRouter(AmsNetId, ILogger) [▶ 1629]	Initializes a new instance of the AmsTcpIpRouter class.
	AmsTcpIpRouter(ILogger, IConfiguration) [▶ 1628]	Initializes a new instance of the AmsTcpIpRouter class.

	Name	Description
	AmsTcpIpRouter(AmsNetId, Int32, IPAddress, Int32, .IPAddress, ILogger) [► 1630]	Initializes a new instance of the AmsTcpIpRouter class.
	AmsTcpIpRouter(AmsNetId, Int32, IPAddress, Int32, IPNetwork, ILogger) [► 1631]	Initializes a new instance of the AmsTcpIpRouter class.

Properties

	Name	Description
	AcceptedLoopbackIps [► 1636]	Gets the allowed loopback sources.
	AcceptedLoopbackNetwork [► 1637]	Gets the Allowed loopback network.
	IsActive [► 1633]	Gets a value indicating whether the IAmsRouter [► 1646] is active (Running or in Starting / Stopping state).
	IsRunning [► 1634]	Gets a value indicating whether the IAmsRouter [► 1646] is running (Start phase completely finished).
	LocalNetId [► 1634]	Gets the local AmsNetId [► 767]
	Logger [► 1637]	Gets the logger interface
	Loopback [► 1635]	Gets the loopback alias
	LoopbackPort [► 1638]	Gets the loopback port for internal Loopback communication (default is 0xBF02)
	NetId [► 1635]	The Local AmsNetId [► 767] of this router.
	RouterStatus [► 1636]	Gets the router status.
	Routes [► 1638]	Gets a read-only list of the routes
	TcpIpPort [► 1638]	Gets the used TCP IP Port for External communication.

Methods

	Name	Description
	AddRoute [► 1640]	Adds a dynamic Route [► 1654]
	Equals	Determines whether the specified object is equal to the current object. (Inherited from Object .)
	Finalize	Allows an object to try to free resources and perform other cleanup operations before it is reclaimed by garbage collection. (Inherited from Object .)

	Name	Description
	GetHashCode	Serves as the default hash function. (Inherited from Object .)
	GetType	Gets the Type of the current instance. (Inherited from Object .)
	IsRegisteredServer [▶ 1640]	Determines whether the Address specifies an locally registered AmsServer
	LoadRouteInfo [▶ 1644]	Loads the route information.
	MemberwiseClone	Creates a shallow copy of the current Object . (Inherited from Object .)
	RemoveRoute(AmsNetId) [▶ 1642]	Removes a dynamic Route [▶ 1654]
	RemoveRoute(String) [▶ 1641]	Removes a dynamic Route [▶ 1654]
	StartAsync [▶ 1642]	Starts the AmsTcpIpRouter asynchronously.
	Stop [▶ 1643]	Stops the AmsTcpIpRouter.
	ToString	Returns a string that represents the current object. (Inherited from Object .)
	TryAddRoute [▶ 1643]	Adds a dynamic Route [▶ 1654]

Events

	Name	Description
	RouterStatusChanged [▶ 1645]	Occurs when the router status changes.

Fields

	Name	Description
	DEFAULT_TCP_PORT [▶ 1645]	The default TCP port (0xBF02, 48898)
	TCP_TIMEOUT [▶ 1646]	The TCP timeout

Remarks

The AmsTcpIpRouter implements a simple ADS/AMS Router for systems, where no TwinCAT Router installation is available.

The Router opens two different type of communication channels

- One for the machine internal communication between AdsClients and AdsServers. This is called the ****ADS Loopback**** port and has by default the IPAddress.Loopback (172.0.0.1) and Port 0xBF02 ([DEFAULT_TCP_PORT](#) [▶ 1645])
- The other that routes the machine external communication to other TwinCAT ADS routers. This ****ADS External Channel**** is opened by default on every available IPAddress connected to a Network again on default Port 0xBF02. A ****StaticRoutes**** table (e.g. the StaticRoutes.xml of every TwinCAT System) is used to ensure security and maintain the list of remote target systems.

With this infrastructure, the AmsTcpIpRouter is able to process ADS/AMS communication in form of ADS Requests and Responses not only isolated on the local system, but also between the local system and remote systems as long they are properly configured.

For sophisticated scenarios, the default configurations can be changed to also support more than one router on one system and/or split Client/Server/Router applications in virtual environments like docker.

Property Name	Description	Default
Name	The name of the local system.	No default, must be set.
LocalNetId [▶ 1634]	The AmsNetId of the local system.	No default, must be set.
RemoteConnections	List of the registered remote Routes / Systems that can be reached remotely.	None/Empty
TcpIpPort [▶ 1638]	The TCP Port to be used for external ADS communication (**ADS External channel**)	0xBF02 (48898)
Loopback [▶ 1635]	The LoopbackIP of Device internal communication. This setting should only be changed if ADS Server and Router application should run on different (virtual) devices. On the AdsServer side an appropriate system configuration via RouterEndPoint [▶ 2006] is necessary if the LoopbackIP is changed.	Loopback 127.0.0.1
LoopbackPort	The Loopback Port of Device internal ADS communication. This setting should only be changed when different TcpPorts are necessary to separate internal and external router communication (e.g. in WSL2 docker containers) where the LoopbackIP 127.0.0.1 isn't appropriate. On the AdsServer side an appropriate system configuration via RouterEndPoint [▶ 2006] is necessary if the loopback port is changed.	0xBF02 (48898)
AcceptedLoopbackIPs [▶ 1636]	The TCP Port to be used for external ADS communication (**ADS External channel**)	0xBF02 (48898)
AcceptedLoopbackNetwork [▶ 1637]	The TCP Port to be used for external ADS communication (**ADS External channel**)	0xBF02 (48898)

The router settings can be configured by the .NET Configuration Builder [IConfigurationBuilder](#) or simply by calling one of the AmsTcpIpRouter constructor overloads.

Xml Configuration (StaticRoutes.xml)	AddStaticRoutesXmlConfiguration(IConfigurationBuilder) [▶ 1691]
Json Configuration (appSettings.json)	Microsoft.Extensions.Configuration.JsonConfigurationExtensions.AddJsonFile(string)
Environment variables	Microsoft.Extensions.Configuration.EnvironmentVariablesExtensions.AddEnvironmentVariables()
ConsoleArguments	Microsoft.Extensions.Configuration.CommandLineConfigurationExtensions.AddCommandLine(string[])

Examples

The following sample shows how to use the `AmsTcpIpRouter` class within an own Console application. This console application can also be accessed as binary from the Nuget.org package repository. The ID of the package is 'Beckhoff.TwinCAT.Ads.AdsRouterConsole'.

Ads Router WorkerService

```

class Program
{
    /// <summary>
    /// Defines the entry point of the application.
    /// </summary>
    /// <param name="args">The arguments.</param>
    public static void Main(string[] args)
    {
        try
        {
            CreateHostBuilder(args).Build().Run();
        }
        catch (OperationCanceledException /*cex*/)
        {
            Console.WriteLine("Router cancelled!");
        }
        catch (Exception ex)
        {
            Console.WriteLine($"Router failed with '{ex.Message}");
        }
    }

    /// <summary>

6.6.1.1.1 AmsTcpIpRouter Constructor (IConfiguration)

Initializes a new instance of the [AmsTcpIpRouter \[▶ 1620\]](#) class.

Namespace: [TwinCAT.Ads.TcpRouter \[▶ 1619\]](#)

Assembly: TwinCAT.Ads.TcpRouter (in TwinCAT.Ads.TcpRouter.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public AmsTcpIpRouter(
    IConfiguration configuration
)
```

Parameters

configuration	Type: Microsoft.Extensions.Configuration.IConfiguration
---------------	---

Remarks

The [AmsTcpIpRouter \[▶ 1620\]](#) will be connected to the Default port [DEFAULT_TCP_PORT \[▶ 1645\]](#).

Reference

Initializes a new instance of the [AmsTcpIpRouter \[▶ 1620\]](#) class.

Namespace: [TwinCAT.Ads.TcpRouter \[▶ 1619\]](#)

Assembly: TwinCAT.Ads.TcpRouter (in TwinCAT.Ads.TcpRouter.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public AmsTcpIpRouter(
    AmsNetId local
)
```

Parameters

local	Type: TwinCAT.Ads.AmsNetId [▸ 767] The local.
-------	--

Remarks

The [AmsTcpIpRouter \[▸ 1620\]](#) will be connected to the Default port [DEFAULT_TCP_PORT \[▸ 1645\]](#).

Reference

Initializes a new instance of the [AmsTcpIpRouter \[▸ 1620\]](#) class.

Namespace: [TwinCAT.Ads.TcpRouter \[▸ 1619\]](#)

Assembly: TwinCAT.Ads.TcpRouter (in TwinCAT.Ads.TcpRouter.dll) Version: 6.0.328+39e3229

Syntax**C#**

```
public AmsTcpIpRouter(
    ILogger? logger,
    IConfiguration configuration
)
```

Parameters

logger	Type: Microsoft.Extensions.Logging.ILogger The logger.
configuration	Type: Microsoft.Extensions.Configuration.IConfiguration The configuration.

Exceptions

Exception	Condition
Exception	No IPv4 address for server

Remarks

The [AmsTcpIpRouter \[▸ 1620\]](#) will be connected to the Default port [DEFAULT_TCP_PORT \[▸ 1645\]](#).

Reference

6.6.1.1.4 AmsTcpIpRouter Constructor (AmsNetId, Int32, IPAddress, Int32, ILogger)

Initializes a new instance of the [AmsTcpIpRouter \[▸ 1620\]](#) class.

Namespace: [TwinCAT.Ads.TcpRouter](#) [[▶ 1619](#)]

Assembly: TwinCAT.Ads.TcpRouter (in TwinCAT.Ads.TcpRouter.dll) Version: 5.0.294+Branch.releases-5.0.Sha.90bb9a1b43b6095934fddca3e72bc0ea15da1c14

Syntax

C#

```
public AmsTcpIpRouter(
    AmsNetId local,
    int externalPort,
    IPAddress loopbackIP,
    int loopbackPort,
    ILogger logger
)
```

Parameters

- local Type: [TwinCAT.Ads.AmsNetId](#) [[▶ 767](#)]
The (enforced) local NET Id.
- externalPort Type: [System.Int32](#)
The TCP/IP port the [AmsTcplpRouter](#) [[▶ 1620](#)] is using.
- loopbackIP Type: [System.Net.IPAddress](#)
The loopback ip.
- loopbackPort Type: [System.Int32](#)
The loopback port.
- logger Type: [ILogger](#)
The logger.

Remarks

This constructor doesn't read the 'StaticRoutes.xml'. Instead, it is expected to force the local [AmsNetId](#) [[▶ 767](#)], the TCP/IP port and add the routes as Dynamic routes.

6.6.1.1.6 AmsTcpIpRouter Constructor (AmsNetId, Int32, IPAddress, Int32, .IPAddress., ILogger)

Initializes a new instance of the [AmsTcpIpRouter](#) [▶ 1620] class.

Namespace: [TwinCAT.Ads.TcpRouter](#) [▶ 1619]

Assembly: TwinCAT.Ads.TcpRouter (in TwinCAT.Ads.TcpRouter.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public AmsTcpIpRouter(
    AmsNetId local,
    int externalPort,
    IPAddress? loopbackIP,
    int loopbackPort,
    IPAddress[]? loopbackCommunicationIPs,
    ILogger? logger
)
```

Parameters

local	Type: TwinCAT.Ads.AmsNetId [▶ 767] The (enforced) local NET Id.
externalPort	Type: System.Int32 The TCP/IP port the AmsTcpIpRouter [▶ 1620] is using.
loopbackIP	Type: System.Net.IPAddress The loopback ip.
loopbackPort	Type: System.Int32 The loopback port.
loopbackCommunicationIPs	Type: .System.Net.IPAddress . The loopback communication sources.
logger	Type: Microsoft.Extensions.Logging.ILogger The logger.

Remarks

This constructor doesn't read the 'StaticRoutes.xml'. Instead, it is expected to force the local [AmsNetId](#) [▶ 767], the TCP/IP port and add the routes as Dynamic routes.

6.6.1.2 AmsTcpIpRouter Properties

The [AmsTcpIpRouter \[▶ 1620\]](#) type exposes the following members.

Properties

	Name	Description
	AcceptedLoopbackPs [▶ 1636]	Gets the allowed loopback sources.
	AcceptedLoopbackNetwork [▶ 1637]	Gets the Allowed loopback network.
	IsActive [▶ 1633]	Gets a value indicating whether the IAmsRouter [▶ 1646] is active (Running or in Starting / Stopping state).
	IsRunning [▶ 1634]	Gets a value indicating whether the IAmsRouter [▶ 1646] is running (Start phase completely finished).
	LocalNetId [▶ 1634]	Gets the local AmsNetId [▶ 767]
	Logger [▶ 1637]	Gets the logger interface
	Loopback [▶ 1635]	Gets the loopback alias
	LoopbackPort [▶ 1638]	Gets the loopback port for internal Loopback communication (default is 0xBF02)
	NetId [▶ 1635]	The Local AmsNetId [▶ 767] of this router.
	RouterStatus [▶ 1636]	Gets the router status.
	Routes [▶ 1638]	Gets a read-only list of the routes
	TcpIpPort [▶ 1638]	Gets the used TCP IP Port for External communication.

Reference

[AmsTcpIpRouter Class \[▶ 1620\]](#)

[TwinCAT.Ads.TcpRouter Namespace \[▶ 1619\]](#)

6.6.1.2.1 AmsTcpIpRouter.IsActive Property

Gets a value indicating whether the [IAmsRouter \[▶ 1646\]](#) is active (Running or in Starting / Stopping state).

Namespace: [TwinCAT.Ads.TcpRouter \[▶ 1619\]](#)

Assembly: TwinCAT.Ads.TcpRouter (in TwinCAT.Ads.TcpRouter.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public bool IsActive { get; }
```

Property Value

Type: [Boolean](#)

true if this the router is active; otherwise, false.

Implements

[IAmsRouter.IsActive](#) [[▶ 1648](#)]

Reference

[AmsTcpIpRouter Class](#) [[▶ 1620](#)]

[TwinCAT.Ads.TcpRouter Namespace](#) [[▶ 1619](#)]

6.6.1.2.2 AmsTcpIpRouter.IsRunning Property

Gets a value indicating whether the [IAmsRouter](#) [[▶ 1646](#)] is running (Start phase completely finished).

Namespace: [TwinCAT.Ads.TcpRouter](#) [[▶ 1619](#)]

Assembly: TwinCAT.Ads.TcpRouter (in TwinCAT.Ads.TcpRouter.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public bool IsRunning { get; }
```

Property Value

Type: [Boolean](#)

true if this the router is running; otherwise, false.

Implements

[IAmsRouter.IsRunning](#) [[▶ 1648](#)]

Reference

[AmsTcpIpRouter Class](#) [[▶ 1620](#)]

6.6.1.2.3 AmsTcpIpRouter.LocalNetId Property

Gets the local [AmsNetId](#) [[▶ 767](#)]

Namespace: [TwinCAT.Ads.TcpRouter](#) [[▶ 1619](#)]

Assembly: TwinCAT.Ads.TcpRouter (in TwinCAT.Ads.TcpRouter.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public static AmsNetId? LocalNetId { get; }
```

Property Value

Type: [AmsNetId](#) [[▶ 767](#)]

The local net identifier.

Remarks

This is initialized during the execution of the [AmsTcpIpRouter \[▸ 1620\]](#) constructor.

Reference

[AmsTcpIpRouter Class \[▸ 1620\]](#)

Namespace: [TwinCAT.Ads.TcpRouter \[▸ 1619\]](#)

Assembly: TwinCAT.Ads.TcpRouter (in TwinCAT.Ads.TcpRouter.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public AmsNetId? NetId { get; }
```

Property Value

Type: [AmsNetId \[▸ 767\]](#)

The net identifier.

Implements

[IAmsRouter.NetId \[▸ 1648\]](#)

Reference

[AmsTcpIpRouter Class \[▸ 1620\]](#)

[TwinCAT.Ads.TcpRouter Namespace \[▸ 1619\]](#)

6.6.1.2.6 AmsTcpIpRouter.RouterStatus Property

Gets the router status.

Namespace: [TwinCAT.Ads.TcpRouter](#) [[▶ 1619](#)]

Assembly: TwinCAT.Ads.TcpRouter (in TwinCAT.Ads.TcpRouter.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public RouterStatus RouterStatus { get; }
```

Property Value

Type: [RouterStatus](#) [[▶ 1687](#)]

The router status.

Implements

[IAmsRouter.RouterStatus](#) [[▶ 1649](#)]

Reference

[AmsTcpIpRouter Class](#) [[▶ 1620](#)]

[TwinCAT.Ads.TcpRouter Namespace](#) [[▶ 1619](#)]

[AmsTcpIpRouter.RouterStatusChanged](#) [[▶ 1645](#)]

6.6.1.2.7 AmsTcpIpRouter.AcceptedLoopbackIPs Property

Gets the allowed loopback sources.

Namespace: [TwinCAT.Ads.TcpRouter](#) [[▶ 1619](#)]

Assembly: TwinCAT.Ads.TcpRouter (in TwinCAT.Ads.TcpRouter.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public IPAddress[]? AcceptedLoopbackIPs { get; }
```

Property Value

Type: [.IPAddress](#).

The allowed loopback sources.

Remarks

These are the Loopback sources that can use the configured Loopback for communication

Remarks

This array specifies the range of valid (external) IPAddresses that are allowed to use the now 'virtual' internal Loopback TCP socket. If not set, the [AmsTcpIpRouter](#) [[▶ 1620](#)] allows on the internal Loopback socket only connections from the same machine. These connections are used for the 'internal' bidirectional communication between Router and AdsClient/AdsServer. To enable sophisticated scenarios (e.g. virtualization of AdsClient or AdsServer applications running in a decoupled environment/container independant of the Router) the accepted Network can be set. The specified network then forms a virtual ADS Device using the Device internal loopback port. This property can be used as an alternative to AcceptedLoopbackIPs.

6.6.1.2.8 AmsTcpIpRouter.AcceptedLoopbackNetwork Property

Gets the Allowed loopback network.

Namespace: [TwinCAT.Ads.TcpRouter](#) [► 1619]

Assembly: TwinCAT.Ads.TcpRouter (in TwinCAT.Ads.TcpRouter.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public IPNetwork? AcceptedLoopbackNetwork { get; }
```

Property Value

Type: [IPNetwork](#)

The allowed loopback network in CIDR notation

Remarks

This subnet specifies the range of valid (external) IPAddresses that are allowed to use the now 'virtual' internal Loopback TCP socket. If not set, the [AmsTcpIpRouter](#) [► 1620] allows on the internal Loopback socket only connections from the same machine. These connections are used for the 'internal' bidirectional communication between Router and AdsClient/AdsServer. To enable sophisticated scenarios (e.g. virtualization of AdsClient or AdsServer applications running in a decoupled environment/container independant of the Router) the accepted Network can be set. The specified network then forms a virtual ADS Device using the Device internal loopback port. This property can be used as an alternative to [AcceptedLoopbackIPs](#) [► 1636].

[TwinCAT.Ads.TcpRouter Namespace](#) [► 1619]

6.6.1.2.10 AmsTcpIpRouter.LoopbackPort Property

Gets the loopback port for internal Loopback communication (default is 0xBF02)

Namespace: [TwinCAT.Ads.TcpRouter](#) [► 1619]

Assembly: TwinCAT.Ads.TcpRouter (in TwinCAT.Ads.TcpRouter.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public int LoopbackPort { get; }
```

Property Value

Type: [Int32](#)

The loopback port.

Reference

[AmsTcpIpRouter Class](#) [► 1620]

[TwinCAT.Ads.TcpRouter Namespace](#) [► 1619]

6.6.1.2.11 AmsTcpIpRouter.Routes Property

Gets a read-only list of the routes

Namespace: [TwinCAT.Ads.TcpRouter](#) [► 1619]

Assembly: TwinCAT.Ads.TcpRouter (in TwinCAT.Ads.TcpRouter.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public IReadOnlyList<Route> Routes { get; }
```

Property Value

Type: [IReadOnlyList.Route](#) [► 1654].

The routes.

Implements

[IAmsRouter.Routes](#) [► 1649]

Reference

[AmsTcpIpRouter Class](#) [► 1620]

[TwinCAT.Ads.TcpRouter Namespace](#) [► 1619]

6.6.1.2.12 AmsTcpIpRouter.TcpIpPort Property

Gets the used TCP IP Port for External communication.

Namespace: [TwinCAT.Ads.TcpRouter](#) [[▶ 1619](#)]

Assembly: TwinCAT.Ads.TcpRouter (in TwinCAT.Ads.TcpRouter.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public int TcpIpPort { get; }
```

Property Value

Type: [Int32](#)
 The TCP ip port.

Reference

6.6.1.3 AmsTcpIpRouter Methods

The [AmsTcpIpRouter](#) [[▶ 1620](#)] type exposes the following members.

Methods

	Name	Description
	AddRoute [▶ 1640]	Adds a dynamic Route [▶ 1654]
	Equals	Determines whether the specified object is equal to the current object. (Inherited from Object .)
	Finalize	Allows an object to try to free resources and perform other cleanup operations before it is reclaimed by garbage collection. (Inherited from Object .)
	GetHashCode	Serves as the default hash function. (Inherited from Object .)
	GetType	Gets the Type of the current instance. (Inherited from Object .)
	IsRegisteredServer [▶ 1640]	Determines whether the Address specifies an locally registered AmsServer
	LoadRouteInfo [▶ 1644]	Loads the route information.
	MemberwiseClone	Creates a shallow copy of the current Object . (Inherited from Object .)
	RemoveRoute(AmsNetId) [▶ 1642]	Removes a dynamic Route [▶ 1654]
	RemoveRoute(String) [▶ 1641]	Removes a dynamic Route [▶ 1654]
	StartAsync [▶ 1642]	Starts the AmsTcpIpRouter [▶ 1620] asynchronously.
	Stop [▶ 1643]	Stops the AmsTcpIpRouter [▶ 1620].
	ToString	Returns a string that represents the current object. (Inherited from Object .)
	TryAddRoute [▶ 1643]	Adds a dynamic Route [▶ 1654]

6.6.2 IAmsRouter Interface

Interface IAmsRouter

Namespace: [TwinCAT.Ads.TcpRouter](#) [[▶ 1619](#)]

Assembly: TwinCAT.Ads.TcpRouter (in TwinCAT.Ads.TcpRouter.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public interface IAmsRouter
```

The IAmsRouter type exposes the following members.

Properties

	Name	Description
	IsActive [▶ 1648]	Gets a value indicating whether the IAmsRouter is active (Running or in Starting / Stopping state).
	IsRunning [▶ 1648]	Gets a value indicating whether the IAmsRouter is running (Start phase completely finished).

	Name	Description
	NetId [▶ 1648]	The Local AmsNetId [▶ 767] of the IAmsRouter
	RouterStatus [▶ 1649]	Gets the router status.
	Routes [▶ 1649]	Gets a read-only list of the routes

Methods

	Name	Description
	AddRoute [▶ 1650]	Adds a dynamic Route [▶ 1654]
	RemoveRoute(AmsNetId) [▶ 1651]	Removes a dynamic Route [▶ 1654]
	RemoveRoute(String) [▶ 1651]	Removes a dynamic Route [▶ 1654]
	StartAsync [▶ 1652]	Starts the IAmsRouter asynchronously.
	Stop [▶ 1652]	Stops the IAmsRouter .
	TryAddRoute [▶ 1653]	Adds a dynamic Route [▶ 1654]

Events

	Name	Description
	RouterStatusChanged [▶ 1654]	Occurs when the router status changes.

Reference

6.6.3 Route Class

Class Route specifies a an AMS/ADS Route object.

Inheritance Hierarchy

[System.Object](#)

[TwinCAT.Ads.TcpRouter.Route](#)

Namespace: [TwinCAT.Ads.TcpRouter](#) [[▶ 1619](#)]

Assembly: TwinCAT.Ads.TcpRouter (in TwinCAT.Ads.TcpRouter.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public class Route
```

The Route type exposes the following members.

Constructors

	Name	Description
	Route(String, AmsNetId, IList<IPAddress>) [▶ 1656]	Initializes a new instance of the Route class.
	Route(String, AmsNetId, String) [▶ 1656]	Initializes a new instance of the Route class.

Properties

	Name	Description
	Address [▶ 1657]	Gets the address of the Route.
	HostName [▶ 1658]	Gets the Host name of the route.

	Name	Description
	IPAddresses [▶ 1658]	Gets the resolved IP Addresses belonging to this Route.
	IsHostNameAddress ed [▶ 1659]	Gets a value indicating whether this instance is an HostName Route.
	IsIPAddressed [▶ 1659]	Gets a value indicating whether the Route address specifies an IPAddress
	IsResolved [▶ 1659]	Gets a value indicating whether the IPAddresses are resolved.
	Name [▶ 1660]	Gets the name of the Route.
	NetId [▶ 1660]	Gets the AmsNetId [▶ 767] of the route.

Methods

	Name	Description
	Equals [▶ 1661]	Determines whether the specified Object is equal to this instance. (Overrides Object.Equals(Object) .)
	Finalize	Allows an object to try to free resources and perform other cleanup operations before it is reclaimed by garbage collection. (Inherited from Object .)
	GetHashCode [▶ 1662]	Returns a hash code for this instance. (Overrides Object.GetHashCode() .)
	GetType	Gets the Type of the current instance. (Inherited from Object .)
	MemberwiseClone	Creates a shallow copy of the current Object . (Inherited from Object .)
	ToString [▶ 1662]	Returns a String that represents this instance. (Overrides Object.ToString() .)

Operators

	Name	Description
	Equality [▶ 1663]	Implements the == operator.
	Inequality [▶ 1663]	Implements the != operator.

6.6.3.1 Route Constructor

Overload List

	Name	Description
	Route (String , AmsNetId , IList.IPAddress) [▶ 1656]	Initializes a new instance of the Route [▶ 1654] class.

	Name	Description
	Route(String, AmsNetId, String) [► 1656]	Initializes a new instance of the Route [► 1654] class.

Reference

[Route Class \[► 1654\]](#)

[TwinCAT.Ads.TcpRouter Namespace \[► 1619\]](#)

6.6.3.1.1 Route Constructor (String, AmsNetId, IList.IPAddress.)

Initializes a new instance of the [Route \[► 1654\]](#) class.

Namespace: [TwinCAT.Ads.TcpRouter \[► 1619\]](#)

Assembly: TwinCAT.Ads.TcpRouter (in TwinCAT.Ads.TcpRouter.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public Route(
    string name,
    AmsNetId netId,
    IList<IPAddress> ips
)
```

Parameters

name	Type: System.String The name of the route.
netId	Type: TwinCAT.Ads.AmsNetId [► 767] The net identifier.
ips	Type: System.Collections.Generic.IList.IPAddress. The ips.

Reference

[TwinCAT.Ads.TcpRouter Namespace \[► 1619\]](#)

6.6.3.1.2 Route Constructor (String, AmsNetId, String)

Initializes a new instance of the [Route \[► 1654\]](#) class.

Namespace: [TwinCAT.Ads.TcpRouter \[► 1619\]](#)

Assembly: TwinCAT.Ads.TcpRouter (in TwinCAT.Ads.TcpRouter.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public Route(
    string name,
    AmsNetId netId,
    string address
)
```

Parameters

name	Type: System.String The name.
netId	Type: TwinCAT.Ads.AmsNetId [▶ 767] The AmsNetId of the route.
address	Type: System.String The address (HostName or IP)

Reference

6.6.3.2 Route Properties

The [Route](#) [[▶ 1654](#)] type exposes the following members.

Properties

	Name	Description
	Address [▶ 1657]	Gets the address of the Route [▶ 1654].
	HostName [▶ 1658]	Gets the Host name of the route.
	IPAddresses [▶ 1658]	Gets the resolved IP Addresses belonging to this Route [▶ 1654].
	IsHostNameAddress [▶ 1659]	Gets a value indicating whether this instance is an HostName Route [▶ 1654].
	IsIPAddressed [▶ 1659]	Gets a value indicating whether the Route address specifies an IP Address
	IsResolved [▶ 1659]	Gets a value indicating whether the IPAddresses are resolved.
	Name [▶ 1660]	Gets the name of the Route [▶ 1654].
	NetId [▶ 1660]	Gets the AmsNetId [▶ 767] of the route.

Reference

[Route Class](#) [[▶ 1654](#)]

[TwinCAT.Ads.TcpRouter Namespace](#) [[▶ 1619](#)]

6.6.3.2.1 Route.Address Property

Gets the address of the [Route](#) [[▶ 1654](#)].

Namespace: [TwinCAT.Ads.TcpRouter](#) [[▶ 1619](#)]

Assembly: [TwinCAT.Ads.TcpRouter](#) (in [TwinCAT.Ads.TcpRouter.dll](#)) Version: 6.0.328+39e3229

Syntax

C#

```
public string Address { get; }
```

Property Value

Type: [String](#)
The address.

Remarks

The Address can be the IPAddress / or the host name of the target system.

Reference

[Route Class](#) [► 1654]

[TwinCAT.Ads.TcpRouter Namespace](#) [► 1619]

6.6.3.2.2 Route.HostName Property

Gets the Host name of the route.

Namespace: [TwinCAT.Ads.TcpRouter](#) [► 1619]

Assembly: TwinCAT.Ads.TcpRouter (in TwinCAT.Ads.TcpRouter.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public string HostName { get; }
```

Property Value

Type: [String](#)
The name of the host.

Reference

[Route Class](#) [► 1654]

[TwinCAT.Ads.TcpRouter Namespace](#) [► 1619]

6.6.3.2.3 Route.IPAddresses Property

Gets the resolved IP Addresses belonging to this [Route](#) [► 1654].

Namespace: [TwinCAT.Ads.TcpRouter](#) [► 1619]

Assembly: TwinCAT.Ads.TcpRouter (in TwinCAT.Ads.TcpRouter.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public IPAddress[]? IPAddresses { get; }
```

Property Value

Type: [.IPAddress](#).
The ip addresses.

Reference

[Route Class](#) [► 1654]

[TwinCAT.Ads.TcpRouter Namespace](#) [► 1619]

6.6.3.2.4 Route.IsHostNameAddressed Property

Gets a value indicating whether this instance is an [HostName](#) [Route](#) [► 1654].

Namespace: [TwinCAT.Ads.TcpRouter](#) [► 1619]

Assembly: TwinCAT.Ads.TcpRouter (in TwinCAT.Ads.TcpRouter.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public bool IsHostNameAddressed { get; }
```

Property Value

Type: [Boolean](#)

true if this instance is an [HostName](#) Addressed route; otherwise, false.

Reference

[Route Class](#) [► 1654]

[TwinCAT.Ads.TcpRouter Namespace](#) [► 1619]

6.6.3.2.5 Route.IsIPAddressed Property

Gets a value indicating whether the [Route](#) address specifies an [IPAddress](#)

Namespace: [TwinCAT.Ads.TcpRouter](#) [► 1619]

Assembly: TwinCAT.Ads.TcpRouter (in TwinCAT.Ads.TcpRouter.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public bool IsIPAddressed { get; }
```

Property Value

Type: [Boolean](#)

true if the [Address](#) is an [IPAddress](#); otherwise when its specified as [HostAddress](#) false.

Reference

[Route Class](#) [► 1654]

[TwinCAT.Ads.TcpRouter Namespace](#) [► 1619]

6.6.3.2.6 Route.IsResolved Property

Gets a value indicating whether the [IPAddresses](#) are resolved.

Namespace: [TwinCAT.Ads.TcpRouter](#) [► 1619]

Assembly: TwinCAT.Ads.TcpRouter (in TwinCAT.Ads.TcpRouter.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public bool IsResolved { get; }
```

Property Value

Type: [Boolean](#)

true if the IP Addresses are resolved; otherwise, false.

Reference

[Route Class](#) [► 1654]

[TwinCAT.Ads.TcpRouter Namespace](#) [► 1619]

6.6.3.2.7 Route.Name Property

Gets the name of the [Route](#) [► 1654].

Namespace: [TwinCAT.Ads.TcpRouter](#) [► 1619]

Assembly: TwinCAT.Ads.TcpRouter (in TwinCAT.Ads.TcpRouter.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public string Name { get; }
```

Property Value

Type: [String](#)

The name.

Reference

[Route Class](#) [► 1654]

[TwinCAT.Ads.TcpRouter Namespace](#) [► 1619]

6.6.3.2.8 Route.NetId Property

Gets the [AmsNetId](#) [► 767] of the route.

Namespace: [TwinCAT.Ads.TcpRouter](#) [► 1619]

Assembly: TwinCAT.Ads.TcpRouter (in TwinCAT.Ads.TcpRouter.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public AmsNetId NetId { get; }
```

Property Value

Type: [AmsNetId](#) [► 767]

The AmsNetId.

Remarks

The [AmsNetId](#) [► 767] is the unique identifier used for the route.

Reference

[Route Class \[▶ 1654\]](#)

6.6.3.3 Route Methods

The [Route \[▶ 1654\]](#) type exposes the following members.

Methods

	Name	Description
	Equals [▶ 1661]	Determines whether the specified <u>Object</u> is equal to this instance. (Overrides <u>Object.Equals(Object).</u>)
	Finalize	Allows an object to try to free resources and perform other cleanup operations before it is reclaimed by garbage collection. (Inherited from <u>Object.</u>)
	GetHashCode [▶ 1662]	Returns a hash code for this instance. (Overrides <u>Object.GetHashCode.</u>)
	GetType	Gets the <u>Type</u> of the current instance. (Inherited from <u>Object.</u>)
	MemberwiseClone	Creates a shallow copy of the current <u>Object</u> . (Inherited from <u>Object.</u>)
	ToString [▶ 1662]	Returns a <u>String</u> that represents this instance. (Overrides <u>Object.ToString.</u>)

Reference

[Route Class \[▶ 1654\]](#)

[TwinCAT.Ads.TcpRouter Namespace \[▶ 1619\]](#)

6.6.3.3.1 Route.Equals Method

Determines whether the specified Object is equal to this instance.

Namespace: [TwinCAT.Ads.TcpRouter \[▶ 1619\]](#)

Assembly: TwinCAT.Ads.TcpRouter (in TwinCAT.Ads.TcpRouter.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public override bool Equals(
    Object? obj
)
```

Parameters

obj	Type: System.Object The object to compare with the current object.
-----	---

Return Value

Type: [Boolean](#)

true if the specified Object is equal to this instance; otherwise, false.

Reference

[Route Class](#) [► 1654]

[TwinCAT.Ads.TcpRouter Namespace](#) [► 1619]

6.6.3.3.2 Route.GetHashCode Method

Returns a hash code for this instance.

Namespace: [TwinCAT.Ads.TcpRouter](#) [► 1619]

Assembly: TwinCAT.Ads.TcpRouter (in TwinCAT.Ads.TcpRouter.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public override int GetHashCode()
```

Return Value

Type: [Int32](#)

A hash code for this instance, suitable for use in hashing algorithms and data structures like a hash table.

Reference

[Route Class](#) [► 1654]

[TwinCAT.Ads.TcpRouter Namespace](#) [► 1619]

6.6.3.3.3 Route.ToString Method

Returns a [String](#) that represents this instance.

Namespace: [TwinCAT.Ads.TcpRouter](#) [► 1619]

Assembly: TwinCAT.Ads.TcpRouter (in TwinCAT.Ads.TcpRouter.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public override string ToString()
```

Return Value

Type: [String](#)

A [String](#) that represents this instance.

Reference

[Route Class](#) [► 1654]

[TwinCAT.Ads.TcpRouter Namespace](#) [► 1619]

6.6.3.4 Route Operators

The [Route](#) [► 1654] type exposes the following members.

Operators

	Name	Description
 	Equality [▶ 1663]	Implements the == operator.
 	Inequality [▶ 1663]	Implements the != operator.

Reference

[Route Class \[▶ 1654\]](#)

[TwinCAT.Ads.TcpRouter Namespace \[▶ 1619\]](#)

6.6.3.4.1 Route.Equality Operator

Implements the == operator.

Namespace: [TwinCAT.Ads.TcpRouter \[▶ 1619\]](#)

Assembly: TwinCAT.Ads.TcpRouter (in TwinCAT.Ads.TcpRouter.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public static bool operator ==(
    Route? o1,
    Route? o2
)
```

Parameters

o1	Type: TwinCAT.Ads.TcpRouter.Route [▶ 1654] The o1.
o2	Type: TwinCAT.Ads.TcpRouter.Route [▶ 1654] The o2.

Return Value

Type: [Boolean](#)
The result of the operator.

Reference

[Route Class \[▶ 1654\]](#)

[TwinCAT.Ads.TcpRouter Namespace \[▶ 1619\]](#)

6.6.3.4.2 Route.Inequality Operator

Implements the != operator.

Namespace: [TwinCAT.Ads.TcpRouter \[▶ 1619\]](#)

Assembly: TwinCAT.Ads.TcpRouter (in TwinCAT.Ads.TcpRouter.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public static bool operator !=(
    Route? o1,
    Route? o2
)
```

Parameters

o1	Type: TwinCAT.Ads.TcpRouter.Route [► 1654] The o1.
o2	Type: TwinCAT.Ads.TcpRouter.Route [► 1654] The o2.

Return Value

Type: [Boolean](#)
The result of the operator.

Reference

[Route Class](#) [► 1654]

[TwinCAT.Ads.TcpRouter Namespace](#) [► 1619]

6.6.4 RouteCollection Class

Collection of routes.

Inheritance Hierarchy

[System.Object](#)

[TwinCAT.Ads.TcpRouter.RouteCollection](#)

Namespace: [TwinCAT.Ads.TcpRouter](#) [► 1619]

Assembly: [TwinCAT.Ads.TcpRouter](#) (in [TwinCAT.Ads.TcpRouter.dll](#)) Version: 6.0.328+39e3229

Syntax

C#

```
public class RouteCollection : IList<Route>,
    ICollection<Route>, IEnumerable<Route>, IEnumerable
```

The [RouteCollection](#) type exposes the following members.

Constructors

	Name	Description
	RouteCollection. [► 1666]	Initializes a new instance of the RouteCollection class.
	RouteCollection(IEnumerable.Route.) [► 1666]	Initializes a new instance of the RouteCollection class (copy constructor)

Properties

	Name	Description
	Count [▶ 1667]	Gets the number of elements contained in the ICollection.T.
	IsReadOnly [▶ 1667]	Gets a value indicating whether the ICollection.T. is read-only.
	Item [▶ 1668]	Gets or sets the Route [▶ 1654] at the specified index.

Methods

	Name	Description
	Add [▶ 1670]	Adds an item to the ICollection.T.
	AddRange [▶ 1670]	Adds a range of routes.
	AsReadOnly [▶ 1677]	Ases the read only.
	Clear [▶ 1671]	Removes all items from the ICollection.T.
	Clone [▶ 1671]	Clones this instance.
	Contains [▶ 1671]	Determines whether the ICollection.T. contains a specific value.
	CopyTo [▶ 1672]	Copies the elements of the ICollection.T. to an Array , starting at a particular Array index.
	Equals	Determines whether the specified object is equal to the current object. (Inherited from Object.)
	Finalize	Allows an object to try to free resources and perform other cleanup operations before it is reclaimed by garbage collection. (Inherited from Object.)
	GetEnumerator [▶ 1673]	Returns an enumerator that iterates through the collection.
	GetHashCode	Serves as the default hash function. (Inherited from Object.)
	GetType	Gets the Type of the current instance. (Inherited from Object.)
	IndexOf [▶ 1673]	Determines the index of a specific item in the IList.T.
	Insert [▶ 1674]	Inserts an item to the IList.T. at the specified index.
	MemberwiseClone	Creates a shallow copy of the current Object. (Inherited from Object.)
	Remove(AmsNetId) [▶ 1675]	Removes the specified AmsNetId [▶ 767] from the RouteCollection.
	Remove(Route) [▶ 1676]	Removes the first occurrence of a specific object from the ICollection.T.
	Remove(String) [▶ 1675]	Removes the specified route from the RouteCollection.
	RemoveAt [▶ 1676]	Removes the IList.T. item at the specified index.
	ToString	Returns a string that represents the current object. (Inherited from Object.)
	TryAdd [▶ 1677]	Tries to add the route to the RouteCollection.

Reference

[TwinCAT.Ads.TcpRouter Namespace](#) [[▶ 1619](#)]

6.6.4.1 RouteCollection Constructor

Overload List

	Name	Description
	RouteCollection. [► 1666]	Initializes a new instance of the RouteCollection [► 1664] class.
	RouteCollection(IEn umerable.Route.) [► 1666]	Initializes a new instance of the RouteCollection [► 1664] class (copy constructor)

[TwinCAT.Ads.TcpRouter Namespace \[▸ 1619\]](#)

6.6.4.2.2 RouteCollection.IsReadOnly Property

Gets a value indicating whether the [ICollection.T.](#) is read-only.

Namespace: [TwinCAT.Ads.TcpRouter](#) [[▶ 1619](#)]

Assembly: TwinCAT.Ads.TcpRouter (in TwinCAT.Ads.TcpRouter.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public bool IsReadOnly { get; }
```

Property Value

Type: Boolean

true if this instance is read only; otherwise, false.

Implements

ICollection.T..IsReadOnly

Reference

[RouteCollection Class](#) [[▶ 1664](#)]

[TwinCAT.Ads.TcpRouter Namespace](#) [[▶ 1619](#)]

6.6.4.2.3 RouteCollection.Item Property

Gets or sets the [Route](#) [[▶ 1654](#)] at the specified index.

Namespace: [TwinCAT.Ads.TcpRouter](#) [[▶ 1619](#)]

Assembly: TwinCAT.Ads.TcpRouter (in TwinCAT.Ads.TcpRouter.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public Route this[
    int index
] { get; set; }
```

Parameters

index	Type: System.Int32 The index.
-------	----------------------------------

Return Value

Type: [Route](#) [[▶ 1654](#)]

Route.

Implements

ICollection.T..Item.Int32.

Exceptions

Exception	Condition
NotImplementedException	

Reference

Determines whether the [ICollection.T.](#) contains a specific value.

Namespace: [TwinCAT.Ads.TcpRouter \[▸ 1619\]](#)

Assembly: TwinCAT.Ads.TcpRouter (in TwinCAT.Ads.TcpRouter.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public bool Contains(
    Route item
)
```

Parameters

item	Type: TwinCAT.Ads.TcpRouter.Route [▶ 1654] The object to locate in the ICollection.T.
------	--

Return Value

Type: [Boolean](#)

. if item is found in the [ICollection.T.](#); otherwise, ..

Implements

[ICollection.T.Contains\(T\)](#)

Reference

[RouteCollection Class](#) [[▶ 1664](#)]

[TwinCAT.Ads.TcpRouter Namespace](#) [[▶ 1619](#)]

6.6.4.3.6 RouteCollection.CopyTo Method

Copies the elements of the [ICollection.T.](#) to an [Array](#), starting at a particular [Array](#) index.

Namespace: [TwinCAT.Ads.TcpRouter](#) [[▶ 1619](#)]

Assembly: TwinCAT.Ads.TcpRouter (in TwinCAT.Ads.TcpRouter.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public void CopyTo(
    Route[] array,
    int arrayIndex
)
```

Parameters

array	Type: .TwinCAT.Ads.TcpRouter.Route [▶ 1654]. The one-dimensional Array that is the destination of the elements copied from ICollection.T. . The Array must have zero-based indexing.
arrayIndex	Type: System.Int32 The zero-based index in array at which copying begins.

Implements

[ICollection.T.CopyTo\(T, Int32\)](#)

Reference

[RouteCollection Class](#) [[▶ 1664](#)]

[TwinCAT.Ads.TcpRouter Namespace](#) [▶ 1619]

6.6.4.3.7 RouteCollection.GetEnumerator Method

Returns an enumerator that iterates through the collection.

Namespace: [TwinCAT.Ads.TcpRouter](#) [▶ 1619]

Assembly: TwinCAT.Ads.TcpRouter (in TwinCAT.Ads.TcpRouter.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public IEnumerator<Route> GetEnumerator()
```

Return Value

Type: [IEnumerator.Route](#) [▶ 1654].

An enumerator that can be used to iterate through the collection.

Implements

[IEnumerable.T..GetEnumerator.](#)

Reference

[RouteCollection Class](#) [▶ 1664]

[TwinCAT.Ads.TcpRouter Namespace](#) [▶ 1619]

6.6.4.3.8 RouteCollection.IndexOf Method

Determines the index of a specific item in the [IList.T.](#).

Namespace: [TwinCAT.Ads.TcpRouter](#) [▶ 1619]

Assembly: TwinCAT.Ads.TcpRouter (in TwinCAT.Ads.TcpRouter.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public int IndexOf(  
    Route item  
)
```

Parameters

item	Type: TwinCAT.Ads.TcpRouter.Route [▶ 1654] The object to locate in the IList.T. .
------	--

Return Value

Type: [Int32](#)

The index of item if found in the list; otherwise, -1.

Implements

[IList.T..IndexOf\(T\)](#)

Reference[RouteCollection Class \[▶ 1664\]](#)[TwinCAT.Ads.TcpRouter Namespace \[▶ 1619\]](#)**6.6.4.3.9 RouteCollection.Insert Method**

Inserts an item to the [IList.T.](#) at the specified index.

Namespace: [TwinCAT.Ads.TcpRouter \[▶ 1619\]](#)

Assembly: TwinCAT.Ads.TcpRouter (in TwinCAT.Ads.TcpRouter.dll) Version: 6.0.328+39e3229

Syntax**C#**

```
public void Insert(
    int index,
    Route item
)
```

Parameters

index	Type: System.Int32 The zero-based index at which item should be inserted.
item	Type: TwinCAT.Ads.TcpRouter.Route [▶ 1654] The object to insert into the IList.T.

Implements

[IList.T..Insert\(Int32, T\)](#)

Exceptions

Exception	Condition
ArgumentException	Cannot add item

Reference[RouteCollection Class \[▶ 1664\]](#)[TwinCAT.Ads.TcpRouter Namespace \[▶ 1619\]](#)**6.6.4.3.10 RouteCollection.Remove Method****Overload List**

	Name	Description
	Remove(AmsNetId) [▶ 1675]	Removes the specified AmsNetId [▶ 767] from the RouteCollection [▶ 1664] .
	Remove(Route) [▶ 1676]	Removes the first occurrence of a specific object from the ICollection.T.
	Remove(String) [▶ 1675]	Removes the specified route from the RouteCollection [▶ 1664] .

6.6.5 RouterException Class

An RouterException is thrown on communication errors in the [AmsTcpIpRouter](#) [[▶ 1620](#)] class.

Inheritance Hierarchy

System.Object
 System.Exception
 TwinCAT.Ads.TcpRouter.RouterException
 [TwinCAT.Ads.TcpRouter.RouterNotInitializedException](#) [[▶ 1682](#)]
 [TwinCAT.Ads.TcpRouter.RouterNotStartedException](#) [[▶ 1684](#)]

Namespace: [TwinCAT.Ads.TcpRouter](#) [[▶ 1619](#)]

Assembly: TwinCAT.Ads.TcpRouter (in TwinCAT.Ads.TcpRouter.dll) Version: 6.0.328+39e3229

Syntax

C#

```
[SerializableAttribute]
public class RouterException : Exception
```

The RouterException type exposes the following members.

Constructors

	Name	Description
	RouterException [▶ 1679]	Initializes a new instance of the RouterException class.

Properties

	Name	Description
	Data	Gets a collection of key/value pairs that provide additional user-defined information about the exception. (Inherited from Exception.)
	HelpLink	Gets or sets a link to the help file associated with this exception. (Inherited from Exception.)
	HResult	Gets or sets HRESULT, a coded numerical value that is assigned to a specific exception. (Inherited from Exception.)
	InnerException	Gets the Exception instance that caused the current exception. (Inherited from Exception.)
	Message	Gets a message that describes the current exception. (Inherited from Exception.)
	Source	Gets or sets the name of the application or the object that causes the error. (Inherited from Exception.)
	StackTrace	Gets a string representation of the immediate frames on the call stack. (Inherited from Exception.)
	TargetSite	Gets the method that throws the current exception. (Inherited from Exception.)

Methods

	Name	Description
	Equals	Determines whether the specified object is equal to the current object. (Inherited from Object.)
	Finalize	Allows an object to try to free resources and perform other cleanup operations before it is reclaimed by garbage collection. (Inherited from Object.)
	GetBaseException	When overridden in a derived class, returns the Exception that is the root cause of one or more subsequent exceptions. (Inherited from Exception.)
	GetHashCode	Serves as the default hash function. (Inherited from Object.)
	<u>GetObjectData</u> [▶ 1681]	When overridden in a derived class, sets the SerializationInfo with information about the exception. (Overrides Exception.GetObjectData(SerializationInfo, StreamingContext).)
	GetType	Gets the runtime type of the current instance. (Inherited from Exception.)
	MemberwiseClone	Creates a shallow copy of the current Object. (Inherited from Object.)
	ToString	Creates and returns a string representation of the current exception. (Inherited from Exception.)

Events

	Name	Description
	SerializeObjectState	Obsolete. Occurs when an exception is serialized to create an exception state object that contains serialized data about the exception. (Inherited from Exception.)

Reference

6.6.5.1 RouterException Constructor

Initializes a new instance of the [RouterException \[▶ 1678\]](#) class.

Namespace: [TwinCAT.Ads.TcpRouter \[▶ 1619\]](#)

Assembly: TwinCAT.Ads.TcpRouter (in TwinCAT.Ads.TcpRouter.dll) Version: 6.0.328+39e3229

Syntax

C#

```
protected RouterException(
    SerializationInfo serializationInfo,
    StreamingContext streamingContext
)
```

Parameters

serializationInfo	Type: System.Runtime.Serialization.SerializationInfo The serialization information.
streamingContext	Type: System.Runtime.Serialization.StreamingContext The streaming context.

Reference

The [RouterException](#) [▶ 1678] type exposes the following members.

Methods

	Name	Description
	Equals	Determines whether the specified object is equal to the current object. (Inherited from Object.)
	Finalize	Allows an object to try to free resources and perform other cleanup operations before it is reclaimed by garbage collection. (Inherited from Object.)
	GetBaseException	When overridden in a derived class, returns the Exception that is the root cause of one or more subsequent exceptions. (Inherited from Exception.)
	GetHashCode	Serves as the default hash function. (Inherited from Object.)
	GetObjectData [▶ 1681]	When overridden in a derived class, sets the SerializationInfo with information about the exception. (Overrides Exception.GetObjectData(SerializationInfo, StreamingContext).)
	GetType	Gets the runtime type of the current instance. (Inherited from Exception.)
	MemberwiseClone	Creates a shallow copy of the current Object. (Inherited from Object.)
	ToString	Creates and returns a string representation of the current exception. (Inherited from Exception.)

Reference

[RouterException Class \[► 1678\]](#)

[TwinCAT.Ads.TcpRouter Namespace \[► 1619\]](#)

6.6.5.3.1 RouterException.GetObjectData Method

When overridden in a derived class, sets the `SerializationInfo` with information about the exception.

Namespace: [TwinCAT.Ads.TcpRouter \[► 1619\]](#)

Assembly: TwinCAT.Ads.TcpRouter (in TwinCAT.Ads.TcpRouter.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public override void GetObjectData(
    SerializationInfo info,
    StreamingContext context
)
```

Parameters

info	Type: System.Runtime.Serialization.SerializationInfo The <code>SerializationInfo</code> that holds the serialized object data about the exception being thrown.
context	Type: System.Runtime.Serialization.StreamingContext The <code>StreamingContext</code> that contains contextual information about the source or destination.

Implements

`ISerializable.GetObjectData(SerializationInfo, StreamingContext)`

Exceptions

Exception	Condition
<code>ArgumentNullException</code>	info

Methods

	Name	Description
	Equals	Determines whether the specified object is equal to the current object. (Inherited from Object.)
	Finalize	Allows an object to try to free resources and perform other cleanup operations before it is reclaimed by garbage collection. (Inherited from Object.)
	GetHashCode	Serves as the default hash function. (Inherited from Object.)
	GetType	Gets the Type of the current instance. (Inherited from Object.)
	MemberwiseClone	Creates a shallow copy of the current Object. (Inherited from Object.)
	ToString	Returns a string that represents the current object. (Inherited from Object.)

Fields

	Name	Description
	RouterStatus [▶ 1690]	The router status

6.6.11 StaticRoutesXmlConfigurationProvider Class

Class StaticRoutesXmlConfigurationProvider. Implements the ConfigurationProvider

Inheritance Hierarchy

System.Object

Microsoft.Extensions.Configuration.ConfigurationProvider

TwinCAT.Ads.TcpRouter.StaticRoutesXmlConfigurationProvider

Namespace: [TwinCAT.Ads.TcpRouter](#) [[▶ 1619](#)]

Assembly: TwinCAT.Ads.TcpRouter (in TwinCAT.Ads.TcpRouter.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public class StaticRoutesXmlConfigurationProvider : ConfigurationProvider
```

The StaticRoutesXmlConfigurationProvider type exposes the following members.

Constructors

	Name	Description
	StaticRoutesXmlConfigurationProvider [▶ 1693]	Initializes a new instance of the StaticRoutesXmlConfigurationProvider class.

Properties

	Name	Description
	Data	The configuration key value pairs for this provider. (Inherited from ConfigurationProvider.)

Methods

	Name	Description
	Equals	Determines whether the specified object is equal to the current object. (Inherited from Object.)
	Finalize	Allows an object to try to free resources and perform other cleanup operations before it is reclaimed by garbage collection. (Inherited from Object.)
	GetChildKeys [▶ 1694]	Returns the list of keys that this provider has. (Overrides ConfigurationProvider.GetChildKeys(IEnumerable<String>, String).)
	GetHashCode	Serves as the default hash function. (Inherited from Object.)
	GetReloadToken	Returns a IChangeToken that can be used to listen when this provider is reloaded. (Inherited from ConfigurationProvider.)
	GetType	Gets the Type of the current instance. (Inherited from Object.)
	Load [▶ 1695]	Loads (or reloads) the data for this provider. (Overrides ConfigurationProvider.Load..)
	MemberwiseClone	Creates a shallow copy of the current Object. (Inherited from Object.)
	OnReload	Triggers the reload change token and creates a new one. (Inherited from ConfigurationProvider.)
	Set	Sets a value for a given key. (Inherited from ConfigurationProvider.)
	ToString	Generates a string representing this provider name and relevant details. (Inherited from ConfigurationProvider.)
	TryGet [▶ 1695]	Attempts to find a value with the given key, returns true if one is found, false otherwise. (Overrides ConfigurationProvider.TryGet(String, String).)

6.6.11.3.1 StaticRoutesXmlConfigurationProvider.GetChildKeys Method

Returns the list of keys that this provider has.

Namespace: [TwinCAT.Ads.TcpRouter \[► 1619\]](#)

Assembly: TwinCAT.Ads.TcpRouter (in TwinCAT.Ads.TcpRouter.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public override IEnumerable<string> GetChildKeys(
    IEnumerable<string> earlierKeys,
    string? parentPath
)
```

Parameters

earlierKeys	Type: System.Collections.Generic.IEnumerable.String. The earlier keys that other providers contain.
parentPath	Type: System.String The path for the parent IConfiguration.

Return Value

Type: IEnumerable.String.
The list of keys for this provider.

Implements

IConfigurationProvider.GetChildKeys(IEnumerable.String., String)

Reference

6.6.11.3.3 StaticRoutesXmlConfigurationProvider.TryGet Method

Attempts to find a value with the given key, returns true if one is found, false otherwise.

Namespace: [TwinCAT.Ads.TcpRouter](#) [[▶ 1619](#)]

Assembly: TwinCAT.Ads.TcpRouter (in TwinCAT.Ads.TcpRouter.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public override bool TryGet(  
    string key,  
    out string?? value  
)
```

Parameters

key	Type: System.String The key to lookup.
value	Type: System.String. The value found at key if one is found.

Return Value

Type: Boolean

True if key has a value, false otherwise.

Implements

IConfigurationProvider.TryGet(String, String.)

6.7 TwinCAT.Ads.TypeSystem Namespace

Root namespace for the ADS type system.

Classes

	Class	Description
	AliasType [▸ 1699]	Alias DataType
	AlignmentCalculator [▸ 1944]	Class calculating alignments.
	ArrayType [▸ 1707]	Represents an Array DataType
	BitMappingType [▸ 1718]	Helper Data Type to implement Bit mapping types.
	DataType [▸ 1721]	DataType class
	EnumType.T. [▸ 1738]	Enum DataType [▸ 1721] .
	Field [▸ 1750]	Represents a field of an Struct/Alias/Union
	FluentRpcMethodExtension [▸ 1947]	Class FluentRpcMethodExtension .
	FluentStructTypeExtension [▸ 1955]	Class FluentStructTypeExtension .
	Instance [▸ 1765]	Instance implementation
	InterfaceType [▸ 1957]	Represents an interface type
	Member [▸ 1781]	Represents a member of an StructType [▸ 1846]
	PCCHType [▸ 1787]	Class PCCHType . This class cannot be inherited. Implements the PointerType [▸ 1790]
	PointerType [▸ 1790]	Represents a pointer type.
	PrimitiveType [▸ 1796]	Class PrimitiveType .
	PVoidType [▸ 1801]	Class PVoidType . This class cannot be inherited. Implements the PointerType [▸ 1790]
	ReferenceType [▸ 1804]	Represents a reference type
	RpcMethod [▸ 1813]	RPC Method Description

	Class	Description
	RpcMethodParameter [▶ 1824]	Class RpcMethodParameter.
	StringType [▶ 1840]	String DataType
	StructType [▶ 1846]	Represents a struct type
	SubRangeType.T. [▶ 1856]	Represents a SubRangType
	Symbol [▶ 1863]	Symbol class
 	SymbolIterator [▶ 1916]	Iterator class for enumerations of Symbols [▶ 2691].
	SymbolLoaderFactory [▶ 1923]	The class SymbolLoaderFactory [▶ 1923] is used to create a new instance of the AdsSymbolLoader initialized to the parametrized mode (SymbolBrowser V2 , new Version)
	UnionInstance [▶ 1992]	Class representing a Union Instance
	UnionType [▶ 1933]	Represents a union type
	WStringType [▶ 1938]	Represents an Unicode string (Wide string)

Interfaces

	Interface	Description
	IAdsSymbol [▶ 1755]	Interface IAdsSymbol
	IAdsSymbolLoader [▶ 1760]	Symbol Loader interface
	IContextMaskProvider [▶ 1764]	Interface IContextMaskProvider

6.7.1 AliasType Class

Alias DataType

Inheritance Hierarchy

System.Object

[TwinCAT.Ads.TypeSystem.DataType](#) [[▶ 1721](#)]

[TwinCAT.Ads.TypeSystem.AliasType](#)

Namespace: [TwinCAT.Ads.TypeSystem](#) [[▶ 1698](#)]

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public sealed class AliasType : DataType,
    IAliasType, IDatatype, IBitSize
```

The AliasType type exposes the following members.

Properties

	Name	Description
	Attributes [▶ 1727]	Gets the attributes of the IDataType [▶ 2475] (Inherited from DataType [▶ 1721].)
	BaseType [▶ 1703]	Gets the Base Type
	BaseTypeName [▶ 1703]	Gets the BaseType name
	BitSize [▶ 1727]	Gets the size of the DataType [▶ 1721] in bits. (Inherited from DataType [▶ 1721].)
	ByteSize [▶ 1728]	Gets the (aligned) size of of the Type/Instance in Bytes (Inherited from DataType [▶ 1721].)
	Category [▶ 1728]	Gets the Data Type category (Inherited from DataType [▶ 1721].)
	Comment [▶ 1729]	Gets the comment. (Inherited from DataType [▶ 1721].)
	FullName [▶ 1729]	Gets the full name of the IDataType [▶ 2475] (Namespace + Name) (Inherited from DataType [▶ 1721].)
	Id [▶ 1729]	Gets the ID of the DataType (Inherited from DataType [▶ 1721].)
	IsBitType [▶ 1730]	Gets a value indicating whether this IDataType [▶ 2475] is a bit mapping Type (Inherited from DataType [▶ 1721].)
	IsByteAligned [▶ 1730]	Indicates that the Size of the Object is Byte aligned ($\text{BitSize} \% 8 == 0$) (Inherited from DataType [▶ 1721].)
	ManagedType [▶ 1705]	Gets the corresponding .NET Type if attached. (Overrides DataType.ManagedType [▶ 1733].)
	Name [▶ 1734]	Gets the name of the Data Type (without namespace) (Inherited from DataType [▶ 1721].)
	Namespace [▶ 1734]	Gets the namespace string within the IDataType [▶ 2475] exists. (Inherited from DataType [▶ 1721].)
	Size [▶ 1735]	Gets the Size of the DataType [▶ 1721] in Bytes or bits. (Inherited from DataType [▶ 1721].)
	TypeGuid [▶ 1735]	Gets the Guid of the DataType [▶ 1721] (optional) (Inherited from DataType [▶ 1721].)

Methods

	Name	Description
	Equals	Determines whether the specified object is equal to the current object. (Inherited from Object.)
	GetHashCode	Serves as the default hash function. (Inherited from Object.)
	GetType	Gets the Type of the current instance. (Inherited from Object.)
	ToString [▶ 1706]	Returns a String that represents this instance. (Overrides DataType.ToString [▶ 1738].)

Extension Methods

	Name	Description
	IsArrayOfPrimitives [▶ 3025]	Overloaded. Determines whether the dataType is an array of Primitives. (Defined by DataTypeExtension [▶ 3021].)

	Name	Description
	IsArrayOfPrimitives(Boolean) [▶ 3025]	Overloaded. Determines whether the dataType is an array of Primitives. (Defined by DataTypeExtension [▶ 3021] .)
	IsContainer. [▶ 3027]	Overloaded. Gets a value indicating whether this IDataType [▶ 2475] is a container type (Defined by DataTypeExtension [▶ 3021] .)
	IsContainer(Boolean) [▶ 3028]	Overloaded. Gets a value indicating whether this IDataType [▶ 2475] is a container type (Defined by DataTypeExtension [▶ 3021] .)
	IsPointer [▶ 3031]	Gets a value indicating whether this IDataType [▶ 2475] is a pointer type (Defined by DataTypeExtension [▶ 3021] .)
	IsPrimitive. [▶ 3033]	Overloaded. Gets a value indicating whether this IDataType [▶ 2475] is primitive (Defined by DataTypeExtension [▶ 3021] .)
	IsPrimitive(Boolean) [▶ 3034]	Overloaded. Gets a value indicating whether this IDataType [▶ 2475] is primitive (Defined by DataTypeExtension [▶ 3021] .)
	IsReference [▶ 3036]	Gets a value indicating whether this IDataType [▶ 2475] is a reference type (Defined by DataTypeExtension [▶ 3021] .)
	ReferencesExternalData [▶ 3037]	Indicates, that the Instance value includes process memory data, that cannot be read in one memory block. (Defined by DataTypeExtension [▶ 3021] .)
	ResolvableAsPrimitive. [▶ 3039]	Overloaded. Indicates, that this data type can be resolved as primitive or primitive Array. (Defined by DataTypeExtension [▶ 3021] .)
	ResolvableAsPrimitive(Boolean) [▶ 3039]	Overloaded. Indicates, that this data type can be resolved as primitive or primitive Array. (Defined by DataTypeExtension [▶ 3021] .)
	Resolve. [▶ 3040]	Overloaded. Resolves the specified data type for AliasReference [▶ 3042] (Defined by DataTypeExtension [▶ 3021] .)
	Resolve(DataTypeResolveStrategy) [▶ 3041]	Overloaded. Resolves the specified strategy. (Defined by DataTypeExtension [▶ 3021] .)

Namespace: [TwinCAT.Ads.TypeSystem](#) [[▶ 1698](#)]

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public string BaseTypeName { get; }
```

Property Value

Type: String

Implements

[IAliasType.BaseTypeName](#) [[▶ 2440](#)]

Reference

[AliasType Class](#) [[▶ 1699](#)]

[TwinCAT.Ads.TypeSystem Namespace](#) [[▶ 1698](#)]

6.7.1.1.3 AliasType.IsContainer Property

Gets a value indicating whether this [IDataType](#) [[▶ 2475](#)] is a container type

Namespace: [TwinCAT.Ads.TypeSystem](#) [[▶ 1698](#)]

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.116+a71ced3

Syntax

C#

```
public override bool IsContainer { get; }
```

Property Value

Type: [Boolean](#)

true if this instance is container type; otherwise, false.

Implements

[IDataType.IsContainer](#) [[▶ 2480](#)]

[IDataType.IsContainer](#) [[▶ 2480](#)]

Remarks

Container Types are all types that contain SubElements like

- [Array](#) [[▶ 2111](#)]
- [Pointer](#) [[▶ 2111](#)]
- [Union](#) [[▶ 2111](#)]
- [Struct](#) [[▶ 2111](#)]
- [Function](#) [[▶ 2111](#)]
- [FunctionBlock](#) [[▶ 2111](#)]
- [Program](#) [[▶ 2111](#)]

And the [Alias](#) [[▶ 2111](#)] types, if they have a container type as base type.

Reference

[AliasType Class](#) [[▶ 1699](#)]

[TwinCAT.Ads.TypeSystem Namespace](#) [[▶ 1698](#)]

[IDataType.Category](#) [[▶ 2478](#)]

6.7.1.1.4 AliasType.IsPrimitive Property

Gets a value indicating whether this [IDataType](#) [[▶ 2475](#)] is primitive

Namespace: [TwinCAT.Ads.TypeSystem](#) [[▶ 1698](#)]

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.116+a71ced3

Syntax

C#

```
public override bool IsPrimitive { get; }
```

Property Value

Type: [Boolean](#)

true if this instance is primitive; otherwise, false.

Implements

[IDataType.IsPrimitive \[▸ 2481\]](#)

[IDataType.IsPrimitive \[▸ 2481\]](#)

Reference

[AliasType Class \[▸ 1699\]](#)

[TwinCAT.Ads.TypeSystem Namespace \[▸ 1698\]](#)

6.7.1.1.5 AliasType.ManagedType Property

Gets the corresponding .NET Type if attached.

Namespace: [TwinCAT.Ads.TypeSystem \[▸ 1698\]](#)

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public override Type? ManagedType { get; }
```

Property Value

Type: Type
Dot net type.

Reference

[AliasType Class \[▸ 1699\]](#)

[TwinCAT.Ads.TypeSystem Namespace \[▸ 1698\]](#)

6.7.1.2 AliasType Methods

The [AliasType \[▸ 1699\]](#) type exposes the following members.

Methods

	Name	Description
	Equals	Determines whether the specified object is equal to the current object. (Inherited from Object.)
	GetHashCode	Serves as the default hash function. (Inherited from Object.)
	GetType	Gets the Type of the current instance. (Inherited from Object.)
	ToString [▸ 1706]	Returns a String that represents this instance. (Overrides IDataType.ToString [▸ 1738] .)

Extension Methods

	Name	Description
	IsArrayOfPrimitives [▸ 3025]	Overloaded. Determines whether the dataType is an array of Primitives. (Defined by IDataTypeExtension [▸ 3021] .)

	Name	Description
	IsArrayOfPrimitives(Boolean) [▶ 3025]	Overloaded. Determines whether the dataType is an array of Primitives. (Defined by DataTypeExtension [▶ 3021] .)
	IsContainer. [▶ 3027]	Overloaded. Gets a value indicating whether this IDataType [▶ 2475] is a container type (Defined by DataTypeExtension [▶ 3021] .)
	IsContainer(Boolean) [▶ 3028]	Overloaded. Gets a value indicating whether this IDataType [▶ 2475] is a container type (Defined by DataTypeExtension [▶ 3021] .)
	IsPointer [▶ 3031]	Gets a value indicating whether this IDataType [▶ 2475] is a pointer type (Defined by DataTypeExtension [▶ 3021] .)
	IsPrimitive. [▶ 3033]	Overloaded. Gets a value indicating whether this IDataType [▶ 2475] is primitive (Defined by DataTypeExtension [▶ 3021] .)
	IsPrimitive(Boolean) [▶ 3034]	Overloaded. Gets a value indicating whether this IDataType [▶ 2475] is primitive (Defined by DataTypeExtension [▶ 3021] .)
	IsReference [▶ 3036]	Gets a value indicating whether this IDataType [▶ 2475] is a reference type (Defined by DataTypeExtension [▶ 3021] .)
	ReferencesExternalData [▶ 3037]	Indicates, that the Instance value includes process memory data, that cannot be read in one memory block. (Defined by DataTypeExtension [▶ 3021] .)
	ResolvableAsPrimitive. [▶ 3039]	Overloaded. Indicates, that this data type can be resolved as primitive or primitive Array. (Defined by DataTypeExtension [▶ 3021] .)
	ResolvableAsPrimitive(Boolean) [▶ 3039]	Overloaded. Indicates, that this data type can be resolved as primitive or primitive Array. (Defined by DataTypeExtension [▶ 3021] .)
	Resolve. [▶ 3040]	Overloaded. Resolves the specified data type for AliasReference [▶ 3042] (Defined by DataTypeExtension [▶ 3021] .)
	Resolve(DataTypeResolveStrategy) [▶ 3041]	Overloaded. Resolves the specified strategy. (Defined by DataTypeExtension [▶ 3021] .)

Reference

[AliasType Class \[▶ 1699\]](#)

[TwinCAT.Ads.TypeSystem Namespace \[▶ 1698\]](#)

6.7.1.2.1 AliasType.ToString Method

Returns a String that represents this instance.

Namespace: [TwinCAT.Ads.TypeSystem \[▶ 1698\]](#)

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public override string ToString()
```

Return Value

Type: String
A String that represents this instance.

Reference

[AliasType Class \[▸ 1699\]](#)

[TwinCAT.Ads.TypeSystem Namespace \[▸ 1698\]](#)

6.7.2 ArrayType Class

Represents an Array DataType

DataType class

Inheritance Hierarchy

System.Object
[TwinCAT.Ads.TypeSystem.DataType \[▸ 1721\]](#)
[TwinCAT.Ads.TypeSystem.ArrayType](#)

Namespace: [TwinCAT.Ads.TypeSystem \[▸ 1698\]](#)
Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public class ArrayType : DataType, IArrayType,
    IDataType, IBitSize
```

The ArrayType type exposes the following members.

Properties

	Name	Description
	Attributes [▸ 1727]	Gets the attributes of the IDataType [▸ 2475] (Inherited from DataType [▸ 1721] .)
	BitSize [▸ 1727]	Gets the size of the DataType [▸ 1721] in bits. (Inherited from DataType [▸ 1721] .)
	ByteSize [▸ 1728]	Gets the (aligned) size of of the Type/Instance in Bytes (Inherited from DataType [▸ 1721] .)
	Category [▸ 1728]	Gets the Data Type category (Inherited from DataType [▸ 1721] .)
	Comment [▸ 1729]	Gets the comment. (Inherited from DataType [▸ 1721] .)
	DimensionCount [▸ 1711]	Gets the dimension count.
	Dimensions [▸ 1711]	Gets the dimensions as read only collection.
	ElementCount [▸ 1712]	Gets the element count.

	Name	Description
	ElementSize [▶ 1712]	Gets the byte-size of a single element of the array
	ElementType [▶ 1712]	Gets the type of the contained elements.
	ElementTypeName [▶ 1713]	Gets the name of the element type.
	FullName [▶ 1729]	Gets the full name of the IDataType [▶ 2475] (Namespace + Name) (Inherited from DataType [▶ 1721] .)
	Id [▶ 1729]	Gets the ID of the DataType (Inherited from DataType [▶ 1721] .)
	IsBitType [▶ 1730]	Gets a value indicating whether this IDataType [▶ 2475] is a bit mapping Type (Inherited from DataType [▶ 1721] .)
	IsByteAligned [▶ 1730]	Indicates that the Size of the Object is Byte aligned (BitSize % 8 == 0) (Inherited from DataType [▶ 1721] .)
	IsJagged [▶ 1713]	Gets a value indicating whether this instance is jagged.
	IsOversampled [▶ 1714]	Gets a value indicating whether this array instance describes an oversampling type.
	JaggedLevel [▶ 1715]	Gets the jagged level (Non-Jagged Array have level 1)
	ManagedType [▶ 1715]	Gets the corresponding .NET Type if attached. (Overrides DataType.ManagedType [▶ 1733] .)
	Name [▶ 1734]	Gets the name of the Data Type (without namespace) (Inherited from DataType [▶ 1721] .)
	Namespace [▶ 1734]	Gets the namespace string within the IDataType [▶ 2475] exists. (Inherited from DataType [▶ 1721] .)
	Size [▶ 1735]	Gets the Size of the DataType [▶ 1721] in Bytes or bits. (Inherited from DataType [▶ 1721] .)
	TypeGuid [▶ 1735]	Gets the Guid of the DataType [▶ 1721] (optional) (Inherited from DataType [▶ 1721] .)

Methods

	Name	Description
	Equals	Determines whether the specified object is equal to the current object. (Inherited from Object.)
	Finalize	Allows an object to try to free resources and perform other cleanup operations before it is reclaimed by garbage collection. (Inherited from Object.)
	GetHashCode	Serves as the default hash function. (Inherited from Object.)
	GetType	Gets the Type of the current instance. (Inherited from Object.)
	MemberwiseClone	Creates a shallow copy of the current Object. (Inherited from Object.)
	SetDimensions [▶ 1717]	Sets the dimensions.
	SetElementType [▶ 1717]	Sets the type of the element.
	ToString [▶ 1738]	Returns a String that represents this instance. (Inherited from DataType [▶ 1721] .)

Extension Methods

	Name	Description
	IsArrayOfPrimitives [▶ 3025]	Overloaded. Determines whether the dataType is an array of Primitives. (Defined by DataTypeExtension [▶ 3021].)
	IsArrayOfPrimitives(Boolean) [▶ 3025]	Overloaded. Determines whether the dataType is an array of Primitives. (Defined by DataTypeExtension [▶ 3021].)
	IsContainer [▶ 3027]	Overloaded. Gets a value indicating whether this IDataType [▶ 2475] is a container type (Defined by DataTypeExtension [▶ 3021].)
	IsContainer(Boolean) [▶ 3028]	Overloaded. Gets a value indicating whether this IDataType [▶ 2475] is a container type (Defined by DataTypeExtension [▶ 3021].)
	IsPointer [▶ 3031]	Gets a value indicating whether this IDataType [▶ 2475] is a pointer type (Defined by DataTypeExtension [▶ 3021].)
	IsPrimitive [▶ 3033]	Overloaded. Gets a value indicating whether this IDataType [▶ 2475] is primitive (Defined by DataTypeExtension [▶ 3021].)
	IsPrimitive(Boolean) [▶ 3034]	Overloaded. Gets a value indicating whether this IDataType [▶ 2475] is primitive (Defined by DataTypeExtension [▶ 3021].)
	IsReference [▶ 3036]	Gets a value indicating whether this IDataType [▶ 2475] is a reference type (Defined by DataTypeExtension [▶ 3021].)
	ReferencesExternalData [▶ 3037]	Indicates, that the Instance value includes process memory data, that cannot be read in one memory block. (Defined by DataTypeExtension [▶ 3021].)
	ResolvableAsPrimitive [▶ 3039]	Overloaded. Indicates, that this data type can be resolved as primitive or primitive Array. (Defined by DataTypeExtension [▶ 3021].)
	ResolvableAsPrimitive(Boolean) [▶ 3039]	Overloaded. Indicates, that this data type can be resolved as primitive or primitive Array. (Defined by DataTypeExtension [▶ 3021].)
	Resolve [▶ 3040]	Overloaded. Resolves the specified data type for AliasReference [▶ 3042] (Defined by DataTypeExtension [▶ 3021].)
	Resolve(DataTypeResolveStrategy) [▶ 3041]	Overloaded. Resolves the specified strategy. (Defined by DataTypeExtension [▶ 3021].)

C#

```
protected void SetElementType(
    DataType elementType
)
```

Parameters

elementType	Type: TwinCAT.Ads.TypeSystem.DataType [▸ 1721] Type of the element.
-------------	--

Reference

[ArrayType Class](#) [[▸ 1707](#)]

[TwinCAT.Ads.TypeSystem Namespace](#) [[▸ 1698](#)]

6.7.3 BitMappingType Class

Helper Data Type to implement Bit mapping types.

Inheritance Hierarchy

System.Object

[TwinCAT.Ads.TypeSystem.DataType](#) [[▸ 1721](#)]

[TwinCAT.Ads.TypeSystem.BitMappingType](#)

Namespace: [TwinCAT.Ads.TypeSystem](#) [[▸ 1698](#)]

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public sealed class BitMappingType : DataType
```

The BitMappingType type exposes the following members.

Constructors

	Name	Description
	BitMappingType [▸ 1719]	Initializes a new instance of the BitMappingType class.

Properties

	Name	Description
	Attributes [▸ 1727]	Gets the attributes of the IDataType [▸ 2475] (Inherited from DataType [▸ 1721].)
	BitSize [▸ 1727]	Gets the size of the DataType [▸ 1721] in bits. (Inherited from DataType [▸ 1721].)
	ByteSize [▸ 1728]	Gets the (aligned) size of of the Type/Instance in Bytes (Inherited from DataType [▸ 1721].)
	Category [▸ 1728]	Gets the Data Type category (Inherited from DataType [▸ 1721].)
	Comment [▸ 1729]	Gets the comment. (Inherited from DataType [▸ 1721].)
	FullName [▸ 1729]	Gets the full name of the IDataType [▸ 2475] (Namespace + Name) (Inherited from DataType [▸ 1721].)

	Name	Description
	Id [▶ 1729]	Gets the ID of the DataType (Inherited from DataType [▶ 1721].)
	IsBitType [▶ 1730]	Gets a value indicating whether this IDataType [▶ 2475] is a bit mapping Type (Inherited from DataType [▶ 1721].)
	IsByteAligned [▶ 1730]	Indicates that the Size of the Object is Byte aligned (BitSize % 8 == 0) (Inherited from DataType [▶ 1721].)
	ManagedType [▶ 1733]	Gets the corresponding .NET Type if attached. (Inherited from DataType [▶ 1721].)
	Name [▶ 1734]	Gets the name of the Data Type (without namespace) (Inherited from DataType [▶ 1721].)
	Namespace [▶ 1734]	Gets the namespace string within the IDataType [▶ 2475] exists. (Inherited from DataType [▶ 1721].)
	Size [▶ 1735]	Gets the Size of the DataType [▶ 1721] in Bytes or bits. (Inherited from DataType [▶ 1721].)
	TypeGuid [▶ 1735]	Gets the Guid of the DataType [▶ 1721] (optional) (Inherited from DataType [▶ 1721].)

Methods

	Name	Description
	Equals	Determines whether the specified object is equal to the current object. (Inherited from Object.)
	GetHashCode	Serves as the default hash function. (Inherited from Object.)
	GetType	Gets the Type of the current instance. (Inherited from Object.)
	ToString [▶ 1738]	Returns a String that represents this instance. (Inherited from DataType [▶ 1721].)

6.7.3.1 BitMappingType Constructor

Initializes a new instance of the [BitMappingType \[▶ 1718\]](#) class.

Namespace: [TwinCAT.Ads.TypeSystem \[▶ 1698\]](#)

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public BitMappingType(
    string name,
    int bitSize,
    Type dotnetType
)
```

Parameters

name	Type: System.String The name.
bitSize	Type: System.Int32 The size of the type in bits.
dotnetType	Type: System.Type Type of the dotnet.

Reference

6.7.3.2 BitMappingType Properties

The [BitMappingType \[▶ 1718\]](#) type exposes the following members.

Properties

	Name	Description
	Attributes [▶ 1727]	Gets the attributes of the IDataType [▶ 2475] (Inherited from DataType [▶ 1721].)
	BitSize [▶ 1727]	Gets the size of the DataType [▶ 1721] in bits. (Inherited from DataType [▶ 1721].)
	ByteSize [▶ 1728]	Gets the (aligned) size of of the Type/Instance in Bytes (Inherited from DataType [▶ 1721].)
	Category [▶ 1728]	Gets the Data Type category (Inherited from DataType [▶ 1721].)
	Comment [▶ 1729]	Gets the comment. (Inherited from DataType [▶ 1721].)
	FullName [▶ 1729]	Gets the full name of the IDataType [▶ 2475] (Namespace + Name) (Inherited from DataType [▶ 1721].)
	Id [▶ 1729]	Gets the ID of the DataType [▶ 1721]. (Inherited from DataType [▶ 1721].)
	IsBitType [▶ 1730]	Gets a value indicating whether this IDataType [▶ 2475] is a bit mapping Type (Inherited from DataType [▶ 1721].)
	IsByteAligned [▶ 1730]	Indicates that the Size of the Object is Byte aligned (BitSize % 8 == 0) (Inherited from DataType [▶ 1721].)
	ManagedType [▶ 1733]	Gets the corresponding .NET Type if attached. (Inherited from DataType [▶ 1721].)
	Name [▶ 1734]	Gets the name of the Data Type (without namespace) (Inherited from DataType [▶ 1721].)
	Namespace [▶ 1734]	Gets the namespace string within the IDataType [▶ 2475] exists. (Inherited from DataType [▶ 1721].)
	Size [▶ 1735]	Gets the Size of the DataType [▶ 1721] in Bytes or bits. (Inherited from DataType [▶ 1721].)
	TypeGuid [▶ 1735]	Gets the Guid of the DataType [▶ 1721] (optional) (Inherited from DataType [▶ 1721].)

DataType class

Inheritance Hierarchy

System.Object
 TwinCAT.Ads.TypeSystem.DataType
[More... \[▶ 1723\]](#)

Namespace: [TwinCAT.Ads.TypeSystem \[▶ 1698\]](#)

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public class DataType : IDataType, IBitSize
```

The DataType type exposes the following members.

Constructors

	Name	Description
	DataType(DataType) [▶ 1724]	Initializes a new instance of the DataType class (copy Constructor)

	Name	Description
	<code>DataType(DataType Category)</code> [1725]	Initializes a new instance of the <code>DataType</code> class.
	<code>DataType(String, DataTypeCategory, Type)</code> [1725]	Initializes a new instance of the <code>DataType</code> class.

Properties

	Name	Description
	<code>Attributes</code> [1727]	Gets the attributes of the <code>IDataType</code> [2475]
	<code>BitSize</code> [1727]	Gets the size of the <code>DataType</code> in bits.
	<code>ByteSize</code> [1728]	Gets the (aligned) size of of the <code>Type/Instance</code> in Bytes
	<code>Category</code> [1728]	Gets the Data Type category
	<code>Comment</code> [1729]	Gets the comment.
	<code>FullName</code> [1729]	Gets the full name of the <code>IDataType</code> [2475] (Namespace + Name)
	<code>Id</code> [1729]	Gets the ID of the <code>DataType</code>
	<code>IsBitType</code> [1730]	Gets a value indicating whether this <code>IDataType</code> [2475] is a bit mapping Type
	<code>IsByteAligned</code> [1730]	Indicates that the Size of the Object is Byte aligned ($\text{BitSize} \% 8 == 0$)
	<code>ManagedType</code> [1733]	Gets the corresponding .NET Type if attached.
	<code>Name</code> [1734]	Gets the name of the Data Type (without namespace)
	<code>Namespace</code> [1734]	Gets the namespace string within the <code>IDataType</code> [2475] exists.
	<code>Size</code> [1735]	Gets the Size of the <code>DataType</code> in Bytes or bits.
	<code>TypeGuid</code> [1735]	Gets the Guid of the <code>DataType</code> (optional)

Methods

	Name	Description
	<code>Equals</code>	Determines whether the specified object is equal to the current object. (Inherited from <code>Object</code> .)
	<code>Finalize</code>	Allows an object to try to free resources and perform other cleanup operations before it is reclaimed by garbage collection. (Inherited from <code>Object</code> .)
	<code>GetHashCode</code>	Serves as the default hash function. (Inherited from <code>Object</code> .)
	<code>GetType</code>	Gets the Type of the current instance. (Inherited from <code>Object</code> .)
	<code>MemberwiseClone</code>	Creates a shallow copy of the current <code>Object</code> . (Inherited from <code>Object</code> .)
	<code>ToString</code> [1738]	Returns a <code>String</code> that represents this instance. (Overrides <code>Object.ToString</code> .)

Extension Methods

	Name	Description
	IsArrayOfPrimitives . [▶ 3025]	Overloaded. Determines whether the dataType is an array of Primitives. (Defined by DataTypeExtension [▶ 3021].)
	IsArrayOfPrimitives(Boolean) [▶ 3025]	Overloaded. Determines whether the dataType is an array of Primitives. (Defined by DataTypeExtension [▶ 3021].)
	IsContainer . [▶ 3027]	Overloaded. Gets a value indicating whether this IDataType [▶ 2475] is a container type (Defined by DataTypeExtension [▶ 3021].)
	IsContainer(Boolean) [▶ 3028]	Overloaded. Gets a value indicating whether this IDataType [▶ 2475] is a container type (Defined by DataTypeExtension [▶ 3021].)
	IsPointer [▶ 3031]	Gets a value indicating whether this IDataType [▶ 2475] is a pointer type (Defined by DataTypeExtension [▶ 3021].)
	IsPrimitive . [▶ 3033]	Overloaded. Gets a value indicating whether this IDataType [▶ 2475] is primitive (Defined by DataTypeExtension [▶ 3021].)
	IsPrimitive(Boolean) [▶ 3034]	Overloaded. Gets a value indicating whether this IDataType [▶ 2475] is primitive (Defined by DataTypeExtension [▶ 3021].)
	IsReference [▶ 3036]	Gets a value indicating whether this IDataType [▶ 2475] is a reference type (Defined by DataTypeExtension [▶ 3021].)
	ReferencesExternalData [▶ 3037]	Indicates, that the Instance value includes process memory data, that cannot be read in one memory block. (Defined by DataTypeExtension [▶ 3021].)
	ResolvableAsPrimitive . [▶ 3039]	Overloaded. Indicates, that this data type can be resolved as primitive or primitive Array. (Defined by DataTypeExtension [▶ 3021].)
	ResolvableAsPrimitive(Boolean) [▶ 3039]	Overloaded. Indicates, that this data type can be resolved as primitive or primitive Array. (Defined by DataTypeExtension [▶ 3021].)
	Resolve . [▶ 3040]	Overloaded. Resolves the specified data type for AliasReference [▶ 3042] (Defined by DataTypeExtension [▶ 3021].)
	Resolve(DataTypeResolveStrategy) [▶ 3041]	Overloaded. Resolves the specified strategy. (Defined by DataTypeExtension [▶ 3021].)

6.7.4.2 DataType Properties

The [DataType \[▸ 1721\]](#) type exposes the following members.

Properties

	Name	Description
	Attributes [▸ 1727]	Gets the attributes of the IDataType [▸ 2475]
	BitSize [▸ 1727]	Gets the size of the DataType [▸ 1721] in bits.
	ByteSize [▸ 1728]	Gets the (aligned) size of of the Type/Instance in Bytes
	Category [▸ 1728]	Gets the Data Type category
	Comment [▸ 1729]	Gets the comment.
	FullName [▸ 1729]	Gets the full name of the IDataType [▸ 2475] (Namespace + Name)
	Id [▸ 1729]	Gets the ID of the DataType
	IsBitType [▸ 1730]	Gets a value indicating whether this IDataType [▸ 2475] is a bit mapping Type
	IsByteAligned [▸ 1730]	Indicates that the Size of the Object is Byte aligned ($\text{BitSize} \% 8 == 0$)
	ManagedType [▸ 1733]	Gets the corresponding .NET Type if attached.
	Name [▸ 1734]	Gets the name of the Data Type (without namespace)
	Namespace [▸ 1734]	Gets the namespace string within the IDataType [▸ 2475] exists.
	Size [▸ 1735]	Gets the Size of the DataType [▸ 1721] in Bytes or bits.
	TypeGuid [▸ 1735]	Gets the Guid of the DataType [▸ 1721] (optional)

[TwinCAT.Ads.TypeSystem Namespace \[► 1698\]](#)

6.7.4.2.3 **DataType.ByteSize Property**

Gets the (aligned) size of of the Type/Instance in Bytes

Namespace: [TwinCAT.Ads.TypeSystem \[► 1698\]](#)

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public int ByteSize { get; }
```

Property Value

Type: Int32

The size of the byte.

Implements

[IBitSize.ByteSize \[► 2474\]](#)

Reference

[DataType Class \[► 1721\]](#)

[TwinCAT.Ads.TypeSystem Namespace \[► 1698\]](#)

6.7.4.2.4 **DataType.Category Property**

Gets the Data Type category

Namespace: [TwinCAT.Ads.TypeSystem \[► 1698\]](#)

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public DataTypeCategory Category { get; protected set; }
```

Property Value

Type: [DataTypeCategory \[► 2111\]](#)

The category.

Implements

[IDataType.Category \[► 2478\]](#)

Reference

[DataType Class \[► 1721\]](#)

[TwinCAT.Ads.TypeSystem Namespace \[► 1698\]](#)

6.7.4.2.5 DataType.Comment Property

Gets the comment.

Namespace: [TwinCAT.Ads.TypeSystem](#) [[▶ 1698](#)]

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public string Comment { get; }
```

Property Value

Type: String

The comment.

Implements

[IDataType.Comment](#) [[▶ 2479](#)]

Reference

[DataType Class](#) [[▶ 1721](#)]

[TwinCAT.Ads.TypeSystem Namespace](#) [[▶ 1698](#)]

6.7.4.2.6 DataType.FullName Property

Gets the full name of the [IDataType](#) [[▶ 2475](#)] (Namespace + Name)

Namespace: [TwinCAT.Ads.TypeSystem](#) [[▶ 1698](#)]

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public string FullName { get; }
```

Property Value

Type: String

The full name.

Implements

[IDataType.FullName](#) [[▶ 2479](#)]

Reference

[DataType Class](#) [[▶ 1721](#)]

[TwinCAT.Ads.TypeSystem Namespace](#) [[▶ 1698](#)]

6.7.4.2.7 DataType.Id Property

Gets the ID of the DataType

Namespace: [TwinCAT.Ads.TypeSystem](#) [[▶ 1698](#)]

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public int Id { get; }
```

Property Value

Type: Int32

The id.

Implements

[IDataType.Id](#) [[▶ 2480](#)]

Reference

[DataType Class](#) [[▶ 1721](#)]

[TwinCAT.Ads.TypeSystem Namespace](#) [[▶ 1698](#)]

6.7.4.2.8 **DataType.IsBitType Property**

Gets a value indicating whether this [IDataType](#) [[▶ 2475](#)] is a bit mapping Type

Namespace: [TwinCAT.Ads.TypeSystem](#) [[▶ 1698](#)]

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public bool IsBitType { get; }
```

Property Value

Type: Boolean

true if this instance is bit mapping subtype; otherwise, false.

Implements

[IBitSize.IsBitType](#) [[▶ 2474](#)]

Reference

[DataType Class](#) [[▶ 1721](#)]

[TwinCAT.Ads.TypeSystem Namespace](#) [[▶ 1698](#)]

6.7.4.2.9 **DataType.IsByteAligned Property**

Indicates that the Size of the Object is Byte aligned (BitSize % 8 == 0)

Namespace: [TwinCAT.Ads.TypeSystem](#) [[▶ 1698](#)]

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public bool IsByteAligned { get; }
```

Property Value

Type: Boolean
true if this instance is byte aligned; otherwise, false.

Implements

[IBitSize.IsByteAligned](#) [[▶ 2475](#)]

Reference

[DataType Class](#) [[▶ 1721](#)]

[TwinCAT.Ads.TypeSystem Namespace](#) [[▶ 1698](#)]

6.7.4.2.10 **DataType.IsContainer Property**

Gets a value indicating whether this [IDataType](#) [[▶ 2475](#)] is a container type

Namespace: [TwinCAT.Ads.TypeSystem](#) [[▶ 1698](#)]

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.116+a71ced3

Syntax

C#

```
public virtual bool IsContainer { get; }
```

Property Value

Type: [Boolean](#)
true if this instance is container type; otherwise, false.

Implements

[IDataType.IsContainer](#) [[▶ 2480](#)]

Remarks

Container Types are all types that contain SubElements like

- [Array](#) [[▶ 2111](#)]
- [Pointer](#) [[▶ 2111](#)]
- [Union](#) [[▶ 2111](#)]
- [Struct](#) [[▶ 2111](#)]
- [Function](#) [[▶ 2111](#)]
- [FunctionBlock](#) [[▶ 2111](#)]
- [Program](#) [[▶ 2111](#)]

and the [Alias](#) [[▶ 2111](#)] and [Reference](#) [[▶ 2111](#)] types, if they have a container type as base type.

Reference

[DataType Class](#) [[▶ 1721](#)]

[TwinCAT.Ads.TypeSystem Namespace](#) [[▶ 1698](#)]

[IDataType.Category](#) [[▶ 2478](#)]

6.7.4.2.11 DataType.IsPointer Property

Gets a value indicating whether this [IDataType](#) [[▶ 2475](#)] is a pointer type

Namespace: [TwinCAT.Ads.TypeSystem](#) [[▶ 1698](#)]

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.116+a71ced3

Syntax

C#

```
public virtual bool IsPointer { get; }
```

Property Value

Type: [Boolean](#)

true if this instance is pointer type; otherwise, false.

Implements

[IDataType.IsPointer](#) [[▶ 2481](#)]

Remarks

Pointer types can be dereferenced with the '^' operator.

Reference

[DataType Class](#) [[▶ 1721](#)]

[TwinCAT.Ads.TypeSystem Namespace](#) [[▶ 1698](#)]

[IDataType.Category](#) [[▶ 2478](#)]

6.7.4.2.12 DataType.IsPrimitive Property

Gets a value indicating whether this [IDataType](#) [[▶ 2475](#)] is primitive

Namespace: [TwinCAT.Ads.TypeSystem](#) [[▶ 1698](#)]

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.116+a71ced3

Syntax

C#

```
public virtual bool IsPrimitive { get; }
```

Property Value

Type: [Boolean](#)

true if this instance is primitive; otherwise, false.

Implements

[IDataType.IsPrimitive](#) [[▶ 2481](#)]

Reference

[DataType Class](#) [[▶ 1721](#)]

[TwinCAT.Ads.TypeSystem Namespace](#) [[▶ 1698](#)]

6.7.4.2.13 **DataType.IsReference Property**

Gets a value indicating whether this [IDataType](#) [[▶ 2475](#)] is a reference type

Namespace: [TwinCAT.Ads.TypeSystem](#) [[▶ 1698](#)]

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.116+a71ced3

Syntax

C#

```
public virtual bool IsReference { get; }
```

Property Value

Type: [Boolean](#)

true if this instance is container type; otherwise, false.

Implements

[IDataType.IsReference](#) [[▶ 2482](#)]

Remarks

Reference types can be dereferenced.

Reference

[DataType Class](#) [[▶ 1721](#)]

[TwinCAT.Ads.TypeSystem Namespace](#) [[▶ 1698](#)]

[IDataType.Category](#) [[▶ 2478](#)]

6.7.4.2.14 **DataType.ManagedType Property**

Gets the corresponding .NET Type if attached.

Namespace: [TwinCAT.Ads.TypeSystem](#) [[▶ 1698](#)]

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public virtual Type? ManagedType { get; protected set; }
```

Property Value

Type: [Type](#)

Dot net type.

Reference

[DataType Class \[► 1721\]](#)

[TwinCAT.Ads.TypeSystem Namespace \[► 1698\]](#)

6.7.4.2.15 DataType.Name Property

Gets the name of the Data Type (without namespace)

Namespace: [TwinCAT.Ads.TypeSystem \[► 1698\]](#)

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public string Name { get; protected set; }
```

Property Value

Type: String
The name.

Implements

[IDataType.Name \[► 2482\]](#)

Reference

[DataType Class \[► 1721\]](#)

[TwinCAT.Ads.TypeSystem Namespace \[► 1698\]](#)

6.7.4.2.16 DataType.Namespace Property

Gets the namespace string within the [IDataType \[► 2475\]](#) exists.

Namespace: [TwinCAT.Ads.TypeSystem \[► 1698\]](#)

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public string Namespace { get; protected set; }
```

Property Value

Type: String
The namespace.

Implements

[IDataType.Namespace \[► 2482\]](#)

Reference

[DataType Class \[► 1721\]](#)

[TwinCAT.Ads.TypeSystem Namespace \[► 1698\]](#)

6.7.4.2.17 DataType.Size Property

Gets the Size of the [DataType](#) [[▶ 1721](#)] in Bytes or bits.

Namespace: [TwinCAT.Ads.TypeSystem](#) [[▶ 1698](#)]

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public int Size { get; protected set; }
```

Property Value

Type: Int32

The size.

Implements

[IBitSize.Size](#) [[▶ 2475](#)]

Reference

[DataType Class](#) [[▶ 1721](#)]

[TwinCAT.Ads.TypeSystem Namespace](#) [[▶ 1698](#)]

6.7.4.2.18 DataType.TypeGuid Property

Gets the Guid of the [DataType](#) [[▶ 1721](#)] (optional)

Namespace: [TwinCAT.Ads.TypeSystem](#) [[▶ 1698](#)]

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public Guid? TypeGuid { get; }
```

Property Value

Type: Nullable.Guid.

The type unique identifier.

Reference

[DataType Class](#) [[▶ 1721](#)]

[TwinCAT.Ads.TypeSystem Namespace](#) [[▶ 1698](#)]

6.7.4.3 DataType Methods

The [DataType](#) [[▶ 1721](#)] type exposes the following members.

Methods

	Name	Description
	Equals	Determines whether the specified object is equal to the current object. (Inherited from Object.)

	Name	Description
	Finalize	Allows an object to try to free resources and perform other cleanup operations before it is reclaimed by garbage collection. (Inherited from Object.)
	GetHashCode	Serves as the default hash function. (Inherited from Object.)
	GetType	Gets the Type of the current instance. (Inherited from Object.)
	MemberwiseClone	Creates a shallow copy of the current Object. (Inherited from Object.)
	ToString [▶ 1738]	Returns a String that represents this instance. (Overrides Object.ToString..)

Extension Methods

	Name	Description
	IsArrayOfPrimitives [▶ 3025]	Overloaded. Determines whether the dataType is an array of Primitives. (Defined by DataTypeExtension [▶ 3021].)
	IsArrayOfPrimitives(Boolean) [▶ 3025]	Overloaded. Determines whether the dataType is an array of Primitives. (Defined by DataTypeExtension [▶ 3021].)
	IsContainer [▶ 3027]	Overloaded. Gets a value indicating whether this IDataType [▶ 2475] is a container type (Defined by DataTypeExtension [▶ 3021].)
	IsContainer(Boolean) [▶ 3028]	Overloaded. Gets a value indicating whether this IDataType [▶ 2475] is a container type (Defined by DataTypeExtension [▶ 3021].)
	IsPointer [▶ 3031]	Gets a value indicating whether this IDataType [▶ 2475] is a pointer type (Defined by DataTypeExtension [▶ 3021].)
	IsPrimitive [▶ 3033]	Overloaded. Gets a value indicating whether this IDataType [▶ 2475] is primitive (Defined by DataTypeExtension [▶ 3021].)
	IsPrimitive(Boolean) [▶ 3034]	Overloaded. Gets a value indicating whether this IDataType [▶ 2475] is primitive (Defined by DataTypeExtension [▶ 3021].)
	IsReference [▶ 3036]	Gets a value indicating whether this IDataType [▶ 2475] is a reference type (Defined by DataTypeExtension [▶ 3021].)
	ReferencesExternalData [▶ 3037]	Indicates, that the Instance value includes process memory data, that cannot be read in one memory block. (Defined by DataTypeExtension [▶ 3021].)
	ResolvableAsPrimitive [▶ 3039]	Overloaded. Indicates, that this data type can be resolved as primitive or primitive Array. (Defined by DataTypeExtension [▶ 3021].)
	ResolvableAsPrimitive(Boolean) [▶ 3039]	Overloaded. Indicates, that this data type can be resolved as primitive or primitive Array. (Defined by DataTypeExtension [▶ 3021].)
	Resolve [▶ 3040]	Overloaded. Resolves the specified data type for AliasReference [▶ 3042] (Defined by DataTypeExtension [▶ 3021].)

	Name	Description
	Resolve(DataTypeResolveStrategy) [▶ 3041]	Overloaded. Resolves the specified strategy. (Defined by DataTypeExtension [▶ 3021].)

Reference

Also see about this

- [DataType.IsPointerType Method](#) [▶ 1737]
- [DataType.IsReferenceType Method](#) [▶ 1737]

6.7.4.3.1 DataType.IsPointerType Method

Determines whether the specified category is a pointer type.

Namespace: [TwinCAT.Ads.TypeSystem](#) [▶ 1698]

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.116+a71ced3

Syntax

C#

```
public static bool IsPointerType(  
    DataTypeCategory cat  
)
```

Parameters

cat Type: [TwinCAT.TypeSystem.DataTypeCategory](#) [▶ 2111]
The data type category.

Return Value

Type: [Boolean](#)
true if [is pointer type] [the specified cat]; otherwise, false.

Reference

[DataType Class](#) [▶ 1721]

[TwinCAT.Ads.TypeSystem Namespace](#) [▶ 1698]

6.7.4.3.2 DataType.IsReferenceType Method

Determines whether the specified category is a reference type.

Namespace: [TwinCAT.Ads.TypeSystem](#) [▶ 1698]

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.116+a71ced3

Syntax

C#

```
public static bool IsReferenceType(  
    DataTypeCategory cat  
)
```

Parameters

cat Type: [TwinCAT.TypeSystem.DataTypeCategory](#) [▶ 2111]
The data type category.

Return Value

Type: [Boolean](#)
true if [is reference type] [the specified cat]; otherwise, false.

Reference

[DataType Class](#) [▶ 1721]

[TwinCAT.Ads.TypeSystem Namespace](#) [▶ 1698]

6.7.4.3.3 **DataType.ToString Method**

Returns a String that represents this instance.

Namespace: [TwinCAT.Ads.TypeSystem](#) [▶ 1698]

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public override string ToString()
```

Return Value

Type: [String](#)
A String that represents this instance.

Reference

[DataType Class](#) [▶ 1721]

[TwinCAT.Ads.TypeSystem Namespace](#) [▶ 1698]

6.7.5 **EnumType.T. Class**

Enum [DataType](#) [▶ 1721].

Inheritance Hierarchy

System.Object

[TwinCAT.Ads.TypeSystem.DataType](#) [▶ 1721]

 TwinCAT.Ads.TypeSystem.EnumType.T.

Namespace: [TwinCAT.Ads.TypeSystem](#) [▶ 1698]

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public sealed class EnumType<T> : DataType,  
    IEnumType<T>, IAliasType, IDataType, IBitSize, IEnumType  
where T : struct, new(), IConvertible
```

Type Parameters

T

The EnumType.T. type exposes the following members.

Properties

	Name	Description
	Attributes [▶ 1727]	Gets the attributes of the IDataType [▶ 2475] (Inherited from DataType [▶ 1721].)
	BaseType [▶ 1742]	Gets the Base Type
	BaseTypeName [▶ 1742]	Gets the BaseType name
	BitSize [▶ 1727]	Gets the size of the DataType [▶ 1721] in bits. (Inherited from DataType [▶ 1721].)
	ByteSize [▶ 1728]	Gets the (aligned) size of of the Type/Instance in Bytes (Inherited from DataType [▶ 1721].)
	Category [▶ 1728]	Gets the Data Type category (Inherited from DataType [▶ 1721].)
	Comment [▶ 1729]	Gets the comment. (Inherited from DataType [▶ 1721].)
	EnumValues [▶ 1743]	Enumeration specification (if enum)
	FullName [▶ 1729]	Gets the full name of the IDataType [▶ 2475] (Namespace + Name) (Inherited from DataType [▶ 1721].)
	Id [▶ 1729]	Gets the ID of the Data Type (Inherited from DataType [▶ 1721].)
	IsBitType [▶ 1730]	Gets a value indicating whether this IDataType [▶ 2475] is a bit mapping Type (Inherited from DataType [▶ 1721].)
	IsByteAligned [▶ 1730]	Indicates that the Size of the Object is Byte aligned ($BitSize \% 8 == 0$) (Inherited from DataType [▶ 1721].)
	ManagedType [▶ 1733]	Gets the corresponding .NET Type if attached. (Inherited from DataType [▶ 1721].)
	Name [▶ 1734]	Gets the name of the Data Type (without namespace) (Inherited from DataType [▶ 1721].)
	Namespace [▶ 1734]	Gets the namespace string within the IDataType [▶ 2475] exists. (Inherited from DataType [▶ 1721].)
	Size [▶ 1735]	Gets the Size of the DataType [▶ 1721] in Bytes or bits. (Inherited from DataType [▶ 1721].)
	TypeGuid [▶ 1735]	Gets the Guid of the DataType [▶ 1721] (optional) (Inherited from DataType [▶ 1721].)

Methods

	Name	Description
	Contains [▶ 1745]	Determines whether the enum values contains the specified name
	Equals	Determines whether the specified object is equal to the current object. (Inherited from Object.)
	GetHashCode	Serves as the default hash function. (Inherited from Object.)
	GetNames [▶ 1746]	Gets the filed names of the IEnumType.T. [▶ 2516]

	Name	Description
	GetType	Gets the Type of the current instance. (Inherited from Object.)
	GetValues [▶ 1746]	Gets the values of the IEnumType.T. [▶ 2516]
	Parse [▶ 1747]	Parses a name of the IEnumType.T. [▶ 2516] and returns the value (as base type)
	ToString. [▶ 1738]	Returns a String that represents this instance. (Inherited from DataType [▶ 1721].)
	ToString(T) [▶ 1748]	Returns a String that represents this instance.
	ToString(IConvertible) [▶ 1747]	Returns a String that represents this instance.
	TryParse(String, T.) [▶ 1750]	Tries to parse the Enum Value
	TryParse(String, IEnumValue.) [▶ 1749]	Tries to parse the Enum Value

Extension Methods

	Name	Description
	IsArrayOfPrimitives. [▶ 3025]	Overloaded. Determines whether the dataType is an array of Primitives. (Defined by DataTypeExtension [▶ 3021].)
	IsArrayOfPrimitives(Boolean) [▶ 3025]	Overloaded. Determines whether the dataType is an array of Primitives. (Defined by DataTypeExtension [▶ 3021].)
	IsContainer. [▶ 3027]	Overloaded. Gets a value indicating whether this IDataType [▶ 2475] is a container type (Defined by DataTypeExtension [▶ 3021].)
	IsContainer(Boolean) [▶ 3028]	Overloaded. Gets a value indicating whether this IDataType [▶ 2475] is a container type (Defined by DataTypeExtension [▶ 3021].)
	IsPointer [▶ 3031]	Gets a value indicating whether this IDataType [▶ 2475] is a pointer type (Defined by DataTypeExtension [▶ 3021].)
	IsPrimitive. [▶ 3033]	Overloaded. Gets a value indicating whether this IDataType [▶ 2475] is primitive (Defined by DataTypeExtension [▶ 3021].)
	IsPrimitive(Boolean) [▶ 3034]	Overloaded. Gets a value indicating whether this IDataType [▶ 2475] is primitive (Defined by DataTypeExtension [▶ 3021].)
	IsReference [▶ 3036]	Gets a value indicating whether this IDataType [▶ 2475] is a reference type (Defined by DataTypeExtension [▶ 3021].)
	ReferencesExternalData [▶ 3037]	Indicates, that the Instance value includes process memory data, that cannot be read in one memory block. (Defined by DataTypeExtension [▶ 3021].)
	ResolvableAsPrimitive. [▶ 3039]	Overloaded. Indicates, that this data type can be resolved as primitive or primitive Array. (Defined by DataTypeExtension [▶ 3021].)

	Name	Description
	ResolveableAsPrimitive(Boolean) [▶ 3039]	Overloaded. Indicates, that this data type can be resolved as primitive or primitive Array. (Defined by DataTypeExtension [▶ 3021] .)
	Resolve. [▶ 3040]	Overloaded. Resolves the specified data type for AliasReference [▶ 3042] (Defined by DataTypeExtension [▶ 3021] .)
	Resolve(DataTypeResolveStrategy) [▶ 3041]	Overloaded. Resolves the specified strategy. (Defined by DataTypeExtension [▶ 3021] .)

6.7.5.1 EnumType.T. Properties

The [EnumType.T. \[▶ 1738\]](#) generic type exposes the following members.

Properties

	Name	Description
	Attributes [▶ 1727]	Gets the attributes of the IDataType [▶ 2475] (Inherited from DataType [▶ 1721] .)
	BaseType [▶ 1742]	Gets the Base Type
	BaseTypeName [▶ 1742]	Gets the BaseType name
	BitSize [▶ 1727]	Gets the size of the DataType [▶ 1721] in bits. (Inherited from DataType [▶ 1721] .)
	ByteSize [▶ 1728]	Gets the (aligned) size of of the Type/Instance in Bytes (Inherited from DataType [▶ 1721] .)
	Category [▶ 1728]	Gets the Data Type category (Inherited from DataType [▶ 1721] .)
	Comment [▶ 1729]	Gets the comment. (Inherited from DataType [▶ 1721] .)
	EnumValues [▶ 1743]	Enumeration specification (if enum)
	FullName [▶ 1729]	Gets the full name of the IDataType [▶ 2475] (Namespace + Name) (Inherited from DataType [▶ 1721] .)
	Id [▶ 1729]	Gets the ID of the DataType (Inherited from DataType [▶ 1721] .)
	IsBitType [▶ 1730]	Gets a value indicating whether this IDataType [▶ 2475] is a bit mapping Type (Inherited from DataType [▶ 1721] .)
	IsByteAligned [▶ 1730]	Indicates that the Size of the Object is Byte aligned (BitSize % 8 == 0) (Inherited from DataType [▶ 1721] .)

	Name	Description
	ManagedType [▶ 1733]	Gets the corresponding .NET Type if attached. (Inherited from DataType [▶ 1721].)
	Name [▶ 1734]	Gets the name of the Data Type (without namespace) (Inherited from DataType [▶ 1721].)
	Namespace [▶ 1734]	Gets the namespace string within the IDataType [▶ 2475] exists. (Inherited from DataType [▶ 1721].)
	Size [▶ 1735]	Gets the Size of the DataType [▶ 1721] in Bytes or bits. (Inherited from DataType [▶ 1721].)
	TypeGuid [▶ 1735]	Gets the Guid of the DataType [▶ 1721] (optional) (Inherited from DataType [▶ 1721].)

Gets the BaseType name

Namespace: [TwinCAT.Ads.TypeSystem](#) [► 1698]

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public string BaseTypeName { get; }
```

Property Value

Type: String

The name of the base type.

Implements

[IAliasType.BaseTypeName](#) [► 2440]

Reference

[EnumType.T. Class](#) [► 1738]

[TwinCAT.Ads.TypeSystem Namespace](#) [► 1698]

6.7.5.1.3 EnumType.T..EnumValues Property

Enumeration specification (if enum)

Namespace: [TwinCAT.Ads.TypeSystem](#) [► 1698]

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public IEnumerable EnumValues { get; }
```

Property Value

Type: [IEnumerable](#) [► 2527]

The enum specification.

Implements

[EnumType.T..EnumValues](#) [► 2519]

Reference

[EnumType.T. Class](#) [► 1738]

6.7.5.2 EnumType.T. Methods

The [EnumType.T.](#) [► 1738] generic type exposes the following members.

Methods

	Name	Description
	Contains [▶ 1745]	Determines whether the enum values contains the specified name
	Equals	Determines whether the specified object is equal to the current object. (Inherited from Object.)
	GetHashCode	Serves as the default hash function. (Inherited from Object.)
	GetNames [▶ 1746]	Gets the filed names of the IEnumType.T. [▶ 2516]
	GetType	Gets the Type of the current instance. (Inherited from Object.)
	GetValues [▶ 1746]	Gets the values of the IEnumType.T. [▶ 2516]
	Parse [▶ 1747]	Parses a name of the IEnumType.T. [▶ 2516] and returns the value (as base type)
	ToString. [▶ 1738]	Returns a String that represents this instance. (Inherited from DataType [▶ 1721].)
	ToString(T) [▶ 1748]	Returns a String that represents this instance.
	ToString(IConvertible) [▶ 1747]	Returns a String that represents this instance.
	TryParse(String, T.) [▶ 1750]	Tries to parse the Enum Value
	TryParse(String, IEnumValue.) [▶ 1749]	Tries to parse the Enum Value

Extension Methods

	Name	Description
	IsArrayOfPrimitives. [▶ 3025]	Overloaded. Determines whether the dataType is an array of Primitives. (Defined by DataTypeExtension [▶ 3021].)
	IsArrayOfPrimitives(Boolean) [▶ 3025]	Overloaded. Determines whether the dataType is an array of Primitives. (Defined by DataTypeExtension [▶ 3021].)
	IsContainer. [▶ 3027]	Overloaded. Gets a value indicating whether this IDataType [▶ 2475] is a container type (Defined by DataTypeExtension [▶ 3021].)
	IsContainer(Boolean) [▶ 3028]	Overloaded. Gets a value indicating whether this IDataType [▶ 2475] is a container type (Defined by DataTypeExtension [▶ 3021].)
	IsPointer [▶ 3031]	Gets a value indicating whether this IDataType [▶ 2475] is a pointer type (Defined by DataTypeExtension [▶ 3021].)
	IsPrimitive. [▶ 3033]	Overloaded. Gets a value indicating whether this IDataType [▶ 2475] is primitive (Defined by DataTypeExtension [▶ 3021].)
	IsPrimitive(Boolean) [▶ 3034]	Overloaded. Gets a value indicating whether this IDataType [▶ 2475] is primitive (Defined by DataTypeExtension [▶ 3021].)

	Name	Description
	IsReference [▶ 3036]	Gets a value indicating whether this IDataType [▶ 2475] is a reference type (Defined by DataTypeExtension [▶ 3021].)
	ReferencesExternalData [▶ 3037]	Indicates, that the Instance value includes process memory data, that cannot be read in one memory block. (Defined by DataTypeExtension [▶ 3021].)
	ResolvableAsPrimitive [▶ 3039]	Overloaded. Indicates, that this data type can be resolved as primitive or primitive Array. (Defined by DataTypeExtension [▶ 3021].)
	ResolvableAsPrimitive(Boolean) [▶ 3039]	Overloaded. Indicates, that this data type can be resolved as primitive or primitive Array. (Defined by DataTypeExtension [▶ 3021].)
	Resolve [▶ 3040]	Overloaded. Resolves the specified data type for AliasReference [▶ 3042] (Defined by DataTypeExtension [▶ 3021].)
	Resolve(DataTypeResolveStrategy) [▶ 3041]	Overloaded. Resolves the specified strategy. (Defined by DataTypeExtension [▶ 3021].)

Parses a name of the [IEnumType.T. \[▶ 2516\]](#) and returns the value (as base type)

Namespace: [TwinCAT.Ads.TypeSystem \[▶ 1698\]](#)

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public T Parse(
    string strValue
)
```

Parameters

strValue	Type: System.String Enum Value as string.
----------	--

Return Value

Type: [T \[▶ 1738\]](#)

T.

Implements

[IEnumType.T..Parse\(String\) \[▶ 2522\]](#)

Reference

[EnumType.T. Class \[▶ 1738\]](#)

[TwinCAT.Ads.TypeSystem Namespace \[▶ 1698\]](#)

6.7.5.2.5 EnumType.T..ToString Method

Overload List

	Name	Description
	ToString. [▶ 1738]	Returns a String that represents this instance. (Inherited from DataType [▶ 1721].)
	ToString(T) [▶ 1748]	Returns a String that represents this instance.
	ToString(IConvertible) [▶ 1747]	Returns a String that represents this instance.

Reference

[EnumType.T. Class \[▶ 1738\]](#)

[TwinCAT.Ads.TypeSystem Namespace \[▶ 1698\]](#)

6.7.5.2.5.1 EnumType.T..ToString Method (IConvertible)

Returns a String that represents this instance.

Namespace: [TwinCAT.Ads.TypeSystem](#) [[▶ 1698](#)]

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public string ToString(  
    IConvertible val  
)
```

Parameters

val	Type: System.IConvertible The value.
-----	---

Return Value

Type: String

A String that represents this instance.

Implements

[IEnumType.ToString\(IConvertible\)](#) [[▶ 2514](#)]

Reference

[EnumType.T.Class](#) [[▶ 1738](#)]

Returns a String that represents this instance.

Namespace: [TwinCAT.Ads.TypeSystem](#) [[▶ 1698](#)]

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public string ToString(  
    T val  
)
```

Parameters

val	Type: T [▶ 1738] The value.
-----	--

Return Value

Type: String

A String that represents this instance.

Implements

[IEnumType.T..ToString\(T\)](#) [[▶ 2523](#)]

Exceptions

Exception	Condition
ArgumentException	val

Tries to parse the Enum Value

Namespace: [TwinCAT.Ads.TypeSystem \[▸ 1698\]](#)

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public bool TryParse(
    string strValue,
    out IEnumValue?? value
)
```

Parameters

strValue	Type: System.String Enum value (in string representation).
value	Type: TwinCAT.TypeSystem.IEnumValue [▸ 2524] . The value.

Return Value

Type: Boolean

true if the [EnumType.T. \[▸ 1738\]](#) could be parsed, false otherwise.

Implements

[IEnumType.TryParse\(String, IEnumValue.\)](#) [[▶ 2515](#)]

Reference

6.7.6 Field Class

Represents a field of an Struct/Alias/Union

Inheritance Hierarchy

System.Object

 TwinCAT.Ads.TypeSystem.Instance [[▶ 1765](#)]

 TwinCAT.Ads.TypeSystem.Field

 TwinCAT.Ads.TypeSystem.Member [[▶ 1781](#)]

Namespace: TwinCAT.Ads.TypeSystem [[▶ 1698](#)]

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public class Field : Instance, IField,
    IAttributedInstance, IInstance, IBitSize
```

The Field type exposes the following members.

Properties

	Name	Description
	Attributes [▶ 1768]	Gets the Type Attributes. (Inherited from Instance [▶ 1765].)
	BitSize [▶ 1768]	Gets the size of this Instance [▶ 1765] in bits. (Inherited from Instance [▶ 1765].)
	ByteSize [▶ 1769]	Gets the (aligned) size of of the Type/Instance in Bytes (Inherited from Instance [▶ 1765].)
	Category [▶ 1769]	Gets the the DataTypeCategory [▶ 2111] of the Instance. (Inherited from Instance [▶ 1765].)
	Comment [▶ 1770]	Gets the comment. (Inherited from Instance [▶ 1765].)
	ContextMask [▶ 1770]	Gets the context mask of this instance. (Inherited from Instance [▶ 1765].)
	DataType [▶ 1771]	Gets the IDataType [▶ 2475] of the IInstance [▶ 2549]. (Inherited from Instance [▶ 1765].)
	HasValue [▶ 1771]	Gets a value indicating whether this instance has a value. (Inherited from Instance [▶ 1765].)
	InstanceName [▶ 1771]	Gets the name of the instance (without periods (.)) (Inherited from Instance [▶ 1765].)
	InstancePath [▶ 1772]	Gets the relative / absolute access path to the instance (with periods (.)) (Inherited from Instance [▶ 1765].)
	IsBitType [▶ 1773]	Gets a value indicating whether this instance is not basing on a full DataType but instead of some sort of bit mapping (Inherited from Instance [▶ 1765].)
	IsByteAligned [▶ 1773]	Indicates that the Size of the Object is Byte aligned (BitSize % 8 == 0) (Inherited from Instance [▶ 1765].)
	IsPersistent [▶ 1773]	Indicates that this instance is persistent. (Inherited from Instance [▶ 1765].)
	IsPointer [▶ 1774]	Gets a value indicating whether this instance is reference. (Inherited from Instance [▶ 1765].)
	IsReadOnly [▶ 1774]	Indicates that this instance is read only. (Inherited from Instance [▶ 1765].)
	IsReference [▶ 1775]	Gets a value indicating whether this instance is reference. (Inherited from Instance [▶ 1765].)
	IsStatic [▶ 1775]	Gets a value indicating whether this IInstance [▶ 2549] is static. (Inherited from Instance [▶ 1765].)

	Name	Description
	IsTcComInterfacePointer [▶ 1776]	Indicates that this instance is a TcComInterfacePointer. (Inherited from Instance [▶ 1765].)
	IsTypeGuid [▶ 1776]	Indicates that this instance has set TypeGuid flag. (Inherited from Instance [▶ 1765].)
	Namespace [▶ 1776]	Gets the namespace name. (Inherited from Instance [▶ 1765].)
	ParentType [▶ 1754]	Gets the Parent of this Field [▶ 2535].
	Size [▶ 1777]	Gets the size of the DataType [▶ 2475] in bytes or Bits dependant on IsBitType [▶ 1773] (Inherited from Instance [▶ 1765].)
	TypeName [▶ 1777]	Gets the name of the DataType [▶ 2475] that is used for this Instance [▶ 2549]. (Inherited from Instance [▶ 1765].)
	ValueEncoding [▶ 1754]	Gets the value encoding of this Field

Methods

	Name	Description
	Equals	Determines whether the specified object is equal to the current object. (Inherited from Object.)
	Finalize	Allows an object to try to free resources and perform other cleanup operations before it is reclaimed by garbage collection. (Inherited from Object.)
	GetHashCode	Serves as the default hash function. (Inherited from Object.)
	GetType	Gets the Type of the current instance. (Inherited from Object.)
	MemberwiseClone	Creates a shallow copy of the current Object. (Inherited from Object.)
	OnGetSize [▶ 1779]	Handler function getting the size of the Instance [▶ 1765] (Inherited from Instance [▶ 1765].)
	OnSetInstanceName [▶ 1780]	Sets a new InstanceName InstancePath (Inherited from Instance [▶ 1765].)
	SetAttributes [▶ 1780]	Sets the type attributes (Inherited from Instance [▶ 1765].)
	SetContextMask [▶ 1780]	Sets the context mask. (Inherited from Instance [▶ 1765].)
	ToString [▶ 1781]	Returns a String that represents this instance. (Inherited from Instance [▶ 1765].)

Extension Methods

	Name	Description
	ReferencesExternalData [▶ 3038]	Indicates, that the Instance value includes process memory data, that cannot be read in one memory block. (Defined by DataTypeExtension [▶ 3021].)

Reference

[TwinCAT.Ads.TypeSystem Namespace](#) [[▶ 1698](#)]

6.7.6.1 Field Properties

The [Field \[▶ 1750\]](#) type exposes the following members.

Properties

	Name	Description
	Attributes [▶ 1768]	Gets the Type Attributes. (Inherited from Instance [▶ 1765].)
	BitSize [▶ 1768]	Gets the size of this Instance [▶ 1765] in bits. (Inherited from Instance [▶ 1765].)
	ByteSize [▶ 1769]	Gets the (aligned) size of of the Type/Instance in Bytes (Inherited from Instance [▶ 1765].)
	Category [▶ 1769]	Gets the the DataTypeCategory [▶ 2111] of the Instance. (Inherited from Instance [▶ 1765].)
	Comment [▶ 1770]	Gets the comment. (Inherited from Instance [▶ 1765].)
	ContextMask [▶ 1770]	Gets the context mask of this instance. (Inherited from Instance [▶ 1765].)
	DataType [▶ 1771]	Gets the IDataType [▶ 2475] of the Instance [▶ 2549] . (Inherited from Instance [▶ 1765].)
	HasValue [▶ 1771]	Gets a value indicating whether this instance has a value. (Inherited from Instance [▶ 1765].)
	InstanceName [▶ 1771]	Gets the name of the instance (without periods (.)) (Inherited from Instance [▶ 1765].)
	InstancePath [▶ 1772]	Gets the relative / absolute access path to the instance (with periods (.)) (Inherited from Instance [▶ 1765].)
	IsBitType [▶ 1773]	Gets a value indicating whether this instance is not basing on a full DataType but instead of some sort of bit mapping (Inherited from Instance [▶ 1765].)
	IsByteAligned [▶ 1773]	Indicates that the Size of the Object is Byte aligned ($\text{BitSize} \% 8 == 0$) (Inherited from Instance [▶ 1765].)
	IsPersistent [▶ 1773]	Indicates that this instance is persistent. (Inherited from Instance [▶ 1765].)
	IsPointer [▶ 1774]	Gets a value indicating whether this instance is reference. (Inherited from Instance [▶ 1765].)
	IsReadOnly [▶ 1774]	Indicates that this instance is read only. (Inherited from Instance [▶ 1765].)
	IsReference [▶ 1775]	Gets a value indicating whether this instance is reference. (Inherited from Instance [▶ 1765].)
	IsStatic [▶ 1775]	Gets a value indicating whether this Instance [▶ 2549] is static. (Inherited from Instance [▶ 1765].)
	IsTcComInterfacePointer [▶ 1776]	Indicates that this instance is a TcComInterfacePointer . (Inherited from Instance [▶ 1765].)
	IsTypeGuid [▶ 1776]	Indicates that this instance has set TypeGuid flag. (Inherited from Instance [▶ 1765].)
	Namespace [▶ 1776]	Gets the namespace name. (Inherited from Instance [▶ 1765].)
	ParentType [▶ 1754]	Gets the Parent of this Field [▶ 2535] .
	Size [▶ 1777]	Gets the size of the IDataType [▶ 2475] in bytes or Bits dependant on IsBitType [▶ 1773] (Inherited from Instance [▶ 1765].)

	Name	Description
	TypeName [▶ 1777]	Gets the name of the DataType [▶ 2475] that is used for this Instance [▶ 2549]. (Inherited from Instance [▶ 1765].)
	ValueEncoding [▶ 1754]	Gets the value encoding of this Field [▶ 1750]

Reference

6.7.7 IAdsSymbol Interface

Interface [IAdsSymbol](#)

Namespace: [TwinCAT.Ads.TypeSystem](#) [[▶ 1698](#)]

Assembly: TwinCAT.Ads.Abstractions (in TwinCAT.Ads.Abstractions.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public interface IAdsSymbol : ISymbol,
    IAttributedInstance, IInstance, IBitSize, IProcessImageAddress, IContextMaskProvider
```

The IAdsSymbol type exposes the following members.

Properties

	Name	Description
	Attributes [▶ 2471]	Gets the Type Attributes. (Inherited from IAttributedInstance [▶ 2469].)
	BitSize [▶ 2473]	Gets the size of the IDataType [▶ 2475] in bits. (Inherited from IBitSize [▶ 2472].)
	ByteSize [▶ 2474]	Gets the (aligned) size of of the Type/Instance in Bytes (Inherited from IBitSize [▶ 2472].)
	Category [▶ 2694]	Gets the Symbol/Datatype Category (Inherited from ISymbol [▶ 2691].)
	Comment [▶ 2550]	Gets the comment of the IInstance [▶ 2549] (Inherited from IInstance [▶ 2549].)
	ContextMask [▶ 1765]	Gets the ContextMask of the symbol, indicating the task the variable belongs to. If ContextMask is not zero use CyclicInContext [▶ 740] or OnChangeInContext [▶ 740] to add notifications. (Inherited from IContextMaskProvider [▶ 1764].)
	DataType [▶ 2551]	Gets the IDataType [▶ 2475] of the IInstance [▶ 2549]. (Inherited from IInstance [▶ 2549].)
	DataTypeId [▶ 1759]	DataType identifier of the Symbol AdsDataTypeId [▶ 663]
	ImageBaseAddress [▶ 1759]	Gets the AmsAddress [▶ 752] of the Process Image
	IndexGroup [▶ 2594]	Gets the index group of the Symbol (Inherited from IProcessImageAddress [▶ 2593].)
	IndexOffset [▶ 2594]	Gets the index offset of the Symbol (Inherited from IProcessImageAddress [▶ 2593].)
	InstanceName [▶ 2551]	Gets the name of the instance (without periods (.)) (Inherited from IInstance [▶ 2549].)
	InstancePath [▶ 2552]	Gets the relative / absolute access path to the instance (with periods (.)) (Inherited from IInstance [▶ 2549].)
	IsBitType [▶ 2474]	Gets a value indicating whether this instance is not basing on a full DataType but instead of some sort of bit mapping (Inherited from IBitSize [▶ 2472].)
	IsByteAligned [▶ 2475]	Indicates that the Size of the Object is Byte aligned ($\text{BitSize} \% 8 == 0$) (Inherited from IBitSize [▶ 2472].)
	IsContainerType [▶ 2694]	Gets a value indicating whether this Symbol is acontainer type. (Inherited from ISymbol [▶ 2691].)
	IsPersistent [▶ 2694]	Gets a value indicating whether this ISymbol [▶ 2691] is persistent. (Inherited from ISymbol [▶ 2691].)
	IsPointer [▶ 2552]	Indicates that the IInstance [▶ 2549] represents a Pointer type (Pointer TO) (Inherited from IInstance [▶ 2549].)

	Name	Description
	IsPrimitiveType [▶ 2695]	Gets a value indicating whether this instance is a primitive type. (Inherited from ISymbol [▶ 2691].)
	IsReadOnly [▶ 2695]	Indicates that this instance is read only. (Inherited from ISymbol [▶ 2691].)
	IsRecursive [▶ 2696]	Gets a value indicating whether this instance is recursive. (Inherited from ISymbol [▶ 2691].)
	IsReference [▶ 2552]	Indicates that the IInstance [▶ 2549] represents a Reference type (REFERENCE TO) (Inherited from IInstance [▶ 2549].)
	IsStatic [▶ 2553]	Gets a value indicating whether this IInstance [▶ 2549] is static. (Inherited from IInstance [▶ 2549].)
	IsVirtual [▶ 2595]	Gets a value indicating whether this instance is virtual. (Inherited from IProcessImageAddress [▶ 2593].)
	Parent [▶ 2696]	Gets the parent Symbol (Inherited from ISymbol [▶ 2691].)
	Size [▶ 2475]	Gets the size of the object in bytes or Bits dependant on IsBitType [▶ 2474] (Inherited from IBitSize [▶ 2472].)
	SubSymbols [▶ 2696]	Gets the SubSymbols of the ISymbol [▶ 2691] (Inherited from ISymbol [▶ 2691].)
	TypeName [▶ 2553]	Gets the name of the DataType [▶ 2475] that is used for this IInstance [▶ 2549]. (Inherited from IInstance [▶ 2549].)
	ValueEncoding [▶ 2472]	Gets the value encoding. (Inherited from IAttributedInstance [▶ 2469].)

Extension Methods

	Name	Description
	ReferencesExternalData [▶ 3038]	Indicates, that the Instance value includes process memory data, that cannot be read in one memory block. (Defined by DataTypeExtension [▶ 3021].)

6.7.7.1 IAdsSymbol Properties

The [IAdsSymbol](#) [[▶ 1755](#)] type exposes the following members.

Properties

	Name	Description
	Attributes [▶ 2471]	Gets the Type Attributes. (Inherited from IAttributedInstance [▶ 2469].)
	BitSize [▶ 2473]	Gets the size of the IDataType [▶ 2475] in bits. (Inherited from IBitSize [▶ 2472].)
	ByteSize [▶ 2474]	Gets the (aligned) size of of the Type/Instance in Bytes (Inherited from IBitSize [▶ 2472].)
	Category [▶ 2694]	Gets the Symbol/Datatype Category (Inherited from ISymbol [▶ 2691].)

	Name	Description
	Comment [▶ 2550]	Gets the comment of the IInstance [▶ 2549] (Inherited from IInstance [▶ 2549].)
	ContextMask [▶ 1765]	Gets the ContextMask of the symbol, indicating the task the variable belongs to. If ContextMask is not zero use CyclicInContext [▶ 740] or OnChangeInContext [▶ 740] to add notifications. (Inherited from IContextMaskProvider [▶ 1764].)
	DataType [▶ 2551]	Gets the IDataType [▶ 2475] of the IInstance [▶ 2549]. (Inherited from IInstance [▶ 2549].)
	DataTypeId [▶ 1759]	DataType identifier of the Symbol AdsDataTypeId [▶ 663]
	ImageBaseAddress [▶ 1759]	Gets the AmsAddress [▶ 752] of the Process Image
	IndexGroup [▶ 2594]	Gets the index group of the Symbol (Inherited from IProcessImageAddress [▶ 2593].)
	IndexOffset [▶ 2594]	Gets the index offset of the Symbol (Inherited from IProcessImageAddress [▶ 2593].)
	InstanceName [▶ 2551]	Gets the name of the instance (without periods (.)) (Inherited from IInstance [▶ 2549].)
	InstancePath [▶ 2552]	Gets the relative / absolute access path to the instance (with periods (.)) (Inherited from IInstance [▶ 2549].)
	IsBitType [▶ 2474]	Gets a value indicating whether this instance is not basing on a full DataType but instead of some sort of bit mapping (Inherited from IBitSize [▶ 2472].)
	IsByteAligned [▶ 2475]	Indicates that the Size of the Object is Byte aligned ($\text{BitSize} \% 8 == 0$) (Inherited from IBitSize [▶ 2472].)
	IsContainerType [▶ 2694]	Gets a value indicating whether this Symbol is a container type. (Inherited from ISymbol [▶ 2691].)
	IsPersistent [▶ 2694]	Gets a value indicating whether this ISymbol [▶ 2691] is persistent. (Inherited from ISymbol [▶ 2691].)
	IsPointer [▶ 2552]	Indicates that the IInstance [▶ 2549] represents a Pointer type (Pointer TO) (Inherited from IInstance [▶ 2549].)
	IsPrimitiveType [▶ 2695]	Gets a value indicating whether this instance is a primitive type. (Inherited from ISymbol [▶ 2691].)
	IsReadOnly [▶ 2695]	Indicates that this instance is read only. (Inherited from ISymbol [▶ 2691].)
	IsRecursive [▶ 2696]	Gets a value indicating whether this instance is recursive. (Inherited from ISymbol [▶ 2691].)
	IsReference [▶ 2552]	Indicates that the IInstance [▶ 2549] represents a Reference type (REFERENCE TO) (Inherited from IInstance [▶ 2549].)
	IsStatic [▶ 2553]	Gets a value indicating whether this IInstance [▶ 2549] is static. (Inherited from IInstance [▶ 2549].)
	IsVirtual [▶ 2595]	Gets a value indicating whether this instance is virtual. (Inherited from IProcessImageAddress [▶ 2593].)
	Parent [▶ 2696]	Gets the parent Symbol (Inherited from ISymbol [▶ 2691].)
	Size [▶ 2475]	Gets the size of the object in bytes or Bits dependant on IsBitType [▶ 2474] (Inherited from IBitSize [▶ 2472].)
	SubSymbols [▶ 2696]	Gets the SubSymbols of the ISymbol [▶ 2691] (Inherited from ISymbol [▶ 2691].)

	Name	Description
	TypeName [▶ 2553]	Gets the name of the DataType [▶ 2475] that is used for this Instance [▶ 2549]. (Inherited from Instance [▶ 2549].)
	ValueEncoding [▶ 2472]	Gets the value encoding. (Inherited from AttributedInstance [▶ 2469].)

6.7.7.1.2 IAdsSymbol.ImageBaseAddress Property

Gets the [AmsAddress](#) [[▶ 752](#)] of the Process Image

Namespace: [TwinCAT.Ads.TypeSystem](#) [[▶ 1698](#)]

Assembly: TwinCAT.Ads.Abstractions (in TwinCAT.Ads.Abstractions.dll) Version: 6.0.328+39e3229

Syntax

C#

```
AmsAddress? ImageBaseAddress { get; }
```

Property Value

Type: [AmsAddress](#) [[▶ 752](#)]

The address.

Reference

[IAdsSymbol Interface](#) [[▶ 1755](#)]

[TwinCAT.Ads.TypeSystem Namespace](#) [[▶ 1698](#)]

6.7.7.2 IAdsSymbol Methods

The [IAdsSymbol](#) [[▶ 1755](#)] type exposes the following members.

Extension Methods

	Name	Description
	ReferencesExternalData [▶ 3038]	Indicates, that the Instance value includes process memory data, that cannot be read in one memory block. (Defined by DataTypeExtension [▶ 3021].)

Reference

[IAdsSymbol Interface](#) [[▶ 1755](#)]

[TwinCAT.Ads.TypeSystem Namespace](#) [[▶ 1698](#)]

6.7.8 IAdsSymbolLoader Interface

Symbol Loader interface

Namespace: [TwinCAT.Ads.TypeSystem](#) [[▶ 1698](#)]

Assembly: TwinCAT.Ads.Abstractions (in TwinCAT.Ads.Abstractions.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public interface IAdsSymbolLoader : ISymbolLoader,
    ISymbolProvider, ISymbolServer
```

The [IAdsSymbolLoader](#) type exposes the following members.

Properties

	Name	Description
	BuildInTypes [▶ 2716]	Gets the build in types. (Inherited from ISymbolLoader [▶ 2714].)
	DataTypes [▶ 2720]	Gets the data types (Inherited from ISymbolServer [▶ 2719].)
 	DefaultNotificationSettings [▶ 1762]	Gets/Sets the default notification settings for this SymbolLoader
	DefaultValueEncoding [▶ 2721]	Gets the default value encoding. (Inherited from ISymbolServer [▶ 2719].)
	ImageBaseAddress [▶ 1763]	Gets the image base address.
	PlatformPointerSize [▶ 1763]	Gets the (byte) size of Pointers on the attached platform system.
	RootNamespaceName [▶ 2718]	Gets the name of the root namespace (Inherited from ISymbolProvider [▶ 2717].)
	Settings [▶ 2716]	Gets or sets the access Method (Inherited from ISymbolLoader [▶ 2714].)
	Symbols [▶ 2721]	Gets the symbols. (Inherited from ISymbolServer [▶ 2719].)

Methods

	Name	Description
	GetDataTypesAsync [▶ 2722]	Gets the data types asynchronously. (Inherited from ISymbolServer [▶ 2719].)
	GetSymbolsAsync [▶ 2723]	Gets the symbols asynchronously (Inherited from ISymbolServer [▶ 2719].)
	ResetCachedSymbolicData [▶ 2724]	Resets the cached symbolic data. (Inherited from ISymbolServer [▶ 2719].)
	TryGetDataTypes [▶ 2723]	Tries to get the symbols from the device target. (Inherited from ISymbolServer [▶ 2719].)
	TryGetSymbols [▶ 2724]	Tries to geth the symbols from the device target. (Inherited from ISymbolServer [▶ 2719].)

Reference

[TwinCAT.Ads.TypeSystem Namespace](#) [[▶ 1698](#)]

6.7.8.1 IAdsSymbolLoader Properties

The [IAdsSymbolLoader](#) [[▶ 1760](#)] type exposes the following members.

Properties

	Name	Description
	BuildInTypes [▶ 2716]	Gets the build in types. (Inherited from ISymbolLoader [▶ 2714].)
	DataTypes [▶ 2720]	Gets the data types (Inherited from ISymbolServer [▶ 2719].)
 	DefaultNotificationSettings [▶ 1762]	Gets/Sets the default notification settings for this SymbolLoader
	DefaultValueEncoding [▶ 2721]	Gets the default value encoding. (Inherited from ISymbolServer [▶ 2719].)
	ImageBaseAddress [▶ 1763]	Gets the image base address.
	PlatformPointerSize [▶ 1763]	Gets the (byte) size of Pointers on the attached platform system.
	RootNamespaceName [▶ 2718]	Gets the name of the root namespace (Inherited from ISymbolProvider [▶ 2717].)
	Settings [▶ 2716]	Gets or sets the access Method (Inherited from ISymbolLoader [▶ 2714].)
	Symbols [▶ 2721]	Gets the symbols. (Inherited from ISymbolServer [▶ 2719].)

Reference

[IAdsSymbolLoader Interface](#) [[▶ 1760](#)]

[TwinCAT.Ads.TypeSystem Namespace](#) [[▶ 1698](#)]

6.7.8.1.1 IAdsSymbolLoader.DefaultNotificationSettings Property

Gets/Sets the default notification settings for this SymbolLoader

Namespace: [TwinCAT.Ads.TypeSystem](#) [[▶ 1698](#)]

Assembly: TwinCAT.Ads.Abstractions (in TwinCAT.Ads.Abstractions.dll) Version: 6.0.328+39e3229

Syntax

C#

```
INotificationSettings DefaultNotificationSettings { get; set; }
```

Property Value

Type: [INotificationSettings](#) [[▶ 1098](#)]

The default notification settings.

Remarks

The Default notification Settings can be set on the SymbolLoader and is used as default on the different Symbols. On the symbol itself the [NotificationSettings](#) [[▶ 1106](#)] can be overridden.

Examples

Setting the DefaultNotificationSettings on the [IAdsSymbolLoader](#) [[▶ 1760](#)] object:

Set DefaultNotificationSettings

```
// Create AdsClient object
using (AdsClient client = new AdsClient())
{
    // No automatic Synchronization (necessary for Console applications without message loop)
    //client.Synchronize = false;

    // Connect to client
    client.Connect(address);

    // Usage of 'dynamic' type/symbol loader
    SymbolLoaderSettings settings = new SymbolLoaderSettings(SymbolLoadMode.DynamicTree, ValueAccessMode.IndexGroupOffsetPreferred);
    IAdsSymbolLoader dynLoader = (IAdsSymbolLoader)SymbolLoaderFactory.Create(client, settings);

    // Set the DefaultNotification Properties
    dynLoader.DefaultNotificationSettings = new NotificationSettings(AdsTransMode.ClientOnChange, 200, 2000);

    // Determine the symbols
    dynamic dynamicSymbols = ((IDynamicSymbolLoader)dynLoader).SymbolsDynamic;

    // Task 1 Symbol (build in symbol)
    dynamic task1Symbol = dynamicSymbols._TaskInfo[1];

    // CycleCount Symbol
    dynamic cycleCountSymbol = task1Symbol.CycleCount;

    // Override Notification Setting for Cycle Count Symbol
    cycleCountSymbol.NotificationSettings = new NotificationSettings(AdsTransMode.OnChange, 250, 0);

    // Register Dynamic Value Changed event.
    cycleCountSymbol.ValueChanged += new EventHandler<ValueChangedEventArgs>(cycleCount_ValueChanged);
};
```

6.7.8.1.3 IAdsSymbolLoader.PlatformPointerSize Property

Gets the (byte) size of Pointers on the attached platform system.

Namespace: [TwinCAT.Ads.TypeSystem](#) [[▶ 1698](#)]

Assembly: TwinCAT.Ads.Abstractions (in TwinCAT.Ads.Abstractions.dll) Version: 6.0.328+39e3229

Syntax

C#

```
int PlatformPointerSize { get; }
```

Property Value

Type: Int32

The size of the platform pointer.

Reference

6.7.8.2 IAdsSymbolLoader Methods

The [IAdsSymbolLoader](#) [[▶ 1760](#)] type exposes the following members.

Methods

	Name	Description
	GetDataTypesAsync [▶ 2722]	Gets the data types asynchronously. (Inherited from ISymbolServer [▶ 2719].)
	GetSymbolsAsync [▶ 2723]	Gets the symbols asynchronously (Inherited from ISymbolServer [▶ 2719].)

	Name	Description
	ResetCachedSymbolicData [▶ 2724]	Resets the cached symbolic data. (Inherited from ISymbolServer [▶ 2719].)
	TryGetDataTypes [▶ 2723]	Tries to get the symbols from the device target. (Inherited from ISymbolServer [▶ 2719].)
	TryGetSymbols [▶ 2724]	Tries to geth the symbols from the device target. (Inherited from ISymbolServer [▶ 2719].)

6.7.9 IContextMaskProvider Interface

Interface IContextMaskProvider

Namespace: [TwinCAT.Ads.TypeSystem](#) [[▶ 1698](#)]

Assembly: TwinCAT.Ads.Abstractions (in TwinCAT.Ads.Abstractions.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public interface IContextMaskProvider
```

The IContextMaskProvider type exposes the following members.

Properties

	Name	Description
	ContextMask [▶ 1765]	Gets the ContextMask of the symbol, indicating the task the variable belongs to. If ContextMask is not zero use CyclicInContext [▶ 740] or OnChangeInContext [▶ 740] to add notifications.

Reference

[TwinCAT.Ads.TypeSystem Namespace](#) [[▶ 1698](#)]

6.7.9.1 IContextMaskProvider Properties

The [IContextMaskProvider](#) [[▶ 1764](#)] type exposes the following members.

Properties

	Name	Description
	ContextMask [▶ 1765]	Gets the ContextMask of the symbol, indicating the task the variable belongs to. If ContextMask is not zero use CyclicInContext [▶ 740] or OnChangeInContext [▶ 740] to add notifications.

Reference

[IContextMaskProvider Interface](#) [[▶ 1764](#)]

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public class Instance : IInstance, IBitSize
```

The Instance type exposes the following members.

Properties

	Name	Description
	Attributes [▶ 1768]	Gets the Type Attributes.
	BitSize [▶ 1768]	Gets the size of this Instance in bits.
	ByteSize [▶ 1769]	Gets the (aligned) size of of the Type/Instance in Bytes
	Category [▶ 1769]	Gets the the DataTypeCategory [▶ 2111] of the Instance.
	Comment [▶ 1770]	Gets the comment.
	ContextMask [▶ 1770]	Gets the context mask of this instance.

	Name	Description
	DataType [▶ 1771]	Gets the IDataType [▶ 2475] of the Instance [▶ 2549].
	HasValue [▶ 1771]	Gets a value indicating whether this instance has a value.
	InstanceName [▶ 1771]	Gets the name of the instance (without periods (.))
	InstancePath [▶ 1772]	Gets the relative / absolute access path to the instance (with periods (.))
	IsBitType [▶ 1773]	Gets a value indicating whether this instance is not basing on a full DataType but instead of some sort of bit mapping
	IsByteAligned [▶ 1773]	Indicates that the Size of the Object is Byte aligned ($\text{BitSize} \% 8 == 0$)
	IsPersistent [▶ 1773]	Indicates that this instance is persistent.
	IsPointer [▶ 1774]	Gets a value indicating whether this instance is reference.
	IsReadOnly [▶ 1774]	Indicates that this instance is read only.
	IsReference [▶ 1775]	Gets a value indicating whether this instance is reference.
	IsStatic [▶ 1775]	Gets a value indicating whether this Instance [▶ 2549] is static.
	IsTcComInterfacePointer [▶ 1776]	Indicates that this instance is a TcComInterfacePointer .
	IsTypeGuid [▶ 1776]	Indicates that this instance has set TypeGuid flag.
	Namespace [▶ 1776]	Gets the namespace name.
	Size [▶ 1777]	Gets the size of the IDataType [▶ 2475] in bytes or Bits dependant on IsBitType [▶ 1773]
	TypeName [▶ 1777]	Gets the name of the DataType [▶ 2475] that is used for this Instance [▶ 2549].

Methods

	Name	Description
	AlignTypeName [▶ 1779]	Aligns the type name
	Equals	Determines whether the specified object is equal to the current object. (Inherited from Object .)
	Finalize	Allows an object to try to free resources and perform other cleanup operations before it is reclaimed by garbage collection. (Inherited from Object .)
	GetHashCode	Serves as the default hash function. (Inherited from Object .)
	GetType	Gets the Type of the current instance. (Inherited from Object .)
	MemberwiseClone	Creates a shallow copy of the current Object . (Inherited from Object .)
	OnGetSize [▶ 1779]	Handler function getting the size of the Instance
	OnSetInstanceName [▶ 1780]	Sets a new InstanceName InstancePath

	Name	Description
	SetAttributes [▶ 1780]	Sets the type attributes
	SetContextMask [▶ 1780]	Sets the context mask.
	ToString [▶ 1781]	Returns a String that represents this instance. (Overrides Object.ToString..)

Extension Methods

	Name	Description
	ReferencesExternalData [▶ 3038]	Indicates, that the Instance value includes process memory data, that cannot be read in one memory block. (Defined by DataTypeExtension [▶ 3021].)

Reference

[TwinCAT.Ads.TypeSystem Namespace](#) [▶ 1698]

6.7.10.1 Instance Properties

The [Instance](#) [▶ 1765] type exposes the following members.

Properties

	Name	Description
	Attributes [▶ 1768]	Gets the Type Attributes.
	BitSize [▶ 1768]	Gets the size of this Instance [▶ 1765] in bits.
	ByteSize [▶ 1769]	Gets the (aligned) size of of the Type/Instance in Bytes
	Category [▶ 1769]	Gets the the DataTypeCategory [▶ 2111] of the Instance.
	Comment [▶ 1770]	Gets the comment.
	ContextMask [▶ 1770]	Gets the context mask of this instance.
	DataType [▶ 1771]	Gets the IDataType [▶ 2475] of the Instance [▶ 2549].
	HasValue [▶ 1771]	Gets a value indicating whether this instance has a value.
	InstanceName [▶ 1771]	Gets the name of the instance (without periods (.))
	InstancePath [▶ 1772]	Gets the relative / absolute access path to the instance (with periods (.))
	IsBitType [▶ 1773]	Gets a value indicating whether this instance is not basing on a full DataType but instead of some sort of bit mapping
	IsByteAligned [▶ 1773]	Indicates that the Size of the Object is Byte aligned ($\text{BitSize} \% 8 == 0$)
	IsPersistent [▶ 1773]	Indicates that this instance is persistent.
	IsPointer [▶ 1774]	Gets a value indicating whether this instance is reference.
	IsReadOnly [▶ 1774]	Indicates that this instance is read only.

	Name	Description
	IsReference [▶ 1775]	Gets a value indicating whether this instance is reference.
	IsStatic [▶ 1775]	Gets a value indicating whether this IInstance [▶ 2549] is static.
	IsTcComInterfacePointer [▶ 1776]	Indicates that this instance is a TcComInterfacePointer.
	IsTypeGuid [▶ 1776]	Indicates that this instance has set TypeGuid flag.
	Namespace [▶ 1776]	Gets the namespace name.
	Size [▶ 1777]	Gets the size of the IDataType [▶ 2475] in bytes or Bits dependant on IsBitType [▶ 1773]
	TypeName [▶ 1777]	Gets the name of the DataType [▶ 2475] that is used for this IInstance [▶ 2549].

6.7.10.1 Instance.Attributes Property

Gets the Type Attributes.

Namespace: [TwinCAT.Ads.TypeSystem](#) [[▶ 1698](#)]

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public ITypeAttributeCollection Attributes { get; }
```

Property Value

Type: [ITypeAttributeCollection](#) [[▶ 2726](#)]

The attributes.

Reference

[Instance Class](#) [[▶ 1765](#)]

[TwinCAT.Ads.TypeSystem Namespace](#) [[▶ 1698](#)]

6.7.10.2 Instance.BitSize Property

Gets the size of this [Instance](#) [[▶ 1765](#)] in bits.

Namespace: [TwinCAT.Ads.TypeSystem](#) [[▶ 1698](#)]

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public virtual int BitSize { get; }
```

Property Value

Type: Int32
The size of the bit.

Implements

[IBitSize.BitSize](#) [[▶ 2473](#)]

Reference

[Instance Class](#) [[▶ 1765](#)]

[TwinCAT.Ads.TypeSystem Namespace](#) [[▶ 1698](#)]

6.7.10.1.3 Instance.ByteSize Property

Gets the (aligned) size of of the Type/Instance in Bytes

Namespace: [TwinCAT.Ads.TypeSystem](#) [[▶ 1698](#)]

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public int ByteSize { get; }
```

Property Value

Type: Int32
The size of the byte.

Implements

[IBitSize.ByteSize](#) [[▶ 2474](#)]

Reference

[Instance Class](#) [[▶ 1765](#)]

[TwinCAT.Ads.TypeSystem Namespace](#) [[▶ 1698](#)]

6.7.10.1.4 Instance.Category Property

Gets the the [DataTypeCategory](#) [[▶ 2111](#)] of the Instance.

Namespace: [TwinCAT.Ads.TypeSystem](#) [[▶ 1698](#)]

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public DataTypeCategory Category { get; protected set; }
```

Property Value

Type: [DataTypeCategory](#) [[▶ 2111](#)]
The category.

Remarks

Corresponds to the [Category \[▶ 2478\]](#)

Reference

[Instance Class \[▶ 1765\]](#)

[TwinCAT.Ads.TypeSystem Namespace \[▶ 1698\]](#)

6.7.10.1.5 Instance.Comment Property

Gets the comment.

Namespace: [TwinCAT.Ads.TypeSystem \[▶ 1698\]](#)

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public string Comment { get; }
```

Property Value

Type: String

The comment.

Implements

[IInstance.Comment \[▶ 2550\]](#)

Reference

[Instance Class \[▶ 1765\]](#)

[TwinCAT.Ads.TypeSystem Namespace \[▶ 1698\]](#)

6.7.10.1.6 Instance.ContextMask Property

Gets the context mask of this instance.

Namespace: [TwinCAT.Ads.TypeSystem \[▶ 1698\]](#)

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public byte ContextMask { get; }
```

Property Value

Type: Byte

Remarks

The Size of the internal data is 4-Bit

Reference

[Instance Class \[▶ 1765\]](#)

[TwinCAT.Ads.TypeSystem Namespace \[▸ 1698\]](#)

6.7.10.1.7 Instance.DataType Property

Gets the [IDataType \[▸ 2475\]](#) of the [IInstance \[▸ 2549\]](#).

Namespace: [TwinCAT.Ads.TypeSystem \[▸ 1698\]](#)

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public IDataType? DataType { get; protected set; }
```

Property Value

Type: [IDataType \[▸ 2475\]](#)

The type of the data.

Implements

[IInstance.DataType \[▸ 2551\]](#)

Reference

[Instance Class \[▸ 1765\]](#)

[TwinCAT.Ads.TypeSystem Namespace \[▸ 1698\]](#)

6.7.10.1.8 Instance.HasValue Property

Gets a value indicating whether this instance has a value.

Namespace: [TwinCAT.Ads.TypeSystem \[▸ 1698\]](#)

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public virtual bool HasValue { get; }
```

Property Value

Type: Boolean

true if this instance has value; otherwise, false.

Remarks

Reference

[Instance Class \[▸ 1765\]](#)

[TwinCAT.Ads.TypeSystem Namespace \[▸ 1698\]](#)

6.7.10.1.9 Instance.InstanceName Property

Gets the name of the instance (without periods (.))

Namespace: [TwinCAT.Ads.TypeSystem \[▸ 1698\]](#)

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public string InstanceName { get; protected set; }
```

Property Value

Type: String

The name of the instance.

Implements

[IInstance.InstanceName \[▸ 2551\]](#)

Reference

[Instance Class \[▸ 1765\]](#)

[TwinCAT.Ads.TypeSystem Namespace \[▸ 1698\]](#)

6.7.10.1.10 Instance.InstancePath Property

Gets the relative / absolute access path to the instance (with periods (.))

Namespace: [TwinCAT.Ads.TypeSystem \[▸ 1698\]](#)

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public virtual string InstancePath { get; }
```

Property Value

Type: String

The instance path.

Implements

[IInstance.InstancePath \[▸ 2552\]](#)

Remarks

If this path is relative or absolute depends on the context. [IMember \[▸ 2561\]](#) are using relative paths, [ISymbol \[▸ 2691\]](#)s are using absolute ones.

Reference

[Instance Class \[▸ 1765\]](#)

6.7.10.1.11 Instance.IsBitType Property

Gets a value indicating whether this instance is not basing on a full DataType but instead of some sort of bit mapping

Namespace: [TwinCAT.Ads.TypeSystem](#) [[▶ 1698](#)]

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public bool IsBitType { get; }
```

Property Value

Type: Boolean

true if this instance is bit mapping; otherwise, false.

Implements

[IBitSize.IsBitType](#) [[▶ 2474](#)]

Reference

[Instance Class](#) [[▶ 1765](#)]

[TwinCAT.Ads.TypeSystem Namespace](#) [[▶ 1698](#)]

6.7.10.1.12 Instance.IsByteAligned Property

Indicates that the Size of the Object is Byte aligned ($\text{BitSize} \% 8 == 0$)

Namespace: [TwinCAT.Ads.TypeSystem](#) [[▶ 1698](#)]

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public bool IsByteAligned { get; }
```

Property Value

Type: Boolean

true if this instance is byte aligned; otherwise, false.

Implements

[IBitSize.IsByteAligned](#) [[▶ 2475](#)]

Reference

[Instance Class](#) [[▶ 1765](#)]

[TwinCAT.Ads.TypeSystem Namespace](#) [[▶ 1698](#)]

6.7.10.1.13 Instance.IsPersistent Property

Indicates that this instance is persistent.

Namespace: [TwinCAT.Ads.TypeSystem](#) [[▶ 1698](#)]

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public bool IsPersistent { get; }
```

Property Value

Type: Boolean

Reference

[Instance Class](#) [[▶ 1765](#)]

[TwinCAT.Ads.TypeSystem Namespace](#) [[▶ 1698](#)]

6.7.10.1.14 Instance.IsPointer Property

Gets a value indicating whether this instance is reference.

Namespace: [TwinCAT.Ads.TypeSystem](#) [[▶ 1698](#)]

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public bool IsPointer { get; }
```

Property Value

Type: Boolean

true if this instance is reference; otherwise, false.

Implements

[IInstance.IsPointer](#) [[▶ 2552](#)]

Reference

[Instance Class](#) [[▶ 1765](#)]

[TwinCAT.Ads.TypeSystem Namespace](#) [[▶ 1698](#)]

6.7.10.1.15 Instance.IsReadOnly Property

Indicates that this instance is read only.

Namespace: [TwinCAT.Ads.TypeSystem](#) [[▶ 1698](#)]

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public bool IsReadOnly { get; }
```

Property Value

Type: Boolean

Remarks

Actually, this Flag is restricted to TcCOM-Objects readonly Parameters. Within the PLC this is used for the ApplicationName and ProjectName of PLC instances. Write-Access on these Modules will create an [DeviceAccessDenied \[▸ 664\]](#) error.

Reference

[Instance Class \[▸ 1765\]](#)

[TwinCAT.Ads.TypeSystem Namespace \[▸ 1698\]](#)

6.7.10.1.16 Instance.IsReference Property

Gets a value indicating whether this instance is reference.

Namespace: [TwinCAT.Ads.TypeSystem \[▸ 1698\]](#)

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public bool IsReference { get; }
```

Property Value

Type: Boolean

true if this instance is reference; otherwise, false.

Implements

[IInstance.IsReference \[▸ 2552\]](#)

Reference

[Instance Class \[▸ 1765\]](#)

[TwinCAT.Ads.TypeSystem Namespace \[▸ 1698\]](#)

6.7.10.1.17 Instance.IsStatic Property

Gets a value indicating whether this [IInstance \[▸ 2549\]](#) is static.

Namespace: [TwinCAT.Ads.TypeSystem \[▸ 1698\]](#)

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public bool IsStatic { get; protected set; }
```

Property Value

Type: Boolean

true if this instance is static; otherwise, false.

Implements

[IInstance.IsStatic](#) [[▶ 2553](#)]

Reference

[Instance Class](#) [[▶ 1765](#)]

[TwinCAT.Ads.TypeSystem Namespace](#) [[▶ 1698](#)]

6.7.10.1.18 Instance.IsTcComInterfacePointer Property

Indicates that this instance is a TcComInterfacePointer.

Namespace: [TwinCAT.Ads.TypeSystem](#) [[▶ 1698](#)]

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public bool IsTcComInterfacePointer { get; }
```

Property Value

Type: Boolean

Reference

[Instance Class](#) [[▶ 1765](#)]

[TwinCAT.Ads.TypeSystem Namespace](#) [[▶ 1698](#)]

6.7.10.1.19 Instance.IsTypeGuid Property

Indicates that this instance has set TypeGuid flag.

Namespace: [TwinCAT.Ads.TypeSystem](#) [[▶ 1698](#)]

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public bool IsTypeGuid { get; }
```

Property Value

Type: Boolean

Reference

[Instance Class](#) [[▶ 1765](#)]

[TwinCAT.Ads.TypeSystem Namespace](#) [[▶ 1698](#)]

6.7.10.1.20 Instance.Namespace Property

Gets the namespace name.

Namespace: [TwinCAT.Ads.TypeSystem](#) [[▶ 1698](#)]

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public string Namespace { get; }
```

Property Value

Type: String

The namespace.

Reference

[Instance Class](#) [[▶ 1765](#)]

[TwinCAT.Ads.TypeSystem Namespace](#) [[▶ 1698](#)]

6.7.10.1.21 Instance.Size Property

Gets the size of the [IDataType](#) [[▶ 2475](#)] in bytes or Bits dependant on [IsBitType](#) [[▶ 1773](#)]

Namespace: [TwinCAT.Ads.TypeSystem](#) [[▶ 1698](#)]

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public int Size { get; protected set; }
```

Property Value

Type: Int32

The size of the bit.

Implements

[IBitSize.Size](#) [[▶ 2475](#)]

Reference

[Instance Class](#) [[▶ 1765](#)]

[TwinCAT.Ads.TypeSystem Namespace](#) [[▶ 1698](#)]

6.7.10.1.22 Instance.TypeName Property

Gets the name of the [DataType](#) [[▶ 2475](#)] that is used for this [Instance](#) [[▶ 2549](#)].

Namespace: [TwinCAT.Ads.TypeSystem](#) [[▶ 1698](#)]

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public string TypeName { get; protected set; }
```

Property Value

Type: String
The name of the type.

Implements

[IInstance.TypeName](#) [[▶ 2553](#)]

Reference

[Instance Class](#) [[▶ 1765](#)]

[TwinCAT.Ads.TypeSystem Namespace](#) [[▶ 1698](#)]

6.7.10.2 Instance Methods

The [Instance](#) [[▶ 1765](#)] type exposes the following members.

Methods

	Name	Description
	AlignTypeName [▶ 1779]	Aligns the type name
		
	Equals	Determines whether the specified object is equal to the current object. (Inherited from Object.)
	Finalize	Allows an object to try to free resources and perform other cleanup operations before it is reclaimed by garbage collection. (Inherited from Object.)
	GetHashCode	Serves as the default hash function. (Inherited from Object.)
	GetType	Gets the Type of the current instance. (Inherited from Object.)
	MemberwiseClone	Creates a shallow copy of the current Object. (Inherited from Object.)
	OnGetSize [▶ 1779]	Handler function getting the size of the Instance [▶ 1765]
	OnSetInstanceName [▶ 1780]	Sets a new InstanceName InstancePath
	SetAttributes [▶ 1780]	Sets the type attributes
	SetContextMask [▶ 1780]	Sets the context mask.
	ToString [▶ 1781]	Returns a String that represents this instance. (Overrides Object.ToString..)

Extension Methods

	Name	Description
	ReferencesExternalData [▶ 3038]	Indicates, that the Instance value includes process memory data, that cannot be read in one memory block. (Defined by DataTypeExtension [▶ 3021].)

Reference

[Instance Class](#) [[▶ 1765](#)]

[TwinCAT.Ads.TypeSystem Namespace \[► 1698\]](#)

6.7.10.2.1 Instance.AlignTypeName Method

Aligns the type name

Namespace: [TwinCAT.Ads.TypeSystem \[► 1698\]](#)

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
protected static string AlignTypeName(  
    string typeName  
)
```

Parameters

typeName	Type: System.String Name of the type.
----------	--

Return Value

Type: String
System.String.

Exceptions

Exception	Condition
ArgumentException	Type name not valid!

Reference

[Instance Class \[► 1765\]](#)

[TwinCAT.Ads.TypeSystem Namespace \[► 1698\]](#)

6.7.10.2.2 Instance.OnGetSize Method

Handler function getting the size of the [Instance \[► 1765\]](#)

Namespace: [TwinCAT.Ads.TypeSystem \[► 1698\]](#)

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
protected virtual int OnGetSize()
```

Return Value

Type: Int32
System.Int32.

Reference

[Instance Class \[► 1765\]](#)

[TwinCAT.Ads.TypeSystem Namespace \[► 1698\]](#)

6.7.10.2.3 Instance.OnSetInstanceName Method

Sets a new InstanceName InstancePath

Namespace: [TwinCAT.Ads.TypeSystem](#) [[▶ 1698](#)]

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
protected virtual void OnSetInstanceName(  
    string instanceName  
)
```

Parameters

instanceName	Type: System.String Instance name.
--------------	---------------------------------------

Reference

[Instance Class](#) [[▶ 1765](#)]

[TwinCAT.Ads.TypeSystem Namespace](#) [[▶ 1698](#)]

6.7.10.2.4 Instance.SetAttributes Method

Sets the type attributes

Namespace: [TwinCAT.Ads.TypeSystem](#) [[▶ 1698](#)]

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
protected void SetAttributes(  
    TypeAttributeCollection? coll  
)
```

Parameters

coll	Type: TwinCAT.TypeSystem.TypeAttributeCollection [▶ 2952] The attributes.
------	--

Reference

[Instance Class](#) [[▶ 1765](#)]

[TwinCAT.Ads.TypeSystem Namespace](#) [[▶ 1698](#)]

6.7.10.2.5 Instance.SetContextMask Method

Sets the context mask.

Namespace: [TwinCAT.Ads.TypeSystem](#) [[▶ 1698](#)]

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
protected void SetContextMask(
    byte contextMask
)
```

Parameters

contextMask	Type: System.Byte The context mask.
-------------	--

Exceptions

Exception	Condition
ArgumentOutOfRangeException	contextMask

Reference

[TwinCAT.Ads.TypeSystem Namespace \[► 1698\]](#)

6.7.10.2.6 Instance.ToString Method

Returns a String that represents this instance.

Namespace: [TwinCAT.Ads.TypeSystem \[► 1698\]](#)

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public override string ToString()
```

Return Value

Type: String

A String that represents this instance.

Reference

[TwinCAT.Ads.TypeSystem Namespace \[► 1698\]](#)

6.7.11 Member Class

Represents a member of an [StructType \[► 1846\]](#)

Inheritance Hierarchy

System.Object

[TwinCAT.Ads.TypeSystem.Instance \[► 1765\]](#)

[TwinCAT.Ads.TypeSystem.Field \[► 1750\]](#)

[TwinCAT.Ads.TypeSystem.Member](#)

Namespace: [TwinCAT.Ads.TypeSystem \[► 1698\]](#)

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public sealed class Member : Field,
    IMember, IField, IAttributedInstance, IInstance, IBitSize
```

The Member type exposes the following members.

Properties

	Name	Description
	Attributes [▶ 1768]	Gets the Type Attributes. (Inherited from Instance [▶ 1765].)
	BitOffset [▶ 1785]	Gets the bit offset.
	BitSize [▶ 1768]	Gets the size of this Instance [▶ 1765] in bits. (Inherited from Instance [▶ 1765].)
	ByteOffset [▶ 1785]	Gets the byte offset.
	ByteSize [▶ 1769]	Gets the (aligned) size of of the Type/Instance in Bytes (Inherited from Instance [▶ 1765].)
	Category [▶ 1769]	Gets the the DataTypeCategory [▶ 2111] of the Instance. (Inherited from Instance [▶ 1765].)
	Comment [▶ 1770]	Gets the comment. (Inherited from Instance [▶ 1765].)
	ContextMask [▶ 1770]	Gets the context mask of this instance. (Inherited from Instance [▶ 1765].)
	DataType [▶ 1771]	Gets the IDataType [▶ 2475] of the IInstance [▶ 2549]. (Inherited from Instance [▶ 1765].)
	HasValue [▶ 1771]	Gets a value indicating whether this instance has a value. (Inherited from Instance [▶ 1765].)
	InstanceName [▶ 1771]	Gets the name of the instance (without periods (.)) (Inherited from Instance [▶ 1765].)
	InstancePath [▶ 1772]	Gets the relative / absolute access path to the instance (with periods (.)) (Inherited from Instance [▶ 1765].)
	IsBitType [▶ 1773]	Gets a value indicating whether this instance is not basing on a full DataType but instead of some sort of bit mapping (Inherited from Instance [▶ 1765].)
	IsByteAligned [▶ 1773]	Indicates that the Size of the Object is Byte aligned ($\text{BitSize} \% 8 == 0$) (Inherited from Instance [▶ 1765].)
	IsPersistent [▶ 1773]	Indicates that this instance is persistent. (Inherited from Instance [▶ 1765].)
	IsPointer [▶ 1774]	Gets a value indicating whether this instance is reference. (Inherited from Instance [▶ 1765].)
	IsReadOnly [▶ 1774]	Indicates that this instance is read only. (Inherited from Instance [▶ 1765].)
	IsReference [▶ 1775]	Gets a value indicating whether this instance is reference. (Inherited from Instance [▶ 1765].)
	IsStatic [▶ 1775]	Gets a value indicating whether this IInstance [▶ 2549] is static. (Inherited from Instance [▶ 1765].)
	IsTcComInterfacePointer [▶ 1776]	Indicates that this instance is a TcComInterfacePointer . (Inherited from Instance [▶ 1765].)

	Name	Description
	IsTypeGuid [▶ 1776]	Indicates that this instance has set TypeGuid flag. (Inherited from Instance [▶ 1765] .)
	Namespace [▶ 1776]	Gets the namespace name. (Inherited from Instance [▶ 1765] .)
	Offset [▶ 1786]	Gets the offset of the Member within the parent StructType [▶ 1846] in bits or bytes dependent on IsBitType [▶ 1773]
	ParentType [▶ 1754]	Gets the Parent of this IField [▶ 2535] . (Inherited from Field [▶ 1750] .)
	Size [▶ 1777]	Gets the size of the IDataType [▶ 2475] in bytes or Bits dependant on IsBitType [▶ 1773] (Inherited from Instance [▶ 1765] .)
	TypeName [▶ 1777]	Gets the name of the DataType [▶ 2475] that is used for this Instance [▶ 2549] . (Inherited from Instance [▶ 1765] .)
	ValueEncoding [▶ 1754]	Gets the value encoding of this Field [▶ 1750] (Inherited from Field [▶ 1750] .)

Methods

	Name	Description
	Equals	Determines whether the specified object is equal to the current object. (Inherited from Object.)
	GetHashCode	Serves as the default hash function. (Inherited from Object.)
	GetType	Gets the Type of the current instance. (Inherited from Object.)
	ToString [▶ 1781]	Returns a String that represents this instance. (Inherited from Instance [▶ 1765] .)

Extension Methods

	Name	Description
	ReferencesExternalData [▶ 3038]	Indicates, that the Instance value includes process memory data, that cannot be read in one memory block. (Defined by DataTypeExtension [▶ 3021] .)

Reference

6.7.11.1 Member Properties

The [Member \[▶ 1781\]](#) type exposes the following members.

Properties

	Name	Description
	Attributes [▶ 1768]	Gets the Type Attributes. (Inherited from Instance [▶ 1765] .)
	BitOffset [▶ 1785]	Gets the bit offset.
	BitSize [▶ 1768]	Gets the size of this Instance [▶ 1765] in bits. (Inherited from Instance [▶ 1765] .)
	ByteOffset [▶ 1785]	Gets the byte offset.

	Name	Description
	ByteSize [▶ 1769]	Gets the (aligned) size of of the Type/Instance in Bytes (Inherited from Instance [▶ 1765].)
	Category [▶ 1769]	Gets the the DataTypeCategory [▶ 2111] of the Instance. (Inherited from Instance [▶ 1765].)
	Comment [▶ 1770]	Gets the comment. (Inherited from Instance [▶ 1765].)
	ContextMask [▶ 1770]	Gets the context mask of this instance. (Inherited from Instance [▶ 1765].)
	DataType [▶ 1771]	Gets the IDataType [▶ 2475] of the Instance [▶ 2549] . (Inherited from Instance [▶ 1765].)
	HasValue [▶ 1771]	Gets a value indicating whether this instance has a value. (Inherited from Instance [▶ 1765].)
	InstanceName [▶ 1771]	Gets the name of the instance (without periods (.)) (Inherited from Instance [▶ 1765].)
	InstancePath [▶ 1772]	Gets the relative / absolute access path to the instance (with periods (.)) (Inherited from Instance [▶ 1765].)
	IsBitType [▶ 1773]	Gets a value indicating whether this instance is not basing on a full DataType but instead of some sort of bit mapping (Inherited from Instance [▶ 1765].)
	IsByteAligned [▶ 1773]	Indicates that the Size of the Object is Byte aligned ($\text{BitSize} \% 8 == 0$) (Inherited from Instance [▶ 1765].)
	IsPersistent [▶ 1773]	Indicates that this instance is persistent. (Inherited from Instance [▶ 1765].)
	IsPointer [▶ 1774]	Gets a value indicating whether this instance is reference. (Inherited from Instance [▶ 1765].)
	IsReadOnly [▶ 1774]	Indicates that this instance is read only. (Inherited from Instance [▶ 1765].)
	IsReference [▶ 1775]	Gets a value indicating whether this instance is reference. (Inherited from Instance [▶ 1765].)
	IsStatic [▶ 1775]	Gets a value indicating whether this Instance [▶ 2549] is static. (Inherited from Instance [▶ 1765].)
	IsTcComInterfacePointer [▶ 1776]	Indicates that this instance is a TcComInterfacePointer . (Inherited from Instance [▶ 1765].)
	IsTypeGuid [▶ 1776]	Indicates that this instance has set TypeGuid flag. (Inherited from Instance [▶ 1765].)
	Namespace [▶ 1776]	Gets the namespace name. (Inherited from Instance [▶ 1765].)
	Offset [▶ 1786]	Gets the offset of the Member [▶ 1781] within the parent StructType [▶ 1846] in bits or bytes dependent on IsBitType [▶ 1773]
	ParentType [▶ 1754]	Gets the Parent of this Field [▶ 2535] . (Inherited from Field [▶ 1750].)
	Size [▶ 1777]	Gets the size of the IDataType [▶ 2475] in bytes or Bits dependant on IsBitType [▶ 1773] (Inherited from Instance [▶ 1765].)
	TypeName [▶ 1777]	Gets the name of the DataType [▶ 2475] that is used for this Instance [▶ 2549] . (Inherited from Instance [▶ 1765].)
	ValueEncoding [▶ 1754]	Gets the value encoding of this Field [▶ 1750] (Inherited from Field [▶ 1750].)

Syntax

C#

```
public sealed class PCCHType : PointerType
```

The PCCHType type exposes the following members.

Properties

	Name	Description
	Attributes [▶ 1727]	Gets the attributes of the IDataType [▶ 2475] (Inherited from DataType [▶ 1721].)
	BitSize [▶ 1727]	Gets the size of the DataType [▶ 1721] in bits. (Inherited from DataType [▶ 1721].)
	ByteSize [▶ 1728]	Gets the (aligned) size of of the Type/Instance in Bytes (Inherited from DataType [▶ 1721].)
	Category [▶ 1728]	Gets the Data Type category (Inherited from DataType [▶ 1721].)
	Comment [▶ 1729]	Gets the comment. (Inherited from DataType [▶ 1721].)
	FullName [▶ 1729]	Gets the full name of the IDataType [▶ 2475] (Namespace + Name) (Inherited from DataType [▶ 1721].)
	Id [▶ 1729]	Gets the ID of the DataType (Inherited from DataType [▶ 1721].)
	IsBitType [▶ 1730]	Gets a value indicating whether this IDataType [▶ 2475] is a bit mapping Type (Inherited from DataType [▶ 1721].)
	IsByteAligned [▶ 1730]	Indicates that the Size of the Object is Byte aligned (BitSize % 8 == 0) (Inherited from DataType [▶ 1721].)
	ManagedType [▶ 1793]	Gets the corresponding .NET Type if attached. (Inherited from PointerType [▶ 1790].)
	Name [▶ 1734]	Gets the name of the Data Type (without namespace) (Inherited from DataType [▶ 1721].)
	Namespace [▶ 1734]	Gets the namespace string within the IDataType [▶ 2475] exists. (Inherited from DataType [▶ 1721].)
	ReferencedType [▶ 1794]	Gets the the referenced type. (Inherited from PointerType [▶ 1790].)
	ReferenceTypeName [▶ 1794]	Gets the name of the referenced datatype (Inherited from PointerType [▶ 1790].)
	Size [▶ 1735]	Gets the Size of the DataType [▶ 1721] in Bytes or bits. (Inherited from DataType [▶ 1721].)

	Name	Description
	TypeGuid [▶ 1735]	Gets the Guid of the DataType [▶ 1721] (optional) (Inherited from DataType [▶ 1721].)

Methods

	Name	Description
	Create [▶ 1790]	Creates this instance.
	Equals	Determines whether the specified object is equal to the current object. (Inherited from Object.)
	GetHashCode	Serves as the default hash function. (Inherited from Object.)
	GetType	Gets the Type of the current instance. (Inherited from Object.)
	ToString [▶ 1738]	Returns a String that represents this instance. (Inherited from DataType [▶ 1721].)

6.7.12.2 PCCHType Methods

The [PCCHType](#) [▶ 1787] type exposes the following members.

Methods

	Name	Description
	Create [▶ 1790]	Creates this instance.
	Equals	Determines whether the specified object is equal to the current object. (Inherited from Object.)
	GetHashCode	Serves as the default hash function. (Inherited from Object.)
	GetType	Gets the Type of the current instance. (Inherited from Object.)
	ToString [▶ 1738]	Returns a String that represents this instance. (Inherited from DataType [▶ 1721].)

Reference

Namespace: [TwinCAT.Ads.TypeSystem](#) [[▶ 1698](#)]

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public class PointerType : DataType,
    IPointerType, IDataType, IBitSize
```

The PointerType type exposes the following members.

Properties

	Name	Description
	Attributes [▶ 1727]	Gets the attributes of the IDataType [▶ 2475] (Inherited from DataType [▶ 1721].)
	BitSize [▶ 1727]	Gets the size of the DataType [▶ 1721] in bits. (Inherited from DataType [▶ 1721].)
	ByteSize [▶ 1728]	Gets the (aligned) size of of the Type/Instance in Bytes (Inherited from DataType [▶ 1721].)
	Category [▶ 1728]	Gets the Data Type category (Inherited from DataType [▶ 1721].)
	Comment [▶ 1729]	Gets the comment. (Inherited from DataType [▶ 1721].)

	Name	Description
	FullName [▶ 1729]	Gets the full name of the IDataType [▶ 2475] (Namespace + Name) (Inherited from DataType [▶ 1721] .)
	Id [▶ 1729]	Gets the ID of the DataType [▶ 1721] (Inherited from DataType [▶ 1721] .)
	IsBitType [▶ 1730]	Gets a value indicating whether this IDataType [▶ 2475] is a bit mapping Type (Inherited from DataType [▶ 1721] .)
	IsByteAligned [▶ 1730]	Indicates that the Size of the Object is Byte aligned (BitSize % 8 == 0) (Inherited from DataType [▶ 1721] .)
	ManagedType [▶ 1793]	Gets the corresponding .NET Type if attached. (Overrides DataType.ManagedType [▶ 1733] .)
	Name [▶ 1734]	Gets the name of the Data Type (without namespace) (Inherited from DataType [▶ 1721] .)
	Namespace [▶ 1734]	Gets the namespace string within the IDataType [▶ 2475] exists. (Inherited from DataType [▶ 1721] .)
	ReferencedType [▶ 1794]	Gets the the referenced type.
	ReferenceTypeName [▶ 1794]	Gets the name of the referenced datatype
	Size [▶ 1735]	Gets the Size of the DataType [▶ 1721] in Bytes or bits. (Inherited from DataType [▶ 1721] .)
	TypeGuid [▶ 1735]	Gets the Guid of the DataType [▶ 1721] (optional) (Inherited from DataType [▶ 1721] .)

Methods

	Name	Description
	Equals	Determines whether the specified object is equal to the current object. (Inherited from Object .)
	Finalize	Allows an object to try to free resources and perform other cleanup operations before it is reclaimed by garbage collection. (Inherited from Object .)
	GetHashCode	Serves as the default hash function. (Inherited from Object .)
	GetType	Gets the Type of the current instance. (Inherited from Object .)
	MemberwiseClone	Creates a shallow copy of the current Object . (Inherited from Object .)
	ToString [▶ 1738]	Returns a String that represents this instance. (Inherited from DataType [▶ 1721] .)

Extension Methods

	Name	Description
	IsArrayOfPrimitives [▶ 3025]	Overloaded. Determines whether the dataType is an array of Primitives. (Defined by DataTypeExtension [▶ 3021] .)
	IsArrayOfPrimitives(Boolean) [▶ 3025]	Overloaded. Determines whether the dataType is an array of Primitives. (Defined by DataTypeExtension [▶ 3021] .)
	IsContainer [▶ 3027]	Overloaded.

	Name	Description
		Gets a value indicating whether this IDataType [▶ 2475] is a container type (Defined by DataTypeExtension [▶ 3021].)
	IsContainer(Boolean) [▶ 3028]	Overloaded. Gets a value indicating whether this IDataType [▶ 2475] is a container type (Defined by DataTypeExtension [▶ 3021].)
	IsPointer [▶ 3031]	Gets a value indicating whether this IDataType [▶ 2475] is a pointer type (Defined by DataTypeExtension [▶ 3021].)
	IsPrimitive. [▶ 3033]	Overloaded. Gets a value indicating whether this IDataType [▶ 2475] is primitive (Defined by DataTypeExtension [▶ 3021].)
	IsPrimitive(Boolean) [▶ 3034]	Overloaded. Gets a value indicating whether this IDataType [▶ 2475] is primitive (Defined by DataTypeExtension [▶ 3021].)
	IsReference [▶ 3036]	Gets a value indicating whether this IDataType [▶ 2475] is a reference type (Defined by DataTypeExtension [▶ 3021].)
	ReferencesExternalData [▶ 3037]	Indicates, that the Instance value includes process memory data, that cannot be read in one memory block. (Defined by DataTypeExtension [▶ 3021].)
	ResolvableAsPrimitive. [▶ 3039]	Overloaded. Indicates, that this data type can be resolved as primitive or primitive Array. (Defined by DataTypeExtension [▶ 3021].)
	ResolvableAsPrimitive(Boolean) [▶ 3039]	Overloaded. Indicates, that this data type can be resolved as primitive or primitive Array. (Defined by DataTypeExtension [▶ 3021].)
	Resolve. [▶ 3040]	Overloaded. Resolves the specified data type for AliasReference [▶ 3042] (Defined by DataTypeExtension [▶ 3021].)
	Resolve(DataTypeResolveStrategy) [▶ 3041]	Overloaded. Resolves the specified strategy. (Defined by DataTypeExtension [▶ 3021].)

6.7.13.1 PointerType Properties

The [PointerType](#) [[▶ 1790](#)] type exposes the following members.

Properties

	Name	Description
	Attributes [▶ 1727]	Gets the attributes of the IDataType [▶ 2475] (Inherited from DataType [▶ 1721].)
	BitSize [▶ 1727]	Gets the size of the DataType [▶ 1721] in bits. (Inherited from DataType [▶ 1721].)
	ByteSize [▶ 1728]	Gets the (aligned) size of of the Type/Instance in Bytes (Inherited from DataType [▶ 1721].)
	Category [▶ 1728]	Gets the Data Type category (Inherited from DataType [▶ 1721].)
	Comment [▶ 1729]	Gets the comment. (Inherited from DataType [▶ 1721].)
	FullName [▶ 1729]	Gets the full name of the IDataType [▶ 2475] (Namespace + Name) (Inherited from DataType [▶ 1721].)
	Id [▶ 1729]	Gets the ID of the DataType [▶ 1721].)
	IsBitType [▶ 1730]	Gets a value indicating whether this IDataType [▶ 2475] is a bit mapping Type (Inherited from DataType [▶ 1721].)
	IsByteAligned [▶ 1730]	Indicates that the Size of the Object is Byte aligned ($\text{BitSize} \% 8 == 0$) (Inherited from DataType [▶ 1721].)
	ManagedType [▶ 1793]	Gets the corresponding .NET Type if attached. (Overrides DataType.ManagedType [▶ 1733].)
	Name [▶ 1734]	Gets the name of the Data Type (without namespace) (Inherited from DataType [▶ 1721].)
	Namespace [▶ 1734]	Gets the namespace string within the IDataType [▶ 2475] exists. (Inherited from DataType [▶ 1721].)
	ReferencedType [▶ 1794]	Gets the the referenced type.
	ReferenceTypeName [▶ 1794]	Gets the name of the referenced datatype
	Size [▶ 1735]	Gets the Size of the DataType [▶ 1721] in Bytes or bits. (Inherited from DataType [▶ 1721].)
	TypeGuid [▶ 1735]	Gets the Guid of the DataType [▶ 1721] (optional) (Inherited from DataType [▶ 1721].)

6.7.13.1.1 PointerType.ManagedType Property

Gets the corresponding .NET Type if attached.

Namespace: [TwinCAT.Ads.TypeSystem](#) [[▶ 1698](#)]

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public override Type? ManagedType { get; }
```

Property Value

Type: Type
Dot net type.

Reference

[PointerType Class](#) [[▶ 1790](#)]

[TwinCAT.Ads.TypeSystem Namespace](#) [[▶ 1698](#)]

6.7.13.1.2 PointerType.ReferencedType Property

Gets the the referenced type.

Namespace: [TwinCAT.Ads.TypeSystem](#) [[▶ 1698](#)]

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public IDataTypes? ReferencedType { get; }
```

Property Value

Type: [IDataTypes](#) [[▶ 2475](#)]
The type of the referenced.

Implements

[IPointerType.ReferencedType](#) [[▶ 2586](#)]

Reference

[PointerType Class](#) [[▶ 1790](#)]

[TwinCAT.Ads.TypeSystem Namespace](#) [[▶ 1698](#)]

6.7.13.1.3 PointerType.ReferenceTypeName Property

Gets the name of the referenced datatype

Namespace: [TwinCAT.Ads.TypeSystem](#) [[▶ 1698](#)]

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public string ReferenceTypeName { get; }
```

Property Value

Type: String
The name of the reference datatype.

Implements

[IPointerType.ReferenceTypeName](#) [[▶ 2587](#)]

Reference

[PointerType Class](#) [[▶ 1790](#)]

[TwinCAT.Ads.TypeSystem Namespace](#) [[▶ 1698](#)]

6.7.13.2 PointerType Methods

The [PointerType](#) [[▶ 1790](#)] type exposes the following members.

Methods

	Name	Description
	Equals	Determines whether the specified object is equal to the current object. (Inherited from Object.)
	Finalize	Allows an object to try to free resources and perform other cleanup operations before it is reclaimed by garbage collection. (Inherited from Object.)
	GetHashCode	Serves as the default hash function. (Inherited from Object.)
	GetType	Gets the Type of the current instance. (Inherited from Object.)
	MemberwiseClone	Creates a shallow copy of the current Object. (Inherited from Object.)
	ToString [▶ 1738]	Returns a String that represents this instance. (Inherited from DataType [▶ 1721].)

Extension Methods

	Name	Description
	IsArrayOfPrimitives [▶ 3025]	Overloaded. Determines whether the dataType is an array of Primitives. (Defined by DataTypeExtension [▶ 3021].)
	IsArrayOfPrimitives(Boolean) [▶ 3025]	Overloaded. Determines whether the dataType is an array of Primitives. (Defined by DataTypeExtension [▶ 3021].)
	IsContainer [▶ 3027]	Overloaded. Gets a value indicating whether this IDataType [▶ 2475] is a container type (Defined by DataTypeExtension [▶ 3021].)
	IsContainer(Boolean) [▶ 3028]	Overloaded. Gets a value indicating whether this IDataType [▶ 2475] is a container type (Defined by DataTypeExtension [▶ 3021].)
	IsPointer [▶ 3031]	Gets a value indicating whether this IDataType [▶ 2475] is a pointer type (Defined by DataTypeExtension [▶ 3021].)
	IsPrimitive [▶ 3033]	Overloaded.

	Name	Description
		Gets a value indicating whether this IDataType [▶ 2475] is primitive (Defined by DataTypeExtension [▶ 3021].)
	IsPrimitive(Boolean) [▶ 3034]	Overloaded. Gets a value indicating whether this IDataType [▶ 2475] is primitive (Defined by DataTypeExtension [▶ 3021].)
	IsReference [▶ 3036]	Gets a value indicating whether this IDataType [▶ 2475] is a reference type (Defined by DataTypeExtension [▶ 3021].)
	ReferencesExternalData [▶ 3037]	Indicates, that the Instance value includes process memory data, that cannot be read in one memory block. (Defined by DataTypeExtension [▶ 3021].)
	ResolvableAsPrimitive [▶ 3039]	Overloaded. Indicates, that this data type can be resolved as primitive or primitive Array. (Defined by DataTypeExtension [▶ 3021].)
	ResolvableAsPrimitive(Boolean) [▶ 3039]	Overloaded. Indicates, that this data type can be resolved as primitive or primitive Array. (Defined by DataTypeExtension [▶ 3021].)
	Resolve [▶ 3040]	Overloaded. Resolves the specified data type for AliasReference [▶ 3042] (Defined by DataTypeExtension [▶ 3021].)
	Resolve(DataTypeResolveStrategy) [▶ 3041]	Overloaded. Resolves the specified strategy. (Defined by DataTypeExtension [▶ 3021].)

Reference

6.7.14 PrimitiveType Class

Class PrimitiveType.

Inheritance Hierarchy

System.Object

[TwinCAT.Ads.TypeSystem.DataType](#) [[▶ 1721](#)]

[TwinCAT.Ads.TypeSystem.PrimitiveType](#)

Namespace: [TwinCAT.Ads.TypeSystem](#) [[▶ 1698](#)]

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public class PrimitiveType : DataType,
    IPrimitiveType, IDataType, IBitSize
```

The PrimitiveType type exposes the following members.

Properties

	Name	Description
	Attributes [▶ 1727]	Gets the attributes of the IDataType [▶ 2475] (Inherited from DataType [▶ 1721].)
	BitSize [▶ 1727]	Gets the size of the DataType [▶ 1721] in bits. (Inherited from DataType [▶ 1721].)
	ByteSize [▶ 1728]	Gets the (aligned) size of of the Type/Instance in Bytes (Inherited from DataType [▶ 1721].)
	Category [▶ 1728]	Gets the Data Type category (Inherited from DataType [▶ 1721].)
	Comment [▶ 1729]	Gets the comment. (Inherited from DataType [▶ 1721].)
	FullName [▶ 1729]	Gets the full name of the IDataType [▶ 2475] (Namespace + Name) (Inherited from DataType [▶ 1721].)
	Id [▶ 1729]	Gets the ID of the DataType [▶ 1721].)
	IsBitType [▶ 1730]	Gets a value indicating whether this IDataType [▶ 2475] is a bit mapping Type (Inherited from DataType [▶ 1721].)
	IsByteAligned [▶ 1730]	Indicates that the Size of the Object is Byte aligned ($\text{BitSize} \% 8 == 0$) (Inherited from DataType [▶ 1721].)
	ManagedType [▶ 1733]	Gets the corresponding .NET Type if attached. (Inherited from DataType [▶ 1721].)
	Name [▶ 1734]	Gets the name of the Data Type (without namespace) (Inherited from DataType [▶ 1721].)
	Namespace [▶ 1734]	Gets the namespace string within the IDataType [▶ 2475] exists. (Inherited from DataType [▶ 1721].)
	PrimitiveFlags [▶ 1800]	Indicates types of different PrimitiveTypes with flags.
	Size [▶ 1735]	Gets the Size of the DataType [▶ 1721] in Bytes or bits. (Inherited from DataType [▶ 1721].)
	TypeGuid [▶ 1735]	Gets the Guid of the DataType [▶ 1721] (optional) (Inherited from DataType [▶ 1721].)

Methods

	Name	Description
	Equals	Determines whether the specified object is equal to the current object. (Inherited from Object.)
	Finalize	Allows an object to try to free resources and perform other cleanup operations before it is reclaimed by garbage collection. (Inherited from Object.)
	GetHashCode	Serves as the default hash function. (Inherited from Object.)
	GetType	Gets the Type of the current instance. (Inherited from Object.)
	MemberwiseClone	Creates a shallow copy of the current Object. (Inherited from Object.)
	ToString [▶ 1738]	Returns a String that represents this instance. (Inherited from DataType [▶ 1721].)

Extension Methods

Name	Description
IsArrayOfPrimitives [▶ 3025]	Overloaded. Determines whether the dataType is an array of Primitives. (Defined by DataTypeExtension [▶ 3021].)
IsArrayOfPrimitives(Boolean) [▶ 3025]	Overloaded. Determines whether the dataType is an array of Primitives. (Defined by DataTypeExtension [▶ 3021].)
IsContainer [▶ 3027]	Overloaded. Gets a value indicating whether this IDataType [▶ 2475] is a container type (Defined by DataTypeExtension [▶ 3021].)
IsContainer(Boolean) [▶ 3028]	Overloaded. Gets a value indicating whether this IDataType [▶ 2475] is a container type (Defined by DataTypeExtension [▶ 3021].)
IsPointer [▶ 3031]	Gets a value indicating whether this IDataType [▶ 2475] is a pointer type (Defined by DataTypeExtension [▶ 3021].)
IsPrimitive [▶ 3033]	Overloaded. Gets a value indicating whether this IDataType [▶ 2475] is primitive (Defined by DataTypeExtension [▶ 3021].)
IsPrimitive(Boolean) [▶ 3034]	Overloaded. Gets a value indicating whether this IDataType [▶ 2475] is primitive (Defined by DataTypeExtension [▶ 3021].)
IsReference [▶ 3036]	Gets a value indicating whether this IDataType [▶ 2475] is a reference type (Defined by DataTypeExtension [▶ 3021].)
ReferencesExternalData [▶ 3037]	Indicates, that the Instance value includes process memory data, that cannot be read in one memory block. (Defined by DataTypeExtension [▶ 3021].)
ResolvableAsPrimitive [▶ 3039]	Overloaded. Indicates, that this data type can be resolved as primitive or primitive Array. (Defined by DataTypeExtension [▶ 3021].)
ResolvableAsPrimitive(Boolean) [▶ 3039]	Overloaded. Indicates, that this data type can be resolved as primitive or primitive Array. (Defined by DataTypeExtension [▶ 3021].)
Resolve [▶ 3040]	Overloaded. Resolves the specified data type for AliasReference [▶ 3042] (Defined by DataTypeExtension [▶ 3021].)
Resolve(DataTypeResolveStrategy) [▶ 3041]	Overloaded. Resolves the specified strategy. (Defined by DataTypeExtension [▶ 3021].)

[TwinCAT.Ads.TypeSystem Namespace](#) [[▶ 1698](#)]

6.7.14.2 PrimitiveType Methods

The [PrimitiveType](#) [[▶ 1796](#)] type exposes the following members.

Methods

	Name	Description
	Equals	Determines whether the specified object is equal to the current object. (Inherited from Object.)
	Finalize	Allows an object to try to free resources and perform other cleanup operations before it is reclaimed by garbage collection. (Inherited from Object.)
	GetHashCode	Serves as the default hash function. (Inherited from Object.)
	GetType	Gets the Type of the current instance. (Inherited from Object.)
	MemberwiseClone	Creates a shallow copy of the current Object. (Inherited from Object.)
	ToString [▶ 1738]	Returns a String that represents this instance. (Inherited from DataType [▶ 1721].)

Extension Methods

	Name	Description
	IsArrayOfPrimitives [▶ 3025]	Overloaded. Determines whether the dataType is an array of Primitives. (Defined by DataTypeExtension [▶ 3021].)
	IsArrayOfPrimitives(Boolean) [▶ 3025]	Overloaded. Determines whether the dataType is an array of Primitives. (Defined by DataTypeExtension [▶ 3021].)

	Name	Description
	IsContainer. [▶ 3027]	Overloaded. Gets a value indicating whether this IDataType [▶ 2475] is a container type (Defined by DataTypesExtension [▶ 3021].)
	IsContainer(Boolean) [▶ 3028]	Overloaded. Gets a value indicating whether this IDataType [▶ 2475] is a container type (Defined by DataTypesExtension [▶ 3021].)
	IsPointer [▶ 3031]	Gets a value indicating whether this IDataType [▶ 2475] is a pointer type (Defined by DataTypesExtension [▶ 3021].)
	IsPrimitive. [▶ 3033]	Overloaded. Gets a value indicating whether this IDataType [▶ 2475] is primitive (Defined by DataTypesExtension [▶ 3021].)
	IsPrimitive(Boolean) [▶ 3034]	Overloaded. Gets a value indicating whether this IDataType [▶ 2475] is primitive (Defined by DataTypesExtension [▶ 3021].)
	IsReference [▶ 3036]	Gets a value indicating whether this IDataType [▶ 2475] is a reference type (Defined by DataTypesExtension [▶ 3021].)
	ReferencesExternalData [▶ 3037]	Indicates, that the Instance value includes process memory data, that cannot be read in one memory block. (Defined by DataTypesExtension [▶ 3021].)
	ResolvableAsPrimitive. [▶ 3039]	Overloaded. Indicates, that this data type can be resolved as primitive or primitive Array. (Defined by DataTypesExtension [▶ 3021].)
	ResolvableAsPrimitive(Boolean) [▶ 3039]	Overloaded. Indicates, that this data type can be resolved as primitive or primitive Array. (Defined by DataTypesExtension [▶ 3021].)
	Resolve. [▶ 3040]	Overloaded. Resolves the specified data type for AliasReference [▶ 3042] (Defined by DataTypesExtension [▶ 3021].)
	Resolve(DataTypeResolveStrategy) [▶ 3041]	Overloaded. Resolves the specified strategy. (Defined by DataTypesExtension [▶ 3021].)

[TwinCAT.Ads.TypeSystem Namespace](#) [[▶ 1698](#)]

6.7.15 PVoidType Class

Class PVoidType. This class cannot be inherited. Implements the [PointerType](#) [[▶ 1790](#)]

Inheritance Hierarchy

System.Object

[TwinCAT.Ads.TypeSystem.DataType](#) [[▶ 1721](#)]

[TwinCAT.Ads.TypeSystem.PointerType](#) [[▶ 1790](#)]

[TwinCAT.Ads.TypeSystem.PVoidType](#)

Namespace: [TwinCAT.Ads.TypeSystem](#) [[▶ 1698](#)]

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public sealed class PVoidType : PointerType
```

The PVoidType type exposes the following members.

Properties

	Name	Description
	Attributes [▶ 1727]	Gets the attributes of the IDataType [▶ 2475] (Inherited from DataType [▶ 1721].)
	BitSize [▶ 1727]	Gets the size of the DataType [▶ 1721] in bits. (Inherited from DataType [▶ 1721].)
	ByteSize [▶ 1728]	Gets the (aligned) size of of the Type/Instance in Bytes (Inherited from DataType [▶ 1721].)
	Category [▶ 1728]	Gets the Data Type category (Inherited from DataType [▶ 1721].)
	Comment [▶ 1729]	Gets the comment. (Inherited from DataType [▶ 1721].)
	FullName [▶ 1729]	Gets the full name of the IDataType [▶ 2475] (Namespace + Name) (Inherited from DataType [▶ 1721].)
	Id [▶ 1729]	Gets the ID of the Data Type (Inherited from DataType [▶ 1721].)
	IsBitType [▶ 1730]	Gets a value indicating whether this IDataType [▶ 2475] is a bit mapping Type (Inherited from DataType [▶ 1721].)
	IsByteAligned [▶ 1730]	Indicates that the Size of the Object is Byte aligned ($\text{BitSize} \% 8 == 0$) (Inherited from DataType [▶ 1721].)
	ManagedType [▶ 1793]	Gets the corresponding .NET Type if attached. (Inherited from PointerType [▶ 1790].)
	Name [▶ 1734]	Gets the name of the Data Type (without namespace) (Inherited from DataType [▶ 1721].)
	Namespace [▶ 1734]	Gets the namespace string within the IDataType [▶ 2475] exists. (Inherited from DataType [▶ 1721].)
	ReferencedType [▶ 1794]	Gets the the referenced type. (Inherited from PointerType [▶ 1790].)
	ReferenceTypeName [▶ 1794]	Gets the name of the referenced datatype (Inherited from PointerType [▶ 1790].)
	Size [▶ 1735]	Gets the Size of the DataType [▶ 1721] in Bytes or bits. (Inherited from DataType [▶ 1721].)
	TypeGuid [▶ 1735]	Gets the Guid of the DataType [▶ 1721] (optional) (Inherited from DataType [▶ 1721].)

Methods

	Name	Description
	Equals	Determines whether the specified object is equal to the current object. (Inherited from Object.)
	GetHashCode	Serves as the default hash function. (Inherited from Object.)
	GetType	Gets the Type of the current instance. (Inherited from Object.)

	Name	Description
	ToString [▶ 1738]	Returns a String that represents this instance. (Inherited from DataType [▶ 1721].)

6.7.15.1 PVoidType Properties

The [PVoidType](#) [[▶ 1801](#)] type exposes the following members.

Properties

	Name	Description
	Attributes [▶ 1727]	Gets the attributes of the IDataType [▶ 2475] (Inherited from DataType [▶ 1721].)
	BitSize [▶ 1727]	Gets the size of the DataType [▶ 1721] in bits. (Inherited from DataType [▶ 1721].)
	ByteSize [▶ 1728]	Gets the (aligned) size of of the Type/Instance in Bytes (Inherited from DataType [▶ 1721].)
	Category [▶ 1728]	Gets the Data Type category (Inherited from DataType [▶ 1721].)
	Comment [▶ 1729]	Gets the comment. (Inherited from DataType [▶ 1721].)
	FullName [▶ 1729]	Gets the full name of the IDataType [▶ 2475] (Namespace + Name) (Inherited from DataType [▶ 1721].)
	Id [▶ 1729]	Gets the ID of the DataType (Inherited from DataType [▶ 1721].)
	IsBitType [▶ 1730]	Gets a value indicating whether this IDataType [▶ 2475] is a bit mapping Type (Inherited from DataType [▶ 1721].)
	IsByteAligned [▶ 1730]	Indicates that the Size of the Object is Byte aligned ($BitSize \% 8 == 0$) (Inherited from DataType [▶ 1721].)
	ManagedType [▶ 1793]	Gets the corresponding .NET Type if attached. (Inherited from PointerType [▶ 1790].)
	Name [▶ 1734]	Gets the name of the Data Type (without namespace) (Inherited from DataType [▶ 1721].)
	Namespace [▶ 1734]	Gets the namespace string within the IDataType [▶ 2475] exists. (Inherited from DataType [▶ 1721].)
	ReferencedType [▶ 1794]	Gets the the referenced type. (Inherited from PointerType [▶ 1790].)
	ReferenceTypeName [▶ 1794]	Gets the name of the referenced datatype (Inherited from PointerType [▶ 1790].)

	Name	Description
	Size [▶ 1735]	Gets the Size of the DataType [▶ 1721] in Bytes or bits. (Inherited from DataType [▶ 1721] .)
	TypeGuid [▶ 1735]	Gets the Guid of the DataType [▶ 1721] (optional) (Inherited from DataType [▶ 1721] .)

Inheritance Hierarchy

System.Object

[TwinCAT.Ads.TypeSystem.DataType \[▶ 1721\]](#)

[TwinCAT.Ads.TypeSystem.ReferenceType](#)

Namespace: [TwinCAT.Ads.TypeSystem \[▶ 1698\]](#)

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public sealed class ReferenceType : DataType,
    IReferenceType, IDataType, IBitSize
```

The ReferenceType type exposes the following members.

Properties

	Name	Description
	Attributes [▶ 1727]	Gets the attributes of the IDataType [▶ 2475] (Inherited from DataType [▶ 1721].)
	BitSize [▶ 1727]	Gets the size of the DataType [▶ 1721] in bits. (Inherited from DataType [▶ 1721].)
	ByteSize [▶ 1728]	Gets the (aligned) size of of the Type/Instance in Bytes (Inherited from DataType [▶ 1721].)
	Category [▶ 1728]	Gets the Data Type category (Inherited from DataType [▶ 1721].)
	Comment [▶ 1729]	Gets the comment. (Inherited from DataType [▶ 1721].)
	FullName [▶ 1729]	Gets the full name of the IDataType [▶ 2475] (Namespace + Name) (Inherited from DataType [▶ 1721].)
	Id [▶ 1729]	Gets the ID of the Data Type (Inherited from DataType [▶ 1721].)
	IsBitType [▶ 1730]	Gets a value indicating whether this IDataType [▶ 2475] is a bit mapping Type (Inherited from DataType [▶ 1721].)
	IsByteAligned [▶ 1730]	Indicates that the Size of the Object is Byte aligned ($\text{BitSize} \% 8 == 0$) (Inherited from DataType [▶ 1721].)
	ManagedType [▶ 1809]	Gets the corresponding .NET Type if attached. (Overrides DataType.ManagedType [▶ 1733].)
	Name [▶ 1734]	Gets the name of the Data Type (without namespace) (Inherited from DataType [▶ 1721].)
	Namespace [▶ 1734]	Gets the namespace string within the IDataType [▶ 2475] exists. (Inherited from DataType [▶ 1721].)
	ReferencedType [▶ 1810]	Gets the the referenced type.
	ReferencedTypeNa me [▶ 1810]	Gets the name of the referenced type.
	ResolvedByteSize [▶ 1811]	Gets the size of the resolved byte.
	ResolvedCategory [▶ 1811]	Gets the resolved category.
	ResolvedType [▶ 1811]	Gets the type of the resolved.
	Size [▶ 1735]	Gets the Size of the DataType [▶ 1721] in Bytes or bits. (Inherited from DataType [▶ 1721].)
	TypeGuid [▶ 1735]	Gets the Guid of the DataType [▶ 1721] (optional) (Inherited from DataType [▶ 1721].)

Methods

	Name	Description
	Equals	Determines whether the specified object is equal to the current object. (Inherited from Object.)
	GetHashCode	Serves as the default hash function. (Inherited from Object.)

	Name	Description
	GetType	Gets the Type of the current instance. (Inherited from Object.)
	ToString [▶ 1738]	Returns a String that represents this instance. (Inherited from DataType [▶ 1721].)

Extension Methods

	Name	Description
	IsArrayOfPrimitives [▶ 3025]	Overloaded. Determines whether the dataType is an array of Primitives. (Defined by DataTypeExtension [▶ 3021].)
	IsArrayOfPrimitives(Boolean) [▶ 3025]	Overloaded. Determines whether the dataType is an array of Primitives. (Defined by DataTypeExtension [▶ 3021].)
	IsContainer [▶ 3027]	Overloaded. Gets a value indicating whether this IDataType [▶ 2475] is a container type (Defined by DataTypeExtension [▶ 3021].)
	IsContainer(Boolean) [▶ 3028]	Overloaded. Gets a value indicating whether this IDataType [▶ 2475] is a container type (Defined by DataTypeExtension [▶ 3021].)
	IsPointer [▶ 3031]	Gets a value indicating whether this IDataType [▶ 2475] is a pointer type (Defined by DataTypeExtension [▶ 3021].)
	IsPrimitive [▶ 3033]	Overloaded. Gets a value indicating whether this IDataType [▶ 2475] is primitive (Defined by DataTypeExtension [▶ 3021].)
	IsPrimitive(Boolean) [▶ 3034]	Overloaded. Gets a value indicating whether this IDataType [▶ 2475] is primitive (Defined by DataTypeExtension [▶ 3021].)
	IsReference [▶ 3036]	Gets a value indicating whether this IDataType [▶ 2475] is a reference type (Defined by DataTypeExtension [▶ 3021].)
	ReferencesExternalData [▶ 3037]	Indicates, that the Instance value includes process memory data, that cannot be read in one memory block. (Defined by DataTypeExtension [▶ 3021].)
	ResolvableAsPrimitive [▶ 3039]	Overloaded. Indicates, that this data type can be resolved as primitive or primitive Array. (Defined by DataTypeExtension [▶ 3021].)
	ResolvableAsPrimitive(Boolean) [▶ 3039]	Overloaded. Indicates, that this data type can be resolved as primitive or primitive Array. (Defined by DataTypeExtension [▶ 3021].)
	Resolve [▶ 3040]	Overloaded. Resolves the specified data type for AliasReference [▶ 3042] (Defined by DataTypeExtension [▶ 3021].)
	Resolve(DataTypeResolveStrategy) [▶ 3041]	Overloaded. Resolves the specified strategy. (Defined by DataTypeExtension [▶ 3021].)

6.7.16.1 ReferenceType Properties

The [ReferenceType \[▶ 1804\]](#) type exposes the following members.

Properties

	Name	Description
	Attributes [▶ 1727]	Gets the attributes of the IDataType [▶ 2475] (Inherited from DataType [▶ 1721].)
	BitSize [▶ 1727]	Gets the size of the DataType [▶ 1721] in bits. (Inherited from DataType [▶ 1721].)
	ByteSize [▶ 1728]	Gets the (aligned) size of of the Type/Instance in Bytes (Inherited from DataType [▶ 1721].)
	Category [▶ 1728]	Gets the Data Type category (Inherited from DataType [▶ 1721].)
	Comment [▶ 1729]	Gets the comment. (Inherited from DataType [▶ 1721].)
	FullName [▶ 1729]	Gets the full name of the IDataType [▶ 2475] (Namespace + Name) (Inherited from DataType [▶ 1721].)
	Id [▶ 1729]	Gets the ID of the DataType (Inherited from DataType [▶ 1721].)
	IsBitType [▶ 1730]	Gets a value indicating whether this IDataType [▶ 2475] is a bit mapping Type (Inherited from DataType [▶ 1721].)
	IsByteAligned [▶ 1730]	Indicates that the Size of the Object is Byte aligned (BitSize % 8 == 0) (Inherited from DataType [▶ 1721].)
	ManagedType [▶ 1809]	Gets the corresponding .NET Type if attached. (Overrides DataType.ManagedType [▶ 1733].)
	Name [▶ 1734]	Gets the name of the Data Type (without namespace) (Inherited from DataType [▶ 1721].)
	Namespace [▶ 1734]	Gets the namespace string within the IDataType [▶ 2475] exists. (Inherited from DataType [▶ 1721].)
	ReferencedType [▶ 1810]	Gets the the referenced type.
	ReferencedTypeNa me [▶ 1810]	Gets the name of the referenced type.
	ResolvedByteSize [▶ 1811]	Gets the size of the resolved byte.
	ResolvedCategory [▶ 1811]	Gets the resolved category.
	ResolvedType [▶ 1811]	Gets the type of the resolved.

	Name	Description
	Size [▶ 1735]	Gets the Size of the DataType [▶ 1721] in Bytes or bits. (Inherited from DataType [▶ 1721] .)
	TypeGuid [▶ 1735]	Gets the Guid of the DataType [▶ 1721] (optional) (Inherited from DataType [▶ 1721] .)

6.7.16.1.1 ReferenceType.IsContainer Property

Gets a value indicating whether this [IDataType \[▶ 2475\]](#) is a container type

Namespace: [TwinCAT.Ads.TypeSystem \[▶ 1698\]](#)

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.116+a71ced3

Syntax

C#

```
public override bool IsContainer { get; }
```

Property Value

Type: [Boolean](#)

true if this instance is container type; otherwise, false.

Implements

[IDataType.IsContainer \[▶ 2480\]](#)

[IDataType.IsContainer \[▶ 2480\]](#)

Remarks

Container Types are all types that contain SubElements like

- [Array \[▶ 2111\]](#)
- [Pointer \[▶ 2111\]](#)
- [Union \[▶ 2111\]](#)
- [Struct \[▶ 2111\]](#)
- [Function \[▶ 2111\]](#)
- [FunctionBlock \[▶ 2111\]](#)
- [Program \[▶ 2111\]](#)

and the [Alias](#) [▸ 2111] and [Reference](#) [▸ 2111] types, if they have a container type as base type.

6.7.16.1.4 ReferenceType.ReferencedType Property

Gets the the referenced type.

Namespace: [TwinCAT.Ads.TypeSystem \[► 1698\]](#)

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public IDataTypeInfo ReferencedType { get; }
```

Property Value

Type: [IDataTypeInfo \[► 2475\]](#)

The type of the referenced.

Implements

[IReferenceType.ReferencedType \[► 2603\]](#)

Reference

[ReferenceType Class \[► 1804\]](#)

[TwinCAT.Ads.TypeSystem Namespace \[► 1698\]](#)

6.7.16.1.5 ReferenceType.ReferencedTypeName Property

Gets the name of the referenced type.

Namespace: [TwinCAT.Ads.TypeSystem \[► 1698\]](#)

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public string ReferencedTypeName { get; }
```

Property Value

Type: String

The name of the referenced type.

Implements

[IReferenceType.ReferencedTypeName \[► 2604\]](#)

Reference

[ReferenceType Class \[► 1804\]](#)

[TwinCAT.Ads.TypeSystem Namespace \[► 1698\]](#)

6.7.16.1.6 ReferenceType.ResolvedByteSize Property

Gets the size of the resolved byte.

Namespace: [TwinCAT.Ads.TypeSystem](#) [[▶ 1698](#)]

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public int ResolvedByteSize { get; }
```

Property Value

Type: Int32

The size of the resolved byte.

Implements

Gets the resolved category.

Namespace: [TwinCAT.Ads.TypeSystem](#) [[▶ 1698](#)]

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public DataTypeCategory ResolvedCategory { get; }
```

Property Value

Type: [DataTypeCategory](#) [[▶ 2111](#)]

The resolved category.

Implements

[IReferenceType.ResolvedCategory](#) [[▶ 2604](#)]

Reference

[ReferenceType Class](#) [[▶ 1804](#)]

[TwinCAT.Ads.TypeSystem Namespace](#) [[▶ 1698](#)]

6.7.16.1.8 ReferenceType.ResolvedType Property

Gets the type of the resolved.

Namespace: [TwinCAT.Ads.TypeSystem](#) [[▶ 1698](#)]

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public IDataType ResolvedType { get; }
```

Property Value

Type: [IDataType](#) [[▶ 2475](#)]

The type of the resolved.

Implements

[IReferenceType.ResolvedType](#) [[▶ 2605](#)]

Reference

[ReferenceType Class](#) [[▶ 1804](#)]

6.7.16.2 ReferenceType Methods

The [ReferenceType](#) [[▶ 1804](#)] type exposes the following members.

Methods

	Name	Description
	Equals	Determines whether the specified object is equal to the current object. (Inherited from Object.)
	GetHashCode	Serves as the default hash function. (Inherited from Object.)
	GetType	Gets the Type of the current instance. (Inherited from Object.)
	ToString [▶ 1738]	Returns a String that represents this instance. (Inherited from DataType [▶ 1721].)

Extension Methods

	Name	Description
	IsArrayOfPrimitives [▶ 3025]	Overloaded. Determines whether the dataType is an array of Primitives. (Defined by DataTypeExtension [▶ 3021].)
	IsArrayOfPrimitives(Boolean) [▶ 3025]	Overloaded. Determines whether the dataType is an array of Primitives. (Defined by DataTypeExtension [▶ 3021].)
	IsContainer [▶ 3027]	Overloaded. Gets a value indicating whether this IDataType [▶ 2475] is a container type (Defined by DataTypeExtension [▶ 3021].)
	IsContainer(Boolean) [▶ 3028]	Overloaded. Gets a value indicating whether this IDataType [▶ 2475] is a container type (Defined by DataTypeExtension [▶ 3021].)

Name	Description
IsPointer [▶ 3031]	Gets a value indicating whether this IDataType [▶ 2475] is a pointer type (Defined by DataTypeExtension [▶ 3021].)
IsPrimitive . [▶ 3033]	Overloaded. Gets a value indicating whether this IDataType [▶ 2475] is primitive (Defined by DataTypeExtension [▶ 3021].)
IsPrimitive(Boolean) [▶ 3034]	Overloaded. Gets a value indicating whether this IDataType [▶ 2475] is primitive (Defined by DataTypeExtension [▶ 3021].)
IsReference [▶ 3036]	Gets a value indicating whether this IDataType [▶ 2475] is a reference type (Defined by DataTypeExtension [▶ 3021].)
ReferencesExternalData [▶ 3037]	Indicates, that the Instance value includes process memory data, that cannot be read in one memory block. (Defined by DataTypeExtension [▶ 3021].)
ResolvableAsPrimitive [▶ 3039]	Overloaded. Indicates, that this data type can be resolved as primitive or primitive Array. (Defined by DataTypeExtension [▶ 3021].)
ResolvableAsPrimitive(Boolean) [▶ 3039]	Overloaded. Indicates, that this data type can be resolved as primitive or primitive Array. (Defined by DataTypeExtension [▶ 3021].)
Resolve . [▶ 3040]	Overloaded. Resolves the specified data type for AliasReference [▶ 3042] (Defined by DataTypeExtension [▶ 3021].)
Resolve(DataTypeResolveStrategy) [▶ 3041]	Overloaded. Resolves the specified strategy. (Defined by DataTypeExtension [▶ 3021].)

6.7.17 RpcMethod Class

RPC Method Description

Inheritance Hierarchy

System.Object

 TwinCAT.Ads.TypeSystem.RpcMethod

Namespace: [TwinCAT.Ads.TypeSystem](#) [[▶ 1698](#)]

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public class RpcMethod : IRpcMethod
```

The `RpcMethod` type exposes the following members.

Constructors

	Name	Description
	RpcMethod(String) [▶ 1822]	Initializes a new instance of the RpcMethod class.
	RpcMethod(String, RpcMethodParameterCollection) [▶ 1822]	Initializes a new instance of the RpcMethod class.
	RpcMethod(String, RpcMethodParameterCollection, IDataTypes) [▶ 1823]	Initializes a new instance of the RpcMethod class.
	RpcMethod(String, RpcMethodParameterCollection, IDataTypes, String) [▶ 1824]	Initializes a new instance of the RpcMethod class.

Properties

	Name	Description
	Comment [▶ 1816]	Gets the Method comment.
	InParameters [▶ 1816]	Gets the In-Parameters of the IRpcMethod [▶ 2625]
	IsVoid [▶ 1817]	Gets a value indicating whether this IRpcMethod [▶ 2625] has no return parameter
	Name [▶ 1817]	Gets the name of the method
	OutParameters [▶ 1818]	Gets the Out-Parameters of the IRpcMethod [▶ 2625]
	Parameters [▶ 1818]	Gets all parameters (In, Out and ref parameters) of the IRpcMethod [▶ 2625]
	ReturnAlignSize [▶ 1819]	Gets the size of the biggest element in bytes for Alignment
	ReturnType [▶ 1819]	Gets the return type.
	ReturnTypeSize [▶ 1819]	Gets the Byte size of the return type.
	VTableIndex [▶ 1820]	Gets the V-table index of the method.

Methods

	Name	Description
	Equals	Determines whether the specified object is equal to the current object. (Inherited from Object.)
	Finalize	Allows an object to try to free resources and perform other cleanup operations before it is reclaimed by garbage collection. (Inherited from Object.)
	GetHashCode	Serves as the default hash function. (Inherited from Object.)
	GetType	Gets the Type of the current instance. (Inherited from Object.)

	Name	Description
	MemberwiseClone	Creates a shallow copy of the current Object. (Inherited from Object.)
	ToString [▶ 1821]	Returns a String that represents this instance. (Overrides Object.ToString..)

Extension Methods

	Name	Description
		Overloaded.
	AddParameter(IRpcMethodParameter) [▶ 1949]	Adds a parameter to the RpcMethod (Defined by FluentRpcMethodExtension [▶ 1947].)
	AddParameter(String, IDataTypeInfo, MethodParamFlags) [▶ 1950]	Overloaded. Adds a parameter to the RpcMethod (Defined by FluentRpcMethodExtension [▶ 1947].)
	AddParameter(String, IDataTypeInfo, MethodParamFlags, Int32) [▶ 1951]	Overloaded. Adds a parameter to the RpcMethod (Defined by FluentRpcMethodExtension [▶ 1947].)
	SetReturnType [▶ 1952]	Sets the ReturnType of the RpcMethod. (Defined by FluentRpcMethodExtension [▶ 1947].)

6.7.17.1 RpcMethod Properties

The [RpcMethod](#) [[▶ 1813](#)] type exposes the following members.

Properties

	Name	Description
	Comment [▶ 1816]	Gets the Method comment.
	InParameters [▶ 1816]	Gets the In-Parameters of the IRpcMethod [▶ 2625]
	IsVoid [▶ 1817]	Gets a value indicating whether this IRpcMethod [▶ 2625] has no return parameter
	Name [▶ 1817]	Gets the name of the method
	OutParameters [▶ 1818]	Gets the Out-Parameters of the IRpcMethod [▶ 2625]
	Parameters [▶ 1818]	Gets all parameters (In, Out and ref parameters) of the . [▶ 2625]
	ReturnAlignSize [▶ 1819]	Gets the size of the biggest element in bytes for Alignment
	ReturnType [▶ 1819]	Gets the return type.
	ReturnTypeSize [▶ 1819]	Gets the Byte size of the return type.

	Name	Description
	VTableIndex [▶ 1820]	Gets the V-table index of the method.

Reference

[RpcMethod Class](#) [[▶ 1813](#)]

[TwinCAT.Ads.TypeSystem Namespace](#) [[▶ 1698](#)]

6.7.17.1.1 RpcMethod.Comment Property

Gets the Method comment.

Namespace: [TwinCAT.Ads.TypeSystem](#) [[▶ 1698](#)]

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public string Comment { get; }
```

Property Value

Type: String
The comment.

Implements

[IRpcMethod.Comment](#) [[▶ 2626](#)]

Reference

[RpcMethod Class](#) [[▶ 1813](#)]

[TwinCAT.Ads.TypeSystem Namespace](#) [[▶ 1698](#)]

6.7.17.1.2 RpcMethod.InParameters Property

Gets the In-Parameters of the [IRpcMethod](#) [[▶ 2625](#)]

Namespace: [TwinCAT.Ads.TypeSystem](#) [[▶ 1698](#)]

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public IRpcMethodParameterCollection InParameters { get; }
```

Property Value

Type: [IRpcMethodParameterCollection](#) [[▶ 2639](#)]
The In- and Ref-Parameters

Implements

[IRpcMethod.InParameters](#) [[▶ 2626](#)]

Reference

[RpcMethod Class](#) [[▶ 1813](#)]

[TwinCAT.Ads.TypeSystem Namespace](#) [[▶ 1698](#)]

6.7.17.1.3 RpcMethod.IsVoid Property

Gets a value indicating whether this [IRpcMethod](#) [[▶ 2625](#)] has no return parameter

Namespace: [TwinCAT.Ads.TypeSystem](#) [[▶ 1698](#)]

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public bool IsVoid { get; }
```

Property Value

Type: Boolean

true if this instance is void; otherwise, false.

Implements

[IRpcMethod.IsVoid](#) [[▶ 2627](#)]

Exceptions

Exception	Condition
NotImplementedException	

Reference

[RpcMethod Class](#) [[▶ 1813](#)]

[TwinCAT.Ads.TypeSystem Namespace](#) [[▶ 1698](#)]

6.7.17.1.4 RpcMethod.Name Property

Gets the name of the method

Namespace: [TwinCAT.Ads.TypeSystem](#) [[▶ 1698](#)]

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public string Name { get; }
```

Property Value

Type: String

The name.

Implements

[IRpcMethod.Name](#) [[▶ 2627](#)]

Reference

[RpcMethod Class](#) [► 1813]

[TwinCAT.Ads.TypeSystem Namespace](#) [► 1698]

6.7.17.1.5 RpcMethod.OutParameters Property

Gets the Out-Parameters of the [IRpcMethod](#) [► 2625]

Namespace: [TwinCAT.Ads.TypeSystem](#) [► 1698]

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public IRpcMethodParameterCollection OutParameters { get; }
```

Property Value

Type: [IRpcMethodParameterCollection](#) [► 2639]

The In- and Ref-Parameters

Implements

[IRpcMethod.OutParameters](#) [► 2628]

Reference

[RpcMethod Class](#) [► 1813]

[TwinCAT.Ads.TypeSystem Namespace](#) [► 1698]

6.7.17.1.6 RpcMethod.Parameters Property

Gets all parameters (In, Out and ref parameters) of the [IRpcMethod](#) [► 2625]

Namespace: [TwinCAT.Ads.TypeSystem](#) [► 1698]

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public IRpcMethodParameterCollection Parameters { get; }
```

Property Value

Type: [IRpcMethodParameterCollection](#) [► 2639]

The parameters.

Implements

[IRpcMethod.Parameters](#) [► 2628]

Reference

[RpcMethod Class](#) [► 1813]

[TwinCAT.Ads.TypeSystem Namespace \[▸ 1698\]](#)

6.7.17.1.7 RpcMethod.ReturnAlignSize Property

Gets the size of the biggest element in bytes for Alignment

Namespace: [TwinCAT.Ads.TypeSystem \[▸ 1698\]](#)

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public int ReturnAlignSize { get; }
```

Property Value

Type: Int32

The size of the return align.

Reference

[RpcMethod Class \[▸ 1813\]](#)

[TwinCAT.Ads.TypeSystem Namespace \[▸ 1698\]](#)

6.7.17.1.8 RpcMethod.ReturnType Property

Gets the return type.

Namespace: [TwinCAT.Ads.TypeSystem \[▸ 1698\]](#)

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public string ReturnType { get; }
```

Property Value

Type: String

Return type.

Implements

[IRpcMethod.ReturnType \[▸ 2628\]](#)

Reference

[RpcMethod Class \[▸ 1813\]](#)

[TwinCAT.Ads.TypeSystem Namespace \[▸ 1698\]](#)

6.7.17.1.9 RpcMethod.ReturnTypeSize Property

Gets the Byte size of the return type.

Namespace: [TwinCAT.Ads.TypeSystem \[▸ 1698\]](#)

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public int ReturnTypeInfoSize { get; }
```

Property Value

Type: Int32

The size of the return type.

Implements

[IRpcMethod.ReturnTypeInfoSize](#) [[▶ 2629](#)]

Reference

[RpcMethod Class](#) [[▶ 1813](#)]

[TwinCAT.Ads.TypeSystem Namespace](#) [[▶ 1698](#)]

6.7.17.1.10 RpcMethod.VTableIndex Property

Gets the V-table index of the method.

Namespace: [TwinCAT.Ads.TypeSystem](#) [[▶ 1698](#)]

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public int VTableIndex { get; }
```

Property Value

Type: Int32

The index of the v table.

Reference

[TwinCAT.Ads.TypeSystem Namespace](#) [[▶ 1698](#)]

6.7.17.2 RpcMethod Methods

The [RpcMethod](#) [[▶ 1813](#)] type exposes the following members.

Methods

	Name	Description
	Equals	Determines whether the specified object is equal to the current object. (Inherited from Object.)
	Finalize	Allows an object to try to free resources and perform other cleanup operations before it is reclaimed by garbage collection. (Inherited from Object.)
	GetHashCode	Serves as the default hash function. (Inherited from Object.)
	GetType	Gets the Type of the current instance. (Inherited from Object.)

	Name	Description
	MemberwiseClone	Creates a shallow copy of the current Object. (Inherited from Object.)
	ToString [▶ 1821]	Returns a String that represents this instance. (Overrides Object.ToString..)

Extension Methods

	Name	Description
		Overloaded.
	AddParameter(IRpcMethodParameter) [▶ 1949]	Adds a parameter to the RpcMethod (Defined by FluentRpcMethodExtension [▶ 1947].)
	AddParameter(String, IDataType, MethodParamFlags) [▶ 1950]	Overloaded. Adds a parameter to the RpcMethod (Defined by FluentRpcMethodExtension [▶ 1947].)
	AddParameter(String, IDataType, MethodParamFlags, Int32) [▶ 1951]	Overloaded. Adds a parameter to the RpcMethod (Defined by FluentRpcMethodExtension [▶ 1947].)
	SetReturnType [▶ 1952]	Sets the ReturnType of the RpcMethod. (Defined by FluentRpcMethodExtension [▶ 1947].)

Reference

[RpcMethod Class](#) [[▶ 1813](#)]

[TwinCAT.Ads.TypeSystem Namespace](#) [[▶ 1698](#)]

6.7.17.2.1 RpcMethod.ToString Method

Returns a String that represents this instance.

Namespace: [TwinCAT.Ads.TypeSystem](#) [[▶ 1698](#)]

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public override string ToString()
```

Return Value

Type: String

A String that represents this instance.

Reference

[RpcMethod Class](#) [[▶ 1813](#)]

[TwinCAT.Ads.TypeSystem Namespace](#) [[▶ 1698](#)]

6.7.17.3 RpcMethod Constructor

Overload List

	Name	Description
	RpcMethod(String) [▸ 1822]	Initializes a new instance of the RpcMethod [▸ 1813] class.
	RpcMethod(String, RpcMethodParameterCollection) [▸ 1822]	Initializes a new instance of the RpcMethod [▸ 1813] class.
	RpcMethod(String, RpcMethodParameterCollection, IDataType) [▸ 1823]	Initializes a new instance of the RpcMethod [▸ 1813] class.
	RpcMethod(String, RpcMethodParameterCollection, IDataType, String) [▸ 1824]	Initializes a new instance of the RpcMethod [▸ 1813] class.

Reference

[RpcMethod Class](#) [[▸ 1813](#)]

Namespace: [TwinCAT.Ads.TypeSystem](#) [▸ 1698]

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public class RpcMethodParameter : IRpcMethodParameter
```

The [RpcMethodParameter](#) type exposes the following members.

Constructors

	Name	Description
	RpcMethodParameter(String, IDataTypeInfo, MethodParamFlags) [▶ 1833]	Initializes a new instance of the RpcMethodParameter class.
	RpcMethodParameter(String, IDataTypeInfo, MethodParamFlags, Int32) [▶ 1833]	Initializes a new instance of the RpcMethodParameter class.
	RpcMethodParameter(String, IDataTypeInfo, MethodParamFlags, Int32, String) [▶ 1834]	Initializes a new instance of the RpcMethodParameter class.

Properties

	Name	Description
	AlignSize [▶ 1826]	Gets the size of biggest element for alignment
	Comment [▶ 1827]	Gets the Parameter Comment.
	HasLengthsParameter [▶ 1827]	Gets a value indicating whether this instance has a related Lengths Parameter.
	IsInput [▶ 1830]	Gets a value indicating whether this instance is input.
	IsOutput [▶ 1831]	Gets a value indicating whether this instance is output.
	LengthsParameterIndex [▶ 1828]	Gets the index of the Lengths parameter (within the MethodParameter List)
	Name [▶ 1828]	Gets the Parameter Name
	ParameterFlags [▶ 1829]	Gets the parameter flags.
	Size [▶ 1829]	Gets the size of the RpcMethodParameter
	TypeGuid [▶ 1830]	Gets the Unique identifier of the parameters data type.
	TypeName [▶ 1830]	Gets the Data type of the Parameter

Methods

	Name	Description
	Equals	Determines whether the specified object is equal to the current object. (Inherited from Object.)
	Finalize	Allows an object to try to free resources and perform other cleanup operations before it is reclaimed by garbage collection. (Inherited from Object.)
	GetHashCode	Serves as the default hash function. (Inherited from Object.)

	Name	Description
	GetType	Gets the Type of the current instance. (Inherited from Object.)
	MemberwiseClone	Creates a shallow copy of the current Object. (Inherited from Object.)
	ToString [▶ 1832]	Returns a String that represents this instance. (Overrides Object.ToString..)

6.7.18.1 RpcMethodParameter Properties

The [RpcMethodParameter](#) [[▶ 1824](#)] type exposes the following members.

Properties

	Name	Description
	AlignSize [▶ 1826]	Gets the size of biggest element for alignment
	Comment [▶ 1827]	Gets the Parameter Comment.
	HasLengthsParameter [▶ 1827]	Gets a value indicating whether this instance has a related Lengths Parameter.
	IsInput [▶ 1830]	Gets a value indicating whether this instance is input.
	IsOutput [▶ 1831]	Gets a value indicating whether this instance is output.
	LengthsParameterIndex [▶ 1828]	Gets the index of the Lengths parameter (within the MethodParameter List)
	Name [▶ 1828]	Gets the Parameter Name
	ParameterFlags [▶ 1829]	Gets the parameter flags.
	Size [▶ 1829]	Gets the size of the RpcMethodParameter [▶ 1824]
	TypeGuid [▶ 1830]	Gets the Unique identifier of the parameters data type.
	TypeName [▶ 1830]	Gets the Data type of the Parameter

Reference

6.7.18.1.1 RpcMethodParameter.AlignSize Property

Gets the size of biggest element for alignment

Namespace: [TwinCAT.Ads.TypeSystem](#) [[▶ 1698](#)]

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public int AlignSize { get; }
```

Property Value

Type: Int32

The size of the align.

Reference

[RpcMethodParameter Class \[▸ 1824\]](#)

[TwinCAT.Ads.TypeSystem Namespace \[▸ 1698\]](#)

6.7.18.1.2 RpcMethodParameter.Comment Property

Gets the Parameter Comment.

Namespace: [TwinCAT.Ads.TypeSystem \[▸ 1698\]](#)

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public string Comment { get; }
```

Property Value

Type: String

The comment.

Reference

[RpcMethodParameter Class \[▸ 1824\]](#)

[TwinCAT.Ads.TypeSystem Namespace \[▸ 1698\]](#)

6.7.18.1.3 RpcMethodParameter.HasLengthsParameter Property

Gets a value indicating whether this instance has a related Lengths Parameter.

Namespace: [TwinCAT.Ads.TypeSystem \[▸ 1698\]](#)

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public bool HasLengthIsParameter { get; }
```

Property Value

Type: Boolean

true if this instance has a Lengths parameter; otherwise, false.

Implements

[IRpcMethodParameter.HasLengthIsParameter \[▸ 2636\]](#)

Reference

[RpcMethodParameter Class](#) [► 1824]

[TwinCAT.Ads.TypeSystem Namespace](#) [► 1698]

6.7.18.1.4 RpcMethodParameter.LengthIsParameterIndex Property

Gets the index of the LengthIs parameter (within the MethodParameter List)

Namespace: [TwinCAT.Ads.TypeSystem](#) [► 1698]

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public int LengthIsParameterIndex { get; }
```

Property Value

Type: Int32

The index of the length is parameter.

Implements

[IRpcMethodParameter.LengthIsParameterIndex](#) [► 2637]

Remarks

This field references to the Parameter that defines the length for this generic one. Equally to the marshalling attributes of COM (sizeof, length) this enables to transport parameter of type (PVOID)

Reference

[TwinCAT.Ads.TypeSystem Namespace](#) [[▶ 1698](#)]

6.7.18.1.6 RpcMethodParameter.ParameterFlags Property

Gets the parameter flags.

Namespace: [TwinCAT.Ads.TypeSystem](#) [[▶ 1698](#)]

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public MethodParamFlags ParameterFlags { get; }
```

Property Value

Type: [MethodParamFlags](#) [[▶ 2812](#)]

The parameter flags.

Implements

[IRpcMethodParameter.ParameterFlags](#) [[▶ 2637](#)]

Reference

[RpcMethodParameter Class](#) [[▶ 1824](#)]

[TwinCAT.Ads.TypeSystem Namespace](#) [[▶ 1698](#)]

6.7.18.1.7 RpcMethodParameter.Size Property

Gets the size of the [RpcMethodParameter](#) [[▶ 1824](#)]

Namespace: [TwinCAT.Ads.TypeSystem](#) [[▶ 1698](#)]

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public int Size { get; }
```

Property Value

Type: Int32

The size.

Implements

[IRpcMethodParameter.Size](#) [[▶ 2638](#)]

Reference

[RpcMethodParameter Class](#) [[▶ 1824](#)]

[TwinCAT.Ads.TypeSystem Namespace \[▸ 1698\]](#)

6.7.18.1.8 RpcMethodParameter.TypeGuid Property

Gets the Unique identifier of the parameters data type.

Namespace: [TwinCAT.Ads.TypeSystem \[▸ 1698\]](#)

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public Guid TypeGuid { get; }
```

Property Value

Type: Guid

The type unique identifier.

Reference

Overload List

	Name	Description
	RpcMethodParameter (String, IDataTypes, MethodParamFlags) [▶ 1833]	Initializes a new instance of the RpcMethodParameter [▶ 1824] class.
	RpcMethodParameter (String, IDataTypes, MethodParamFlags, Int32) [▶ 1833]	Initializes a new instance of the RpcMethodParameter [▶ 1824] class.

	Name	Description
	RpcMethodParameter(String, IDataTypes, MethodParamFlags, Int32, String) [▸ 1834]	Initializes a new instance of the RpcMethodParameter [▸ 1824] class.

Reference

[RpcMethodParameter Class \[▸ 1824\]](#)

6.7.18.3.1 RpcMethodParameter Constructor (String, IDataTypes, MethodParamFlags)

Initializes a new instance of the [RpcMethodParameter \[▸ 1824\]](#) class.

Namespace: [TwinCAT.Ads.TypeSystem \[▸ 1698\]](#)

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public RpcMethodParameter(
    string name,
    IDataTypes type,
    MethodParamFlags flags
)
```

Parameters

name	Type: System.String The name.
type	Type: TwinCAT.TypeSystem.IDataTypes [▸ 2475] The type.
flags	Type: TwinCAT.TypeSystem.MethodParamFlags [▸ 2812] The flags.

Reference

6.7.18.3.2 RpcMethodParameter Constructor (String, IDataTypes, MethodParamFlags, Int32)

Initializes a new instance of the [RpcMethodParameter \[▸ 1824\]](#) class.

Namespace: [TwinCAT.Ads.TypeSystem \[▸ 1698\]](#)

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public RpcMethodParameter(
    string name,
    IDataType type,
    MethodParamFlags flags,
    int lengthIsIndex
)
```

Parameters

name	Type: System.String The name.
type	Type: TwinCAT.TypeSystem.IDataType [▶ 2475] The type.
flags	Type: TwinCAT.TypeSystem.MethodParamFlags [▶ 2812] The flags.
lengthIsIndex	Type: System.Int32 Index of the length is.

6.7.18.3 RpcMethodParameter Constructor (String, IDataType, MethodParamFlags, Int32, String)

Initializes a new instance of the [RpcMethodParameter](#) [▶ 1824] class.

Namespace: [TwinCAT.Ads.TypeSystem](#) [▶ 1698]

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public RpcMethodParameter(
    string name,
    IDataType type,
    MethodParamFlags flags,
    int lengthIsIndex,
    string? comment
)
```

Parameters

name	Type: System.String The name.
type	Type: TwinCAT.TypeSystem.IDataType [▶ 2475] The type.
flags	Type: TwinCAT.TypeSystem.MethodParamFlags [▶ 2812] The flags.
lengthIsIndex	Type: System.Int32 Index of the length is.
comment	Type: System.String The comment.

6.7.19 RpcStructType Class

StructType which is callable by RPC Methods.

Inheritance Hierarchy

- [System.Object](#)
- [TwinCAT.Ads.TypeSystem.DataType \[▶ 1721\]](#)
- [TwinCAT.Ads.TypeSystem.StructType \[▶ 1846\]](#)
- [TwinCAT.Ads.TypeSystem.RpcStructType](#)

Namespace: [TwinCAT.Ads.TypeSystem \[▶ 1698\]](#)
Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.95+cf8c3f5

Syntax

C#

```
public sealed class RpcStructType : StructType,
    IRpcStructType, IRpcCallableType, IStructType, IInterfaceType, IDataType,
    IBitSize
```

The RpcStructType type exposes the following members.

Properties

	Name	Description
	AllMembers [▶ 1851]	Gets all members (down the derivation hierarchy) (Inherited from StructType [▶ 1846] .)
	Attributes [▶ 1727]	Gets the attributes of the IDataType [▶ 2475] (Inherited from DataType [▶ 1721] .)
	BaseType [▶ 1851]	Gets the structs Base Type (Null if not derived). (Inherited from StructType [▶ 1846] .)
	BaseTypeName [▶ 1851]	Gets the the Name of the Base class (if derived) (Inherited from StructType [▶ 1846] .)
	BitSize [▶ 1727]	Gets the size of the DataType [▶ 1721] in bits. (Inherited from DataType [▶ 1721] .)
	ByteSize [▶ 1728]	Gets the (aligned) size of of the Type/Instance in Bytes (Inherited from DataType [▶ 1721] .)
	Category [▶ 1728]	Gets the Data Type category (Inherited from DataType [▶ 1721] .)
	Comment [▶ 1729]	Gets the comment. (Inherited from DataType [▶ 1721] .)
	FullName [▶ 1729]	Gets the full name of the IDataType [▶ 2475] (Namespace + Name) (Inherited from DataType [▶ 1721] .)
	HasRpcMethods [▶ 1838]	Gets a value indicating whether this instance has RPC Methods. (Overrides StructType.HasRpcMethods [▶ 1852] .)
	Id [▶ 1729]	Gets the ID of the DataType (Inherited from DataType [▶ 1721] .)

	Name	Description
	InterfaceImplementationNames [▶ 1853]	Gets the names of the interfaces, this IDataType [▶ 2475] implements. (Inherited from StructType [▶ 1846].)
	InterfaceImplementations [▶ 1854]	Gets the resolved interface types, this IDataType [▶ 2475] implments. (Inherited from StructType [▶ 1846].)
	IsBitType [▶ 1730]	Gets a value indicating whether this IDataType [▶ 2475] is a bit mapping Type (Inherited from DataType [▶ 1721].)
	IsByteAligned [▶ 1730]	Indicates that the Size of the Object is Byte aligned ($\text{BitSize} \% 8 == 0$) (Inherited from DataType [▶ 1721].)
	IsContainer [▶ 1731]	Gets a value indicating whether this IDataType [▶ 2475] is a container type (Inherited from DataType [▶ 1721].)
	IsDerived [▶ 1852]	Gets a value indicating whether this instance is derived. (Inherited from StructType [▶ 1846].)
	IsPointer [▶ 1732]	Gets a value indicating whether this IDataType [▶ 2475] is a pointer type (Inherited from DataType [▶ 1721].)
	IsPrimitive [▶ 1732]	Gets a value indicating whether this IDataType [▶ 2475] is primitive (Inherited from DataType [▶ 1721].)
	IsReference [▶ 1733]	Gets a value indicating whether this IDataType [▶ 2475] is a reference type (Inherited from DataType [▶ 1721].)
	ManagedType [▶ 1733]	Gets the corresponding .NET Type if attached. (Inherited from DataType [▶ 1721].)
	Members [▶ 1853]	Gets a read only collection of the Members [▶ 2561] of the IStructType [▶ 2671]. (Inherited from StructType [▶ 1846].)
	Name [▶ 1734]	Gets the name of the Data Type (without namespace) (Inherited from DataType [▶ 1721].)
	Namespace [▶ 1734]	Gets the namespace string within the IDataType [▶ 2475] exists. (Inherited from DataType [▶ 1721].)
	RpcMethods [▶ 1839]	Gets the Method descriptions for the IRpcCallableType [▶ 2624]
	Size [▶ 1735]	Gets the Size of the DataType [▶ 1721] in Bytes or bits. (Inherited from DataType [▶ 1721].)

Methods

	Name	Description
	Equals	Determines whether the specified object is equal to the current object. (Inherited from Object .)
	GetHashCode	Serves as the default hash function. (Inherited from Object .)
	GetType	Gets the Type of the current instance. (Inherited from Object .)
	ToString [▶ 1738]	Returns a String that represents this instance. (Inherited from DataType [▶ 1721].)

Extension Methods

	Name	Description
	AddAligned(IMember) [▶ 1953]	Overloaded. Adds a member (Defined by FluentRpcStructTypeExtension [▶ 1952].)

	Name	Description
	AddAligned(IMember) [▶ 1956]	Overloaded. Adds a member to the StructType [▶ 1846] (Defined by FluentStructTypeExtension [▶ 1955] .)
	AddMethod [▶ 1954]	Adds a RpcMethod. (Defined by FluentRpcStructTypeExtension [▶ 1952] .)

6.7.19.1 RpcStructType Properties

The [RpcStructType \[▶ 1835\]](#) type exposes the following members.

Properties

	Name	Description
	AllMembers [▶ 1851]	Gets all members (down the derivation hierarchy) (Inherited from StructType [▶ 1846] .)
	Attributes [▶ 1727]	Gets the attributes of the IDataType [▶ 2475] (Inherited from DataType [▶ 1721] .)
	BaseType [▶ 1851]	Gets the structs Base Type (Null if not derived). (Inherited from StructType [▶ 1846] .)
	BaseTypeName [▶ 1851]	Gets the the Name of the Base class (if derived) (Inherited from StructType [▶ 1846] .)
	BitSize [▶ 1727]	Gets the size of the DataType [▶ 1721] in bits. (Inherited from DataType [▶ 1721] .)
	ByteSize [▶ 1728]	Gets the (aligned) size of of the Type/Instance in Bytes (Inherited from DataType [▶ 1721] .)
	Category [▶ 1728]	Gets the Data Type category (Inherited from DataType [▶ 1721] .)
	Comment [▶ 1729]	Gets the comment. (Inherited from DataType [▶ 1721] .)
	FullName [▶ 1729]	Gets the full name of the IDataType [▶ 2475] (Namespace + Name) (Inherited from DataType [▶ 1721] .)
	HasRpcMethods [▶ 1838]	Gets a value indicating whether this instance has RPC Methods. (Overrides StructType.HasRpcMethods [▶ 1852] .)
	Id [▶ 1729]	Gets the ID of the DataType (Inherited from DataType [▶ 1721] .)
	InterfaceImplementationNames [▶ 1853]	Gets the names of the interfaces, this IDataType [▶ 2475] implements. (Inherited from StructType [▶ 1846] .)
	InterfaceImplementations [▶ 1854]	Gets the resolved interface types, this IDataType [▶ 2475] implments. (Inherited from StructType [▶ 1846] .)
	IsBitType [▶ 1730]	Gets a value indicating whether this IDataType [▶ 2475] is a bit mapping Type (Inherited from DataType [▶ 1721] .)
	IsByteAligned [▶ 1730]	Indicates that the Size of the Object is Byte aligned (BitSize % 8 == 0) (Inherited from DataType [▶ 1721] .)
	IsContainer [▶ 1731]	Gets a value indicating whether this IDataType [▶ 2475] is a container type (Inherited from DataType [▶ 1721] .)

	Name	Description
	IsDerived [▶ 1852]	Gets a value indicating whether this instance is derived. (Inherited from StructType [▶ 1846].)
	IsPointer [▶ 1732]	Gets a value indicating whether this IDataType [▶ 2475] is a pointer type (Inherited from DataType [▶ 1721].)
	IsPrimitive [▶ 1732]	Gets a value indicating whether this IDataType [▶ 2475] is primitive (Inherited from DataType [▶ 1721].)
	IsReference [▶ 1733]	Gets a value indicating whether this IDataType [▶ 2475] is a reference type (Inherited from DataType [▶ 1721].)
	ManagedType [▶ 1733]	Gets the corresponding .NET Type if attached. (Inherited from DataType [▶ 1721].)
	Members [▶ 1853]	Gets a read only collection of the Members [▶ 2561] of the IStructType [▶ 2671]. (Inherited from StructType [▶ 1846].)
	Name [▶ 1734]	Gets the name of the Data Type (without namespace) (Inherited from DataType [▶ 1721].)
	Namespace [▶ 1734]	Gets the namespace string within the IDataType [▶ 2475] exists. (Inherited from DataType [▶ 1721].)
	RpcMethods [▶ 1839]	Gets the Method descriptions for the IRpcCallableType [▶ 2624]
	Size [▶ 1735]	Gets the Size of the DataType [▶ 1721] in Bytes or bits. (Inherited from DataType [▶ 1721].)

Reference

[RpcStructType Class](#) [[▶ 1835](#)]

[TwinCAT.Ads.TypeSystem Namespace](#) [[▶ 1698](#)]

6.7.19.1.1 RpcStructType.HasRpcMethods Property

Gets a value indicating whether this instance has RPC Methods.

Namespace: TwinCAT.Ads.TypeSystem

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.95+cf8c3f5

Syntax

C#

```
public override bool HasRpcMethods { get; }
```

Property Value

Type: [Boolean](#)

true if this instance has methods; otherwise, false.

Implements

[InterfaceType.HasRpcMethods](#) [[▶ 2986](#)]

[InterfaceType.HasRpcMethods](#) [[▶ 2986](#)]

Remarks

The [DataType](#) (Structure) must be marked with the [PlcAttribute](#) 'TcRpcEnable' to enable [RpcMethods](#), otherwise [RpcMethods](#) are not passed through to the ADS symbolic information.

6.7.19.1.2 RpcStructType.RpcMethods Property

Gets the Method descriptions for the [IRpcCallableType \[▶ 2624\]](#)

Namespace: [TwinCAT.Ads.TypeSystem \[▶ 1698\]](#)

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.95+cf8c3f5

Syntax

C#

```
public IRpcMethodCollection RpcMethods { get; }
```

Property Value

Type: [IRpcMethodCollection \[▶ 2629\]](#)

The methods.

Implements

[IRpcCallableType.RpcMethods \[▶ 2624\]](#)

Remarks

The DataType (Structure) must be marked with the PlcAttribute 'TcRpcEnable' to enable RpcMethods, otherwise RpcMethods are not passed through to the ADS symbolic information.

Syntax

C#

```
public sealed class StringType : DataType,
    IStringType, IDataType, IBitSize
```

The StringType type exposes the following members.

Properties

	Name	Description
	Attributes [▸ 1727]	Gets the attributes of the IDataType [▸ 2475] (Inherited from DataType [▸ 1721].)
	BitSize [▸ 1727]	Gets the size of the DataType [▸ 1721] in bits. (Inherited from DataType [▸ 1721].)
	ByteSize [▸ 1728]	Gets the (aligned) size of of the Type/Instance in Bytes (Inherited from DataType [▸ 1721].)
	Category [▸ 1728]	Gets the Data Type category (Inherited from DataType [▸ 1721].)
	Comment [▸ 1729]	Gets the comment. (Inherited from DataType [▸ 1721].)
	Encoding [▸ 1843]	Gets the encoding of the String (Encoding.Default (Ansi Codepage, STRING) or Encoding.UNICODE (WSTRING))
	FullName [▸ 1729]	Gets the full name of the IDataType [▸ 2475] (Namespace + Name) (Inherited from DataType [▸ 1721].)
	Id [▸ 1729]	Gets the ID of the DataType (Inherited from DataType [▸ 1721].)

	Name	Description
	IsBitType [▶ 1730]	Gets a value indicating whether this IDataType [▶ 2475] is a bit mapping Type (Inherited from DataType [▶ 1721].)
	IsByteAligned [▶ 1730]	Indicates that the Size of the Object is Byte aligned (BitSize % 8 == 0) (Inherited from DataType [▶ 1721].)
	IsFixedLength [▶ 1844]	Gets a value indicating whether the string is of fixed length.
	Length [▶ 1844]	Gets the number of characters within the string.
	ManagedType [▶ 1733]	Gets the corresponding .NET Type if attached. (Inherited from DataType [▶ 1721].)
	Name [▶ 1734]	Gets the name of the Data Type (without namespace) (Inherited from DataType [▶ 1721].)
	Namespace [▶ 1734]	Gets the namespace string within the IDataType [▶ 2475] exists. (Inherited from DataType [▶ 1721].)
	Size [▶ 1735]	Gets the Size of the DataType [▶ 1721] in Bytes or bits. (Inherited from DataType [▶ 1721].)
	TypeGuid [▶ 1735]	Gets the Guid of the DataType [▶ 1721] (optional) (Inherited from DataType [▶ 1721].)

Methods

	Name	Description
	Equals	Determines whether the specified object is equal to the current object. (Inherited from Object.)
	GetHashCode	Serves as the default hash function. (Inherited from Object.)
	GetType	Gets the Type of the current instance. (Inherited from Object.)
	ToString [▶ 1846]	Returns a String that represents this instance. (Overrides DataType.ToString . [▶ 1738].)

Extension Methods

	Name	Description
	IsArrayOfPrimitives . [▶ 3025]	Overloaded. Determines whether the dataType is an array of Primitives. (Defined by DataTypeExtension [▶ 3021].)
	IsArrayOfPrimitives(Boolean) [▶ 3025]	Overloaded. Determines whether the dataType is an array of Primitives. (Defined by DataTypeExtension [▶ 3021].)
	IsContainer . [▶ 3027]	Overloaded. Gets a value indicating whether this IDataType [▶ 2475] is a container type (Defined by DataTypeExtension [▶ 3021].)
	IsContainer(Boolean) [▶ 3028]	Overloaded. Gets a value indicating whether this IDataType [▶ 2475] is a container type (Defined by DataTypeExtension [▶ 3021].)
	IsPointer [▶ 3031]	Gets a value indicating whether this IDataType [▶ 2475] is a pointer type (Defined by DataTypeExtension [▶ 3021].)
	IsPrimitive . [▶ 3033]	Overloaded. Gets a value indicating whether this IDataType [▶ 2475] is primitive (Defined by DataTypeExtension [▶ 3021].)

	Name	Description
	IsPrimitive(Boolean) [▶ 3034]	Overloaded. Gets a value indicating whether this IDataType [▶ 2475] is primitive (Defined by DataTypeExtension [▶ 3021].)
	IsReference [▶ 3036]	Gets a value indicating whether this IDataType [▶ 2475] is a reference type (Defined by DataTypeExtension [▶ 3021].)
	ReferencesExternalData [▶ 3037]	Indicates, that the Instance value includes process memory data, that cannot be read in one memory block. (Defined by DataTypeExtension [▶ 3021].)
	ResolvableAsPrimitive [▶ 3039]	Overloaded. Indicates, that this data type can be resolved as primitive or primitive Array. (Defined by DataTypeExtension [▶ 3021].)
	ResolvableAsPrimitive(Boolean) [▶ 3039]	Overloaded. Indicates, that this data type can be resolved as primitive or primitive Array. (Defined by DataTypeExtension [▶ 3021].)
	Resolve . [▶ 3040]	Overloaded. Resolves the specified data type for AliasReference [▶ 3042] (Defined by DataTypeExtension [▶ 3021].)
	Resolve(DataTypeResolveStrategy) [▶ 3041]	Overloaded. Resolves the specified strategy. (Defined by DataTypeExtension [▶ 3021].)

6.7.20.1 StringType Properties

The [StringType](#) [▶ 1840] type exposes the following members.

Properties

	Name	Description
	Attributes [▶ 1727]	Gets the attributes of the IDataType [▶ 2475] (Inherited from DataType [▶ 1721].)
	BitSize [▶ 1727]	Gets the size of the DataType [▶ 1721] in bits. (Inherited from DataType [▶ 1721].)
	ByteSize [▶ 1728]	Gets the (aligned) size of of the Type/Instance in Bytes (Inherited from DataType [▶ 1721].)
	Category [▶ 1728]	Gets the Data Type category (Inherited from DataType [▶ 1721].)
	Comment [▶ 1729]	Gets the comment. (Inherited from DataType [▶ 1721].)
	Encoding [▶ 1843]	Gets the encoding of the String (Encoding.Default (Ansi Codepage, STRING) or Encoding.UNICODE (WSTRING))

	Name	Description
	FullName [▶ 1729]	Gets the full name of the IDataType [▶ 2475] (Namespace + Name) (Inherited from DataType [▶ 1721].)
	Id [▶ 1729]	Gets the ID of the DataType (Inherited from DataType [▶ 1721].)
	IsBitType [▶ 1730]	Gets a value indicating whether this IDataType [▶ 2475] is a bit mapping Type (Inherited from DataType [▶ 1721].)
	IsByteAligned [▶ 1730]	Indicates that the Size of the Object is Byte aligned (BitSize % 8 == 0) (Inherited from DataType [▶ 1721].)
	IsFixedLength [▶ 1844]	Gets a value indicating whether the string is of fixed length.
	Length [▶ 1844]	Gets the number of characters within the string.
	ManagedType [▶ 1733]	Gets the corresponding .NET Type if attached. (Inherited from DataType [▶ 1721].)
	Name [▶ 1734]	Gets the name of the Data Type (without namespace) (Inherited from DataType [▶ 1721].)
	Namespace [▶ 1734]	Gets the namespace string within the IDataType [▶ 2475] exists. (Inherited from DataType [▶ 1721].)
	Size [▶ 1735]	Gets the Size of the DataType [▶ 1721] in Bytes or bits. (Inherited from DataType [▶ 1721].)
	TypeGuid [▶ 1735]	Gets the Guid of the DataType [▶ 1721] (optional) (Inherited from DataType [▶ 1721].)

Reference

[StringType Class](#) [► 1840]

[TwinCAT.Ads.TypeSystem Namespace](#) [► 1698]

6.7.20.1.2 StringType.IsFixedLength Property

Gets a value indicating whether the string is of fixed length.

Namespace: [TwinCAT.Ads.TypeSystem](#) [► 1698]

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public bool IsFixedLength { get; }
```

Property Value

Type: Boolean

true if this instance is fixed length; otherwise, false.

Implements

[IStringType.IsFixedLength](#) [► 2665]

Exceptions

Exception	Condition
NotImplementedException	

Reference

[StringType Class](#) [► 1840]

6.7.20.2 StringType Methods

The [StringType](#) [[▶ 1840](#)] type exposes the following members.

Methods

	Name	Description
	Equals	Determines whether the specified object is equal to the current object. (Inherited from Object.)
	GetHashCode	Serves as the default hash function. (Inherited from Object.)
	GetType	Gets the Type of the current instance. (Inherited from Object.)
	ToString [▶ 1846]	Returns a String that represents this instance. (Overrides DataType.ToString . [▶ 1738].)

Extension Methods

	Name	Description
	IsArrayOfPrimitives . [▶ 3025]	Overloaded. Determines whether the dataType is an array of Primitives. (Defined by DataTypeExtension [▶ 3021].)
	IsArrayOfPrimitives(Boolean) [▶ 3025]	Overloaded. Determines whether the dataType is an array of Primitives. (Defined by DataTypeExtension [▶ 3021].)
	IsContainer . [▶ 3027]	Overloaded. Gets a value indicating whether this IDataType [▶ 2475] is a container type (Defined by DataTypeExtension [▶ 3021].)
	IsContainer(Boolean) [▶ 3028]	Overloaded. Gets a value indicating whether this IDataType [▶ 2475] is a container type (Defined by DataTypeExtension [▶ 3021].)
	IsPointer [▶ 3031]	Gets a value indicating whether this IDataType [▶ 2475] is a pointer type (Defined by DataTypeExtension [▶ 3021].)
	IsPrimitive . [▶ 3033]	Overloaded. Gets a value indicating whether this IDataType [▶ 2475] is primitive (Defined by DataTypeExtension [▶ 3021].)
	IsPrimitive(Boolean) [▶ 3034]	Overloaded. Gets a value indicating whether this IDataType [▶ 2475] is primitive (Defined by DataTypeExtension [▶ 3021].)
	IsReference [▶ 3036]	Gets a value indicating whether this IDataType [▶ 2475] is a reference type (Defined by DataTypeExtension [▶ 3021].)

	Name	Description
	ReferencesExternalData [▶ 3037]	Indicates, that the Instance value includes process memory data, that cannot be read in one memory block. (Defined by DataTypeExtension [▶ 3021].)
	ResolvableAsPrimitive [▶ 3039]	Overloaded. Indicates, that this data type can be resolved as primitive or primitive Array. (Defined by DataTypeExtension [▶ 3021].)
	ResolvableAsPrimitive(Boolean) [▶ 3039]	Overloaded. Indicates, that this data type can be resolved as primitive or primitive Array. (Defined by DataTypeExtension [▶ 3021].)
	Resolve [▶ 3040]	Overloaded. Resolves the specified data type for AliasReference [▶ 3042] (Defined by DataTypeExtension [▶ 3021].)
	Resolve(DataTypeResolveStrategy) [▶ 3041]	Overloaded. Resolves the specified strategy. (Defined by DataTypeExtension [▶ 3021].)

Reference

[StringType Class](#) [[▶ 1840](#)]

[TwinCAT.Ads.TypeSystem Namespace](#) [[▶ 1698](#)]

6.7.20.2.1 StringType.ToString Method

Returns a String that represents this instance.

Namespace: [TwinCAT.Ads.TypeSystem](#) [[▶ 1698](#)]

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public override string ToString()
```

Return Value

Type: String

A String that represents this instance.

Reference

[StringType Class](#) [[▶ 1840](#)]

6.7.21 StructType Class

Represents a struct type

Inheritance Hierarchy

System.Object

 TwinCAT.Ads.TypeSystem.DataType [[▶ 1721](#)]

 TwinCAT.Ads.TypeSystem.StructType

Namespace: [TwinCAT.Ads.TypeSystem](#) [[▶ 1698](#)]

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public class StructType : DataType, IStructType,
    IInterfaceType, IDataType, IBitSize, IRpcCallableType, IRpcStructType
```

The StructType type exposes the following members.

Properties

	Name	Description
	AllMembers [▶ 1851]	Gets all members (down the derivation hierarchy)
	Attributes [▶ 1727]	Gets the attributes of the IDataType [▶ 2475] (Inherited from DataType [▶ 1721].)
	BaseType [▶ 1851]	Gets the structs Base Type (Null if not derived).
	BaseTypeName [▶ 1851]	Gets the the Name of the Base class (if derived)
	BitSize [▶ 1727]	Gets the size of the DataType [▶ 1721] in bits. (Inherited from DataType [▶ 1721].)
	ByteSize [▶ 1728]	Gets the (aligned) size of of the Type/Instance in Bytes (Inherited from DataType [▶ 1721].)
	Category [▶ 1728]	Gets the Data Type category (Inherited from DataType [▶ 1721].)
	Comment [▶ 1729]	Gets the comment. (Inherited from DataType [▶ 1721].)
	FullName [▶ 1729]	Gets the full name of the IDataType [▶ 2475] (Namespace + Name) (Inherited from DataType [▶ 1721].)
	HasRpcMethods [▶ 1852]	Gets a value indicating whether this instance has RPC Methods.
	Id [▶ 1729]	Gets the ID of the DataType (Inherited from DataType [▶ 1721].)
	InterfaceImplementationNames [▶ 1853]	Gets the names of the interfaces, this IDataType [▶ 2475] implements.
	InterfaceImplementations [▶ 1854]	Gets the resolved interface types, this IDataType [▶ 2475] implments.
	IsBitType [▶ 1730]	Gets a value indicating whether this IDataType [▶ 2475] is a bit mapping Type (Inherited from DataType [▶ 1721].)
	IsByteAligned [▶ 1730]	Indicates that the Size of the Object is Byte aligned (BitSize % 8 == 0) (Inherited from DataType [▶ 1721].)
	IsDerived [▶ 1852]	Gets a value indicating whether this instance is derived.
	ManagedType [▶ 1733]	Gets the corresponding .NET Type if attached. (Inherited from DataType [▶ 1721].)

	Name	Description
	Members [▶ 1853]	Gets a read only collection of the Members [▶ 2561] of the IStructType [▶ 2671].
	Name [▶ 1734]	Gets the name of the Data Type (without namespace) (Inherited from DataType [▶ 1721].)
	Namespace [▶ 1734]	Gets the namespace string within the IDataType [▶ 2475] exists. (Inherited from DataType [▶ 1721].)
	RpcMethods [▶ 1854]	Gets the Method descriptions for the IRpcCallableType [▶ 2624]
	Size [▶ 1735]	Gets the Size of the DataType [▶ 1721] in Bytes or bits. (Inherited from DataType [▶ 1721].)
	TypeGuid [▶ 1735]	Gets the Guid of the DataType [▶ 1721] (optional) (Inherited from DataType [▶ 1721].)

Methods

	Name	Description
	Equals	Determines whether the specified object is equal to the current object. (Inherited from Object.)
	Finalize	Allows an object to try to free resources and perform other cleanup operations before it is reclaimed by garbage collection. (Inherited from Object.)
	GetHashCode	Serves as the default hash function. (Inherited from Object.)
	GetType	Gets the Type of the current instance. (Inherited from Object.)
	MemberwiseClone	Creates a shallow copy of the current Object. (Inherited from Object.)
	ToString [▶ 1738]	Returns a String that represents this instance. (Inherited from DataType [▶ 1721].)

Extension Methods

	Name	Description
	AddAligned [▶ 1956]	Adds a member to the StructType (Defined by FluentStructTypeExtension [▶ 1955].)
	AddMethod [▶ 1956]	Adds a RpcMethod. (Defined by FluentStructTypeExtension [▶ 1955].)
	IsArrayOfPrimitives [▶ 3025]	Overloaded. Determines whether the dataType is an array of Primitives. (Defined by DataTypeExtension [▶ 3021].)
	IsArrayOfPrimitives(Boolean) [▶ 3025]	Overloaded. Determines whether the dataType is an array of Primitives. (Defined by DataTypeExtension [▶ 3021].)
	IsContainer [▶ 3027]	Overloaded. Gets a value indicating whether this IDataType [▶ 2475] is a container type (Defined by DataTypeExtension [▶ 3021].)
	IsContainer(Boolean) [▶ 3028]	Overloaded. Gets a value indicating whether this IDataType [▶ 2475] is a container type (Defined by DataTypeExtension [▶ 3021].)
	IsPointer [▶ 3031]	Gets a value indicating whether this IDataType [▶ 2475] is a pointer type (Defined by DataTypeExtension [▶ 3021].)
	IsPrimitive [▶ 3033]	Overloaded.

	Name	Description
		Gets a value indicating whether this IDataType [▶ 2475] is primitive (Defined by DataTypeExtension [▶ 3021].)
	IsPrimitive(Boolean) [▶ 3034]	Overloaded. Gets a value indicating whether this IDataType [▶ 2475] is primitive (Defined by DataTypeExtension [▶ 3021].)
	IsReference [▶ 3036]	Gets a value indicating whether this IDataType [▶ 2475] is a reference type (Defined by DataTypeExtension [▶ 3021].)
	ReferencesExternalData [▶ 3037]	Indicates, that the Instance value includes process memory data, that cannot be read in one memory block. (Defined by DataTypeExtension [▶ 3021].)
	ResolvableAsPrimitive [▶ 3039]	Overloaded. Indicates, that this data type can be resolved as primitive or primitive Array. (Defined by DataTypeExtension [▶ 3021].)
	ResolvableAsPrimitive(Boolean) [▶ 3039]	Overloaded. Indicates, that this data type can be resolved as primitive or primitive Array. (Defined by DataTypeExtension [▶ 3021].)
	Resolve [▶ 3040]	Overloaded. Resolves the specified data type for AliasReference [▶ 3042] (Defined by DataTypeExtension [▶ 3021].)
	Resolve(DataTypeResolveStrategy) [▶ 3041]	Overloaded. Resolves the specified strategy. (Defined by DataTypeExtension [▶ 3021].)

6.7.21.1 StructType Properties

The [StructType](#) [[▶ 1846](#)] type exposes the following members.

Properties

	Name	Description
	AllMembers [▶ 1851]	Gets all members (down the derivation hierarchy)
	Attributes [▶ 1727]	Gets the attributes of the IDataType [▶ 2475] (Inherited from DataType [▶ 1721].)
	BaseType [▶ 1851]	Gets the structs Base Type (Null if not derived).
	BaseTypeName [▶ 1851]	Gets the the Name of the Base class (if derived)
	BitSize [▶ 1727]	Gets the size of the DataType [▶ 1721] in bits. (Inherited from DataType [▶ 1721].)

	Name	Description
	ByteSize [▸ 1728]	Gets the (aligned) size of of the Type/Instance in Bytes (Inherited from DataType [▸ 1721].)
	Category [▸ 1728]	Gets the Data Type category (Inherited from DataType [▸ 1721].)
	Comment [▸ 1729]	Gets the comment. (Inherited from DataType [▸ 1721].)
	FullName [▸ 1729]	Gets the full name of the IDataType [▸ 2475] (Namespace + Name) (Inherited from DataType [▸ 1721].)
	HasRpcMethods [▸ 1852]	Gets a value indicating whether this instance has RPC Methods.
	Id [▸ 1729]	Gets the ID of the DataType (Inherited from DataType [▸ 1721].)
	InterfaceImplementationNames [▸ 1853]	Gets the names of the interfaces, this IDataType [▸ 2475] implements.
	InterfaceImplementations [▸ 1854]	Gets the resolved interface types, this IDataType [▸ 2475] implments.
	IsBitType [▸ 1730]	Gets a value indicating whether this IDataType [▸ 2475] is a bit mapping Type (Inherited from DataType [▸ 1721].)
	IsByteAligned [▸ 1730]	Indicates that the Size of the Object is Byte aligned ($\text{BitSize} \% 8 == 0$) (Inherited from DataType [▸ 1721].)
	IsDerived [▸ 1852]	Gets a value indicating whether this instance is derived.
	ManagedType [▸ 1733]	Gets the corresponding .NET Type if attached. (Inherited from DataType [▸ 1721].)
	Members [▸ 1853]	Gets a read only collection of the Members [▸ 2561] of the IStructType [▸ 2671].
	Name [▸ 1734]	Gets the name of the Data Type (without namespace) (Inherited from DataType [▸ 1721].)
	Namespace [▸ 1734]	Gets the namespace string within the IDataType [▸ 2475] exists. (Inherited from DataType [▸ 1721].)
	RpcMethods [▸ 1854]	Gets the Method descriptions for the IRpcCallableType [▸ 2624]
	Size [▸ 1735]	Gets the Size of the DataType [▸ 1721] in Bytes or bits. (Inherited from DataType [▸ 1721].)
	TypeGuid [▸ 1735]	Gets the Guid of the DataType [▸ 1721] (optional) (Inherited from DataType [▸ 1721].)

6.7.21.1.1 StructType.AllMembers Property

Gets all members (down the derivation hierarchy)

Namespace: [TwinCAT.Ads.TypeSystem](#) [[▶ 1698](#)]

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public ICollection AllMembers { get; }
```

Property Value

Type: [ICollection](#) [[▶ 2565](#)]

All members.

Implements

[IInterfaceType.AllMembers](#) [[▶ 2987](#)]

Reference

[StructType Class](#) [[▶ 1846](#)]

[TwinCAT.Ads.TypeSystem Namespace](#) [[▶ 1698](#)]

6.7.21.1.2 StructType.BaseType Property

Gets the structs Base Type (Null if not derived).

Namespace: [TwinCAT.Ads.TypeSystem](#) [[▶ 1698](#)]

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public IDataType? BaseType { get; }
```

Property Value

Type: [IDataType](#) [[▶ 2475](#)]

Implements

[IInterfaceType.BaseType](#) [[▶ 2988](#)]

Reference

[StructType Class](#) [[▶ 1846](#)]

[TwinCAT.Ads.TypeSystem Namespace](#) [[▶ 1698](#)]

6.7.21.1.3 StructType.BaseTypeName Property

Gets the the Name of the Base class (if derived)

Namespace: [TwinCAT.Ads.TypeSystem](#) [[▶ 1698](#)]

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public string BaseTypeName { get; }
```

Property Value

Type: String

Empty if not derived.

Implements

[IInterfaceType.BaseTypeName](#) [[▶ 2988](#)]

Reference

[StructType Class](#) [[▶ 1846](#)]

[TwinCAT.Ads.TypeSystem Namespace](#) [[▶ 1698](#)]

6.7.21.1.4 StructType.HasRpcMethods Property

Gets a value indicating whether this instance has RPC Methods.

Namespace: [TwinCAT.Ads.TypeSystem](#) [[▶ 1698](#)]

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public bool HasRpcMethods { get; }
```

Property Value

Type: Boolean

true if this instance has methods; otherwise, false.

Implements

[IInterfaceType.HasRpcMethods](#) [[▶ 2986](#)]

Remarks

The DataType (Structure) must be marked with the PlcAttribute 'TcRpcEnable' to enable RpcMethods, otherwise RpcMethods are not passed through to the ADS symbolic information.

Reference

[StructType Class](#) [[▶ 1846](#)]

[TwinCAT.Ads.TypeSystem Namespace](#) [[▶ 1698](#)]

6.7.21.1.5 StructType.IsDerived Property

Gets a value indicating whether this instance is derived.

Namespace: [TwinCAT.Ads.TypeSystem](#) [[▶ 1698](#)]

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public bool IsDerived { get; }
```

Property Value

Type: Boolean

true if this instance is derived; otherwise, false.

Reference

[StructType Class](#) [[▶ 1846](#)]

[TwinCAT.Ads.TypeSystem Namespace](#) [[▶ 1698](#)]

6.7.21.1.6 StructType.Members Property

Gets a read only collection of the [Members](#) [[▶ 2561](#)] of the [IStructType](#) [[▶ 2671](#)].

Namespace: [TwinCAT.Ads.TypeSystem](#) [[▶ 1698](#)]

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public IMemberCollection Members { get; }
```

Property Value

Type: [IMemberCollection](#) [[▶ 2565](#)]

The members as read only collection.

Implements

[IInterfaceType.Members](#) [[▶ 2988](#)]

Remarks

If the [IStructType](#) [[▶ 2671](#)] is derived, only the extended members are returned. To get all supported members down the inheritance chain, use the [AllMembers](#) [[▶ 2987](#)] property.

Reference

[StructType Class](#) [[▶ 1846](#)]

[TwinCAT.Ads.TypeSystem Namespace](#) [[▶ 1698](#)]

6.7.21.1.7 StructType.InterfaceImplementationNames Property

Gets the names of the interfaces, this [IDataType](#) [[▶ 2475](#)] implements.

Namespace: [TwinCAT.Ads.TypeSystem](#) [[▶ 1698](#)]

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public string[] InterfaceImplementationNames { get; }
```

Property Value

Type: `.String`.
The interface implementations.

Implements

[IInterfaceType.InterfaceImplementationNames](#) [[▶ 2987](#)]

Reference

[StructType Class](#) [[▶ 1846](#)]

[TwinCAT.Ads.TypeSystem Namespace](#) [[▶ 1698](#)]

6.7.21.1.8 StructType.InterfaceImplementations Property

Gets the resolved interface types, this [IDataType](#) [[▶ 2475](#)] implements.

Namespace: [TwinCAT.Ads.TypeSystem](#) [[▶ 1698](#)]

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public IInterfaceType?[]? InterfaceImplementations { get; }
```

Property Value

Type: `.IInterfaceType` [[▶ 2983](#)].
The implements.

Implements

[IInterfaceType.InterfaceImplementations](#) [[▶ 2987](#)]

Reference

[StructType Class](#) [[▶ 1846](#)]

[TwinCAT.Ads.TypeSystem Namespace](#) [[▶ 1698](#)]

6.7.21.1.9 StructType.RpcMethods Property

Gets the Method descriptions for the [IRpcCallableType](#) [[▶ 2624](#)]

Namespace: [TwinCAT.Ads.TypeSystem](#) [[▶ 1698](#)]

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public IRpcMethodCollection RpcMethods { get; }
```

Property Value

Type: [IRpcMethodCollection](#) [[▶ 2629](#)]
 The methods.

Implements

[IRpcCallableType.RpcMethods](#) [[▶ 2624](#)]

Remarks

The `DataType` (Structure) must be marked with the `PlcAttribute` 'TcRpcEnable' to enable `RpcMethods`, otherwise `RpcMethods` are not passed through to the ADS symbolic information.

6.7.21.2 StructType Methods

The [StructType](#) [[▶ 1846](#)] type exposes the following members.

Methods

	Name	Description
	Equals	Determines whether the specified object is equal to the current object. (Inherited from Object .)
	Finalize	Allows an object to try to free resources and perform other cleanup operations before it is reclaimed by garbage collection. (Inherited from Object .)
	GetHashCode	Serves as the default hash function. (Inherited from Object .)
	GetType	Gets the Type of the current instance. (Inherited from Object .)
	MemberwiseClone	Creates a shallow copy of the current Object . (Inherited from Object .)
	ToString [▶ 1738]	Returns a String that represents this instance. (Inherited from DataType [▶ 1721].)

Extension Methods

	Name	Description
	AddAligned [▶ 1956]	Adds a member to the StructType [▶ 1846] (Defined by FluentStructTypeExtension [▶ 1955].)
	AddMethod [▶ 1956]	Adds a RpcMethod . (Defined by FluentStructTypeExtension [▶ 1955].)
	IsArrayOfPrimitives [▶ 3025]	Overloaded. Determines whether the <code>dataType</code> is an array of Primitives . (Defined by DataTypeExtension [▶ 3021].)
	IsArrayOfPrimitives(Boolean) [▶ 3025]	Overloaded. Determines whether the <code>dataType</code> is an array of Primitives . (Defined by DataTypeExtension [▶ 3021].)
	IsContainer [▶ 3027]	Overloaded. Gets a value indicating whether this IDataType [▶ 2475] is a container type (Defined by DataTypeExtension [▶ 3021].)

Name	Description
	Overloaded.
IsContainer(Boolean) [▶ 3028]	Gets a value indicating whether this IDataType [▶ 2475] is a container type (Defined by DataTypeExtension [▶ 3021] .)
IsPointer [▶ 3031]	Gets a value indicating whether this IDataType [▶ 2475] is a pointer type (Defined by DataTypeExtension [▶ 3021] .)
	Overloaded.
IsPrimitive. [▶ 3033]	Gets a value indicating whether this IDataType [▶ 2475] is primitive (Defined by DataTypeExtension [▶ 3021] .)
	Overloaded.
IsPrimitive(Boolean) [▶ 3034]	Gets a value indicating whether this IDataType [▶ 2475] is primitive (Defined by DataTypeExtension [▶ 3021] .)
IsReference [▶ 3036]	Gets a value indicating whether this IDataType [▶ 2475] is a reference type (Defined by DataTypeExtension [▶ 3021] .)
ReferencesExternalData [▶ 3037]	Indicates, that the Instance value includes process memory data, that cannot be read in one memory block. (Defined by DataTypeExtension [▶ 3021] .)
	Overloaded.
ResolvableAsPrimitive. [▶ 3039]	Indicates, that this data type can be resolved as primitive or primitive Array. (Defined by DataTypeExtension [▶ 3021] .)
	Overloaded.
ResolvableAsPrimitive(Boolean) [▶ 3039]	Indicates, that this data type can be resolved as primitive or primitive Array. (Defined by DataTypeExtension [▶ 3021] .)
Resolve. [▶ 3040]	Overloaded. Resolves the specified data type for AliasReference [▶ 3042] (Defined by DataTypeExtension [▶ 3021] .)
	Overloaded.
Resolve(DataTypeResolveStrategy) [▶ 3041]	Resolves the specified strategy. (Defined by DataTypeExtension [▶ 3021] .)

6.7.22 SubRangeType.T. Class

Represents a SubRangType

Inheritance Hierarchy

System.Object

[TwinCAT.Ads.TypeSystem.DataType \[▶ 1721\]](#)

[TwinCAT.Ads.TypeSystem.SubRangeType.T.](#)

Namespace: [TwinCAT.Ads.TypeSystem \[▶ 1698\]](#)

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public sealed class SubRangeType<T> : DataType,
    ISubRangeType<T>, ISubRangeType, IDataType, IBitSize
where T : struct, new()
```

Type Parameters

T

The SubRangeType.T. type exposes the following members.

Properties

	Name	Description
	Attributes [▶ 1727]	Gets the attributes of the IDataType [▶ 2475] (Inherited from DataType [▶ 1721].)
	BaseType [▶ 1860]	Gets the the base type.
	BaseTypeName [▶ 1860]	Gets the name of the base type.
	BitSize [▶ 1727]	Gets the size of the DataType [▶ 1721] in bits. (Inherited from DataType [▶ 1721].)
	ByteSize [▶ 1728]	Gets the (aligned) size of of the Type/Instance in Bytes (Inherited from DataType [▶ 1721].)
	Category [▶ 1728]	Gets the Data Type category (Inherited from DataType [▶ 1721].)
	Comment [▶ 1729]	Gets the comment. (Inherited from DataType [▶ 1721].)
	FullName [▶ 1729]	Gets the full name of the IDataType [▶ 2475] (Namespace + Name) (Inherited from DataType [▶ 1721].)
	Id [▶ 1729]	Gets the ID of the Data Type (Inherited from DataType [▶ 1721].)
	IsBitType [▶ 1730]	Gets a value indicating whether this IDataType [▶ 2475] is a bit mapping Type (Inherited from DataType [▶ 1721].)
	IsByteAligned [▶ 1730]	Indicates that the Size of the Object is Byte aligned (BitSize % 8 == 0) (Inherited from DataType [▶ 1721].)
	LowerBound [▶ 1861]	Gets the lower bound.
	ManagedType [▶ 1861]	Gets the corresponding .NET Type if attached. (Overrides DataType.ManagedType [▶ 1733].)
	Name [▶ 1734]	Gets the name of the Data Type (without namespace) (Inherited from DataType [▶ 1721].)
	Namespace [▶ 1734]	Gets the namespace string within the IDataType [▶ 2475] exists. (Inherited from DataType [▶ 1721].)
	Size [▶ 1735]	Gets the Size of the DataType [▶ 1721] in Bytes or bits. (Inherited from DataType [▶ 1721].)
	TypeGuid [▶ 1735]	Gets the Guid of the DataType [▶ 1721] (optional) (Inherited from DataType [▶ 1721].)
	UpperBound [▶ 1862]	Gets the upper bound.

Methods

	Name	Description
	Equals	Determines whether the specified object is equal to the current object. (Inherited from Object.)
	GetHashCode	Serves as the default hash function. (Inherited from Object.)
	GetType	Gets the Type of the current instance. (Inherited from Object.)
	ToString [▶ 1738]	Returns a String that represents this instance. (Inherited from DataType [▶ 1721].)

Extension Methods

	Name	Description
	IsArrayOfPrimitives . [▶ 3025]	Overloaded. Determines whether the dataType is an array of Primitives. (Defined by DataTypeExtension [▶ 3021].)
	IsArrayOfPrimitives(Boolean) [▶ 3025]	Overloaded. Determines whether the dataType is an array of Primitives. (Defined by DataTypeExtension [▶ 3021].)
	IsContainer . [▶ 3027]	Overloaded. Gets a value indicating whether this IDataType [▶ 2475] is a container type (Defined by DataTypeExtension [▶ 3021].)
	IsContainer(Boolean) [▶ 3028]	Overloaded. Gets a value indicating whether this IDataType [▶ 2475] is a container type (Defined by DataTypeExtension [▶ 3021].)
	IsPointer [▶ 3031]	Gets a value indicating whether this IDataType [▶ 2475] is a pointer type (Defined by DataTypeExtension [▶ 3021].)
	IsPrimitive . [▶ 3033]	Overloaded. Gets a value indicating whether this IDataType [▶ 2475] is primitive (Defined by DataTypeExtension [▶ 3021].)
	IsPrimitive(Boolean) [▶ 3034]	Overloaded. Gets a value indicating whether this IDataType [▶ 2475] is primitive (Defined by DataTypeExtension [▶ 3021].)
	IsReference [▶ 3036]	Gets a value indicating whether this IDataType [▶ 2475] is a reference type (Defined by DataTypeExtension [▶ 3021].)
	ReferencesExternalData [▶ 3037]	Indicates, that the Instance value includes process memory data, that cannot be read in one memory block. (Defined by DataTypeExtension [▶ 3021].)
	ResolvableAsPrimitive . [▶ 3039]	Overloaded. Indicates, that this data type can be resolved as primitive or primitive Array. (Defined by DataTypeExtension [▶ 3021].)
	ResolvableAsPrimitive(Boolean) [▶ 3039]	Overloaded. Indicates, that this data type can be resolved as primitive or primitive Array. (Defined by DataTypeExtension [▶ 3021].)
	Resolve . [▶ 3040]	Overloaded. Resolves the specified data type for AliasReference [▶ 3042] (Defined by DataTypeExtension [▶ 3021].)

	Name	Description
	Resolve(DataTypeResolveStrategy) [▶ 3041]	Overloaded. Resolves the specified strategy. (Defined by DataTypeExtension [▶ 3021].)

6.7.22.1 SubRangeType.T. Properties

The [SubRangeType.T](#) [[▶ 1856](#)] generic type exposes the following members.

Properties

	Name	Description
	Attributes [▶ 1727]	Gets the attributes of the IDataType [▶ 2475] (Inherited from DataType [▶ 1721].)
	BaseType [▶ 1860]	Gets the the base type.
	BaseTypeName [▶ 1860]	Gets the name of the base type.
	BitSize [▶ 1727]	Gets the size of the DataType [▶ 1721] in bits. (Inherited from DataType [▶ 1721].)
	ByteSize [▶ 1728]	Gets the (aligned) size of of the Type/Instance in Bytes (Inherited from DataType [▶ 1721].)
	Category [▶ 1728]	Gets the Data Type category (Inherited from DataType [▶ 1721].)
	Comment [▶ 1729]	Gets the comment. (Inherited from DataType [▶ 1721].)
	FullName [▶ 1729]	Gets the full name of the IDataType [▶ 2475] (Namespace + Name) (Inherited from DataType [▶ 1721].)
	Id [▶ 1729]	Gets the ID of the DataType (Inherited from DataType [▶ 1721].)
	IsBitType [▶ 1730]	Gets a value indicating whether this IDataType [▶ 2475] is a bit mapping Type (Inherited from DataType [▶ 1721].)
	IsByteAligned [▶ 1730]	Indicates that the Size of the Object is Byte aligned (BitSize % 8 == 0) (Inherited from DataType [▶ 1721].)
	LowerBound [▶ 1861]	Gets the lower bound.
	ManagedType [▶ 1861]	Gets the corresponding .NET Type if attached. (Overrides DataType.ManagedType [▶ 1733].)
	Name [▶ 1734]	Gets the name of the Data Type (without namespace) (Inherited from DataType [▶ 1721].)
	Namespace [▶ 1734]	Gets the namespace string within the IDataType [▶ 2475] exists. (Inherited from DataType [▶ 1721].)

	Name	Description
	Size [▶ 1735]	Gets the Size of the DataType [▶ 1721] in Bytes or bits. (Inherited from DataType [▶ 1721].)
	TypeGuid [▶ 1735]	Gets the Guid of the DataType [▶ 1721] (optional) (Inherited from DataType [▶ 1721].)
	UpperBound [▶ 1862]	Gets the upper bound.

6.7.22.1.1 SubRangeType.T..BaseType Property

Gets the the base type.

Namespace: [TwinCAT.Ads.TypeSystem](#) [[▶ 1698](#)]

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public IDatatype? BaseType { get; }
```

Property Value

Type: [IDatatype](#) [[▶ 2475](#)]

The type of the referenced.

Implements

[ISubRangeType.BaseType](#) [[▶ 2684](#)]

Reference

[SubRangeType.T. Class](#) [[▶ 1856](#)]

[TwinCAT.Ads.TypeSystem Namespace](#) [[▶ 1698](#)]

6.7.22.1.2 SubRangeType.T..BaseTypeName Property

Gets the name of the base type.

Namespace: [TwinCAT.Ads.TypeSystem](#) [[▶ 1698](#)]

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public string BaseTypeName { get; }
```

Property Value

Type: String

The name of the base type.

Implements

[ISubRangeType.BaseTypeName](#) [[▶ 2685](#)]

Reference

[SubRangeType.T. Class](#) [[▶ 1856](#)]

[TwinCAT.Ads.TypeSystem Namespace](#) [[▶ 1698](#)]

6.7.22.1.3 SubRangeType.T..LowerBound Property

Gets the lower bound.

Namespace: [TwinCAT.Ads.TypeSystem](#) [[▶ 1698](#)]

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public T LowerBound { get; }
```

Property Value

Type: [T](#) [[▶ 1856](#)]

The lower bound.

Implements

[ISubRangeType.T..LowerBound](#) [[▶ 2689](#)]

Reference

[SubRangeType.T. Class](#) [[▶ 1856](#)]

[TwinCAT.Ads.TypeSystem Namespace](#) [[▶ 1698](#)]

6.7.22.1.4 SubRangeType.T..ManagedType Property

Gets the corresponding .NET Type if attached.

Namespace: [TwinCAT.Ads.TypeSystem](#) [[▶ 1698](#)]

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public override Type ManagedType { get; }
```

Property Value

Type: Type
Dot net type.

Reference

6.7.22.2 SubRangeType.T. Methods

The [SubRangeType.T. \[▶ 1856\]](#) generic type exposes the following members.

Methods

	Name	Description
	Equals	Determines whether the specified object is equal to the current object. (Inherited from Object.)
	GetHashCode	Serves as the default hash function. (Inherited from Object.)
	GetType	Gets the Type of the current instance. (Inherited from Object.)
	ToString [▶ 1738]	Returns a String that represents this instance. (Inherited from DataType [▶ 1721] .)

Extension Methods

	Name	Description
	IsArrayOfPrimitives [▶ 3025]	Overloaded.

	Name	Description
		Determines whether the dataType is an array of Primitives. (Defined by DataTypeExtension [▶ 3021].)
	IsArrayOfPrimitives(Boolean) [▶ 3025]	Overloaded. Determines whether the dataType is an array of Primitives. (Defined by DataTypeExtension [▶ 3021].)
	IsContainer. [▶ 3027]	Overloaded. Gets a value indicating whether this IDataType [▶ 2475] is a container type (Defined by DataTypeExtension [▶ 3021].)
	IsContainer(Boolean) [▶ 3028]	Overloaded. Gets a value indicating whether this IDataType [▶ 2475] is a container type (Defined by DataTypeExtension [▶ 3021].)
	IsPointer [▶ 3031]	Gets a value indicating whether this IDataType [▶ 2475] is a pointer type (Defined by DataTypeExtension [▶ 3021].)
	IsPrimitive. [▶ 3033]	Overloaded. Gets a value indicating whether this IDataType [▶ 2475] is primitive (Defined by DataTypeExtension [▶ 3021].)
	IsPrimitive(Boolean) [▶ 3034]	Overloaded. Gets a value indicating whether this IDataType [▶ 2475] is primitive (Defined by DataTypeExtension [▶ 3021].)
	IsReference [▶ 3036]	Gets a value indicating whether this IDataType [▶ 2475] is a reference type (Defined by DataTypeExtension [▶ 3021].)
	ReferencesExternalData [▶ 3037]	Indicates, that the Instance value includes process memory data, that cannot be read in one memory block. (Defined by DataTypeExtension [▶ 3021].)
	ResolvableAsPrimitive. [▶ 3039]	Overloaded. Indicates, that this data type can be resolved as primitive or primitive Array. (Defined by DataTypeExtension [▶ 3021].)
	ResolvableAsPrimitive(Boolean) [▶ 3039]	Overloaded. Indicates, that this data type can be resolved as primitive or primitive Array. (Defined by DataTypeExtension [▶ 3021].)
	Resolve. [▶ 3040]	Overloaded. Resolves the specified data type for AliasReference [▶ 3042] (Defined by DataTypeExtension [▶ 3021].)
	Resolve(DataTypeResolveStrategy) [▶ 3041]	Overloaded. Resolves the specified strategy. (Defined by DataTypeExtension [▶ 3021].)

Symbol class

Inheritance Hierarchy

System.Object

[TwinCAT.Ads.TypeSystem.Instance](#) [▶ 1765]

[TwinCAT.Ads.TypeSystem.Symbol](#)

[TwinCAT.Ads.TypeSystem.UnionInstance](#) [▶ 1992]

Namespace: [TwinCAT.Ads.TypeSystem](#) [▶ 1698]

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public class Symbol : Instance, IEquatable<Symbol>,
    IValueSymbol, IValueRawSymbol, IHierarchicalSymbol, ISymbol, IAttributedInstance,
    IInstance, IBitSize, IValueAnySymbol, IValueAccessorProvider, ISymbolFactoryServicesProvider,
    IAdsSymbol, IProcessImageAddress, IContextMaskProvider
```

The Symbol type exposes the following members.

Properties

	Name	Description
	AccessRights [▶ 1872]	Gets the access rights.
	Attributes [▶ 1768]	Gets the Type Attributes. (Inherited from Instance [▶ 1765].)
	BitSize [▶ 1768]	Gets the size of this Instance [▶ 1765] in bits. (Inherited from Instance [▶ 1765].)
	ByteSize [▶ 1769]	Gets the (aligned) size of of the Type/Instance in Bytes (Inherited from Instance [▶ 1765].)
	Category [▶ 1769]	Gets the the DataTypeCategory [▶ 2111] of the Instance. (Inherited from Instance [▶ 1765].)
	Comment [▶ 1770]	Gets the comment. (Inherited from Instance [▶ 1765].)
	Connection [▶ 1873]	Gets the connection that produces values for this IValueSymbol [▶ 2775]
	ContextMask [▶ 1770]	Gets the context mask of this instance. (Inherited from Instance [▶ 1765].)
	DataType [▶ 1771]	Gets the IDataType [▶ 2475] of the Instance [▶ 2549]. (Inherited from Instance [▶ 1765].)
	HasValue [▶ 1771]	Gets a value indicating whether this instance has a value. (Inherited from Instance [▶ 1765].)
	ImageBaseAddress [▶ 1873]	Gets the AmsAddress [▶ 752] of the Process Image
	IndexGroup [▶ 1874]	Gets the index group of the Symbol
	IndexOffset [▶ 1874]	Gets the index offset of the Symbol
	InstanceName [▶ 1771]	Gets the name of the instance (without periods (.)) (Inherited from Instance [▶ 1765].)
	InstancePath [▶ 1874]	Gets the relative / absolute access path to the instance (with periods (.)) (Overrides Instance.InstancePath [▶ 1772].)
	IsBitType [▶ 1773]	Gets a value indicating whether this instance is not basing on a full DataType but instead of some sort of bit mapping (Inherited from Instance [▶ 1765].)

	Name	Description
	IsByteAligned [▶ 1773]	Indicates that the Size of the Object is Byte aligned (BitSize % 8 == 0) (Inherited from Instance [▶ 1765].)
	IsContainerType [▶ 1875]	Gets a value indicating whether the Symbols datatype is a Container type.
	IsDereferencedPointer [▶ 1876]	Gets or sets a value indicating whether an ancestor is a dereferenced Pointer
	IsDereferencedReference [▶ 1876]	Gets or sets a value indicating whether an ancestor is a dereferenced Reference
	IsPersistent [▶ 1773]	Indicates that this instance is persistent. (Inherited from Instance [▶ 1765].)
	IsPointer [▶ 1774]	Gets a value indicating whether this instance is reference. (Inherited from Instance [▶ 1765].)
	IsPrimitiveType [▶ 1877]	Gets a value indicating whether this instance is primitive.
	IsReadOnly [▶ 1774]	Indicates that this instance is read only. (Inherited from Instance [▶ 1765].)
	IsRecursive [▶ 1877]	Gets a value indicating whether this instance is recursive.
	IsReference [▶ 1775]	Gets a value indicating whether this instance is reference. (Inherited from Instance [▶ 1765].)
	IsStatic [▶ 1775]	Gets a value indicating whether this Instance [▶ 2549] is static. (Inherited from Instance [▶ 1765].)
	IsTcComInterfacePointer [▶ 1776]	Indicates that this instance is a TcComInterfacePointer. (Inherited from Instance [▶ 1765].)
	IsTypeGuid [▶ 1776]	Indicates that this instance has set TypeGuid flag. (Inherited from Instance [▶ 1765].)
	IsVirtual [▶ 1878]	Gets a value indicating whether this instance is virtual.
	Namespace [▶ 1776]	Gets the namespace name. (Inherited from Instance [▶ 1765].)
	NotificationSettings [▶ 1878]	Gets or sets the notification settings.
	Parent [▶ 1879]	Gets the parent Symbol
	Size [▶ 1777]	Gets the size of the IDataType [▶ 2475] in bytes or Bits dependant on IsBitType [▶ 1773] (Inherited from Instance [▶ 1765].)
	SubSymbolCount [▶ 1879]	Gets the number of SubSymbols
	SubSymbols [▶ 1880]	Gets the SubSymbols of the ISymbol [▶ 2691]
	TypeName [▶ 1777]	Gets the name of the DataType [▶ 2475] that is used for this Instance [▶ 2549]. (Inherited from Instance [▶ 1765].)
	ValueEncoding [▶ 1880]	Gets the value encoding.

Methods

	Name	Description
	EnsureRights [▶ 1885]	Ensures that the AccessRights are matched.
	Equals(ISymbol) [▶ 1885]	Equals the specified inst.
	Equals(Object) [▶ 1886]	Equals (Overrides Object.Equals(Object).)
	Equals(Symbol) [▶ 1887]	Equals the specified inst.
	Finalize	Allows an object to try to free resources and perform other cleanup operations before it is reclaimed by garbage collection. (Inherited from Object.)
	GetHashCode [▶ 1887]	Gets the HashCode of the Address (Overrides Object.GetHashCode..)
	GetType	Gets the Type of the current instance. (Inherited from Object.)
	MemberwiseClone	Creates a shallow copy of the current Object. (Inherited from Object.)
	OnGetSize [▶ 1779]	Handler function getting the size of the Instance [▶ 1765] (Inherited from Instance [▶ 1765].)
	OnReadRawValue [▶ 1888]	Handler function for reading the raw value
	OnReadRawValueAsync [▶ 1888]	Handler function for reading the raw value
	OnReadValue [▶ 1889]	Handler function for reading the dynamic value.
	OnReadValueAsync [▶ 1889]	Handler function for reading the dynamic value.
	OnSetInstanceName [▶ 1890]	Sets a new InstanceName InstancePath (Overrides Instance.OnSetInstanceName(String) [▶ 1780].)
	OnTryReadValue [▶ 1890]	Handler function for reading the dynamic value.
	OnTryWriteValue [▶ 1891]	Handler function for writing the dynamic value
	OnWriteRawValue [▶ 1891]	Handler function for writing the RawValue
	OnWriteRawValueAsync [▶ 1892]	Handler function Writing the raw value asynchronously.
	OnWriteValue [▶ 1893]	Handler function for writing the dynamic value
	OnWriteValueAsync [▶ 1893]	Handler function for writing the dynamic value
	ReadAnyValue(Type) [▶ 1894]	Reads the value of this Value [▶ 2775] into a new created instance of the managed type
	ReadAnyValue(Type, Int32) [▶ 1895]	Reads the value of this Value [▶ 2775] into a new created instance of the managed type

	Name	Description
	ReadAnyValue.T. [▶ 1896]	Reads the value of this Value [▶ 2753] into a new created instance of the managed type
	ReadAnyValue.T. (Int32) [▶ 1896]	Reads the value of this Value [▶ 2775] into a new created instance of the managed type
	ReadAnyValueAsync (Type, CancellationTok en) [▶ 1898]	Reads the (AnyType) value asynchronously.
	ReadAnyValueAsync .T. (CancellationTok en) [▶ 1898]	Read any value as an asynchronous operation.
	ReadRawValue. [▶ 1899]	Reads the raw value of the IValueSymbol [▶ 2775] (Ads Read / Write)
	ReadRawValue(Int32) [▶ 1900]	Reads the raw value of the IValueSymbol [▶ 2775] (Ads Read / Write)
	ReadRawValueAsyn c [▶ 1901]	Reads the raw value of the IValueSymbol [▶ 2775] (Ads Read / Write) asynchronously.
	ReadValue. [▶ 1902]	Reads the Value of the IValueSymbol [▶ 2775]
	ReadValue(Int32) [▶ 1902]	Reads the Value of the IValueSymbol [▶ 2775]
	ReadValueAsync [▶ 1903]	Reads the Value of the IValueSymbol [▶ 2775] asynchronously.
	SetAttributes [▶ 1780]	Sets the type attributes (Inherited from Instance [▶ 1765].)
	SetContextMask [▶ 1780]	Sets the context mask. (Inherited from Instance [▶ 1765].)
	SetParent [▶ 1904]	Sets the parent symbol.
	ToString [▶ 1904]	Returns a String that represents this instance. (Overrides Instance.ToString. [▶ 1781].)
	TryReadValue [▶ 1905]	Reads the Value of the IValueSymbol [▶ 2775]
	TryWriteValue [▶ 1905]	Writes the Value of the IValueSymbol [▶ 2775]
	UpdateAnyValue(O bject.) [▶ 1907]	Reads the value of this Value [▶ 2775] into the specified managed value.
	UpdateAnyValue(O bject., Int32) [▶ 1907]	Reads the value of this Value [▶ 2775] into the specified managed value.
	WriteRawValue.(Byt e.) [▶ 1908]	Writes the raw value of the IValueSymbol [▶ 2775] (Ads Read / Write)

	Name	Description
	WriteRawValue(Byte, Int32) [▶ 1909]	Writes the raw value of the IValueSymbol [▶ 2775] (Ads Read / Write)
	WriteRawValueAsync [▶ 1910]	Writes the raw value of the IValueSymbol [▶ 2775] (Ads Read / Write)
	WriteValue(Object) [▶ 1910]	Writes the Value of the IValueSymbol [▶ 2775]
	WriteValue(Object, Int32) [▶ 1911]	Writes the Value of the IValueSymbol [▶ 2775]
	WriteValueAsync [▶ 1912]	Writes the Value of the IValueSymbol [▶ 2775]

Events

	Name	Description
	RawValueChanged [▶ 1913]	Occurs when the RawValue of the IValueSymbol [▶ 2775] has changed.
	ValueChanged [▶ 1913]	Occurs when the (Primitive) value of the IValueSymbol [▶ 2775] has changed.

Operators

	Name	Description
 	Equality [▶ 1914]	Operator==
 	Inequality [▶ 1915]	Implements the != operator.

Fields

	Name	Description
	syncObject [▶ 1916]	Synchronization object

Extension Methods

	Name	Description
	PollValues(IObservableUnit) [▶ 1355]	Overloaded. Poll symbol values on trigger signals. (Defined by ValueSymbolExtensions [▶ 1333].)
 	PollValues(TimeSpan) [▶ 1356]	Overloaded. Polls the symbol as value sequence of object values with a specified period time. (Defined by ValueSymbolExtensions [▶ 1333].)
	PollValues(IObservableUnit, Boolean) [▶ 1357]	Overloaded. Polls symbol values on trigger signals. (Defined by ValueSymbolExtensions [▶ 1333].)

	Name	Description
	PollValues(TimeSpan, Boolean) [▶ 1358]	Overloaded. Polls the symbol as value sequence of object values with a specified period time. (Defined by ValueSymbolExtensions [▶ 1333].)
	PollValues.T.(IObservable.Unit.) [▶ 1362]	Overloaded. Poll symbol values as a value sequence on trigger signals (typed) (Defined by ValueSymbolExtensions [▶ 1333].)
	PollValues.T.(TimeSpan) [▶ 1363]	Overloaded. Polls the symbol as value sequence of object values with a specified period time (typed) (Defined by ValueSymbolExtensions [▶ 1333].)
	PollValues.T.(IObservable.Unit., Func.ResultReadValueAccess2.IValueSymbol, Object., T.) [▶ 1365]	Overloaded. Poll symbol values on trigger signals (typed) (Defined by ValueSymbolExtensions [▶ 1333].)
	PollValues.T.(IObservable.Unit., Boolean) [▶ 1364]	Overloaded. Poll symbol values on trigger signals (typed) (Defined by ValueSymbolExtensions [▶ 1333].)
	PollValues.T.(TimeSpan, Boolean) [▶ 1367]	Overloaded. Polls the symbol as value sequence of object values with a specified period time (typed) (Defined by ValueSymbolExtensions [▶ 1333].)
	PollValues2(IObservable.Unit.) [▶ 1368]	Overloaded. Poll symbol values as a sequence of annotated results (Value + ErrorCode) (Defined by ValueSymbolExtensions [▶ 1333].)
	PollValues2(TimeSpan) [▶ 1369]	Overloaded. Poll symbol values with communication return codes. (Defined by ValueSymbolExtensions [▶ 1333].)
	ReferencesExternalData [▶ 3038]	Indicates, that the Instance value includes process memory data, that cannot be read in one memory block. (Defined by DataTypeExtension [▶ 3021].)
	WhenValueChanged [▶ 1344]	Gets an observable sequence when the value of the IValueSymbol [▶ 2775] has changed. (Defined by ValueSymbolExtensions [▶ 1333].)
	WriteValues(IObservable.Object.) [▶ 1347]	Overloaded. Subscribes the IValueSymbol [▶ 2775] to an observable sequence of values and writes them to the IValueSymbol [▶ 2775]. (Defined by ValueSymbolExtensions [▶ 1333].)
	WriteValues(IObservable.Object., Action.Exception.) [▶ 1348]	Overloaded. Subscribes the IValueSymbol [▶ 2775] to an observable sequence of values and writes them to the IValueSymbol [▶ 2775]. (Defined by ValueSymbolExtensions [▶ 1333].)
	WriteValues(IObservable.Object., Cancellation.Token) [▶ 1349]	Overloaded. Subscribes the IValueSymbol [▶ 2775] to an observable sequence of values and writes them to the IValueSymbol [▶ 2775]. (Defined by ValueSymbolExtensions [▶ 1333].)

	Name	Description
	WriteValues(IObservable.Object., Action.Exception., CancellationToken) [▶ 1350]	Overloaded. Subscribes the IValueSymbol [▶ 2775] to an observable sequence of values and writes them to the IValueSymbol [▶ 2775] . (Defined by ValueSymbolExtensions [▶ 1333] .)

Remarks

A Symbol is a (named) memory object within the Process Image with a fixed address indicated by Index Group and Index Offset. Symbols can optionally be addressed by instance path and are bound to a specific [DataType \[▶ 1721\]](#).

6.7.23.1 Symbol Properties

The [Symbol \[▶ 1863\]](#) type exposes the following members.

Properties

	Name	Description
	AccessRights [▶ 1872]	Gets the access rights.
	Attributes [▶ 1768]	Gets the Type Attributes. (Inherited from Instance [▶ 1765] .)
	BitSize [▶ 1768]	Gets the size of this Instance [▶ 1765] in bits. (Inherited from Instance [▶ 1765] .)
	ByteSize [▶ 1769]	Gets the (aligned) size of of the Type/Instance in Bytes (Inherited from Instance [▶ 1765] .)

	Name	Description
	Category [▶ 1769]	Gets the the DataTypeCategory [▶ 2111] of the Instance. (Inherited from Instance [▶ 1765].)
	Comment [▶ 1770]	Gets the comment. (Inherited from Instance [▶ 1765].)
	Connection [▶ 1873]	Gets the connection that produces values for this IValueSymbol [▶ 2775]
	ContextMask [▶ 1770]	Gets the context mask of this instance. (Inherited from Instance [▶ 1765].)
	DataType [▶ 1771]	Gets the IDataType [▶ 2475] of the Instance [▶ 2549]. (Inherited from Instance [▶ 1765].)
	HasValue [▶ 1771]	Gets a value indicating whether this instance has a value. (Inherited from Instance [▶ 1765].)
	ImageBaseAddress [▶ 1873]	Gets the AmsAddress [▶ 752] of the Process Image
	IndexGroup [▶ 1874]	Gets the index group of the Symbol
	IndexOffset [▶ 1874]	Gets the index offset of the Symbol
	InstanceName [▶ 1771]	Gets the name of the instance (without periods (.)) (Inherited from Instance [▶ 1765].)
	InstancePath [▶ 1874]	Gets the relative / absolute access path to the instance (with periods (.)) (Overrides Instance.InstancePath [▶ 1772].)
	IsBitType [▶ 1773]	Gets a value indicating whether this instance is not basing on a full DataType but instead of some sort of bit mapping (Inherited from Instance [▶ 1765].)
	IsByteAligned [▶ 1773]	Indicates that the Size of the Object is Byte aligned ($\text{BitSize} \% 8 == 0$) (Inherited from Instance [▶ 1765].)
	IsContainerType [▶ 1875]	Gets a value indicating whether the Symbols datatype is a Container type.
	IsDereferencedPointer [▶ 1876]	Gets or sets a value indicating whether an ancestor is a dereferenced Pointer
	IsDereferencedReference [▶ 1876]	Gets or sets a value indicating whether an ancestor is a dereferenced Reference
	IsPersistent [▶ 1773]	Indicates that this instance is persistent. (Inherited from Instance [▶ 1765].)
	IsPointer [▶ 1774]	Gets a value indicating whether this instance is reference. (Inherited from Instance [▶ 1765].)
	IsPrimitiveType [▶ 1877]	Gets a value indicating whether this instance is primitive.
	IsReadOnly [▶ 1774]	Indicates that this instance is read only. (Inherited from Instance [▶ 1765].)
	IsRecursive [▶ 1877]	Gets a value indicating whether this instance is recursive.
	IsReference [▶ 1775]	Gets a value indicating whether this instance is reference. (Inherited from Instance [▶ 1765].)
	IsStatic [▶ 1775]	Gets a value indicating whether this Instance [▶ 2549] is static. (Inherited from Instance [▶ 1765].)

	Name	Description
	IsTcComInterfacePointer [▸ 1776]	Indicates that this instance is a TcComInterfacePointer. (Inherited from Instance [▸ 1765].)
	IsTypeGuid [▸ 1776]	Indicates that this instance has set TypeGuid flag. (Inherited from Instance [▸ 1765].)
	IsVirtual [▸ 1878]	Gets a value indicating whether this instance is virtual.
	Namespace [▸ 1776]	Gets the namespace name. (Inherited from Instance [▸ 1765].)
	NotificationSettings [▸ 1878]	Gets or sets the notification settings.
	Parent [▸ 1879]	Gets the parent Symbol
	Size [▸ 1777]	Gets the size of the IDataType [▸ 2475] in bytes or Bits dependant on IsBitType [▸ 1773] (Inherited from Instance [▸ 1765].)
	SubSymbolCount [▸ 1879]	Gets the number of SubSymbols
	SubSymbols [▸ 1880]	Gets the SubSymbols of the ISymbol [▸ 2691]
	TypeName [▸ 1777]	Gets the name of the DataType [▸ 2475] that is used for this Instance [▸ 2549]. (Inherited from Instance [▸ 1765].)
	ValueEncoding [▸ 1880]	Gets the value encoding.

Reference

6.7.23.1.1 Symbol.AccessRights Property

Gets the access rights.

Namespace: [TwinCAT.Ads.TypeSystem](#) [[▸ 1698](#)]

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public SymbolAccessRights AccessRights { get; }
```

Property Value

Type: [SymbolAccessRights](#) [[▸ 2928](#)]

The access rights.

Implements

[IValueSymbol.AccessRights](#) [[▸ 2780](#)]

Reference

[Symbol Class](#) [[▸ 1863](#)]

[TwinCAT.Ads.TypeSystem Namespace \[▶ 1698\]](#)

6.7.23.1.2 Symbol.Connection Property

Gets the connection that produces values for this [IValueSymbol \[▶ 2775\]](#)

Namespace: [TwinCAT.Ads.TypeSystem \[▶ 1698\]](#)

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public IConnection? Connection { get; }
```

Property Value

Type: [IConnection \[▶ 79\]](#)

The connection object.

Implements

[IValueSymbol.Connection \[▶ 2781\]](#)

Reference

[Symbol Class \[▶ 1863\]](#)

[TwinCAT.Ads.TypeSystem Namespace \[▶ 1698\]](#)

6.7.23.1.3 Symbol.ImageBaseAddress Property

Gets the [AmsAddress \[▶ 752\]](#) of the Process Image

Namespace: [TwinCAT.Ads.TypeSystem \[▶ 1698\]](#)

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public AmsAddress? ImageBaseAddress { get; }
```

Property Value

Type: [AmsAddress \[▶ 752\]](#)

The address.

Implements

[IAdsSymbol.ImageBaseAddress \[▶ 1759\]](#)

Reference

[Symbol Class \[▶ 1863\]](#)

[TwinCAT.Ads.TypeSystem Namespace \[▶ 1698\]](#)

6.7.23.1.4 Symbol.IndexGroup Property

Gets the index group of the Symbol

Namespace: [TwinCAT.Ads.TypeSystem](#) [[▶ 1698](#)]

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public uint IndexGroup { get; }
```

Property Value

Type: UInt32

The index group.

Implements

[IProcessImageAddress.IndexGroup](#) [[▶ 2594](#)]

Reference

[Symbol Class](#) [[▶ 1863](#)]

[TwinCAT.Ads.TypeSystem Namespace](#) [[▶ 1698](#)]

6.7.23.1.5 Symbol.IndexOffset Property

Gets the index offset of the Symbol

Namespace: [TwinCAT.Ads.TypeSystem](#) [[▶ 1698](#)]

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public uint IndexOffset { get; }
```

Property Value

Type: UInt32

The index offset.

Implements

[IProcessImageAddress.IndexOffset](#) [[▶ 2594](#)]

Reference

[Symbol Class](#) [[▶ 1863](#)]

[TwinCAT.Ads.TypeSystem Namespace](#) [[▶ 1698](#)]

6.7.23.1.6 Symbol.InstancePath Property

Gets the relative / absolute access path to the instance (with periods (.))

Namespace: [TwinCAT.Ads.TypeSystem \[▶ 1698\]](#)

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public override string InstancePath { get; }
```

Property Value

Type: String

The instance path.

Implements

[IInstance.InstancePath \[▶ 2552\]](#)

[IInstance.InstancePath \[▶ 2552\]](#)

Remarks

If this path is relative or absolute depends on the context. [IMember \[▶ 2561\]](#) are using relative paths, [ISymbol \[▶ 2691\]](#)s are using absolute ones.

Reference

[Symbol Class \[▶ 1863\]](#)

[TwinCAT.Ads.TypeSystem Namespace \[▶ 1698\]](#)

6.7.23.1.7 Symbol.IsContainerType Property

Gets a value indicating whether the Symbols datatype is a Container type.

Namespace: [TwinCAT.Ads.TypeSystem \[▶ 1698\]](#)

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public virtual bool IsContainerType { get; }
```

Property Value

Type: Boolean

true if this instance is container type; otherwise, false.

Implements

[ISymbol.IsContainerType \[▶ 2694\]](#)

Remarks

Container Types are all types that contain SubElements like

- [Array \[▶ 2111\]](#)
- [Pointer \[▶ 2111\]](#)
- [Union \[▶ 2111\]](#)

- [Struct \[▸ 2111\]](#)
- [Function \[▸ 2111\]](#)
- [FunctionBlock \[▸ 2111\]](#)
- [Program \[▸ 2111\]](#)

and the [Alias \[▸ 2111\]](#) and [Reference \[▸ 2111\]](#) types, if they have a container type as base type.

Reference

6.7.23.1.8 Symbol.IsDereferencedPointer Property

Gets or sets a value indicating whether an ancestor is a dereferenced Pointer

Namespace: [TwinCAT.Ads.TypeSystem \[▸ 1698\]](#)

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public bool IsDereferencedPointer { get; }
```

Property Value

Type: Boolean

true if this instance is ancestor is pointer; otherwise, false.

Reference

[Symbol Class \[▸ 1863\]](#)

[TwinCAT.Ads.TypeSystem Namespace \[▸ 1698\]](#)

6.7.23.1.9 Symbol.IsDereferencedReference Property

Gets or sets a value indicating whether an ancestor is a dereferenced Reference

Namespace: [TwinCAT.Ads.TypeSystem \[▸ 1698\]](#)

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public bool IsDereferencedReference { get; }
```

Property Value

Type: Boolean

true if this instance is ancestor is reference; otherwise, false.

Reference

[Symbol Class \[▸ 1863\]](#)

[TwinCAT.Ads.TypeSystem Namespace \[► 1698\]](#)

6.7.23.1.10 Symbol.IsPrimitiveType Property

Gets a value indicating whether this instance is primitive.

Namespace: [TwinCAT.Ads.TypeSystem \[► 1698\]](#)

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public virtual bool IsPrimitiveType { get; }
```

Property Value

Type: Boolean

true if this instance is primitive; otherwise, false.

Implements

[ISymbol.IsPrimitiveType \[► 2695\]](#)

Reference

[Symbol Class \[► 1863\]](#)

[TwinCAT.Ads.TypeSystem Namespace \[► 1698\]](#)

6.7.23.1.11 Symbol.IsRecursive Property

Gets a value indicating whether this instance is recursive.

Namespace: [TwinCAT.Ads.TypeSystem \[► 1698\]](#)

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public bool IsRecursive { get; }
```

Property Value

Type: Boolean

true if this instance is recursive; otherwise, false.

Implements

[ISymbol.IsRecursive \[► 2696\]](#)

Reference

[Symbol Class \[► 1863\]](#)

[TwinCAT.Ads.TypeSystem Namespace \[► 1698\]](#)

6.7.23.1.12 Symbol.IsVirtual Property

Gets a value indicating whether this instance is virtual.

Namespace: [TwinCAT.Ads.TypeSystem](#) [[▶ 1698](#)]

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public bool IsVirtual { get; }
```

Property Value

Type: Boolean

true if this instance is virtual; otherwise, false.

Implements

[IProcessImageAddress.IsVirtual](#) [[▶ 2595](#)]

Remarks

Virtual symbols are only organizational elements within the Symbols Hierarchy and cannot be accessed separately by IndexGroup/IndexOffset, Value Read/Writes, notifications or handles.

Reference

[Symbol Class](#) [[▶ 1863](#)]

[TwinCAT.Ads.TypeSystem Namespace](#) [[▶ 1698](#)]

6.7.23.1.13 Symbol.NotificationSettings Property

Gets or sets the notification settings.

Namespace: [TwinCAT.Ads.TypeSystem](#) [[▶ 1698](#)]

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public INotificationSettings? NotificationSettings { get; set; }
```

Property Value

Type: [INotificationSettings](#) [[▶ 1098](#)]

The notification settings.

Implements

[IValueSymbol.NotificationSettings](#) [[▶ 2781](#)]

Remarks

The NotificationSettings will be inherited from [Parent](#) [[▶ 1879](#)] if the setting is not overwritten. If the Root Symbol also doesn't contain the settings, then the [DefaultNotificationSettings](#) [[▶ 1762](#)] will be returned.

Reference

6.7.23.1.14 Symbol.Parent Property

Gets the parent Symbol

Namespace: [TwinCAT.Ads.TypeSystem](#) [► 1698]

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public ISymbol? Parent { get; }
```

Property Value

Type: [ISymbol](#) [► 2691]

The parent.

Implements

[ISymbol.Parent](#) [► 2696]

Reference

[Symbol Class](#) [► 1863]

[TwinCAT.Ads.TypeSystem Namespace](#) [► 1698]

6.7.23.1.15 Symbol.SubSymbolCount Property

Gets the number of SubSymbols

Namespace: [TwinCAT.Ads.TypeSystem](#) [► 1698]

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public int SubSymbolCount { get; }
```

Property Value

Type: Int32

The Number of SubSymbols.

Remarks

If the [SubSymbols](#) [► 1880] collection is not generated yet (WeakReference), then this method is less memory and cpu consuming to use for just determining the the number of child symbols (instead of using `SubSymbols.Count`)>

Reference

[Symbol Class](#) [► 1863]

[TwinCAT.Ads.TypeSystem Namespace \[▶ 1698\]](#)

6.7.23.1.16 Symbol.SubSymbols Property

Gets the SubSymbols of the [ISymbol \[▶ 2691\]](#)

Namespace: [TwinCAT.Ads.TypeSystem \[▶ 1698\]](#)

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public ISymbolCollection<ISymbol> SubSymbols { get; }
```

Property Value

Type: [ISymbolCollection \[▶ 2700\]](#).[ISymbol \[▶ 2691\]](#).

Implements

[ISymbol.SubSymbols \[▶ 2696\]](#)

Remarks

Used for Array, Struct, Pointer and Reference instances. Otherwise empty

Reference

6.7.23.1.17 Symbol.ValueEncoding Property

Gets the value encoding.

Namespace: [TwinCAT.Ads.TypeSystem \[▶ 1698\]](#)

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public virtual Encoding ValueEncoding { get; }
```

Property Value

Type: Encoding
The value encoding.

Implements

[IAttributedInstance.ValueEncoding \[▶ 2472\]](#)

Reference

[Symbol Class \[▶ 1863\]](#)

[TwinCAT.Ads.TypeSystem Namespace \[▶ 1698\]](#)

6.7.23.2 Symbol Methods

The [Symbol](#) [[▶ 1863](#)] type exposes the following members.

Methods

	Name	Description
	EnsureRights [▶ 1885]	Ensures that the AccessRights are matched.
	Equals(ISymbol) [▶ 1885]	Equals the specified inst.
	Equals(Object) [▶ 1886]	Equals (Overrides Object.Equals(Object).)
	Equals(Symbol) [▶ 1887]	Equals the specified inst.
	Finalize	Allows an object to try to free resources and perform other cleanup operations before it is reclaimed by garbage collection. (Inherited from Object.)
	GetHashCode [▶ 1887]	Gets the GetHashCode of the Address (Overrides Object.GetHashCode..)
	GetType	Gets the Type of the current instance. (Inherited from Object.)
	MemberwiseClone	Creates a shallow copy of the current Object. (Inherited from Object.)
	OnGetSize [▶ 1779]	Handler function getting the size of the Instance [▶ 1765] (Inherited from Instance [▶ 1765].)
	OnReadRawValue [▶ 1888]	Handler function for reading the raw value
	OnReadRawValueAsync [▶ 1888]	Handler function for reading the raw value
	OnReadValue [▶ 1889]	Handler function for reading the dynamic value.
	OnReadValueAsync [▶ 1889]	Handler function for reading the dynamic value.
	OnSetInstanceName [▶ 1890]	Sets a new InstanceName InstancePath (Overrides Instance.OnSetInstanceName(String) [▶ 1780].)
	OnTryReadValue [▶ 1890]	Handler function for reading the dynamic value.
	OnTryWriteValue [▶ 1891]	Handler function for writing the dynamic value
	OnWriteRawValue [▶ 1891]	Handler function for writing the RawValue
	OnWriteRawValueAsync [▶ 1892]	Handler function Writing the raw value asynchronously.
	OnWriteValue [▶ 1893]	Handler function for writing the dynamic value
	OnWriteValueAsync [▶ 1893]	Handler function for writing the dynamic value

	Name	Description
	ReadAnyValue(Type) [▸ 1894]	Reads the value of this Value [▸ 2775] into a new created instance of the managed type
	ReadAnyValue(Type, Int32) [▸ 1895]	Reads the value of this Value [▸ 2775] into a new created instance of the managed type
	ReadAnyValue.T.. [▸ 1896]	Reads the value of this Value [▸ 2753] into a new created instance of the managed type
	ReadAnyValue.T.(Int32) [▸ 1896]	Reads the value of this Value [▸ 2775] into a new created instance of the managed type
	ReadAnyValueAsync(Type, CancellationToken) [▸ 1898]	Reads the (AnyType) value asynchronously.
	ReadAnyValueAsync.T.(CancellationToken) [▸ 1898]	Read any value as an asynchronous operation.
	ReadRawValue. [▸ 1899]	Reads the raw value of the IValueSymbol [▸ 2775] (Ads Read / Write)
	ReadRawValue(Int32) [▸ 1900]	Reads the raw value of the IValueSymbol [▸ 2775] (Ads Read / Write)
	ReadRawValueAsync [▸ 1901]	Reads the raw value of the IValueSymbol [▸ 2775] (Ads Read / Write) asynchronously.
	ReadValue. [▸ 1902]	Reads the Value of the IValueSymbol [▸ 2775]
	ReadValue(Int32) [▸ 1902]	Reads the Value of the IValueSymbol [▸ 2775]
	ReadValueAsync [▸ 1903]	Reads the Value of the IValueSymbol [▸ 2775] asynchronously.
	SetAttributes [▸ 1780]	Sets the type attributes (Inherited from Instance [▸ 1765] .)
	SetContextMask [▸ 1780]	Sets the context mask. (Inherited from Instance [▸ 1765] .)
	SetParent [▸ 1904]	Sets the parent symbol.
	ToString [▸ 1904]	Returns a String that represents this instance. (Overrides Instance.ToString. [▸ 1781] .)
	TryReadValue [▸ 1905]	Reads the Value of the IValueSymbol [▸ 2775]
	TryWriteValue [▸ 1905]	Writes the Value of the IValueSymbol [▸ 2775]
	UpdateAnyValue(Object.) [▸ 1907]	Reads the value of this Value [▸ 2775] into the specified managed value.

	Name	Description
	UpdateAnyValue(Object, Int32) [▶ 1907]	Reads the value of this Value [▶ 2775] into the specified managed value.
	WriteRawValue(Byte) [▶ 1908]	Writes the raw value of the IValueSymbol [▶ 2775] (Ads Read / Write)
	WriteRawValue(Byte, Int32) [▶ 1909]	Writes the raw value of the IValueSymbol [▶ 2775] (Ads Read / Write)
	WriteRawValueAsync [▶ 1910]	Writes the raw value of the IValueSymbol [▶ 2775] (Ads Read / Write)
	WriteValue(Object) [▶ 1910]	Writes the Value of the IValueSymbol [▶ 2775]
	WriteValue(Object, Int32) [▶ 1911]	Writes the Value of the IValueSymbol [▶ 2775]
	WriteValueAsync [▶ 1912]	Writes the Value of the IValueSymbol [▶ 2775]

Extension Methods

	Name	Description
	PollValues(IObservable.Unit) [▶ 1355]	Overloaded. Poll symbol values on trigger signals. (Defined by ValueSymbolExtensions [▶ 1333] .)
 	PollValues(TimeSpan) [▶ 1356]	Overloaded. Polls the symbol as value sequence of object values with a specified period time. (Defined by ValueSymbolExtensions [▶ 1333] .)
	PollValues(IObservable.Unit, Boolean) [▶ 1357]	Overloaded. Polls symbol values on trigger signals. (Defined by ValueSymbolExtensions [▶ 1333] .)
 	PollValues(TimeSpan, Boolean) [▶ 1358]	Overloaded. Polls the symbol as value sequence of object values with a specified period time. (Defined by ValueSymbolExtensions [▶ 1333] .)
	PollValues.T.(IObservable.Unit) [▶ 1362]	Overloaded. Poll symbol values as a value sequence on trigger signals (typed) (Defined by ValueSymbolExtensions [▶ 1333] .)
 	PollValues.T.(TimeSpan) [▶ 1363]	Overloaded. Polls the symbol as value sequence of object values with a specified period time (typed) (Defined by ValueSymbolExtensions [▶ 1333] .)
 	PollValues.T.(IObservable.Unit, Func.ResultReadValueAccess2.IValueSymbol, Object, T) [▶ 1365]	Overloaded. Poll symbol values on trigger signals (typed) (Defined by ValueSymbolExtensions [▶ 1333] .)

	Name	Description
	PollValues.T. (IObservable.Unit. , Boolean) [▶ 1364]	Overloaded. Poll symbol values on trigger signals (typed) (Defined by ValueSymbolExtensions [▶ 1333].)
	PollValues.T. (TimeSpan , Boolean) [▶ 1367]	Overloaded. Polls the symbol as value sequence of object values with a specified period time (typed) (Defined by ValueSymbolExtensions [▶ 1333].)
	PollValues2(IObservable.Unit.) [▶ 1368]	Overloaded. Poll symbol values as a sequence of annotated results (Value + ErrorCode) (Defined by ValueSymbolExtensions [▶ 1333].)
	PollValues2(TimeSpan) [▶ 1369]	Overloaded. Poll symbol values with communication return codes. (Defined by ValueSymbolExtensions [▶ 1333].)
	ReferencesExternalData [▶ 3038]	Indicates, that the Instance value includes process memory data, that cannot be read in one memory block. (Defined by DataTypeExtension [▶ 3021].)
 	WhenValueChanged [▶ 1344]	Gets an observable sequence when the value of the IValueSymbol [▶ 2775] has changed. (Defined by ValueSymbolExtensions [▶ 1333].)
 	WriteValues(IObservable.Object.) [▶ 1347]	Overloaded. Subscribes the IValueSymbol [▶ 2775] to an observable sequence of values and writes them to the IValueSymbol [▶ 2775]. (Defined by ValueSymbolExtensions [▶ 1333].)
	WriteValues(IObservable.Object., Action.Exception.) [▶ 1348]	Overloaded. Subscribes the IValueSymbol [▶ 2775] to an observable sequence of values and writes them to the IValueSymbol [▶ 2775]. (Defined by ValueSymbolExtensions [▶ 1333].)
	WriteValues(IObservable.Object., CancellationToken) [▶ 1349]	Overloaded. Subscribes the IValueSymbol [▶ 2775] to an observable sequence of values and writes them to the IValueSymbol [▶ 2775]. (Defined by ValueSymbolExtensions [▶ 1333].)
	WriteValues(IObservable.Object., Action.Exception., CancellationToken) [▶ 1350]	Overloaded. Subscribes the IValueSymbol [▶ 2775] to an observable sequence of values and writes them to the IValueSymbol [▶ 2775]. (Defined by ValueSymbolExtensions [▶ 1333].)

6.7.23.2.1 Symbol.EnsureRights Method

Ensures that the AccessRights are matched.

Namespace: [TwinCAT.Ads.TypeSystem](#) [[▶ 1698](#)]

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
protected void EnsureRights(
    SymbolAccessRights requested
)
```

Parameters

requested	Type: TwinCAT.TypeSystem.SymbolAccessRights [▶ 2928] The requested rights.
-----------	---

Exceptions

Exception	Condition
InsufficientAccessRightsException [▶ 2573]	

Reference

[Symbol Class](#) [[▶ 1863](#)]

 [TwinCAT.Ads.TypeSystem Namespace](#) [[▶ 1698](#)]

6.7.23.2.2.1 Symbol.Equals Method (ISymbol)

Equalses the specified inst.

Namespace: [TwinCAT.Ads.TypeSystem](#) [[▶ 1698](#)]

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public bool Equals(  
    ISymbol? inst  
)
```

Parameters

inst	Type: TwinCAT.TypeSystem.ISymbol [▶ 2691] The inst.
------	--

Return Value

Type: Boolean

true if the Symbols are Equal, false otherwise.

Reference

[Symbol Class](#) [[▶ 1863](#)]

[Equals Overload](#) [[▶ 1885](#)]

[TwinCAT.Ads.TypeSystem Namespace](#) [[▶ 1698](#)]

6.7.23.2.2 Symbol.Equals Method (Object)

Equals

Namespace: [TwinCAT.Ads.TypeSystem](#) [[▶ 1698](#)]

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public override bool Equals(  
    Object? obj  
)
```

Parameters

obj	Type: System.Object The object to compare with the current object.
-----	---

Return Value

Type: Boolean

true if the specified Object is equal to this instance; otherwise, false.

Reference

[Symbol Class](#) [[▶ 1863](#)]

[Equals Overload](#) [[▶ 1885](#)]

[TwinCAT.Ads.TypeSystem Namespace](#) [[▶ 1698](#)]

6.7.23.2.3 Symbol.Equals Method (Symbol)

Equalses the specified inst.

Namespace: [TwinCAT.Ads.TypeSystem](#) [[▶ 1698](#)]

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public bool Equals(  
    Symbol? inst  
)
```

Parameters

inst	Type: TwinCAT.Ads.TypeSystem.Symbol [▶ 1863] The inst.
------	---

Return Value

Type: Boolean
true if the Symbols are equal, false otherwise.

Implements

[IEquatable.T..Equals\(T\)](#)

Reference

[Symbol Class](#) [[▶ 1863](#)]

[Equals Overload](#) [[▶ 1885](#)]

6.7.23.2.3 Symbol.GetHashCode Method

Gets the HashCode of the Address

Namespace: [TwinCAT.Ads.TypeSystem](#) [[▶ 1698](#)]

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public override int GetHashCode()
```

Return Value

Type: Int32
A hash code for this instance, suitable for use in hashing algorithms and data structures like a hash table.

Reference

[Symbol Class](#) [[▶ 1863](#)]

6.7.23.2.4 Symbol.OnReadRawValue Method

Handler function for reading the raw value

Namespace: [TwinCAT.Ads.TypeSystem](#) [[▶ 1698](#)]

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
protected virtual byte[] OnReadRawValue(
    int timeout
)
```

Parameters

timeout	Type: System.Int32
---------	--------------------

Return Value

Type: .Byte.
System.Byte[].

Exceptions

Exception	Condition

6.7.23.2.19 Symbol.ReadValue Method

Overload List

	Name	Description
	ReadValue. [▶ 1902]	Reads the Value of the IValueSymbol [▶ 2775]
	ReadValue(Int32) [▶ 1902]	Reads the Value of the IValueSymbol [▶ 2775]

Reference

[Symbol Class](#) [► 1863]

[TwinCAT.Ads.TypeSystem Namespace](#) [► 1698]

6.7.23.2.19.1 Symbol.ReadValue Method

Reads the Value of the [IValueSymbol](#) [► 2775]

Namespace: [TwinCAT.Ads.TypeSystem](#) [► 1698]

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public Object ReadValue()
```

Field Value

Type: Object
The value.

Return Value

Type: Object
System.Object.

Implements

[IValueSymbol.ReadValue.](#) [► 2784]

Remarks

Calling on primitive types, a call of this method will return the primitive value. On complex types (structures and arrays) it depends on the [ISymbolLoader](#) [► 2714] settings what will happen. In non dynamic modes: the raw byte Array will be returned, in dynamic mode: A Value will be created on the fly.

Reference

[Symbol Class](#) [► 1863]

[ReadValue Overload](#) [► 1901]

[TwinCAT.Ads.TypeSystem Namespace](#) [► 1698]

6.7.23.2.19.2 Symbol.ReadValue Method (Int32)

Reads the Value of the [IValueSymbol](#) [► 2775]

Namespace: [TwinCAT.Ads.TypeSystem](#) [► 1698]

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public Object ReadValue(  
    int timeout  
)
```

Parameters

timeout	Type: System.Int32 The timeout in ms.
---------	--

Field Value

Type: Object
The value.

Return Value

Type: Object
System.Object.

Implements

[IValueSymbol.ReadValue\(Int32\)](#) [[▶ 2785](#)]

Remarks

Calling on primitive types, a call of this method will return the primitive value. On complex types (structures and arrays) it depends on the [ISymbolLoader](#) [[▶ 2714](#)] settings what will happen. In non dynamic modes: the raw byte Array will be returned, in dynamic mode: A Value will be created on the fly. A negative timeout indicates that the Default Timeout for the communication will be used. 0 means timeout is switched off.

Reads the Value of the [IValueSymbol](#) [[▶ 2775](#)] asynchronously.

Namespace: [TwinCAT.Ads.TypeSystem](#) [[▶ 1698](#)]

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax**C#**

```
public Task<ResultReadValueAccess> ReadValueAsync (
    CancellationToken cancel
)
```

Parameters

cancel	Type: System.Threading.CancellationToken The cancellation token.
--------	---

Return Value

Type: [Task.ResultReadValueAccess](#) [[▶ 3209](#)].

A tasks that represents the asynchronous 'ReadValue' operation. The read result is stored in the [ResultReadValueAccess](#) [[▶ 3209](#)] return value and contains the [Value](#) [[▶ 3213](#)] and the [ErrorCode](#) [[▶ 3202](#)].

Implements

[IValueSymbol.ReadValueAsync\(CancellationTokens\)](#) [[▶ 2785](#)]

Remarks

Calling on primitive types, a call of this method will return the primitive value. On complex types (structures and arrays) it depends on the [ISymbolLoader](#) [[▶ 2714](#)] settings what will happen. In non dynamic modes: the raw byte Array will be returned, in dynamic mode: A Value will be created on the fly.

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public override string ToString()
```

Return Value

Type: String
A String that represents this instance.

Reference

[Symbol Class](#) [► 1863]

[TwinCAT.Ads.TypeSystem Namespace](#) [► 1698]

6.7.23.2.23 Symbol.TryReadValue Method

Reads the Value of the [IValueSymbol](#) [► 2775]

Namespace: [TwinCAT.Ads.TypeSystem](#) [► 1698]

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public int TryReadValue(  
    int timeout,  
    out Object?? value  
)
```

Parameters

timeout	Type: System.Int32 The timeout in ms.
value	Type: System.Object. The read value.

Return Value

Type: Int32
The error Code..

Implements

[IValueSymbol.TryReadValue\(Int32, Object.\)](#) [► 2786]

Remarks

Calling on primitive types, a call of this method will return the primitive value. On complex types (structures and arrays) it depends on the [ISymbolLoader](#) [► 2714] settings what will happen. In non dynamic modes: the raw byte Array will be returned, in dynamic mode: A Value will be created on the fly. A negative timeout indicates that the Default Timeout for the communication will be used. 0 means timeout is switched off.

6.7.23.2.24 Symbol.TryWriteValue Method

Writes the Value of the [IValueSymbol](#) [► 2775]

Namespace: [TwinCAT.Ads.TypeSystem](#) [[▶ 1698](#)]

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public int TryWriteValue(
    Object value,
    int timeout
)
```

Parameters

value	Type: System.Object The value.
timeout	Type: System.Int32 The timeout in ms.

Return Value

Type: Int32
The error code.

Implements

[IValueSymbol.TryWriteValue\(Object, Int32\)](#) [[▶ 2787](#)]

Remarks

Calling on primitive types, a call of this method will directly write this Value. On complex types (structs and arrays) it depends on the [ISymbolLoader](#) [[▶ 2714](#)] settings what will happen. In non dynamic modes: Only byte Arrays (of correct size) can be written) in dynamic mode: A Value that represents the value will be accepted also. A negative timeout indicates that the Default Timeout for the communication will be used. 0 means timeout is switched off.

6.7.24 SymbolIterator Class

Iterator class for enumerations of [Symbols](#) [[▶ 2691](#)].

Inheritance Hierarchy

System.Object

[TwinCAT.TypeSystem.Generic.SymbolIterator](#) [[▶ 3172](#)].[ISymbol](#) [[▶ 2691](#)].

[TwinCAT.Ads.TypeSystem.SymbolIterator](#)

Namespace: [TwinCAT.Ads.TypeSystem](#) [[▶ 1698](#)]

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public class SymbolIterator : SymbolIterator<ISymbol>
```

The SymbolIterator type exposes the following members.

Constructors

	Name	Description
	SymbolIterator (IInstanceCollection . ISymbol .) [▶ 1919]	Initializes a new instance of the SymbolIterator class.
	SymbolIterator (IEnumerable . ISymbol ., Boolean) [▶ 1920]	Initializes a new instance of the SymbolIterator class.
	SymbolIterator (IInstanceCollection . ISymbol ., Func . ISymbol ., Boolean .) [▶ 1919]	Initializes a new instance of the SymbolIterator class.

	Name	Description
	SymbolIterator(IEnumerable.ISymbol, Boolean, Func.ISymbol, Boolean.) [▶ 1920]	Initializes a new instance of the SymbolIterator class.
	SymbolIterator(IEnumerable.ISymbol, Boolean, SymbolIterationMask, Func.ISymbol, Boolean.) [▶ 1921]	Initializes a new instance of the SymbolIterator class.

Properties

	Name	Description
	Mask [▶ 3178]	Gets or sets the SymbolIterationMask [▶ 3019] (Inherited from SymbolIterator.T. [▶ 3172].)
	SymbolRecursionDetection [▶ 3178]	Gets or sets a value indicating whether the iterator checks for Symbol recursions (true by default). (Inherited from SymbolIterator.T. [▶ 3172].)

Methods

	Name	Description
	Equals	Determines whether the specified object is equal to the current object. (Inherited from Object.)
	Finalize	Allows an object to try to free resources and perform other cleanup operations before it is reclaimed by garbage collection. (Inherited from Object.)
	GetEnumerator [▶ 3179]	Gets the enumerator that enumerates through a collection (Inherited from SymbolIterator.T. [▶ 3172].)
	GetHashCode	Serves as the default hash function. (Inherited from Object.)
	GetType	Gets the Type of the current instance. (Inherited from Object.)
	MemberwiseClone	Creates a shallow copy of the current Object. (Inherited from Object.)
	ToString	Returns a string that represents the current object. (Inherited from Object.)

Remarks

This iterator class can be used to iterate over collections of symbol trees (root symbols + sub symbols). By constructor the user can choose if the iterator works recursively within the symbol tree and optionally a filter function to select only specific symbols (predicate).

Examples

The following example shows how to determine, browse and filter symbols.

Browsing and filtering Symbols

```

using (AdsClient client = new AdsClient())
{
    CancellationToken cancel = CancellationToken.None;

    uint valueToRead = 0;
    uint valueToWrite = 42;

    client.Connect(AmsNetId.Local, 851);

    // Load all Symbols + DataTypes
    ISymbolLoader loader = SymbolLoaderFactory.Create(client, SymbolLoaderSettings.Default);

    ResultSymbols resultSymbols = await loader.GetSymbolsAsync(cancel);

    if (resultSymbols.Succeeded)
    {
        Symbol symbol = (Symbol)resultSymbols.Symbols["MAIN.nCounter"];

        // Works for ALL Primitive 'ANY TYPES' Symbols
        ResultWriteAccess resultWrite = await symbol.WriteValueAsync(valueToWrite, cancel);
        ResultReadValueAccess resultRead = await symbol.ReadValueAsync(cancel);

        if (resultRead.Succeeded)
            valueToRead = (uint)resultRead.Value;

        // Simple filtering of Symbols
        Regex filterExpression = new Regex(pattern: @"^MAIN.*"); // Everything that starts with "MAIN"

        // FilterFunction that filters for the InstancePath
        Func<ISymbol, bool> filter = s => filterExpression.IsMatch(s.InstancePath);
        SymbolIterator iterator = new SymbolIterator(symbols: resultSymbols.Symbols, recurse: true, selector: filter);

        foreach (ISymbol filteredSymbol in iterator)
        {
            Console.WriteLine(filteredSymbol.InstancePath);
        }
    }
}

```

[TwinCAT.Ads.TypeSystem Namespace \[▸ 1698\]](#)

6.7.24.1.5 SymbolIterator Constructor (IEnumerable.ISymbol., Boolean, SymbolIterationMask, Func.ISymbol, Boolean., Func.ISymbol, Boolean.)

Initializes a new instance of the [SymbolIterator \[▸ 1916\]](#) class.

Namespace: [TwinCAT.Ads.TypeSystem \[▸ 1698\]](#)
Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public SymbolIterator(
    IEnumerable<ISymbol> symbols,
    bool recurse,
    SymbolIterationMask mask,
    Func<ISymbol, bool>? selector,
    Func<ISymbol, bool>? areChildsIterated
)
```

Parameters

symbols	Type: System.Collections.Generic.IEnumerable. ISymbol [▸ 2691] . The symbol collection.
recurse	Type: System.Boolean if set to true, the iterator works recursively over all subsymbols.
mask	Type: TwinCAT.TypeSystem.SymbolIterationMask [▸ 3019] Specifies a mask over the symbols, that filters out specific symbol categories. The default is All [▸ 3019] and all symbols are shown.

selector	Type: System.Func.ISymbol [▶ 2691], Boolean. Predicate function indicating that symbols are visible for the iteration. The default value null returns all symbols (of the specified mask).
areChildsIterated	Type: System.Func.ISymbol [▶ 2691], Boolean. Predicate function indicating that child of the actual symbol should be iterated (in recurse mode). The default value iterates all child (of the specified mask).

6.7.24.2 SymbolIterator Properties

The [SymbolIterator \[▶ 1916\]](#) type exposes the following members.

Properties

	Name	Description
	Mask [▶ 3178]	Gets or sets the SymbolIterationMask [▶ 3019] (Inherited from SymbolIterator.T. [▶ 3172].)
	SymbolRecursionDetection [▶ 3178]	Gets or sets a value indicating whether the iterator checks for Symbol recursions (true by default). (Inherited from SymbolIterator.T. [▶ 3172].)

Reference

[SymbolIterator Class \[▶ 1916\]](#)

[TwinCAT.Ads.TypeSystem Namespace \[▶ 1698\]](#)

6.7.24.3 SymbolIterator Methods

The [SymbolIterator \[▶ 1916\]](#) type exposes the following members.

Methods

	Name	Description
	Equals	Determines whether the specified object is equal to the current object. (Inherited from Object.)
	Finalize	Allows an object to try to free resources and perform other cleanup operations before it is reclaimed by garbage collection. (Inherited from Object.)
	GetEnumerator [▶ 3179]	Gets the enumerator that enumerates through a collection (Inherited from SymbolIterator.T. [▶ 3172].)
	GetHashCode	Serves as the default hash function. (Inherited from Object.)
	GetType	Gets the Type of the current instance. (Inherited from Object.)
	MemberwiseClone	Creates a shallow copy of the current Object. (Inherited from Object.)
	ToString	Returns a string that represents the current object. (Inherited from Object.)

6.7.25 SymbolLoaderFactory Class

The class SymbolLoaderFactory is used to create a new instance of the AdsSymbolLoader initialized to the parametrized mode (SymbolBrowser V2, new Version)

Inheritance Hierarchy

System.Object

 TwinCAT.Ads.TypeSystem.SymbolLoaderFactory

Namespace: [TwinCAT.Ads.TypeSystem \[► 1698\]](#)

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public static class SymbolLoaderFactory
```

The SymbolLoaderFactory type exposes the following members.

Methods

	Name	Description
	Create [► 1924]	Creates the specified connection.
		
		

Remarks

The Symbol Loader (V2) supports the following [modes \[► 159\]](#). [Flat \[► 159\]](#)The flat mode organizes the Symbols in a flat list. This mode is available in all .NET versions. [VirtualTree \[► 159\]](#)The virtual tree mode organizes the Symbols hierarchically with parent-child relationships. This mode is available in all .NET Versions. [DynamicTree \[► 159\]](#)The Dynamic tree mode organizes the Symbols hierarchically and (dynamically) creates struct members, array elements and enum fields on the fly. This feature is only available on platforms that support the Dynamic Language Runtime (DLR), actually all .NET Framework Version larger than 4.0. Virtual instances means, that all Symbols are ordered within a tree structure. For that symbol nodes that are not located on a fixed address, a Virtual Symbol will be created. Setting the virtualInstance parameter to 'false' means, that the located symbols will be returned in a flattened list.

6.7.25.1 SymbolLoaderFactory Methods

The [SymbolLoaderFactory \[► 1923\]](#) type exposes the following members.

Methods

	Name	Description
  	Create [▶ 1924]	Creates the specified connection.

Reference

[SymbolLoaderFactory Class](#) [[▶ 1923](#)]

[TwinCAT.Ads.TypeSystem Namespace](#) [[▶ 1698](#)]

6.7.25.1 SymbolLoaderFactory.Create Method

Creates the specified connection.

Namespace: [TwinCAT.Ads.TypeSystem](#) [[▶ 1698](#)]

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public static ISymbolLoader Create(
    IConnection connection,
    ISymbolLoaderSettings settings
)
```

Parameters

connection	Type: TwinCAT.IConnection [▶ 79] The connection.
settings	Type: TwinCAT.ISymbolLoaderSettings [▶ 104] The settings.

Return Value

Type: [ISymbolLoader](#) [[▶ 2714](#)]

ISymbolLoader.

Examples

The following sample shows how to create a dynamic version of the SymbolLoader V2. The dynamic symbol loader makes use of the Dynamic Language Runtime (DLR) of the .NET Framework. That means Structures, Arrays and Enumeration types and instances are generated 'on-the-fly' during symbol Browsing. These created dynamic objects are a one to one representation of the Symbol Server target objects (e.g the IEC61131 types on the PLC). Dynamic language features are only available from .NET4 upwards.

Dynamic Tree Mode

```
namespace Sample
{
    using System;
    using System.Diagnostics;
    using System.Threading;
    using TwinCAT;
    using TwinCAT.Ads;
    using TwinCAT.Ads.TypeSystem;
    using TwinCAT.Ads.ValueAccess;
    using TwinCAT.TypeSystem;
    using TwinCAT.TypeSystem.Generic;
    using TwinCAT.ValueAccess;
```

```

class SymbolBrowserProgramV2DynamicTree
{

        dynamic val = e.Value;
        DateTimeOffset changedTime = e.DateTime.ToLocalTime(); // Convert to local time

        // Val is a during Runtime created struct type and contains
        // the same Properties as related PLC object.
        int cycleTime = val.CycleTime;
        Console.WriteLine("TaskInfo1Value changed TimeStamp: {0}", changedTime.ToString("HH:mm:ss:fff"));
    }
}
}

```

The following sample shows how to create a static (non dynamic) version of the SymbolLoader V2. The static symbol loader in version 2 is a nearly code compatible version of the Dynamic Loader, only the dynamic creation of objects is not available. The reason for supporting this mode is that .NET Framework Versions lower than Version 4.0 (CLR2) doesn't support the Dynamic Language Runtime (DLR). The SymbolLoader V2 static object is supported from .NET 2.0 on.

Virtual Tree Mode

```

using System;
using System.Threading;
using System.Diagnostics;
using TwinCAT;
using TwinCAT.Ads;
using TwinCAT.TypeSystem;
using TwinCAT.TypeSystem.Generic;
using TwinCAT.Ads.ValueAccess;
using TwinCAT.Ads.TypeSystem;
using TwinCAT.ValueAccess;

namespace Sample
{
    class SymbolBrowserProgramV2VirtualTree
    {
        /// <summary>
        /// Defines the entry point of the application.
        /// </summary>
        /// <param name="args">The arguments.</param>
        static void Main(string[] args)
        {
            ConsoleLogger logger = new ConsoleLogger();

            Console.WriteLine("");
            Console.WriteLine("Press [Enter] for start:");
            Console.ReadLine();

            //logger.Active = false;

            Stopwatch stopper = new Stopwatch();

            // Parse the command-line arguments
            AmsAddress address = ArgParser.Parse(args);

            stopper.Start();

            using (AdsClient client = new AdsClient())
            {
                //client.Synchronize = false;

                // Connect the AdsClient to the device target.
                client.Connect(address);

                // Creates the Symbol Objects as hierarchical tree
                SymbolLoaderSettings settings = new SymbolLoaderSettings(SymbolsLoadMode.VirtualTree, ValueAccessMode.IndexGroupOffsetPreferred);
                ISymbolLoader symbolLoader = SymbolLoaderFactory.Create(client, settings);

                // Dump Datatypes from Target Device
                Console.WriteLine(string.Format("Dumping '{0}' DataTypes:", symbolLoader.DataTypes.Count));
                foreach (IDataType type in symbolLoader.DataTypes)
                {
                    logger.DumpType(type);
                }
                Console.WriteLine("");

                // Dump Symbols from target device
                Console.WriteLine("Dumping '{0}' Symbols:", symbolLoader.Symbols.Count);
                foreach (ISymbol symbol in symbolLoader.Symbols)
                {
                    logger.DumpSymbol(symbol, 0);
                }
            }
            stopper.Stop();
            TimeSpan elapsed = stopper.Elapsed;

            Console.WriteLine("");
            Console.WriteLine("Browsing complete tree: {0},
            ({1} DataTypes, {2} Symbols)", elapsed, logger.DataTypesCount, logger.SymbolsCount);
            Console.WriteLine("Press [Enter] for leave:");
            Console.ReadLine();
        }
    }
}

```

Examples

The SymbolLoader V2 static object is supported from .NET 2.0 on.

Flat Mode

```

6.7.26 UnionType Class

Represents a union type

Inheritance Hierarchy

System.Object

[TwinCAT.Ads.TypeSystem.DataType \[▶ 1721\]](#)

[TwinCAT.Ads.TypeSystem.UnionType](#)

Namespace: [TwinCAT.Ads.TypeSystem \[▶ 1698\]](#)

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```

public sealed class UnionType : DataType,
    IUnionType, IDataType, IBitSize

```

The UnionType type exposes the following members.

Properties

	Name	Description
	Attributes [▶ 1727]	Gets the attributes of the IDataType [▶ 2475] (Inherited from DataType [▶ 1721] .)
	BitSize [▶ 1727]	Gets the size of the DataType [▶ 1721] in bits. (Inherited from DataType [▶ 1721] .)
	ByteSize [▶ 1728]	Gets the (aligned) size of of the Type/Instance in Bytes (Inherited from DataType [▶ 1721] .)
	Category [▶ 1728]	Gets the Data Type category (Inherited from DataType [▶ 1721] .)
	Comment [▶ 1729]	Gets the comment. (Inherited from DataType [▶ 1721] .)
	Fields [▶ 1936]	Gets a read only collection of the Fields [▶ 2535] of the IUnionType [▶ 2740] .
	FullName [▶ 1729]	Gets the full name of the IDataType [▶ 2475] (Namespace + Name) (Inherited from DataType [▶ 1721] .)
	Id [▶ 1729]	Gets the ID of the DataType (Inherited from DataType [▶ 1721] .)

	Name	Description
	IsBitType [▶ 1730]	Gets a value indicating whether this IDataType [▶ 2475] is a bit mapping Type (Inherited from DataType [▶ 1721] .)
	IsByteAligned [▶ 1730]	Indicates that the Size of the Object is Byte aligned (BitSize % 8 == 0) (Inherited from DataType [▶ 1721] .)
	ManagedType [▶ 1733]	Gets the corresponding .NET Type if attached. (Inherited from DataType [▶ 1721] .)
	Name [▶ 1734]	Gets the name of the Data Type (without namespace) (Inherited from DataType [▶ 1721] .)
	Namespace [▶ 1734]	Gets the namespace string within the IDataType [▶ 2475] exists. (Inherited from DataType [▶ 1721] .)
	Size [▶ 1735]	Gets the Size of the DataType [▶ 1721] in Bytes or bits. (Inherited from DataType [▶ 1721] .)
	TypeGuid [▶ 1735]	Gets the Guid of the DataType [▶ 1721] (optional) (Inherited from DataType [▶ 1721] .)

Methods

	Name	Description
	Equals	Determines whether the specified object is equal to the current object. (Inherited from Object.)
	GetHashCode	Serves as the default hash function. (Inherited from Object.)
	GetType	Gets the Type of the current instance. (Inherited from Object.)
	ToString [▶ 1738]	Returns a String that represents this instance. (Inherited from DataType [▶ 1721] .)

Extension Methods

	Name	Description
	IsArrayOfPrimitives. [▶ 3025]	Overloaded. Determines whether the dataType is an array of Primitives. (Defined by DataTypeExtension [▶ 3021] .)
	IsArrayOfPrimitives(Boolean) [▶ 3025]	Overloaded. Determines whether the dataType is an array of Primitives. (Defined by DataTypeExtension [▶ 3021] .)
	IsContainer. [▶ 3027]	Overloaded. Gets a value indicating whether this IDataType [▶ 2475] is a container type (Defined by DataTypeExtension [▶ 3021] .)
	IsContainer(Boolean) [▶ 3028]	Overloaded. Gets a value indicating whether this IDataType [▶ 2475] is a container type (Defined by DataTypeExtension [▶ 3021] .)
	IsPointer [▶ 3031]	Gets a value indicating whether this IDataType [▶ 2475] is a pointer type (Defined by DataTypeExtension [▶ 3021] .)
	IsPrimitive. [▶ 3033]	Overloaded. Gets a value indicating whether this IDataType [▶ 2475] is primitive (Defined by DataTypeExtension [▶ 3021] .)
	IsPrimitive(Boolean) [▶ 3034]	Overloaded. Gets a value indicating whether this IDataType [▶ 2475] is primitive (Defined by DataTypeExtension [▶ 3021] .)

	Name	Description
	IsReference [▶ 3036]	Gets a value indicating whether this IDataType [▶ 2475] is a reference type (Defined by DataTypeExtension [▶ 3021].)
	ReferencesExternalData [▶ 3037]	Indicates, that the Instance value includes process memory data, that cannot be read in one memory block. (Defined by DataTypeExtension [▶ 3021].)
	ResolvableAsPrimitive [▶ 3039]	Overloaded. Indicates, that this data type can be resolved as primitive or primitive Array. (Defined by DataTypeExtension [▶ 3021].)
	ResolvableAsPrimitive(Boolean) [▶ 3039]	Overloaded. Indicates, that this data type can be resolved as primitive or primitive Array. (Defined by DataTypeExtension [▶ 3021].)
	Resolve [▶ 3040]	Overloaded. Resolves the specified data type for AliasReference [▶ 3042] (Defined by DataTypeExtension [▶ 3021].)
	Resolve(DataTypeResolveStrategy) [▶ 3041]	Overloaded. Resolves the specified strategy. (Defined by DataTypeExtension [▶ 3021].)

Syntax

C#

```
public sealed class WStringType : DataType,
    IStringType, IDataType, IBitSize
```

The WStringType type exposes the following members.

Properties

	Name	Description
	Attributes [▶ 1727]	Gets the attributes of the IDataType [▶ 2475] (Inherited from DataType [▶ 1721].)
	BitSize [▶ 1727]	Gets the size of the DataType [▶ 1721] in bits. (Inherited from DataType [▶ 1721].)
	ByteSize [▶ 1728]	Gets the (aligned) size of of the Type/Instance in Bytes (Inherited from DataType [▶ 1721].)
	Category [▶ 1728]	Gets the Data Type category (Inherited from DataType [▶ 1721].)
	Comment [▶ 1729]	Gets the comment. (Inherited from DataType [▶ 1721].)
	Encoding [▶ 1941]	Gets the encoding of the String (Encoding.Default (STRING) or Encoding.UNICODE (WSTRING))
	FullName [▶ 1729]	Gets the full name of the IDataType [▶ 2475] (Namespace + Name) (Inherited from DataType [▶ 1721].)
	Id [▶ 1729]	Gets the ID of the DataType (Inherited from DataType [▶ 1721].)
	IsBitType [▶ 1730]	Gets a value indicating whether this IDataType [▶ 2475] is a bit mapping Type (Inherited from DataType [▶ 1721].)

	Name	Description
	IsByteAligned [▶ 1730]	Indicates that the Size of the Object is Byte aligned (BitSize % 8 == 0) (Inherited from DataType [▶ 1721].)
	IsFixedLength [▶ 1942]	Gets a value indicating whether the string is of fixed length.
	Length [▶ 1942]	Gets the number of characters within the string.
	ManagedType [▶ 1733]	Gets the corresponding .NET Type if attached. (Inherited from DataType [▶ 1721].)
	Name [▶ 1734]	Gets the name of the Data Type (without namespace) (Inherited from DataType [▶ 1721].)
	Namespace [▶ 1734]	Gets the namespace string within the IDataType [▶ 2475] exists. (Inherited from DataType [▶ 1721].)
	Size [▶ 1735]	Gets the Size of the DataType [▶ 1721] in Bytes or bits. (Inherited from DataType [▶ 1721].)
	TypeGuid [▶ 1735]	Gets the Guid of the DataType [▶ 1721] (optional) (Inherited from DataType [▶ 1721].)

Methods

	Name	Description
	Equals	Determines whether the specified object is equal to the current object. (Inherited from Object.)
	GetHashCode	Serves as the default hash function. (Inherited from Object.)
	GetType	Gets the Type of the current instance. (Inherited from Object.)
	ToString [▶ 1944]	Returns a String that represents this instance. (Overrides DataType.ToString . [▶ 1738].)

Extension Methods

	Name	Description
	IsArrayOfPrimitives . [▶ 3025]	Overloaded. Determines whether the dataType is an array of Primitives. (Defined by DataTypeExtension [▶ 3021].)
	IsArrayOfPrimitives (Boolean) [▶ 3025]	Overloaded. Determines whether the dataType is an array of Primitives. (Defined by DataTypeExtension [▶ 3021].)
	IsContainer . [▶ 3027]	Overloaded. Gets a value indicating whether this IDataType [▶ 2475] is a container type (Defined by DataTypeExtension [▶ 3021].)
	IsContainer (Boolean) [▶ 3028]	Overloaded. Gets a value indicating whether this IDataType [▶ 2475] is a container type (Defined by DataTypeExtension [▶ 3021].)
	IsPointer [▶ 3031]	Gets a value indicating whether this IDataType [▶ 2475] is a pointer type (Defined by DataTypeExtension [▶ 3021].)
	IsPrimitive . [▶ 3033]	Overloaded. Gets a value indicating whether this IDataType [▶ 2475] is primitive (Defined by DataTypeExtension [▶ 3021].)
	IsPrimitive (Boolean) [▶ 3034]	Overloaded.

	Name	Description
		Gets a value indicating whether this IDataType [▶ 2475] is primitive (Defined by DataTypeExtension [▶ 3021].)
	IsReference [▶ 3036]	Gets a value indicating whether this IDataType [▶ 2475] is a reference type (Defined by DataTypeExtension [▶ 3021].)

	Comment [▶ 1729]	Gets the comment. (Inherited from DataType [▶ 1721].)
	Encoding [▶ 1941]	Gets the encoding of the String (Encoding.Default (STRING) or Encoding.UNICODE (WSTRING))

	Name	Description
	FullName [▶ 1729]	Gets the full name of the IDataType [▶ 2475] (Namespace + Name) (Inherited from DataType [▶ 1721].)
	Id [▶ 1729]	Gets the ID of the DataType (Inherited from DataType [▶ 1721].)
	IsBitType [▶ 1730]	Gets a value indicating whether this IDataType [▶ 2475] is a bit mapping Type (Inherited from DataType [▶ 1721].)
	IsByteAligned [▶ 1730]	Indicates that the Size of the Object is Byte aligned (BitSize % 8 == 0) (Inherited from DataType [▶ 1721].)
	IsFixedLength [▶ 1942]	Gets a value indicating whether the string is of fixed length.
	Length [▶ 1942]	Gets the number of characters within the string.
	ManagedType [▶ 1733]	Gets the corresponding .NET Type if attached. (Inherited from DataType [▶ 1721].)
	Name [▶ 1734]	Gets the name of the Data Type (without namespace) (Inherited from DataType [▶ 1721].)
	Namespace [▶ 1734]	Gets the namespace string within the IDataType [▶ 2475] exists. (Inherited from DataType [▶ 1721].)
	Size [▶ 1735]	Gets the Size of the DataType [▶ 1721] in Bytes or bits. (Inherited from DataType [▶ 1721].)
	TypeGuid [▶ 1735]	Gets the Guid of the DataType [▶ 1721] (optional) (Inherited from DataType [▶ 1721].)

6.7.27.2 WStringType Methods

The [WStringType](#) [[▸ 1938](#)] type exposes the following members.

Methods

	Name	Description
	Equals	Determines whether the specified object is equal to the current object. (Inherited from Object.)
	GetHashCode	Serves as the default hash function. (Inherited from Object.)
	GetType	Gets the Type of the current instance. (Inherited from Object.)
	ToString [▸ 1944]	Returns a String that represents this instance. (Overrides DataType.ToString . [▸ 1738].)

Extension Methods

	Name	Description
	IsArrayOfPrimitives . [▸ 3025]	Overloaded. Determines whether the dataType is an array of Primitives. (Defined by DataTypeExtension [▸ 3021].)
	IsArrayOfPrimitives(Boolean) [▸ 3025]	Overloaded. Determines whether the dataType is an array of Primitives. (Defined by DataTypeExtension [▸ 3021].)
	IsContainer . [▸ 3027]	Overloaded. Gets a value indicating whether this IDataType [▸ 2475] is a container type (Defined by DataTypeExtension [▸ 3021].)
	IsContainer(Boolean) [▸ 3028]	Overloaded. Gets a value indicating whether this IDataType [▸ 2475] is a container type (Defined by DataTypeExtension [▸ 3021].)
	IsPointer [▸ 3031]	Gets a value indicating whether this IDataType [▸ 2475] is a pointer type (Defined by DataTypeExtension [▸ 3021].)
	IsPrimitive . [▸ 3033]	Overloaded. Gets a value indicating whether this IDataType [▸ 2475] is primitive (Defined by DataTypeExtension [▸ 3021].)
	IsPrimitive(Boolean) [▸ 3034]	Overloaded. Gets a value indicating whether this IDataType [▸ 2475] is primitive (Defined by DataTypeExtension [▸ 3021].)
	IsReference [▸ 3036]	Gets a value indicating whether this IDataType [▸ 2475] is a reference type (Defined by DataTypeExtension [▸ 3021].)

	Name	Description
	ReferencesExternalData [▶ 3037]	Indicates, that the Instance value includes process memory data, that cannot be read in one memory block. (Defined by DataTypeExtension [▶ 3021].)
	ResolvableAsPrimitive [▶ 3039]	Overloaded. Indicates, that this data type can be resolved as primitive or primitive Array. (Defined by DataTypeExtension [▶ 3021].)
	ResolvableAsPrimitive(Boolean) [▶ 3039]	Overloaded. Indicates, that this data type can be resolved as primitive or primitive Array. (Defined by DataTypeExtension [▶ 3021].)
	Resolve [▶ 3040]	Overloaded. Resolves the specified data type for AliasReference [▶ 3042] (Defined by DataTypeExtension [▶ 3021].)
	Resolve(DataTypeResolveStrategy) [▶ 3041]	Overloaded. Resolves the specified strategy. (Defined by DataTypeExtension [▶ 3021].)

6.7.28 AlignmentCalculator Class

Class calculating alignments.

Inheritance Hierarchy

System.Object

 TwinCAT.Ads.TypeSystem.AlignmentCalculator

Namespace: [TwinCAT.Ads.TypeSystem](#) [[▶ 1698](#)]

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public class AlignmentCalculator
```

The AlignmentCalculator type exposes the following members.

Constructors

	Name	Description
	AlignmentCalculator [▶ 1945]	Initializes a new instance of the AlignmentCalculator class.

Properties

	Name	Description
	Pack1 [▶ 1946]	Gets the Pack1 Alignment Calculator

Methods

	Name	Description
	Equals	Determines whether the specified object is equal to the current object. (Inherited from Object.)
	Finalize	Allows an object to try to free resources and perform other cleanup operations before it is reclaimed by garbage collection. (Inherited from Object.)
	GetHashCode	Serves as the default hash function. (Inherited from Object.)
	GetNextOffset [▶ 1947]	Gets the next offset.
	GetType	Gets the Type of the current instance. (Inherited from Object.)
	MemberwiseClone	Creates a shallow copy of the current Object. (Inherited from Object.)
	ToString	Returns a string that represents the current object. (Inherited from Object.)

6.7.29.1.1.1 FluentRpcMethodExtension.AddParameter Method (RpcMethod, IRpcMethodParameter)

Adds a parameter to the RpcMethod

Namespace: [TwinCAT.Ads.TypeSystem](#) [[▶ 1698](#)]

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public static RpcMethod AddParameter(
    this RpcMethod method,
    IRpcMethodParameter parameter
)
```

Parameters

method	Type: TwinCAT.Ads.TypeSystem.RpcMethod [1813] The method.
parameter	Type: TwinCAT.TypeSystem.IRpcMethodParameter [2635] The Parameter.

Return Value

Type: [RpcMethod](#) [[1813](#)]
RpcMethod.

Usage Note

In Visual Basic and C#, you can call this method as an instance method on any object of type [RpcMethod](#) [[1813](#)]. When you use instance method syntax to call this method, omit the first parameter. Properties

	Name	Description
	AllMembers [▸ 1962]	Gets all members (down the derivation hierarchy)
	Attributes [▸ 1727]	Gets the attributes of the IDataType [▸ 2475] (Inherited from DataType [▸ 1721] .)
	BaseType [▸ 1963]	Gets the structs Base Type (Null if not derived).
	BaseTypeName [▸ 1963]	Gets the the Name of the Base class (if derived)
	BitSize [▸ 1727]	Gets the size of the DataType [▸ 1721] in bits. (Inherited from DataType [▸ 1721] .)
	ByteSize [▸ 1728]	Gets the (aligned) size of of the Type/Instance in Bytes (Inherited from DataType [▸ 1721] .)

Name	Description
Category [▶ 1728]	Gets the Data Type category (Inherited from DataType [▶ 1721].)
Comment [▶ 1729]	Gets the comment. (Inherited from DataType [▶ 1721].)
FullName [▶ 1729]	Gets the full name of the IDataType [▶ 2475] (Namespace + Name) (Inherited from DataType [▶ 1721].)
HasRpcMethods [▶ 1961]	Gets a value indicating whether this instance has RPC Methods.
Id [▶ 1729]	Gets the ID of the DataType (Inherited from DataType [▶ 1721].)
InterfaceImplementationNames [▶ 1961]	Gets the names of the interfaces, this IDataType [▶ 2475] implements.
InterfaceImplementations [▶ 1962]	Gets the resolved interface types, this IDataType [▶ 2475] implments.
IsBitType [▶ 1730]	Gets a value indicating whether this IDataType [▶ 2475] is a bit mapping Type (Inherited from DataType [▶ 1721].)
IsByteAligned [▶ 1730]	Indicates that the Size of the Object is Byte aligned ($\text{BitSize} \% 8 == 0$) (Inherited from DataType [▶ 1721].)
IsDerived [▶ 1964]	Gets a value indicating whether this instance is derived.
ManagedType [▶ 1733]	Gets the corresponding .NET Type if attached. (Inherited from DataType [▶ 1721].)
Members [▶ 1964]	Gets a read only collection of the Members [▶ 2561] of the IInterfaceType [▶ 2983].
Name [▶ 1734]	Gets the name of the Data Type (without namespace) (Inherited from DataType [▶ 1721].)
Namespace [▶ 1734]	Gets the namespace string within the IDataType [▶ 2475] exists. (Inherited from DataType [▶ 1721].)
RpcMethods [▶ 1965]	Gets the Method descriptions for the IRpcCallableType [▶ 2624]
Size [▶ 1735]	Gets the Size of the DataType [▶ 1721] in Bytes or bits. (Inherited from DataType [▶ 1721].)
TypeGuid [▶ 1735]	Gets the Guid of the DataType [▶ 1721] (optional) (Inherited from DataType [▶ 1721].)

Methods

Name	Description
Equals	Determines whether the specified object is equal to the current object. (Inherited from Object .)
Finalize	Allows an object to try to free resources and perform other cleanup operations before it is reclaimed by garbage collection. (Inherited from Object .)
GetHashCode	Serves as the default hash function. (Inherited from Object .)
GetType	Gets the Type of the current instance. (Inherited from Object .)
MemberwiseClone	Creates a shallow copy of the current Object. (Inherited from Object .)
ToString [▶ 1738]	Returns a String that represents this instance. (Inherited from DataType [▶ 1721].)

Extension Methods

	Name	Description
	IsArrayOfPrimitives . [▶ 3025]	Overloaded. Determines whether the dataType is an array of Primitives. (Defined by DataTypeExtension [▶ 3021].)
	IsArrayOfPrimitives(Boolean) [▶ 3025]	Overloaded. Determines whether the dataType is an array of Primitives. (Defined by DataTypeExtension [▶ 3021].)
	IsContainer . [▶ 3027]	Overloaded. Gets a value indicating whether this IDataType [▶ 2475] is a container type (Defined by DataTypeExtension [▶ 3021].)
	IsContainer(Boolean) [▶ 3028]	Overloaded. Gets a value indicating whether this IDataType [▶ 2475] is a container type (Defined by DataTypeExtension [▶ 3021].)
	IsPointer [▶ 3031]	Gets a value indicating whether this IDataType [▶ 2475] is a pointer type (Defined by DataTypeExtension [▶ 3021].)
	IsPrimitive . [▶ 3033]	Overloaded. Gets a value indicating whether this IDataType [▶ 2475] is primitive (Defined by DataTypeExtension [▶ 3021].)
	IsPrimitive(Boolean) [▶ 3034]	Overloaded. Gets a value indicating whether this IDataType [▶ 2475] is primitive (Defined by DataTypeExtension [▶ 3021].)
	IsReference [▶ 3036]	Gets a value indicating whether this IDataType [▶ 2475] is a reference type (Defined by DataTypeExtension [▶ 3021].)
	ReferencesExternalData [▶ 3037]	Indicates, that the Instance value includes process memory data, that cannot be read in one memory block. (Defined by DataTypeExtension [▶ 3021].)
	ResolvableAsPrimitive . [▶ 3039]	Overloaded. Indicates, that this data type can be resolved as primitive or primitive Array. (Defined by DataTypeExtension [▶ 3021].)
	ResolvableAsPrimitive(Boolean) [▶ 3039]	Overloaded. Indicates, that this data type can be resolved as primitive or primitive Array. (Defined by DataTypeExtension [▶ 3021].)
	Resolve . [▶ 3040]	Overloaded. Resolves the specified data type for AliasReference [▶ 3042] (Defined by DataTypeExtension [▶ 3021].)
	Resolve(DataTypeResolveStrategy) [▶ 3041]	Overloaded. Resolves the specified strategy. (Defined by DataTypeExtension [▶ 3021].)

6.7.32.1 InterfaceType Properties

The [InterfaceType](#) [[▶ 1957](#)] type exposes the following members.

Properties

Name	Description
AllMembers [▶ 1962]	Gets all members (down the derivation hierarchy)
Attributes [▶ 1727]	Gets the attributes of the IDataType [▶ 2475] (Inherited from DataType [▶ 1721].)
BaseType [▶ 1963]	Gets the structs Base Type (Null if not derived).
BaseTypeName [▶ 1963]	Gets the the Name of the Base class (if derived)
BitSize [▶ 1727]	Gets the size of the DataType [▶ 1721] in bits. (Inherited from DataType [▶ 1721].)
ByteSize [▶ 1728]	Gets the (aligned) size of of the Type/Instance in Bytes (Inherited from DataType [▶ 1721].)
Category [▶ 1728]	Gets the Data Type category (Inherited from DataType [▶ 1721].)
Comment [▶ 1729]	Gets the comment. (Inherited from DataType [▶ 1721].)
FullName [▶ 1729]	Gets the full name of the IDataType [▶ 2475] (Namespace + Name) (Inherited from DataType [▶ 1721].)
HasRpcMethods [▶ 1961]	Gets a value indicating whether this instance has RPC Methods.
Id [▶ 1729]	Gets the ID of the DataType (Inherited from DataType [▶ 1721].)
InterfaceImplementationNames [▶ 1961]	Gets the names of the interfaces, this IDataType [▶ 2475] implements.
InterfaceImplementations [▶ 1962]	Gets the resolved interface types, this IDataType [▶ 2475] implments.
IsBitType [▶ 1730]	Gets a value indicating whether this IDataType [▶ 2475] is a bit mapping Type (Inherited from DataType [▶ 1721].)
IsByteAligned [▶ 1730]	Indicates that the Size of the Object is Byte aligned ($\text{BitSize} \% 8 == 0$) (Inherited from DataType [▶ 1721].)
IsDerived [▶ 1964]	Gets a value indicating whether this instance is derived.
ManagedType [▶ 1733]	Gets the corresponding .NET Type if attached. (Inherited from DataType [▶ 1721].)
Members [▶ 1964]	Gets a read only collection of the Members [▶ 2561] of the IInterfaceType [▶ 2983].
Name [▶ 1734]	Gets the name of the Data Type (without namespace) (Inherited from DataType [▶ 1721].)
Namespace [▶ 1734]	Gets the namespace string within the IDataType [▶ 2475] exists. (Inherited from DataType [▶ 1721].)
RpcMethods [▶ 1965]	Gets the Method descriptions for the IRpcCallableType [▶ 2624]
Size [▶ 1735]	Gets the Size of the DataType [▶ 1721] in Bytes or bits. (Inherited from DataType [▶ 1721].)
TypeGuid [▶ 1735]	Gets the Guid of the DataType [▶ 1721] (optional) (Inherited from DataType [▶ 1721].)

Reference

[InterfaceType Class \[► 1957\]](#)

[TwinCAT.Ads.TypeSystem Namespace \[► 1698\]](#)

Also see about this

- [DataType.IsContainer Property \[► 1731\]](#)

- [DataType.IsPrimitive Property \[► 1732\]](#)
- [DataType.IsReference Property \[► 1733\]](#)

6.7.32.1.1 InterfaceType.HasRpcMethods Property

Gets a value indicating whether this instance has RPC Methods.

Namespace: [TwinCAT.Ads.TypeSystem \[► 1698\]](#)

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public bool HasRpcMethods { get; }
```

Property Value

Type: Boolean

true if this instance has methods; otherwise, false.

Implements

[IInterfaceType.HasRpcMethods \[► 2986\]](#)

Remarks

The `DataType` (Structure) must be marked with the `PlcAttribute` 'TcRpcEnable' to enable `RpcMethods`, otherwise `RpcMethods` are not passed through to the ADS symbolic information.

Reference

[InterfaceType Class \[► 1957\]](#)

[TwinCAT.Ads.TypeSystem Namespace \[► 1698\]](#)

6.7.32.1.2 InterfaceType.InterfaceImplementationNames Property

Gets the names of the interfaces, this `IDataType` [► 2475] implements.

Namespace: [TwinCAT.Ads.TypeSystem \[► 1698\]](#)

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public string[] InterfaceImplementationNames { get; }
```

Property Value

Type: [.String](#).
The interface implementations.

Implements

[IInterfaceType.InterfaceImplementationNames](#) [[▶ 2987](#)]

Reference

[InterfaceType Class](#) [[▶ 1957](#)]

[TwinCAT.Ads.TypeSystem Namespace](#) [[▶ 1698](#)]

6.7.32.1.3 InterfaceType.InterfaceImplementations Property

Gets the resolved interface types, this [IDataType](#) [[▶ 2475](#)] implements.

Namespace: [TwinCAT.Ads.TypeSystem](#) [[▶ 1698](#)]

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public IInterfaceType?[]? InterfaceImplementations { get; }
```

Property Value

Type: [.IInterfaceType](#) [[▶ 2983](#)].
The implements.

Implements

[IInterfaceType.InterfaceImplementations](#) [[▶ 2987](#)]

Reference

[InterfaceType Class](#) [[▶ 1957](#)]

[TwinCAT.Ads.TypeSystem Namespace](#) [[▶ 1698](#)]

6.7.32.1.4 InterfaceType.AllMembers Property

Gets all members (down the derivation hierarchy)

Namespace: [TwinCAT.Ads.TypeSystem](#) [[▶ 1698](#)]

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public IMemberCollection AllMembers { get; }
```

Property Value

Type: [IMemberCollection](#) [[▶ 2565](#)]
All members.

Implements

[IInterfaceType.AllMembers](#) [[▶ 2987](#)]

Reference

[InterfaceType Class](#) [[▶ 1957](#)]

[TwinCAT.Ads.TypeSystem Namespace](#) [[▶ 1698](#)]

6.7.32.1.5 InterfaceType.BaseType Property

Gets the structs Base Type (Null if not derived).

Namespace: [TwinCAT.Ads.TypeSystem](#) [[▶ 1698](#)]

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public IDataType? BaseType { get; }
```

Property Value

Type: [IDataType](#) [[▶ 2475](#)]

Implements

[IInterfaceType.BaseType](#) [[▶ 2988](#)]

Reference

[InterfaceType Class](#) [[▶ 1957](#)]

[TwinCAT.Ads.TypeSystem Namespace](#) [[▶ 1698](#)]

6.7.32.1.6 InterfaceType.BaseTypeName Property

Gets the the Name of the Base class (if derived)

Namespace: [TwinCAT.Ads.TypeSystem](#) [[▶ 1698](#)]

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public string BaseTypeName { get; }
```

Property Value

Type: String
Empty if not derived.

Implements

[IInterfaceType.BaseTypeName](#) [[▶ 2988](#)]

Reference

[InterfaceType Class](#) [[▶ 1957](#)]

[TwinCAT.Ads.TypeSystem Namespace](#) [[▶ 1698](#)]

6.7.32.1.7 InterfaceType.IsDerived Property

Gets a value indicating whether this instance is derived.

Namespace: [TwinCAT.Ads.TypeSystem](#) [[▶ 1698](#)]

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public bool IsDerived { get; }
```

Property Value

Type: Boolean

true if this instance is derived; otherwise, false.

Reference

[InterfaceType Class](#) [[▶ 1957](#)]

[TwinCAT.Ads.TypeSystem Namespace](#) [[▶ 1698](#)]

6.7.32.1.8 InterfaceType.Members Property

Gets a read only collection of the [Members](#) [[▶ 2561](#)] of the [IInterfaceType](#) [[▶ 2983](#)].

Namespace: [TwinCAT.Ads.TypeSystem](#) [[▶ 1698](#)]

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public IMemberCollection Members { get; }
```

Property Value

Type: [IMemberCollection](#) [[▶ 2565](#)]

The members as read only collection.

Implements

[IInterfaceType.Members](#) [[▶ 2988](#)]

Remarks

If the [IStructType](#) [[▶ 2671](#)] is derived, only the extended members are returned. To get all supported members down the inheritance chain, use the [AllMembers](#) [[▶ 2987](#)] property.

Reference

[InterfaceType Class](#) [[▶ 1957](#)]

[TwinCAT.Ads.TypeSystem Namespace \[▶ 1698\]](#)

6.7.32.1.9 InterfaceType.RpcMethods Property

Gets the Method descriptions for the [IRpcCallableType \[▶ 2624\]](#)

Namespace: [TwinCAT.Ads.TypeSystem \[▶ 1698\]](#)

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public IRpcMethodCollection RpcMethods { get; }
```

Property Value

Type: [IRpcMethodCollection \[▶ 2629\]](#)

The methods.

Implements

[IRpcCallableType.RpcMethods \[▶ 2624\]](#)

Remarks

The DataType (Structure) must be marked with the PlcAttribute 'TcRpcEnable' to enable RpcMethods, otherwise RpcMethods are not passed through to the ADS symbolic information.

6.7.32.2 InterfaceType Methods

The [InterfaceType \[▶ 1957\]](#) type exposes the following members.

Methods

	Name	Description
	Equals	Determines whether the specified object is equal to the current object. (Inherited from Object.)
	Finalize	Allows an object to try to free resources and perform other cleanup operations before it is reclaimed by garbage collection. (Inherited from Object.)
	GetHashCode	Serves as the default hash function. (Inherited from Object.)
	GetType	Gets the Type of the current instance. (Inherited from Object.)
	MemberwiseClone	Creates a shallow copy of the current Object. (Inherited from Object.)
	ToString [▶ 1738]	Returns a String that represents this instance. (Inherited from DataType [▶ 1721] .)

Extension Methods

	Name	Description
	IsArrayOfPrimitives. [▶ 3025]	Overloaded.

Name	Description
	Determines whether the dataType is an array of Primitives. (Defined by DataTypeExtension [▶ 3021].)
IsArrayOfPrimitives(Boolean) [▶ 3025]	Overloaded. Determines whether the dataType is an array of Primitives. (Defined by DataTypeExtension [▶ 3021].)
IsContainer. [▶ 3027]	Overloaded. Gets a value indicating whether this IDataType [▶ 2475] is a container type (Defined by DataTypeExtension [▶ 3021].)
IsContainer(Boolean) [▶ 3028]	Overloaded. Gets a value indicating whether this IDataType [▶ 2475] is a container type (Defined by DataTypeExtension [▶ 3021].)
IsPointer [▶ 3031]	Gets a value indicating whether this IDataType [▶ 2475] is a pointer type (Defined by DataTypeExtension [▶ 3021].)
IsPrimitive. [▶ 3033]	Overloaded. Gets a value indicating whether this IDataType [▶ 2475] is primitive (Defined by DataTypeExtension [▶ 3021].)
IsPrimitive(Boolean) [▶ 3034]	Overloaded. Gets a value indicating whether this IDataType [▶ 2475] is primitive (Defined by DataTypeExtension [▶ 3021].)
IsReference [▶ 3036]	Gets a value indicating whether this IDataType [▶ 2475] is a reference type (Defined by DataTypeExtension [▶ 3021].)
ReferencesExternalData [▶ 3037]	Indicates, that the Instance value includes process memory data, that cannot be read in one memory block. (Defined by DataTypeExtension [▶ 3021].)
ResolvableAsPrimitive. [▶ 3039]	Overloaded. Indicates, that this data type can be resolved as primitive or primitive Array. (Defined by DataTypeExtension [▶ 3021].)
ResolvableAsPrimitive(Boolean) [▶ 3039]	Overloaded. Indicates, that this data type can be resolved as primitive or primitive Array. (Defined by DataTypeExtension [▶ 3021].)
Resolve. [▶ 3040]	Overloaded. Resolves the specified data type for AliasReference [▶ 3042] (Defined by DataTypeExtension [▶ 3021].)
Resolve(DataTypeResolveStrategy) [▶ 3041]	Overloaded. Resolves the specified strategy. (Defined by DataTypeExtension [▶ 3021].)

6.7.33 RpcStructInstance Class

Struct Instance with RPC Methods

Inheritance Hierarchy

System.Object

 TwinCAT.Ads.TypeSystem.Instance [▶ 1765]

 TwinCAT.Ads.TypeSystem.Symbol [▶ 1863]

 StructInstance

 TwinCAT.Ads.TypeSystem.RpcStructInstance

Namespace: TwinCAT.Ads.TypeSystem [▶ 1698]

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.95+cf8c3f5

Syntax

C#

```
public sealed class RpcStructInstance : StructInstance,
    IRpcStructInstance, IStructInstance, ISymbol, IAttributedInstance, IInstance,
    IBitSize, IRpcCallableInstance
```

The RpcStructInstance type exposes the following members.

Properties

	Name	Description
	AccessRights [▶ 1872]	Gets the access rights. (Inherited from Symbol [▶ 1863].)
	Attributes [▶ 1768]	Gets the Type Attributes. (Inherited from Instance [▶ 1765].)
	BitSize [▶ 1768]	Gets the size of this Instance [▶ 1765] in bits. (Inherited from Instance [▶ 1765].)
	ByteSize [▶ 1769]	Gets the (aligned) size of of the Type/Instance in Bytes (Inherited from Instance [▶ 1765].)
	Category [▶ 1769]	Gets the the DataTypeCategory [▶ 2111] of the Instance. (Inherited from Instance [▶ 1765].)
	Comment [▶ 1770]	Gets the comment. (Inherited from Instance [▶ 1765].)
	Connection [▶ 1873]	Gets the connection that produces values for this ValueSymbol [▶ 2775] (Inherited from Symbol [▶ 1863].)
	ContextMask [▶ 1770]	Gets the context mask of this instance. (Inherited from Instance [▶ 1765].)
	DataType [▶ 1771]	Gets the IDataType [▶ 2475] of the Instance [▶ 2549]. (Inherited from Instance [▶ 1765].)
	HasValue [▶ 1771]	Gets a value indicating whether this instance has a value. (Inherited from Instance [▶ 1765].)
	ImageBaseAddress [▶ 1873]	Gets the AmsAddress [▶ 752] of the Process Image (Inherited from Symbol [▶ 1863].)
	IndexGroup [▶ 1874]	Gets the index group of the Symbol (Inherited from Symbol [▶ 1863].)
	IndexOffset [▶ 1874]	Gets the index offset of the Symbol (Inherited from Symbol [▶ 1863].)
	InstanceName [▶ 1771]	Gets the name of the instance (without periods (.)) (Inherited from Instance [▶ 1765].)
	InstancePath [▶ 1874]	Gets the relative / absolute access path to the instance (with periods (.)) (Inherited from Symbol [▶ 1863].)
	IsBitType [▶ 1773]	Gets a value indicating whether this instance is not basing on a full DataType but instead of some sort of bit mapping (Inherited from Instance [▶ 1765].)

	Name	Description
	IsByteAligned [▶ 1773]	Indicates that the Size of the Object is Byte aligned ($\text{BitSize} \% 8 == 0$) (Inherited from Instance [▶ 1765].)
	IsDereferencedPointer [▶ 1876]	Gets or sets a value indicating whether an ancestor is a dereferenced Pointer (Inherited from Symbol [▶ 1863].)
	IsDereferencedReference [▶ 1876]	Gets or sets a value indicating whether an ancestor is a dereferenced Reference (Inherited from Symbol [▶ 1863].)
	IsPersistent [▶ 1773]	Indicates that this instance is persistent. (Inherited from Instance [▶ 1765].)
	IsPointer [▶ 1774]	Gets a value indicating whether this instance is reference. (Inherited from Instance [▶ 1765].)
	IsReadOnly [▶ 1774]	Indicates that this instance is read only. (Inherited from Instance [▶ 1765].)
	IsRecursive [▶ 1877]	Gets a value indicating whether this instance is recursive. (Inherited from Symbol [▶ 1863].)
	IsReference [▶ 1775]	Gets a value indicating whether this instance is reference. (Inherited from Instance [▶ 1765].)
	IsStatic [▶ 1775]	Gets a value indicating whether this Instance [▶ 2549] is static. (Inherited from Instance [▶ 1765].)
	IsTcComInterfacePointer [▶ 1776]	Indicates that this instance is a TcComInterfacePointer. (Inherited from Instance [▶ 1765].)
	IsTypeGuid [▶ 1776]	Indicates that this instance has set TypeGuid flag. (Inherited from Instance [▶ 1765].)
	IsVirtual [▶ 1878]	Gets a value indicating whether this instance is virtual. (Inherited from Symbol [▶ 1863].)
	Namespace [▶ 1776]	Gets the namespace name. (Inherited from Instance [▶ 1765].)
	NotificationSettings [▶ 1878]	Gets or sets the notification settings. (Inherited from Symbol [▶ 1863].)
	Parent [▶ 1879]	Gets the parent Symbol (Inherited from Symbol [▶ 1863].)
	RpcMethods [▶ 1973]	Gets the Method descriptions for the IRpcCallableType [▶ 2624]
	Size [▶ 1777]	Gets the size of the IDataType [▶ 2475] in bytes or Bits dependant on IsBitType [▶ 1773] (Inherited from Instance [▶ 1765].)
	SubSymbolCount [▶ 1879]	Gets the number of SubSymbols (Inherited from Symbol [▶ 1863].)
	SubSymbols [▶ 1880]	Gets the SubSymbols of the ISymbol [▶ 2691] (Inherited from Symbol [▶ 1863].)
	TypeName [▶ 1777]	Gets the name of the DataType [▶ 2475] that is used for this Instance [▶ 2549]. (Inherited from Instance [▶ 1765].)
	ValueEncoding [▶ 1880]	Gets the value encoding. (Inherited from Symbol [▶ 1863].)

Methods

	Name	Description
	Equals [▶ 1885]	Equals (Inherited from Symbol [▶ 1863].)

	Name	Description
	GetHashCode [▶ 1887]	Gets the HashCode of the Address (Inherited from Symbol [▶ 1863].)
	GetType	Gets the Type of the current instance. (Inherited from Object .)
 	InvokeRpcMethod(String, .Object.) [▶ 1976]	Invokes the specified RPC Method
 	InvokeRpcMethod(String, .Object., .Object.) [▶ 1978]	Invokes the specified RPC Method
 	InvokeRpcMethod(String, .Object., .AnyTypeSpecifier., AnyTypeSpecifier., Object.) [▶ 1979]	Invokes the specified RPC Method
 	InvokeRpcMethodAsync(String, .Object., CancellationTokentoken) [▶ 1981]	Invokes the specified RPC Method asynchronously
 	InvokeRpcMethodAsync(String, .Object., .AnyTypeSpecifier., AnyTypeSpecifier, CancellationTokentoken) [▶ 1983]	Invokes the specified RPC Method asynchronously
	ReadAnyValue(Type) [▶ 1894]	Reads the value of this Value [▶ 2775] into a new created instance of the managed type (Inherited from Symbol [▶ 1863].)
	ReadAnyValue(Type, Int32) [▶ 1895]	Reads the value of this Value [▶ 2775] into a new created instance of the managed type (Inherited from Symbol [▶ 1863].)
	ReadAnyValueAsync [▶ 1897]	Reads the (AnyType) value asynchronously. (Inherited from Symbol [▶ 1863].)
	ReadRawValue. [▶ 1899]	Reads the raw value of the IValueSymbol [▶ 2775] (Ads Read / Write) (Inherited from Symbol [▶ 1863].)
	ReadRawValue(Int32) [▶ 1900]	Reads the raw value of the IValueSymbol [▶ 2775] (Ads Read / Write) (Inherited from Symbol [▶ 1863].)
	ReadRawValueAsync [▶ 1901]	Reads the raw value of the IValueSymbol [▶ 2775] (Ads Read / Write) asynchronously. (Inherited from Symbol [▶ 1863].)
	ReadValue. [▶ 1902]	Reads the Value of the IValueSymbol [▶ 2775] (Inherited from Symbol [▶ 1863].)
	ReadValue(Int32) [▶ 1902]	Reads the Value of the IValueSymbol [▶ 2775] (Inherited from Symbol [▶ 1863].)

	Name	Description
	ReadValueAsync [▶ 1903]	Reads the Value of the IValueSymbol [▶ 2775] asynchronously. (Inherited from Symbol [▶ 1863].)
	SetParent [▶ 1904]	Sets the parent symbol. (Inherited from Symbol [▶ 1863].)
	ToString [▶ 1904]	Returns a String that represents this instance. (Inherited from Symbol [▶ 1863].)
 	TryInvokeRpcMethod(String, .Object., Object.) [▶ 1985]	Invokes the specified RPC Method
 	TryInvokeRpcMethod(String, .Object., .Object., Object.) [▶ 1987]	Invokes the specified RPC Method
 	TryInvokeRpcMethod(IRpcMethod, .Object., .AnyTypeSpecifier, .AnyTypeSpecifier, .Object., Object.) [▶ 1989]	Invokes the the specified RpcMethod of the IRpcCallableInstance [▶ 2606].
 	TryInvokeRpcMethod(String, .Object., .AnyTypeSpecifier, .AnyTypeSpecifier, .Object., Object.) [▶ 1990]	Invokes the the specified RpcMethod of the IRpcCallableInstance [▶ 2606].
	TryReadValue [▶ 1905]	Reads the Value of the IValueSymbol [▶ 2775] (Inherited from Symbol [▶ 1863].)
	TryWriteValue [▶ 1905]	Writes the Value of the IValueSymbol [▶ 2775] (Inherited from Symbol [▶ 1863].)
	UpdateAnyValue(Object.) [▶ 1907]	Reads the value of this Value [▶ 2775] into the specified managed value. (Inherited from Symbol [▶ 1863].)
	UpdateAnyValue(Object, Int32) [▶ 1907]	Reads the value of this Value [▶ 2775] into the specified managed value. (Inherited from Symbol [▶ 1863].)
	WriteRawValue(Byte.) [▶ 1908]	Writes the raw value of the IValueSymbol [▶ 2775] (Ads Read / Write) (Inherited from Symbol [▶ 1863].)
	WriteRawValue(Byte, Int32) [▶ 1909]	Writes the raw value of the IValueSymbol [▶ 2775] (Ads Read / Write) (Inherited from Symbol [▶ 1863].)
	WriteRawValueAsync [▶ 1910]	Writes the raw value of the IValueSymbol [▶ 2775] (Ads Read / Write) (Inherited from Symbol [▶ 1863].)
	WriteValue(Object) [▶ 1910]	Writes the Value of the IValueSymbol [▶ 2775] (Inherited from Symbol [▶ 1863].)

	Name	Description
	WriteValue(Object, Int32) [1911]	Writes the Value of the IValueSymbol [2775] (Inherited from Symbol [1863].)
	WriteValueAsync [1912]	Writes the Value of the IValueSymbol [2775] (Inherited from Symbol [1863].)

Events

	Name	Description
	RawValueChanged [1913]	Occurs when the RawValue of the IValueSymbol [2775] has changed. (Inherited from Symbol [1863].)
	ValueChanged [1913]	Occurs when the (Primitive) value of the IValueSymbol [2775] has changed. (Inherited from Symbol [1863].)

6.7.33.1 RpcStructInstance Properties

The [RpcStructInstance](#) [[1966](#)] type exposes the following members.

Properties

	Name	Description
	AccessRights [1872]	Gets the access rights. (Inherited from Symbol [1863].)
	Attributes [1768]	Gets the Type Attributes. (Inherited from Instance [1765].)
	BitSize [1768]	Gets the size of this Instance [1765] in bits. (Inherited from Instance [1765].)
	ByteSize [1769]	Gets the (aligned) size of of the Type/Instance in Bytes (Inherited from Instance [1765].)
	Category [1769]	Gets the the DataTypeCategory [2111] of the Instance. (Inherited from Instance [1765].)
	Comment [1770]	Gets the comment. (Inherited from Instance [1765].)
	Connection [1873]	Gets the connection that produces values for this IValueSymbol [2775] (Inherited from Symbol [1863].)
	ContextMask [1770]	Gets the context mask of this instance. (Inherited from Instance [1765].)
	DataType [1771]	Gets the IDataType [2475] of the Instance [2549]. (Inherited from Instance [1765].)
	HasValue [1771]	Gets a value indicating whether this instance has a value. (Inherited from Instance [1765].)
	ImageBaseAddress [1873]	Gets the AmsAddress [752] of the Process Image (Inherited from Symbol [1863].)
	IndexGroup [1874]	Gets the index group of the Symbol (Inherited from Symbol [1863].)
	IndexOffset [1874]	Gets the index offset of the Symbol (Inherited from Symbol [1863].)

	Name	Description
	InstanceName [▶ 1771]	Gets the name of the instance (without periods (.)) (Inherited from Instance [▶ 1765].)
	InstancePath [▶ 1874]	Gets the relative / absolute access path to the instance (with periods (.)) (Inherited from Symbol [▶ 1863].)
	IsBitType [▶ 1773]	Gets a value indicating whether this instance is not basing on a full DataType but instead of some sort of bit mapping (Inherited from Instance [▶ 1765].)
	IsByteAligned [▶ 1773]	Indicates that the Size of the Object is Byte aligned ($\text{BitSize} \% 8 == 0$) (Inherited from Instance [▶ 1765].)
	IsDereferencedPointer [▶ 1876]	Gets or sets a value indicating whether an ancestor is a dereferenced Pointer (Inherited from Symbol [▶ 1863].)
	IsDereferencedReference [▶ 1876]	Gets or sets a value indicating whether an ancestor is a dereferenced Reference (Inherited from Symbol [▶ 1863].)
	IsPersistent [▶ 1773]	Indicates that this instance is persistent. (Inherited from Instance [▶ 1765].)
	IsPointer [▶ 1774]	Gets a value indicating whether this instance is reference. (Inherited from Instance [▶ 1765].)
	IsReadOnly [▶ 1774]	Indicates that this instance is read only. (Inherited from Instance [▶ 1765].)
	IsRecursive [▶ 1877]	Gets a value indicating whether this instance is recursive. (Inherited from Symbol [▶ 1863].)
	IsReference [▶ 1775]	Gets a value indicating whether this instance is reference. (Inherited from Instance [▶ 1765].)
	IsStatic [▶ 1775]	Gets a value indicating whether this Instance [▶ 2549] is static. (Inherited from Instance [▶ 1765].)
	IsTcComInterfacePointer [▶ 1776]	Indicates that this instance is a TcComInterfacePointer . (Inherited from Instance [▶ 1765].)
	IsTypeGuid [▶ 1776]	Indicates that this instance has set TypeGuid flag. (Inherited from Instance [▶ 1765].)
	IsVirtual [▶ 1878]	Gets a value indicating whether this instance is virtual. (Inherited from Symbol [▶ 1863].)
	Namespace [▶ 1776]	Gets the namespace name. (Inherited from Instance [▶ 1765].)
	NotificationSettings [▶ 1878]	Gets or sets the notification settings. (Inherited from Symbol [▶ 1863].)
	Parent [▶ 1879]	Gets the parent Symbol (Inherited from Symbol [▶ 1863].)
	RpcMethods [▶ 1973]	Gets the Method descriptions for the IRpcCallableType [▶ 2624]
	Size [▶ 1777]	Gets the size of the IDataType [▶ 2475] in bytes or Bits dependant on IsBitType [▶ 1773] (Inherited from Instance [▶ 1765].)
	SubSymbolCount [▶ 1879]	Gets the number of SubSymbols (Inherited from Symbol [▶ 1863].)
	SubSymbols [▶ 1880]	Gets the SubSymbols of the ISymbol [▶ 2691] (Inherited from Symbol [▶ 1863].)
	TypeName [▶ 1777]	Gets the name of the DataType [▶ 2475] that is used for this Instance [▶ 2549]. (Inherited from Instance [▶ 1765].)

	Name	Description
	ValueEncoding [▶ 1880]	Gets the value encoding. (Inherited from Symbol [▶ 1863].)

6.7.33.2 RpcStructInstance Methods

The [RpcStructInstance](#) [\[▶ 1966\]](#) type exposes the following members.

Methods

	Name	Description
	Equals [▶ 1885]	Equals (Inherited from Symbol [▶ 1863].)
	GetHashCode [▶ 1887]	Gets the HashCode of the Address (Inherited from Symbol [▶ 1863].)
	GetType	Gets the Type of the current instance. (Inherited from Object .)
 	InvokeRpcMethod(S tring, Object.) [▶ 1976]	Invokes the specified RPC Method

	Name	Description
 	InvokeRpcMethod(String, .Object., .Object.) [▶ 1978]	Invokes the specified RPC Method
 	InvokeRpcMethod(String, .Object., .AnyTypeSpecifier., AnyTypeSpecifier., .Object.) [▶ 1979]	Invokes the specified RPC Method
 	InvokeRpcMethodAsync(String, .Object., CancellationToken) [▶ 1981]	Invokes the specified RPC Method asynchronously
 	InvokeRpcMethodAsync(String, .Object., .AnyTypeSpecifier., AnyTypeSpecifier, CancellationToken) [▶ 1983]	Invokes the specified RPC Method asynchronously
	ReadAnyValue(Type) [▶ 1894]	Reads the value of this Value [▶ 2775] into a new created instance of the managed type (Inherited from Symbol [▶ 1863].)
	ReadAnyValue(Type, Int32) [▶ 1895]	Reads the value of this Value [▶ 2775] into a new created instance of the managed type (Inherited from Symbol [▶ 1863].)
	ReadAnyValueAsync [▶ 1897]	Reads the (AnyType) value asynchronously. (Inherited from Symbol [▶ 1863].)
	ReadRawValue. [▶ 1899]	Reads the raw value of the IValueSymbol [▶ 2775] (Ads Read / Write) (Inherited from Symbol [▶ 1863].)
	ReadRawValue(Int32) [▶ 1900]	Reads the raw value of the IValueSymbol [▶ 2775] (Ads Read / Write) (Inherited from Symbol [▶ 1863].)
	ReadRawValueAsync [▶ 1901]	Reads the raw value of the IValueSymbol [▶ 2775] (Ads Read / Write) asynchronously. (Inherited from Symbol [▶ 1863].)
	ReadValue. [▶ 1902]	Reads the Value of the IValueSymbol [▶ 2775] (Inherited from Symbol [▶ 1863].)
	ReadValue(Int32) [▶ 1902]	Reads the Value of the IValueSymbol [▶ 2775] (Inherited from Symbol [▶ 1863].)
	ReadValueAsync [▶ 1903]	Reads the Value of the IValueSymbol [▶ 2775] asynchronously. (Inherited from Symbol [▶ 1863].)
	SetParent [▶ 1904]	Sets the parent symbol. (Inherited from Symbol [▶ 1863].)
	ToString [▶ 1904]	Returns a String that represents this instance. (Inherited from Symbol [▶ 1863].)

	Name	Description
 	TryInvokeRpcMethod(String, Object, Object.) [▶ 1985]	Invokes the specified RPC Method
 	TryInvokeRpcMethod(String, Object, Object, Object.) [▶ 1987]	Invokes the specified RPC Method
 	TryInvokeRpcMethod(IRpcMethod, Object, AnyTypeSpecifier, AnyTypeSpecifier, Object, Object.) [▶ 1989]	Invokes the the specified RpcMethod of the IRpcCallableInstance [▶ 2606].
 	TryInvokeRpcMethod(String, Object, AnyTypeSpecifier, AnyTypeSpecifier, Object, Object.) [▶ 1990]	Invokes the the specified RpcMethod of the IRpcCallableInstance [▶ 2606].
	TryReadValue [▶ 1905]	Reads the Value of the IValueSymbol [▶ 2775] (Inherited from Symbol [▶ 1863].)
	TryWriteValue [▶ 1905]	Writes the Value of the IValueSymbol [▶ 2775] (Inherited from Symbol [▶ 1863].)
	UpdateAnyValue(Object.) [▶ 1907]	Reads the value of this Value [▶ 2775] into the specified managed value. (Inherited from Symbol [▶ 1863].)
	UpdateAnyValue(Object, Int32) [▶ 1907]	Reads the value of this Value [▶ 2775] into the specified managed value. (Inherited from Symbol [▶ 1863].)
	WriteRawValue(Byte.) [▶ 1908]	Writes the raw value of the IValueSymbol [▶ 2775] (Ads Read / Write) (Inherited from Symbol [▶ 1863].)
	WriteRawValue(Byte, Int32) [▶ 1909]	Writes the raw value of the IValueSymbol [▶ 2775] (Ads Read / Write) (Inherited from Symbol [▶ 1863].)
	WriteRawValueAsync [▶ 1910]	Writes the raw value of the IValueSymbol [▶ 2775] (Ads Read / Write) (Inherited from Symbol [▶ 1863].)
	WriteValue(Object) [▶ 1910]	Writes the Value of the IValueSymbol [▶ 2775] (Inherited from Symbol [▶ 1863].)
	WriteValue(Object, Int32) [▶ 1911]	Writes the Value of the IValueSymbol [▶ 2775] (Inherited from Symbol [▶ 1863].)
	WriteValueAsync [▶ 1912]	Writes the Value of the IValueSymbol [▶ 2775] (Inherited from Symbol [▶ 1863].)

Invokes the specified RPC Method

Namespace: [TwinCAT.Ads.TypeSystem](#) [► 1698]**Assembly:** TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.95+cf8c3f5**Syntax****C#**

```
public Object InvokeRpcMethod(
    string methodName,
    Object[]? inParameters
)
```

Parameters

methodName Type: [System.String](#)
The method name.

inParameters Type: [.System.Object](#).
The input parameters or NULL

Return Value

Type: [Object](#)
The return value of the Method (as object).

Implements

[IRpcCallableInstance.InvokeRpcMethod\(String, .Object.\)](#) [► 2609]

Remarks

This method only supports primitive data types as inParameters. Any available outparameters will be ignored. Complex types will fall back to byte[] arrays.

Examples

The following sample shows how to call (Remote Procedures / Methods) within the PLC.

Dynamic Tree Mode

```
class RpcCallVirtualProgram
{
    /// <summary>
    /// Defines the entry point of the application.
    /// </summary>
    /// <param name="args">The arguments.</param>
    static void Main(string[] args)
    {
        // Get the AdsAddress from command-line arguments
        AmsAddress address = ArgParser.Parse(args);

        using (AdsClient client = new AdsClient())
        {
            //client.Synchronize = false;

            // Connect to the target device
            client.Connect(address);

            SymbolLoaderSettings settings = new SymbolLoaderSettings(SymbolLoadMode.VirtualTree);
            ISymbolLoader loader = SymbolLoaderFactory.Create(client, settings);

            // Get the Symbols (Dynamic Symbols)

            IRpcStructInstance main = (IRpcStructInstance)loader.Symbols["MAIN"]; // Gets the MAIN Instance of the PLC Program

            // Call a Method that has the following signature (within MAIN Program)
            /* {attribute 'TcRpcEnable'}
            METHOD PUBLIC M_Add : INT
            VAR_INPUT
                i1 : INT := 0;
                i2 : INT := 0;
            END_VAR
            */

            short result = (short)main.InvokeRpcMethod("M_Add", new object[] {(short) 3, (short) 4});

            // Call a Method that has no parameter and returns VOID
            main.InvokeRpcMethod("M_Method1", new object[] {});

            //Browsing RpcMethods
            foreach(IRpcMethod method in main.RpcMethods)
            {
                string methodName = method.Name;

                foreach(IRpcMethodParameter parameter in method.Parameters)
                {
                    string parameterName = parameter.Name;
                    string parameterType = parameter.TypeName;
                }
            }
        }
    }
}
```

Reference

[RpcStructInstance Class](#) [► 1966]

[InvokeRpcMethod Overload](#) [▶ 1976]

[TwinCAT.Ads.TypeSystem Namespace](#) [▶ 1698]

6.7.33.2.1.2 RpcStructInstance.InvokeRpcMethod Method (String, .Object., .Object.)

Invokes the specified RPC Method

Namespace: [TwinCAT.Ads.TypeSystem](#) [▶ 1698]

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.95+cf8c3f5

Syntax

C#

```
public Object InvokeRpcMethod(  
    string methodName,  
    Object[]? inParameters,  
    out Object[]? outParameters  
)
```

Parameters

methodName	Type: System.String The method name.
inParameters	Type: .System.Object . The input parameters or NULL
outParameters	Type: .System.Object . The output parameters.

Return Value

Type: [Object](#)
The return value of the Method (as object).

Implements

[IRpcCallableInstance.InvokeRpcMethod\(String, .Object., .Object.\)](#) [▶ 2610]

Remarks

Because this overload doesn't provide any [AnyTypeSpecifier](#) [▶ 2094] specifications, only primitive datatypes will be correctly marshalled by this method. Complex types will fall back to byte[] arrays.

Examples

The following sample shows how to call (Remote Procedures / Methods) within the PLC.

Dynamic Tree Mode

```
class RpcCallVirtualProgram  
{  
    /// <summary>  
    /// Defines the entry point of the application.  
    /// </summary>  
    /// <param name="args">The arguments.</param>  
    static void Main(string[] args)  
    {  
        // Get the AdsAddress from command-line arguments  
        AmsAddress address = ArgParser.Parse(args);  
  
        using (AdsClient client = new AdsClient())  
        {
```

```

//client.Synchronize = false;

// Connect to the target device
client.Connect(address);

SymbolLoaderSettings settings = new SymbolLoaderSettings(SymbolLoadMode.VirtualTree);
ISymbolLoader loader = SymbolLoaderFactory.Create(client, settings);

// Get the Symbols (Dynamic Symbols)

IRpcStructInstance main = (IRpcStructInstance)loader.Symbols["MAIN"]; // Gets the MAIN Instance of the PLC Program

// Call a Method that has the following signature (within MAIN Program)
/* {attribute 'TcRpcEnable'}
METHOD PUBLIC M_Add : INT
VAR_INPUT
    i1 : INT := 0;
    i2 : INT := 0;
END_VAR
*/

short result = (short)main.InvokeRpcMethod("M_Add", new object[] {(short) 3, (short) 4});

// Call a Method that has no parameter and returns VOID
main.InvokeRpcMethod("M_Method1", new object[] {});

//Browsing RpcMethods
foreach(IRpcMethod method in main.RpcMethods)
{
    string methodName = method.Name;

    foreach(IRpcMethodParameter parameter in method.Parameters)
    {
        string parameterName = parameter.Name;
        string parameterType = parameter.TypeName;
    }
}
}
}
}

```

Reference

[RpcStructInstance Class](#) [► 1966]

[InvokeRpcMethod Overload](#) [► 1976]

[TwinCAT.Ads.TypeSystem Namespace](#) [► 1698]

6.7.33.2.1.3 **RpcStructInstance.InvokeRpcMethod Method** (String, .Object., .AnyTypeSpecifier., AnyTypeSpecifier, .Object..)

Invokes the specified RPC Method

Namespace: [TwinCAT.Ads.TypeSystem](#) [► 1698]

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.95+cf8c3f5

Syntax

C#

```

public Object InvokeRpcMethod(
    string methodName,
    Object[]? inParameters,
    AnyTypeSpecifier[]? outSpecifiers,
    AnyTypeSpecifier? retSpecifier,
    out Object[]? outParameters
)

```

Parameters

methodName	Type: System.String The method name.
inParameters	Type: .System.Object . The parameters.
outSpecifiers	Type: .TwinCAT.TypeSystem.AnyTypeSpecifier [▶ 2094]. The out specifiers (specifying the out types) or NULL.
retSpecifier	Type: TwinCAT.TypeSystem.AnyTypeSpecifier [▶ 2094]. The ret specifier (specifying the return value) or NULL.
outParameters	Type: .System.Object.. The out parameters.

Return Value

Type: [Object](#)
The return value of the Method (as object).

Remarks

The RpcMethod optionally support In-Parameters, Out-Parameters and Return values. Therefore the parameters inParameters, outParameters, outSpecifiers, retSpecifier are allowed to be empty or NULL. In case of using primitive datatypes, the type specifier parameters (outSpecifiers and retSpecifier) are not necessary and should not be set.

Examples

The following sample shows how to call (Remote Procedures / Methods) within the PLC.

Dynamic Tree Mode

```
class RpcCallVirtualProgram
{
    /// <summary>
    /// Defines the entry point of the application.
    /// </summary>

6.7.33.2.2.1 RpcStructInstance.InvokeRpcMethodAsync Method (String, .Object., CancellationTokens)

Invokes the specified RPC Method asynchronously

Namespace: [TwinCAT.Ads.TypeSystem \[▶ 1698\]](#)

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.95+cf8c3f5

Syntax

C#

```
public Task<ResultRpcMethodAccess> InvokeRpcMethodAsync(
    string methodName,
    Object[]? inParameters,
    CancellationToken cancel
)
```

Parameters

methodName	Type: System.String The method name.
inParameters	Type: .System.Object . The parameters.
cancel	Type: System.Threading.CancellationToken The cancellation token

Return Value

Type: [Task.ResultRpcMethodAccess](#) [► 3213].

A task that represents the asynchronous 'InvokeRpcMethod' operation. The [ResultRpcMethodAccess](#) [► 3213] results contains the return value ([ReturnValue](#) [► 3216]) together with the output parameters. The succeeded communication is indicated by the [ErrorCode](#) property ([ErrorCode](#) [► 3202]) after the communication.

Implements

[IRpcCallableInstance.InvokeRpcMethodAsync\(String, .Object., CancellationToken\)](#) [► 2614]

Remarks

Because this overload doesn't provide any [AnyTypeSpecifier](#) [► 2094] specifications, only primitive datatypes will be correctly marshalled by this method. Complex types will fall back to byte[] arrays.

Examples

[TwinCAT.Ads.TypeSystem Namespace \[► 1698\]](#)

6.7.33.2.2 RpcStructInstance.InvokeRpcMethodAsync Method (String, .Object., .AnyTypeSpecifier., AnyTypeSpecifier, CancellationToken)

Invokes the specified RPC Method asynchronously

Namespace: [TwinCAT.Ads.TypeSystem \[► 1698\]](#)

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.95+cf8c3f5

Syntax

C#

```

public Task<ResultRpcMethodAccess> InvokeRpcMethodAsync(
    string methodName,
    Object[]? inParameters,
    AnyTypeSpecifier[]? outSpecifiers,
    AnyTypeSpecifier? retSpecifier,
    CancellationToken cancel
)

```

Parameters

methodName	Type: System.String The method name.
inParameters	Type: .System.Object . The parameters.
outSpecifiers	Type: .TwinCAT.TypeSystem.AnyTypeSpecifier [► 2094] . The out specifiers (specifying the out types) or NULL.
retSpecifier	Type: TwinCAT.TypeSystem.AnyTypeSpecifier [► 2094] The ret specifier (specifying the return value) or NULL.

cancel Type: [System.Threading.CancellationToken](#)
The cancellation token

Return Value

Type: [Task.ResultRpcMethodAccess](#) [▶ 3213].

A task that represents the asynchronous 'InvokeRpcMethod' operation. The [ResultRpcMethodAccess](#) [▶ 3213] results contains the return value ([ReturnValue](#) [▶ 3216]) together with the output parameters. The succeeded communication is indicated by the [ErrorCode](#) property ([ErrorCode](#) [▶ 3202]) after the communication.

Remarks

The RpcMethod optionally support In-Parameters, Out-Parameters and Return values. Therefore the parameters inParameters, outSpecifiers, retSpecifier are allowed to be empty or NULL. In case of using primitive datatypes, the type specifier parameters (outSpecifiers and retSpecifier) are not necessary and should not be set.

Examples

The following sample shows how to call (Remote Procedures / Methods) within the PLC.

Dynamic Tree Mode

```
class RpcCallVirtualProgram
{
    /// <summary>
    /// Defines the entry point of the application.
    /// </summary>
    /// <param name="args">The arguments.</param>
    static void Main(string[] args)
    {
        // Get the AdsAddress from command-line arguments
        AmsAddress address = ArgParser.Parse(args);

        using (AdsClient client = new AdsClient())
        {
            //client.Synchronize = false;

            // Connect to the target device
            client.Connect(address);

            SymbolLoaderSettings settings = new SymbolLoaderSettings(SymbolsLoadMode.VirtualTree);
            ISymbolLoader loader = SymbolLoaderFactory.Create(client, settings);

            // Get the Symbols (Dynamic Symbols)

            IRpcStructInstance main = (IRpcStructInstance)loader.Symbols["MAIN"]; // Gets the MAIN Instance of the PLC Program

            /* Call a Method that has the following signature (within MAIN Program)
            /* {attribute 'TcRpcEnable'}
            METHOD PUBLIC M_Add : INT
            VAR_INPUT
                i1 : INT := 0;
                i2 : INT := 0;
            END_VAR
            */

            short result = (short)main.InvokeRpcMethod("M_Add", new object[] {(short) 3, (short) 4});

            // Call a Method that has no parameter and returns VOID
            main.InvokeRpcMethod("M_Method1", new object[] {});

            //Browsing RpcMethods
            foreach(IRpcMethod method in main.RpcMethods)
            {
                string methodName = method.Name;

                foreach(IRpcMethodParameter parameter in method.Parameters)
                {
                    string parameterName = parameter.Name;
                    string parameterType = parameter.TypeName;
                }
            }
        }
    }
}
```

```

    }
  }
}

```

[TwinCAT.Ads.TypeSystem Namespace \[▶ 1698\]](#)

6.7.33.2.3.1 RpcStructInstance.TryInvokeRpcMethod Method (String, .Object., Object.)

Invokes the specified RPC Method

Namespace: [TwinCAT.Ads.TypeSystem \[▶ 1698\]](#)

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.95+cf8c3f5

Syntax

C#

```
public int TryInvokeRpcMethod(
    string methodName,
    Object[]? inParameters,
    out Object?? retValue
)
```

Parameters

methodName	Type: System.String The method name.
inParameters	Type: .System.Object . The parameters.
retValue	Type: System.Object . The return value of the RPC method as object.

Return Value

Type: [Int32](#)
The result value of the call (ErrorCode). 0 means Succeeded.

Implements

[IRpcCallableInstance.TryInvokeRpcMethod\(String, .Object., Object.\)](#) [[▶ 2619](#)]

Remarks

Because this overload doesn't provide any [AnyTypeSpecifier](#) [[▶ 2094](#)] specifications, only primitive datatypes will be correctly marshalled by this method. Complex types will fall back to byte[] arrays.

Examples

The following sample shows how to call (Remote Procedures / Methods) within the PLC.

Dynamic Tree Mode

```
class RpcCallVirtualProgram
{
    /// <summary>
    /// Defines the entry point of the application.
    /// </summary>
    /// <param name="args">The arguments.</param>

6.7.34 UnionInstance Class

Class representing a Union Instance

Inheritance Hierarchy

System.Object

 TwinCAT.Ads.TypeSystem.Instance [[▶ 1765](#)]

 TwinCAT.Ads.TypeSystem.Symbol [[▶ 1863](#)]

 TwinCAT.Ads.TypeSystem.UnionInstance

Namespace: TwinCAT.Ads.TypeSystem [[▶ 1698](#)]

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public sealed class UnionInstance : Symbol,
    IUnionInstance, ISymbol, IAttributedInstance, IInstance, IBitSize
```

The UnionInstance type exposes the following members.

Properties

Name	Description
AccessRights [▶ 1872]	Gets the access rights. (Inherited from Symbol [▶ 1863].)
Attributes [▶ 1768]	Gets the Type Attributes. (Inherited from Instance [▶ 1765].)
BitSize [▶ 1768]	Gets the size of this Instance [▶ 1765] in bits. (Inherited from Instance [▶ 1765].)
ByteSize [▶ 1769]	Gets the (aligned) size of of the Type/Instance in Bytes (Inherited from Instance [▶ 1765].)
Category [▶ 1769]	Gets the the DataTypeCategory [▶ 2111] of the Instance. (Inherited from Instance [▶ 1765].)
Comment [▶ 1770]	Gets the comment. (Inherited from Instance [▶ 1765].)
Connection [▶ 1873]	Gets the connection that produces values for this IValueSymbol [▶ 2775] (Inherited from Symbol [▶ 1863].)
ContextMask [▶ 1770]	Gets the context mask of this instance. (Inherited from Instance [▶ 1765].)
DataType [▶ 1771]	Gets the IDataType [▶ 2475] of the IInstance [▶ 2549]. (Inherited from Instance [▶ 1765].)
FieldInstances [▶ 1998]	Gets the member instances of the Struct Instance [▶ 2666].
HasValue [▶ 1771]	Gets a value indicating whether this instance has a value. (Inherited from Instance [▶ 1765].)
ImageBaseAddress [▶ 1873]	Gets the AmsAddress [▶ 752] of the Process Image (Inherited from Symbol [▶ 1863].)
IndexGroup [▶ 1874]	Gets the index group of the Symbol (Inherited from Symbol [▶ 1863].)
IndexOffset [▶ 1874]	Gets the index offset of the Symbol (Inherited from Symbol [▶ 1863].)
InstanceName [▶ 1771]	Gets the name of the instance (without periods (.)) (Inherited from Instance [▶ 1765].)
InstancePath [▶ 1874]	Gets the relative / absolute access path to the instance (with periods (.)) (Inherited from Symbol [▶ 1863].)
IsBitType [▶ 1773]	Gets a value indicating whether this instance is not basing on a full DataType but instead of some sort of bit mapping (Inherited from Instance [▶ 1765].)

Name	Description
IsByteAligned [▶ 1773]	Indicates that the Size of the Object is Byte aligned (BitSize % 8 == 0) (Inherited from Instance [▶ 1765].)
IsContainerType [▶ 1999]	Gets a value indicating whether this Symbol is a container/complex type. (Overrides Symbol.IsContainerType [▶ 1875].)
IsDereferencedPointer [▶ 1876]	Gets or sets a value indicating whether an ancestor is a dereferenced Pointer (Inherited from Symbol [▶ 1863].)
IsDereferencedReference [▶ 1876]	Gets or sets a value indicating whether an ancestor is a dereferenced Reference (Inherited from Symbol [▶ 1863].)
IsPersistent [▶ 1773]	Indicates that this instance is persistent. (Inherited from Instance [▶ 1765].)
IsPointer [▶ 1774]	Gets a value indicating whether this instance is reference. (Inherited from Instance [▶ 1765].)
IsPrimitiveType [▶ 1999]	Gets a value indicating whether this instance is primitive. (Overrides Symbol.IsPrimitiveType [▶ 1877].)
IsReadOnly [▶ 1774]	Indicates that this instance is read only. (Inherited from Instance [▶ 1765].)
IsRecursive [▶ 1877]	Gets a value indicating whether this instance is recursive. (Inherited from Symbol [▶ 1863].)
IsReference [▶ 1775]	Gets a value indicating whether this instance is reference. (Inherited from Instance [▶ 1765].)
IsStatic [▶ 1775]	Gets a value indicating whether this Instance [▶ 2549] is static. (Inherited from Instance [▶ 1765].)
IsTcComInterfacePointer [▶ 1776]	Indicates that this instance is a TcComInterfacePointer. (Inherited from Instance [▶ 1765].)
IsTypeGuid [▶ 1776]	Indicates that this instance has set TypeGuid flag. (Inherited from Instance [▶ 1765].)
IsVirtual [▶ 1878]	Gets a value indicating whether this instance is virtual. (Inherited from Symbol [▶ 1863].)
Namespace [▶ 1776]	Gets the namespace name. (Inherited from Instance [▶ 1765].)
NotificationSettings [▶ 1878]	Gets or sets the notification settings. (Inherited from Symbol [▶ 1863].)
Parent [▶ 1879]	Gets the parent Symbol (Inherited from Symbol [▶ 1863].)
Size [▶ 1777]	Gets the size of the IDataType [▶ 2475] in bytes or Bits dependant on IsBitType [▶ 1773] (Inherited from Instance [▶ 1765].)
SubSymbolCount [▶ 1879]	Gets the number of SubSymbols (Inherited from Symbol [▶ 1863].)
SubSymbols [▶ 1880]	Gets the SubSymbols of the ISymbol [▶ 2691] (Inherited from Symbol [▶ 1863].)
TypeName [▶ 1777]	Gets the name of the DataType [▶ 2475] that is used for this Instance [▶ 2549]. (Inherited from Instance [▶ 1765].)
ValueEncoding [▶ 1880]	Gets the value encoding. (Inherited from Symbol [▶ 1863].)

Methods

Name	Description
Equals(ISymbol) [▶ 1885]	Equalses the specified inst. (Inherited from Symbol [▶ 1863].)

	Name	Description
	Equals(Object) [▶ 1886]	Equals (Inherited from Symbol [▶ 1863].)
	Equals(Symbol) [▶ 1887]	Equalses the specified inst. (Inherited from Symbol [▶ 1863].)
	GetHashCode [▶ 1887]	Gets the GetHashCode of the Address (Inherited from Symbol [▶ 1863].)
	GetType	Gets the Type of the current instance. (Inherited from Object.)
	ReadAnyValue(Type) [▶ 1894]	Reads the value of this Value [▶ 2775] into a new created instance of the managed type (Inherited from Symbol [▶ 1863].)
	ReadAnyValue(Type, Int32) [▶ 1895]	Reads the value of this Value [▶ 2775] into a new created instance of the managed type (Inherited from Symbol [▶ 1863].)
	ReadAnyValue.T. [▶ 1896]	Reads the value of this Value [▶ 2753] into a new created instance of the managed type (Inherited from Symbol [▶ 1863].)
	ReadAnyValue.T. (Int32) [▶ 1896]	Reads the value of this Value [▶ 2775] into a new created instance of the managed type (Inherited from Symbol [▶ 1863].)
	ReadAnyValueAsync(Type, CancellationToken) [▶ 1898]	Reads the (AnyType) value asynchronously. (Inherited from Symbol [▶ 1863].)
	ReadAnyValueAsync.T. (CancellationToken) [▶ 1898]	Read any value as an asynchronous operation. (Inherited from Symbol [▶ 1863].)
	ReadRawValue. [▶ 1899]	Reads the raw value of the IValueSymbol [▶ 2775] (Ads Read / Write) (Inherited from Symbol [▶ 1863].)
	ReadRawValue(Int32) [▶ 1900]	Reads the raw value of the IValueSymbol [▶ 2775] (Ads Read / Write) (Inherited from Symbol [▶ 1863].)
	ReadRawValueAsync [▶ 1901]	Reads the raw value of the IValueSymbol [▶ 2775] (Ads Read / Write) asynchronously. (Inherited from Symbol [▶ 1863].)
	ReadValue. [▶ 1902]	Reads the Value of the IValueSymbol [▶ 2775] (Inherited from Symbol [▶ 1863].)
	ReadValue(Int32) [▶ 1902]	Reads the Value of the IValueSymbol [▶ 2775] (Inherited from Symbol [▶ 1863].)
	ReadValueAsync [▶ 1903]	Reads the Value of the IValueSymbol [▶ 2775] asynchronously. (Inherited from Symbol [▶ 1863].)
	SetParent [▶ 1904]	Sets the parent symbol. (Inherited from Symbol [▶ 1863].)
	ToString [▶ 1904]	Returns a String that represents this instance. (Inherited from Symbol [▶ 1863].)
	TryReadValue [▶ 1905]	Reads the Value of the IValueSymbol [▶ 2775] (Inherited from Symbol [▶ 1863].)
	TryWriteValue [▶ 1905]	Writes the Value of the IValueSymbol [▶ 2775] (Inherited from Symbol [▶ 1863].)

	Name	Description
	UpdateAnyValue(Object) [1907]	Reads the value of this Value [2775] into the specified managed value. (Inherited from Symbol [1863].)
	UpdateAnyValue(Object, Int32) [1907]	Reads the value of this Value [2775] into the specified managed value. (Inherited from Symbol [1863].)
	WriteRawValue(Byte) [1908]	Writes the raw value of the IValueSymbol [2775] (Ads Read / Write) (Inherited from Symbol [1863].)
	WriteRawValue(Byte, Int32) [1909]	Writes the raw value of the IValueSymbol [2775] (Ads Read / Write) (Inherited from Symbol [1863].)
	WriteRawValueAsync [1910]	Writes the raw value of the IValueSymbol [2775] (Ads Read / Write) (Inherited from Symbol [1863].)
	WriteValue(Object) [1910]	Writes the Value of the IValueSymbol [2775] (Inherited from Symbol [1863].)
	WriteValue(Object, Int32) [1911]	Writes the Value of the IValueSymbol [2775] (Inherited from Symbol [1863].)
	WriteValueAsync [1912]	Writes the Value of the IValueSymbol [2775] (Inherited from Symbol [1863].)

Events

	Name	Description
	RawValueChanged [1913]	Occurs when the RawValue of the IValueSymbol [2775] has changed. (Inherited from Symbol [1863].)
	ValueChanged [1913]	Occurs when the (Primitive) value of the IValueSymbol [2775] has changed. (Inherited from Symbol [1863].)

Extension Methods

	Name	Description
	ReferencesExternalData [3038]	Indicates, that the Instance value includes process memory data, that cannot be read in one memory block. (Defined by DataTypeExtension [3021].)

6.7.34.1 UnionInstance Properties

The [UnionInstance](#) [[1992](#)] type exposes the following members.

Properties

Name	Description
AccessRights [▶ 1872]	Gets the access rights. (Inherited from Symbol [▶ 1863] .)
Attributes [▶ 1768]	Gets the Type Attributes. (Inherited from Instance [▶ 1765] .)
BitSize [▶ 1768]	Gets the size of this Instance [▶ 1765] in bits. (Inherited from Instance [▶ 1765] .)
ByteSize [▶ 1769]	Gets the (aligned) size of of the Type/Instance in Bytes (Inherited from Instance [▶ 1765] .)
Category [▶ 1769]	Gets the the DataTypeCategory [▶ 2111] of the Instance. (Inherited from Instance [▶ 1765] .)
Comment [▶ 1770]	Gets the comment. (Inherited from Instance [▶ 1765] .)
Connection [▶ 1873]	Gets the connection that produces values for this ValueSymbol [▶ 2775] (Inherited from Symbol [▶ 1863] .)
ContextMask [▶ 1770]	Gets the context mask of this instance. (Inherited from Instance [▶ 1765] .)
DataType [▶ 1771]	Gets the IDataType [▶ 2475] of the Instance [▶ 2549] . (Inherited from Instance [▶ 1765] .)
FieldInstances [▶ 1998]	Gets the member instances of the Struct Instance [▶ 2666] .
HasValue [▶ 1771]	Gets a value indicating whether this instance has a value. (Inherited from Instance [▶ 1765] .)
ImageBaseAddress [▶ 1873]	Gets the AmsAddress [▶ 752] of the Process Image (Inherited from Symbol [▶ 1863] .)
IndexGroup [▶ 1874]	Gets the index group of the Symbol (Inherited from Symbol [▶ 1863] .)
IndexOffset [▶ 1874]	Gets the index offset of the Symbol (Inherited from Symbol [▶ 1863] .)
InstanceName [▶ 1771]	Gets the name of the instance (without periods (.)) (Inherited from Instance [▶ 1765] .)
InstancePath [▶ 1874]	Gets the relative / absolute access path to the instance (with periods (.)) (Inherited from Symbol [▶ 1863] .)
IsBitType [▶ 1773]	Gets a value indicating whether this instance is not basing on a full DataType but instead of some sort of bit mapping (Inherited from Instance [▶ 1765] .)
IsByteAligned [▶ 1773]	Indicates that the Size of the Object is Byte aligned ($\text{BitSize} \% 8 == 0$) (Inherited from Instance [▶ 1765] .)
IsContainerType [▶ 1999]	Gets a value indicating whether this Symbol is a container/complex type. (Overrides Symbol.IsContainerType [▶ 1875] .)
IsDereferencedPointer [▶ 1876]	Gets or sets a value indicating whether an ancestor is a dereferenced Pointer (Inherited from Symbol [▶ 1863] .)
IsDereferencedReference [▶ 1876]	Gets or sets a value indicating whether an ancestor is a dereferenced Reference (Inherited from Symbol [▶ 1863] .)
IsPersistent [▶ 1773]	Indicates that this instance is persistent. (Inherited from Instance [▶ 1765] .)
IsPointer [▶ 1774]	Gets a value indicating whether this instance is reference. (Inherited from Instance [▶ 1765] .)
IsPrimitiveType [▶ 1999]	Gets a value indicating whether this instance is primitive. (Overrides Symbol.IsPrimitiveType [▶ 1877] .)

Name	Description
IsReadOnly [▶ 1774]	Indicates that this instance is read only. (Inherited from Instance [▶ 1765].)
IsRecursive [▶ 1877]	Gets a value indicating whether this instance is recursive. (Inherited from Symbol [▶ 1863].)
IsReference [▶ 1775]	Gets a value indicating whether this instance is reference. (Inherited from Instance [▶ 1765].)
IsStatic [▶ 1775]	Gets a value indicating whether this Instance [▶ 2549] is static. (Inherited from Instance [▶ 1765].)
IsTcComInterfacePointer [▶ 1776]	Indicates that this instance is a TcComInterfacePointer . (Inherited from Instance [▶ 1765].)
IsTypeGuid [▶ 1776]	Indicates that this instance has set TypeGuid flag. (Inherited from Instance [▶ 1765].)
IsVirtual [▶ 1878]	Gets a value indicating whether this instance is virtual. (Inherited from Symbol [▶ 1863].)
Namespace [▶ 1776]	Gets the namespace name. (Inherited from Instance [▶ 1765].)
NotificationSettings [▶ 1878]	Gets or sets the notification settings. (Inherited from Symbol [▶ 1863].)
Parent [▶ 1879]	Gets the parent Symbol (Inherited from Symbol [▶ 1863].)
Size [▶ 1777]	Gets the size of the IDataType [▶ 2475] in bytes or Bits dependant on IsBitType [▶ 1773] (Inherited from Instance [▶ 1765].)
SubSymbolCount [▶ 1879]	Gets the number of SubSymbols (Inherited from Symbol [▶ 1863].)
SubSymbols [▶ 1880]	Gets the SubSymbols of the ISymbol [▶ 2691] (Inherited from Symbol [▶ 1863].)
TypeName [▶ 1777]	Gets the name of the DataType [▶ 2475] that is used for this Instance [▶ 2549]. (Inherited from Instance [▶ 1765].)
ValueEncoding [▶ 1880]	Gets the value encoding. (Inherited from Symbol [▶ 1863].)

6.7.34.2 UnionInstance Methods

The [UnionInstance](#) [[▶ 1992](#)] type exposes the following members.

Methods

	Name	Description
	Equals(ISymbol) [▶ 1885]	Equalses the specified inst. (Inherited from Symbol [▶ 1863].)
	Equals(Object) [▶ 1886]	Equals (Inherited from Symbol [▶ 1863].)
	Equals(Symbol) [▶ 1887]	Equalses the specified inst. (Inherited from Symbol [▶ 1863].)
	GetHashCode [▶ 1887]	Gets the GetHashCode of the Address (Inherited from Symbol [▶ 1863].)
	GetType	Gets the Type of the current instance. (Inherited from Object .)
	ReadAnyValue(Type) [▶ 1894]	Reads the value of this Value [▶ 2775] into a new created instance of the managed type (Inherited from Symbol [▶ 1863].)
	ReadAnyValue(Type, Int32) [▶ 1895]	Reads the value of this Value [▶ 2775] into a new created instance of the managed type (Inherited from Symbol [▶ 1863].)
	ReadAnyValue.T. [▶ 1896]	Reads the value of this Value [▶ 2753] into a new created instance of the managed type (Inherited from Symbol [▶ 1863].)
	ReadAnyValue.T. (Int32) [▶ 1896]	Reads the value of this Value [▶ 2775] into a new created instance of the managed type (Inherited from Symbol [▶ 1863].)
	ReadAnyValueAsync (Type, CancellationToken) [▶ 1898]	Reads the (AnyType) value asynchronously. (Inherited from Symbol [▶ 1863].)
	ReadAnyValueAsync.T. (CancellationToken) [▶ 1898]	Read any value as an asynchronous operation. (Inherited from Symbol [▶ 1863].)
	ReadRawValue. [▶ 1899]	Reads the raw value of the IValueSymbol [▶ 2775] (Ads Read / Write) (Inherited from Symbol [▶ 1863].)
	ReadRawValue(Int32) [▶ 1900]	Reads the raw value of the IValueSymbol [▶ 2775] (Ads Read / Write) (Inherited from Symbol [▶ 1863].)

	Name	Description
	ReadRawValueAsync [▶ 1901]	Reads the raw value of the IValueSymbol [▶ 2775] (Ads Read / Write) asynchronously. (Inherited from Symbol [▶ 1863].)
	ReadValue. [▶ 1902]	Reads the Value of the IValueSymbol [▶ 2775] (Inherited from Symbol [▶ 1863].)
	ReadValue(Int32) [▶ 1902]	Reads the Value of the IValueSymbol [▶ 2775] (Inherited from Symbol [▶ 1863].)
	ReadValueAsync [▶ 1903]	Reads the Value of the IValueSymbol [▶ 2775] asynchronously. (Inherited from Symbol [▶ 1863].)
	SetParent [▶ 1904]	Sets the parent symbol. (Inherited from Symbol [▶ 1863].)
	ToString [▶ 1904]	Returns a String that represents this instance. (Inherited from Symbol [▶ 1863].)
	TryReadValue [▶ 1905]	Reads the Value of the IValueSymbol [▶ 2775] (Inherited from Symbol [▶ 1863].)
	TryWriteValue [▶ 1905]	Writes the Value of the IValueSymbol [▶ 2775] (Inherited from Symbol [▶ 1863].)
	UpdateAnyValue(Object) [▶ 1907]	Reads the value of this Value [▶ 2775] into the specified managed value. (Inherited from Symbol [▶ 1863].)
	UpdateAnyValue(Object, Int32) [▶ 1907]	Reads the value of this Value [▶ 2775] into the specified managed value. (Inherited from Symbol [▶ 1863].)
	WriteRawValue(Byte) [▶ 1908]	Writes the raw value of the IValueSymbol [▶ 2775] (Ads Read / Write) (Inherited from Symbol [▶ 1863].)
	WriteRawValue(Byte, Int32) [▶ 1909]	Writes the raw value of the IValueSymbol [▶ 2775] (Ads Read / Write) (Inherited from Symbol [▶ 1863].)
	WriteRawValueAsync [▶ 1910]	Writes the raw value of the IValueSymbol [▶ 2775] (Ads Read / Write) (Inherited from Symbol [▶ 1863].)
	WriteValue(Object) [▶ 1910]	Writes the Value of the IValueSymbol [▶ 2775] (Inherited from Symbol [▶ 1863].)
	WriteValue(Object, Int32) [▶ 1911]	Writes the Value of the IValueSymbol [▶ 2775] (Inherited from Symbol [▶ 1863].)
	WriteValueAsync [▶ 1912]	Writes the Value of the IValueSymbol [▶ 2775] (Inherited from Symbol [▶ 1863].)

Extension Methods

	Name	Description
	ReferencesExternalData [▶ 3038]	Indicates, that the Instance value includes process memory data, that cannot be read in one memory block. (Defined by DataTypeExtension [▶ 3021].)

6.8 TwinCAT.Ads.ValueAccess Namespace

Root namespace for ADS value access.

Enumerations

	Enumeration	Description
	ValueAccessMode [▸ 2002]	Enum ValueAccessMethod

6.8.1 ValueAccessMode Enumeration

Enum ValueAccessMethod

Namespace: [TwinCAT.Ads.ValueAccess \[▸ 2002\]](#)

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.116+a71ced3

Syntax**C#**

```
public enum ValueAccessMode
```

Members

	Member name	Value	Description
	None	0	None / Uninitialized
	IndexGroupOffset	1	Value access via Index Group and Offset Only
	Symbolic	2	Symbolic access via Instance Path only.
	IndexGroupOffsetPreferred	3	Uses IndexGroup IndexOffset Preferred (and Symbolic for Dereferenced Pointers / References)

	Member name	Value	Description
	Default	2	The Default access mode (Symbolic)

Remarks

Mode	Description
None	None/Uninitialized. No Valid mode.
IndexGroupOffset	Communicates over IndexGroup/IndexOffset only. This is the most direct/ efficient access into the Process image. The advantage is that, the symbol access is done via 1 ADS round trip. Disadvantages are that not all Symbols can be accessed via IG/IO (e.g. References) and IndexOffsets could be invalid after online changes / PlcProgram downloads. Detection of these events and following invalidation of all changed symbols need to be done within the user application.
Symbolic	The Symbolic-only mode is the most safe mode to use but needs more time than the IndexGroupOffset. It could need up to 3 ADS round trips (create handle, access value, close handle) but is not influenced by online changes or / plcProgram downloads.
IndexGroupOffsetPreferred	This is a mixed access mode. For symbols, where it is possible it uses the IndexGroup/IndexOffset. For others it chooses the Symbolic access.
Default	The Default-Mode setting if no other ValueAccessMode is specified. This is set to Symbolic.

6.9 TwinCAT.Ams Namespace

Classes

	Class	Description
	AmsConfiguration [► 2004]	Static configuration of the Ams Router system.
	AmsPortNotAvailableException [► 2013]	Class AmsPortNotAvailableException. Cannot register to the Router Port. Implements the AmsServerException [► 2009]
	AmsServerException [► 2009]	Ams Server Exception class Implements the Exception

Interfaces

	Interface	Description
	IAdsHeaderDump [► 2012]	Interface IAdsHeaderDump

Enumerations

	Enumeration	Description
	AmsServerErrorCode [► 2008]	Ams Server Error Codes.

6.9.1 AmsConfiguration Class

Static configuration of the Ams Router system.

Inheritance Hierarchy

System.Object

TwinCAT.Ams.AmsConfiguration

Namespace: [TwinCAT.Ams](#) [[▶ 2003](#)]

Assembly: TwinCAT.Ads.Abstractions (in TwinCAT.Ads.Abstractions.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public static class AmsConfiguration
```

The AmsConfiguration type exposes the following members.

Properties

	Name	Description
 	DefaultRouterEndPo int [▶ 2005]	Gets the default router end point (IPAddress.Loopback, Port 0xBF02)
 	RouterAddress [▶ 2005]	Gets the actually configured router address.
 	RouterEndPoint [▶ 2006]	Gets or sets the default router IPEndPoint.
 	RouterPort [▶ 2007]	Gets actually configured router port.

Fields

	Name	Description
 	DEFAULT_TCP_PORT [▶ 2007]	The default TCP port (0xBF02, 48898), unsecured
 	DEFAULT_TCP_PORT ADSSECURE [▶ 2008]	The default ADSSecure Port (0x1f50, 8016), secured

Remarks

If the router is intended to run separately of the (virtual) system that instantiates the AdsClient or AdsServer (e.g. in UnitTests), some global static settings must be adopted to enable different network scenarios. In the default case the AdsServers and AdsClients use the Loopback TCP port **0xBF02** to communicate internally. If the systems of AdsServer/AdsClient are split from the router (e.g. running the router isolated in a virtual machine), the Router Endpoint must be set via [RouterEndPoint](#) [[▶ 2006](#)] setter.

Gets or sets the default router IPEndPoint.

Namespace: [TwinCAT.Ads \[► 2003\]](#)

Assembly: TwinCAT.Ads.Abstractions (in TwinCAT.Ads.Abstractions.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public static IPEndPoint RouterEndPoint { get; set; }
```

Property Value

Type: IPEndPoint
The IPEndPoint used by Ams Clients/Servers.

Remarks

This setting allows to change the Router Endpoint - which listens by default on **IPAddress 127.0.0.1, Port 0xBF02**. An application for this could be to move the router to a different (virtual) system, separated from the system running the **AdsServer** or **AdsClient**. This endpoint can only be changed process wide and should be done before the first access to the Router occurs (e.g. getting the local NetId).

ATTENTION: Bending this Endpoint is not possible with the standard TwinCAT Router. As security feature the TwinCAT Router only accepts Loopback connections to 127.0.0.1, connection requests from the outside will be closed immediately.

The simplistic .NET Core Router implementation in class 'TwinCAT.Ads.AdsRouter.AmsTcpIpRouter' from nuget package '[Beckhoff.TwinCAT.Ads.TcpRouter](#)' or the '[Beckhoff.TwinCAT.Ads.AdsRouterConsole](#)' doesn't have that restriction and can be used more flexible for use with virtual environments like VirtualMachines or Docker. flexible.

The following sample demonstrates how to configure the (internal) RouterEndPoint to IPAddress 1.2.3.4:42 . This must be done before AdsServer or AdsClient are instantiated.

```
AmsConfiguration.RouterEndPoint = new IPEndPoint(IPAddress.Parse("1.2.3.4"), 42);
```

6.9.3 AmsServerException Class

Ams Server Exception class Implements the Exception

Inheritance Hierarchy

System.Object
 System.Exception
 TwinCAT.Ads.AmsServerException
 TwinCAT.Ads.AmsPortNotAvailableException [[▶ 2013](#)]

Namespace: [TwinCAT.Ads](#) [[▶ 2003](#)]

Assembly: TwinCAT.Ads.Server (in TwinCAT.Ads.Server.dll) Version: 6.0.328+39e3229

Syntax

C#

```
[SerializableAttribute]
public class AmsServerException : Exception
```

The AmsServerException type exposes the following members.

Constructors

	Name	Description
	AmsServerException [▶ 2010]	Initializes a new instance of the AmsServerException class.

Properties

	Name	Description
	Data	Gets a collection of key/value pairs that provide additional user-defined information about the exception. (Inherited from Exception.)
	HelpLink	Gets or sets a link to the help file associated with this exception. (Inherited from Exception.)
	HResult	Gets or sets HRESULT, a coded numerical value that is assigned to a specific exception. (Inherited from Exception.)
	InnerException	Gets the Exception instance that caused the current exception. (Inherited from Exception.)
	Message	Gets a message that describes the current exception. (Inherited from Exception.)
	Source	Gets or sets the name of the application or the object that causes the error. (Inherited from Exception.)
	StackTrace	Gets a string representation of the immediate frames on the call stack. (Inherited from Exception.)
	TargetSite	Gets the method that throws the current exception. (Inherited from Exception.)

Methods

	Name	Description
	Equals	Determines whether the specified object is equal to the current object. (Inherited from Object.)
	Finalize	Allows an object to try to free resources and perform other cleanup operations before it is reclaimed by garbage collection. (Inherited from Object.)
	GetBaseException	When overridden in a derived class, returns the Exception that is the root cause of one or more subsequent exceptions. (Inherited from Exception.)

	Name	Description
	GetHashCode	Serves as the default hash function. (Inherited from Object.)
	GetObjectData	When overridden in a derived class, sets the SerializationInfo with information about the exception. (Inherited from Exception.)
	GetType	Gets the runtime type of the current instance. (Inherited from Exception.)
	MemberwiseClone	Creates a shallow copy of the current Object. (Inherited from Object.)
	ToString	Creates and returns a string representation of the current exception. (Inherited from Exception.)

Events

	Name	Description
	SerializeObjectState	Obsolete. Occurs when an exception is serialized to create an exception state object that contains serialized data about the exception. (Inherited from Exception.)

Assembly: TwinCAT.Ads.Server (in TwinCAT.Ads.Server.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public class AmsPortNotAvailableException : AmsServerException
```

The AmsPortNotAvailableException type exposes the following members.

Properties

	Name	Description
	Data	Gets a collection of key/value pairs that provide additional user-defined information about the exception. (Inherited from Exception.)
	HelpLink	Gets or sets a link to the help file associated with this exception. (Inherited from Exception.)
	HResult	Gets or sets HRESULT, a coded numerical value that is assigned to a specific exception. (Inherited from Exception.)
	InnerException	Gets the Exception instance that caused the current exception. (Inherited from Exception.)
	Message	Gets a message that describes the current exception. (Inherited from Exception.)
	Source	Gets or sets the name of the application or the object that causes the error. (Inherited from Exception.)

	Name	Description
	StackTrace	Gets a string representation of the immediate frames on the call stack. (Inherited from Exception.)
	TargetSite	Gets the method that throws the current exception. (Inherited from Exception.)

Methods

	Name	Description
	Equals	Determines whether the specified object is equal to the current object. (Inherited from Object.)
	Finalize	Allows an object to try to free resources and perform other cleanup operations before it is reclaimed by garbage collection. (Inherited from Object.)
	GetBaseException	When overridden in a derived class, returns the Exception that is the root cause of one or more subsequent exceptions. (Inherited from Exception.)
	GetHashCode	Serves as the default hash function. (Inherited from Object.)
	GetObjectData	When overridden in a derived class, sets the SerializationInfo with information about the exception. (Inherited from Exception.)
	GetType	Gets the runtime type of the current instance. (Inherited from Exception.)
	MemberwiseClone	Creates a shallow copy of the current Object. (Inherited from Object.)
	ToString	Creates and returns a string representation of the current exception. (Inherited from Exception.)

Events

	Name	Description
	SerializeObjectState	Obsolete. Occurs when an exception is serialized to create an exception state object that contains serialized data about the exception. (Inherited from Exception.)

Remarks

No router port available. Usually this error occurs when the local TwinCAT Router is not started or if it doesn't support the TcpIp Loopback channel

DATE.

Exceptions

Exception	Condition
FormatException	Cannot parse DATE object!

Reference[DATE Class \[► 2016\]](#)[TwinCAT.PlcOpen Namespace \[► 2016\]](#)**6.10.1.3.2 DATE.ToString Method**

Returns a String that represents this instance.

Namespace: [TwinCAT.PlcOpen \[► 2016\]](#)**Assembly:** TwinCAT.Ads.Abstractions (in TwinCAT.Ads.Abstractions.dll) Version: 6.0.328+39e3229**Syntax****C#**

```
public override string ToString()
```

Return Value

Type: String

A String that represents this instance.

Reference[DATE Class \[► 2016\]](#)[TwinCAT.PlcOpen Namespace \[► 2016\]](#)**6.10.1.3.3 DATE.TryParse Method**

Tries to parse the specified string to a [DATE \[► 2016\]](#) object.

Namespace: [TwinCAT.PlcOpen \[► 2016\]](#)**Assembly:** TwinCAT.Ads.Abstractions (in TwinCAT.Ads.Abstractions.dll) Version: 6.0.328+39e3229**Syntax****C#**

```
public static bool TryParse(
    string s,
    out DATE?? date
)
```

Parameters

s	Type: System.String The s.
date	Type: TwinCAT.PlcOpen.DATE [► 2016] . The date.

Return Value

Type: Boolean

true if the string could be parsed to [DATE \[► 2016\]](#), false otherwise.**Reference**[DATE Class \[► 2016\]](#)[TwinCAT.PlcOpen Namespace \[► 2016\]](#)**6.10.2 DateBase Class**

```
public abstract class DataBase : IPlcOpenTimeBase<DateTime, uint>,
    IPlcOpenTimeBase
```

The DataBase type exposes the following members.

Constructors

	Name	Description
	DateBase. [▶ 2025]	Initializes a new instance of the DateBase class.
	DateBase(DateTime) [▶ 2027]	Initializes a new instance of the DateBase class.
	DateBase(UInt32) [▶ 2026]	Initializes a new instance of the DateBase class.

Properties

	Name	Description
	IsDate [▶ 2029]	Gets a value indicating whether this instance is representig a date (despite date and time)
 	MarshalSize [▶ 2028]	Gets the marshal size in bytes.
	Ticks [▶ 2028]	Returns the number of ticks that represent the value of this DateBase.

Methods

	Name	Description
	Equals [▶ 2030]	Determines whether the specified Object is equal to this instance. (Overrides Object.Equals(Object).)
	Finalize	Allows an object to try to free resources and perform other cleanup operations before it is reclaimed by garbage collection. (Inherited from Object.)
	GetHashCode [▶ 2031]	Gets the GetHashCode of the Address (Overrides Object.GetHashCode..)
	GetType	Gets the Type of the current instance. (Inherited from Object.)
	MemberwiseClone	Creates a shallow copy of the current Object. (Inherited from Object.)
	ParseToTicks [▶ 2031]	Parses the specified PlcOpen Date string to PlcOpen ticks.
	ToString	Returns a string that represents the current object. (Inherited from Object.)

Fields

	Name	Description
	plcTimeSeconds [▶ 2033]	PlcTime Seconds (Ticks)

6.10.3 DT Class

PlcOpen DT (DATE_AND_TIME) datatype.

Inheritance Hierarchy

System.Object

[TwinCAT.PlcOpen.DateBase \[► 2023\]](#)

TwinCAT.PlcOpen.DT

Namespace: [TwinCAT.PlcOpen \[► 2016\]](#)

Assembly: TwinCAT.Ads.Abstractions (in TwinCAT.Ads.Abstractions.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public sealed class DT : DateBase
```

The DT type exposes the following members.

Constructors

	Name	Description
	DT. [► 2035]	Initializes a new instance of the DT class.
	DT(DateTime) [► 2038]	Initializes a new instance of the DT class.
	DT(DateTimeOffset) [► 2036]	Initializes a new instance of the DT class.
	DT(UInt32) [► 2037]	Initializes a new instance of the DT class.
	DT(Int32, Int32, Int32, Int32, Int32) [► 2037]	Initializes a new instance of the DT class.

Properties

	Name	Description
	DateTime [► 2038]	Gets or the date value (only the Date part of the DateTime)
	Ticks [► 2028]	Returns the number of ticks that represent the value of this DateBase [► 2023] . (Inherited from DateBase [► 2023] .)

Methods

	Name	Description
	Equals [► 2030]	Determines whether the specified Object is equal to this instance. (Inherited from DateBase [► 2023] .)

	Name	Description
	GetHashCode [▶ 2031]	Gets the HashCode of the Address (Inherited from DateBase [▶ 2023] .)
	GetType	Gets the Type of the current instance. (Inherited from Object.)
	Parse [▶ 2039]	Parses the specified string to the DT object.
	ToString [▶ 2040]	Returns a String that represents this instance. (Overrides Object.ToString ..)
	TryParse [▶ 2040]	Tries to parse the specified string to a DT object.

[TwinCAT.PlcOpen Namespace \[► 2016\]](#)

6.10.3.3.1 DT.Parse Method

Parses the specified string to the [DT \[► 2034\]](#) object.

Namespace: [TwinCAT.PlcOpen \[► 2016\]](#)

Assembly: TwinCAT.Ads.Abstractions (in TwinCAT.Ads.Abstractions.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public static DT Parse(
    string s
)
```

Parameters

s	Type: System.String The s.
---	-------------------------------

Return Value

Type: [DT \[▸ 2034\]](#)
DT.

Exceptions

Exception	Condition
FormatException	Cannot parse DT object!

Reference

6.10.3.3.3 DT.TryParse Method

Tries to parse the specified string to a [DT \[▸ 2034\]](#) object.

Namespace: [TwinCAT.PlcOpen \[▸ 2016\]](#)

Assembly: TwinCAT.Ads.Abstractions (in TwinCAT.Ads.Abstractions.dll) Version: 6.0.328+39e3229

Syntax**C#**

```
public static bool TryParse(
    string s,
    out DT?? dt
)
```

Parameters

s	Type: System.String The s.
dt	Type: TwinCAT.PlcOpen.DT [▶ 2034]. The dt.

Return Value

Type: Boolean
true if the string could be parsed to [DT \[\[▶ 2034\]\(#\)\]](#), false otherwise.

6.10.4 IPlcOpenTimeBase Interface

Interface IPlcOpenType

Namespace: [TwinCAT.PlcOpen \[\[▶ 2016\]\(#\)\]](#)

Assembly: TwinCAT.Ads.Abstractions (in TwinCAT.Ads.Abstractions.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public interface IPlcOpenTimeBase
```

The IPlcOpenTimeBase type exposes the following members.

Properties

	Name	Description
	ManagedValueType [▶ 2042]	Gets the type of the underlying human readable type (DateTime or Timespan)
	TicksValueType [▶ 2042]	Gets the type of the underlying ticks resolution (uint32 or uint64)
	UntypedValue [▶ 2042]	Returns the 'Value' as object type.

Reference

6.10.5 IPlcOpenTimeBase.T1, T2. Interface

Interface IPlcOpenType

Namespace: [TwinCAT.PlcOpen \[▸ 2016\]](#)

Assembly: TwinCAT.Ads.Abstractions (in TwinCAT.Ads.Abstractions.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public interface IPlcOpenTimeBase<T1, T2> : IPlcOpenTimeBase
```

Type Parameters

T1	The type of the t1.
T2	The type of the t2.

The IPlcOpenTimeBase.T1, T2. type exposes the following members.

Properties

	Name	Description
	ManagedValueType [▸ 2042]	Gets the type of the underlying human readable type (DateTime or Timespan) (Inherited from IPlcOpenTimeBase [▸ 2041] .)
	Ticks [▸ 2044]	Returns the number of ticks that represent the value of this IPlcOpenTimeBase.T1, T2. (uint32 or uint64).
	TicksValueType [▸ 2042]	Gets the type of the underlying ticks resolution (uint32 or uint64) (Inherited from IPlcOpenTimeBase [▸ 2041] .)
	UntypedValue [▸ 2042]	Returns the 'Value' as object type. (Inherited from IPlcOpenTimeBase [▸ 2041] .)
	Value [▸ 2044]	Returns the value of this IPlcOpenTimeBase.T1, T2. as Managed base type (DateTime or Timespan)

6.10.6 LTIME Class

PlcOpen LTIME class

Inheritance Hierarchy

System.Object
[TwinCAT.PlcOpen.LTimeBase](#) [[▶ 2053](#)]
 TwinCAT.PlcOpen.LTIME

Namespace: [TwinCAT.PlcOpen](#) [[▶ 2016](#)]

Assembly: TwinCAT.Ads.Abstractions (in TwinCAT.Ads.Abstractions.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public sealed class LTIME : LTimeBase
```

The LTIME type exposes the following members.

Constructors

	Name	Description
	LTIME . [▶ 2047]	Initializes a new instance of the TIME [▶ 2061] class.
	LTIME(Int64) [▶ 2047]	Initializes a new instance of the TIME [▶ 2061] class.
	LTIME(TimeSpan) [▶ 2047]	Initializes a new instance of the TIME [▶ 2061] class.
	LTIME(UInt64) [▶ 2048]	Initializes a new instance of the TIME [▶ 2061] class.
	LTIME(Int32, Int32, Int32) [▶ 2048]	Initializes a new instance of the LTIME class.
	LTIME(Int32, Int32, Int32, Int32) [▶ 2049]	Initializes a new instance of the LTIME class.
	LTIME(Int32, Int32, Int32, Int32, Int32, Int32) [▶ 2050]	Initializes a new instance of the LTIME class.

Properties

	Name	Description
	Ticks [▶ 2056]	Returns the number of ticks that represent the value of this LTimeBase [▶ 2053]. (Inherited from LTimeBase [▶ 2053].)
	Time [▶ 2056]	Gets or the time value. (Inherited from LTimeBase [▶ 2053].)

Methods

	Name	Description
	Equals [▶ 2057]	Determines whether the specified Object is equal to this instance. (Inherited from LTimeBase [▶ 2053].)
	GetHashCode [▶ 2058]	Gets the GetHashCode of the Address (Inherited from LTimeBase [▶ 2053].)
	GetType	Gets the Type of the current instance. (Inherited from Object.)
	Parse [▶ 2051]	Parses the specified string to a LTIME object.
	ToString [▶ 2052]	Returns a String that represents this instance. (Overrides Object.ToString..)
	TryParse [▶ 2052]	Tries to parse the string to a LTIME object.

Remarks

This class has an internal representation of an UINT64 (8 Bytes)

Reference

 TwinCAT.PlcOpen.LTIME [|> 2045](#)

Namespace: [TwinCAT.PlcOpen |> 2016](#)

Assembly: TwinCAT.Ads.Abstractions (in TwinCAT.Ads.Abstractions.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public abstract class LTimeBase : IPlcOpenTimeBase<TimeSpan, ulong>,
    IPlcOpenTimeBase
```

The LTimeBase type exposes the following members.

Constructors

	Name	Description
	LTimeBase. > 2054	Initializes a new instance of the TimeBase > 2068 class.
	LTimeBase(UInt64) > 2054	Initializes a new instance of the TimeBase > 2068 class.

Properties

	Name	Description
	MarshalSize > 2055	Gets the marshal size in bytes.
		
	Ticks > 2056	Returns the number of ticks that represent the value of this LTimeBase.
	Time > 2056	Gets or the time value.

Methods

	Name	Description
	Equals > 2057	Determines whether the specified Object is equal to this instance. (Overrides Object.Equals(Object).)
	Finalize	Allows an object to try to free resources and perform other cleanup operations before it is reclaimed by garbage collection. (Inherited from Object.)
	GetHashCode > 2058	Gets the GetHashCode of the Address (Overrides Object.GetHashCode..)
	GetType	Gets the Type of the current instance. (Inherited from Object.)
	MemberwiseClone	Creates a shallow copy of the current Object. (Inherited from Object.)
	TimeToValue > 2058	Converts the Timespan to PlcOpen ticks.
		
	ToString	Returns a string that represents the current object. (Inherited from Object.)

	Name	Description
 	ValueToTime(Int64) [▶ 2059]	Converts the timeValue (PlcOpen ticks) to TimeSpan
 	ValueToTime(UInt64) [▶ 2060]	Converts the timeValue (PlcOpen ticks) to TimeSpan

Fields

	Name	Description
	internalTimeValue [▶ 2060]	The internal time value

6.10.7.1.2 LTimeBase Constructor (UInt64)

Initializes a new instance of the [TimeBase](#) [▶ 2068] class.

Namespace: [TwinCAT.PlcOpen \[▸ 2016\]](#)

Assembly: TwinCAT.Ads.Abstractions (in TwinCAT.Ads.Abstractions.dll) Version: 6.0.328+39e3229

Syntax

C#

```
protected LTimeBase(
    ulong timeValue
)
```

Parameters

timeValue	Type: System.UInt64 The time value.
-----------	--

Exceptions

Exception	Condition
ArgumentOutOfRangeException

6.10.7.2.1 LTimeBase.MarshalSize Property

Gets the marshal size in bytes.

Namespace: [TwinCAT.PlcOpen \[▸ 2016\]](#)

Assembly: TwinCAT.Ads.Abstractions (in TwinCAT.Ads.Abstractions.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public static int MarshalSize { get; }
```

Property Value

Type: Int32
Marshal size in bytes.

Reference

[LTimeBase Class](#) [[▶ 2053](#)]

[TwinCAT.PlcOpen Namespace](#) [[▶ 2016](#)]

6.10.7.2.2 LTimeBase.Ticks Property

Returns the number of ticks that represent the value of this [LTimeBase](#) [[▶ 2053](#)].

Namespace: [TwinCAT.PlcOpen](#) [[▶ 2016](#)]

Assembly: TwinCAT.Ads.Abstractions (in TwinCAT.Ads.Abstractions.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public ulong Ticks { get; }
```

Property Value

Type: UInt64
The ticks.

Implements

6.10.7.3 LTimeBase Methods

The [LTimeBase \[▸ 2053\]](#) type exposes the following members.

Methods

	Name	Description
	Equals [▸ 2057]	Determines whether the specified Object is equal to this instance. (Overrides Object.Equals(Object).)
	Finalize	Allows an object to try to free resources and perform other cleanup operations before it is reclaimed by garbage collection. (Inherited from Object.)
	GetHashCode [▸ 2058]	Gets the GetHashCode of the Address (Overrides Object.GetHashCode..)
	GetType	Gets the Type of the current instance. (Inherited from Object.)
	MemberwiseClone	Creates a shallow copy of the current Object. (Inherited from Object.)
 	TimeToValue [▸ 2058]	Converts the Timespan to PlcOpen ticks.
	ToString	Returns a string that represents the current object. (Inherited from Object.)
 	ValueToTime(Int64) [▸ 2059]	Converts the timeValue (PlcOpen ticks) to TimeSpan
 	ValueToTime(UInt64) [▸ 2060]	Converts the timeValue (PlcOpen ticks) to TimeSpan

Reference

6.10.7.3.1 LTimeBase.Equals Method

Determines whether the specified Object is equal to this instance.

Namespace: [TwinCAT.PlcOpen \[▸ 2016\]](#)

Assembly: TwinCAT.Ads.Abstractions (in TwinCAT.Ads.Abstractions.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public override bool Equals(
    Object? obj
)
```

Parameters

obj	Type: System.Object The object to compare with the current object.
-----	---

Return Value

Type: Boolean

true if the specified Object is equal to this instance; otherwise, false.

Assembly: TwinCAT.Ads.Abstractions (in TwinCAT.Ads.Abstractions.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public sealed class TIME : TimeBase
```

The TIME type exposes the following members.

Constructors

	Name	Description
	TIME. [▶ 2062]	Initializes a new instance of the TIME class.
	TIME(UInt64) [▶ 2063]	Initializes a new instance of the TIME class.
	TIME(TimeSpan) [▶ 2063]	Initializes a new instance of the TIME class.
	TIME(UInt32) [▶ 2064]	Initializes a new instance of the TIME class.
	TIME(Int32, Int32) [▶ 2064]	Initializes a new instance of the TIME class.
	TIME(Int32, Int32, Int32, Int32, Int32, Int32) [▶ 2065]	Initializes a new instance of the TIME class.

Properties

	Name	Description
	InternalTimeValue [▶ 2071]	Gets the internal time value. (Inherited from TimeBase [▶ 2068].)
	Ticks [▶ 2072]	Returns the number of ticks that represent the value of this TimeBase [▶ 2068] (uint32 or uint64). (Inherited from TimeBase [▶ 2068].)
	Time [▶ 2072]	Gets the time value. (Inherited from TimeBase [▶ 2068].)

Methods

	Name	Description
	Equals [▸ 2073]	Determines whether the specified Object is equal to this instance. (Inherited from TimeBase [▸ 2068].)
	GetHashCode [▸ 2074]	Gets the GetHashCode of the Address (Inherited from TimeBase [▸ 2068].)
	GetType	Gets the Type of the current instance. (Inherited from Object.)
	Parse [▸ 2066]	Parses the specified string to a TIME object.
		
	ToString [▸ 2067]	Returns a String that represents this instance. (Overrides Object.ToString ..)
	TryParse [▸ 2067]	Tries to parse the TIME object from string.
		

Remarks

This class has an internal representation of an UINT32 (4 bytes).

Gets the marshal size in bytes.

Namespace: [TwinCAT.PlcOpen \[► 2016\]](#)

Assembly: TwinCAT.Ads.Abstractions (in TwinCAT.Ads.Abstractions.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public static int MarshalSize { get; }
```

Property Value

Type: Int32

Marshal size in bytes.

Reference

[TwinCAT.PlcOpen Namespace \[► 2016\]](#)

6.10.9.2.3 TimeBase.Ticks Property

Returns the number of ticks that represent the value of this [TimeBase \[► 2068\]](#) (uint32 or uint64).

Namespace: [TwinCAT.PlcOpen \[► 2016\]](#)

Assembly: TwinCAT.Ads.Abstractions (in TwinCAT.Ads.Abstractions.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public uint Ticks { get; }
```

Property Value

Type: UInt32

The ticks (in 100ns).

Implements

[IPlcOpenTimeBase.T1, T2..Ticks \[► 2044\]](#)

Reference

6.10.9.3 TimeBase Methods

The [TimeBase \[▶ 2068\]](#) type exposes the following members.

Methods

	Name	Description
	Equals [▶ 2073]	Determines whether the specified Object is equal to this instance. (Overrides Object.Equals(Object).)
	Finalize	Allows an object to try to free resources and perform other cleanup operations before it is reclaimed by garbage collection. (Inherited from Object.)
	GetHashCode [▶ 2074]	Gets the GetHashCode of the Address (Overrides Object.GetHashCode..)
	GetType	Gets the Type of the current instance. (Inherited from Object.)
	MemberwiseClone	Creates a shallow copy of the current Object. (Inherited from Object.)
	TimeToValue [▶ 2074]	Converts the Timespan to PlcOpen ticks.
		
	ToString	Returns a string that represents the current object. (Inherited from Object.)
	ValueToTime(Int64) [▶ 2075]	Converts the timeValue (PlcOpen ticks) to TimeSpan
		
	ValueToTime(UInt32) [▶ 2076]	Converts the timeValue (PlcOpen ticks) to TimeSpan

[TwinCAT.PlcOpen Namespace \[▶ 2016\]](#)

6.10.9.3.1 TimeBase.Equals Method

Determines whether the specified Object is equal to this instance.

Namespace: [TwinCAT.PlcOpen \[► 2016\]](#)

Assembly: TwinCAT.Ads.Abstractions (in TwinCAT.Ads.Abstractions.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public override bool Equals(  
    Object? obj  
)
```

Parameters

obj	Type: System.Object The object to compare with the current object.
-----	---

Return Value

Type: Boolean

true if the specified Object is equal to this instance; otherwise, false.

Reference

Assembly: TwinCAT.Ads.Abstractions (in TwinCAT.Ads.Abstractions.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public sealed class TOD : TimeBase
```

The TOD type exposes the following members.

Constructors

	Name	Description
	TOD. [▶ 2079]	Initializes a new instance of the TOD class.
	TOD(Int64) [▶ 2079]	Initializes a new instance of the TOD class.
	TOD(TimeSpan) [▶ 2079]	Initializes a new instance of the TOD class.
	TOD(UInt32) [▶ 2080]	Initializes a new instance of the TOD class.
	TOD(Int32, Int32, Int32, Int32, Int32) [▶ 2080]	Initializes a new instance of the TOD class.

Properties

	Name	Description
	InternalTimeValue [▶ 2071]	Gets the internal time value. (Inherited from TimeBase [▶ 2068] .)
	Ticks [▶ 2072]	Returns the number of ticks that represent the value of this TimeBase [▶ 2068] (uint32 or uint64). (Inherited from TimeBase [▶ 2068] .)
	Time [▶ 2072]	Gets the time value. (Inherited from TimeBase [▶ 2068] .)

Methods

	Name	Description
	Equals [▶ 2073]	Determines whether the specified Object is equal to this instance. (Inherited from TimeBase [▶ 2068] .)
	GetHashCode [▶ 2074]	Gets the GetHashCode of the Address (Inherited from TimeBase [▶ 2068] .)
	GetType	Gets the Type of the current instance. (Inherited from Object.)
	Parse [▶ 2082]	Parses the specified string to a TOD object.
	ToString [▶ 2082]	Returns a string that represents the current object. (Overrides Object.ToString..)
	TryParse [▶ 2083]	Tries to parse the string to a TOD object.

6.10.10.3.1 TOD.Parse Method

Parses the specified string to a [TOD \[► 2077\]](#) object.

Namespace: [TwinCAT.PlcOpen \[► 2016\]](#)

Assembly: TwinCAT.Ads.Abstractions (in TwinCAT.Ads.Abstractions.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public static TOD Parse(
    string str
)
```

Parameters

str	Type: System.String The string.
-----	------------------------------------

Return Value

Type: [TOD \[► 2077\]](#)
TOD.

Exceptions

Exception	Condition
FormatException	Cannot parse TOD object!

Reference

[TOD Class \[► 2077\]](#)

6.10.10.3.2 TOD.ToString Method

Returns a string that represents the current object.

Namespace: [TwinCAT.PlcOpen \[► 2016\]](#)

Assembly: TwinCAT.Ads.Abstractions (in TwinCAT.Ads.Abstractions.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public override string ToString()
```

Return Value

Type: String
 A string that represents the current object.

Reference

[TOD Class \[▶ 2077\]](#)

[TwinCAT.PlcOpen Namespace \[▶ 2016\]](#)

6.10.10.3.3 TOD.TryParse Method

Tries to parse the string to a [TOD \[▶ 2077\]](#) object.

Namespace: [TwinCAT.PlcOpen \[▶ 2016\]](#)

Assembly: TwinCAT.Ads.Abstractions (in TwinCAT.Ads.Abstractions.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public static bool TryParse(
    string str,
    out TOD?? ret
)
```

Parameters

str	Type: System.String The string.
ret	Type: TwinCAT.PlcOpen.TOD [▶ 2077] . The ret.

Return Value

Type: Boolean
 true if the [TOD \[▶ 2077\]](#) object could be parsed, false otherwise.

Reference

[TwinCAT.PlcOpen Namespace \[▶ 2016\]](#)

6.11 TwinCAT.TypeSystem Namespace

Namespace for the common (non ADS dependent) type system.

Classes

	Class	Description
	AlignedMemberCollection [▶ 2973]	Class AlignedMemberCollection. Implements the MemberCollection [▶ 2802]
	AnySymbolSpecifier [▶ 2091]	Class AnySymbolSpecifier.
	AnyTypeSpecifier [▶ 2094]	Class AnyTypeSpecifier.

	Class	Description
	AnyTypeValueCreator [▶ 3020]	Class AnyTypeValueCreator.
	CannotAccessVirtualSymbolException [▶ 2103]	Cannot access virtual Symbol
	CannotResolveDataTypeException [▶ 2106]	Class CannotResolveDataTypeException. Implements the DataTypeException [▶ 2121]
	DataTypeCollection [▶ 2112]	Collection of DataTypes . [▶ 2475]
	DataTypeEventArgs [▶ 2118]	Class DataTypeEventArgs.
	DataTypeException [▶ 2121]	Data Type Exception
	DataTypeExtension [▶ 3021]	Extends the IDataType [▶ 2475] interface with more sophisticated functions.
	DataTypeNameEventArgs [▶ 2127]	Class DataTypeNameEventArgs.
	Dimension [▶ 2130]	Represents a single dimension of an IArrayType [▶ 2459]
	DimensionCollection [▶ 2133]	Collection class for Array Dimensions
	DynamicAliasInstance [▶ 2149]	Class DynamicAliasInstance. This class cannot be inherited.
	DynamicArrayInstance [▶ 2160]	Dynamic Array Instance
	DynamicArrayValue [▶ 3042]	Class DynamicArrayValue. Implements the DynamicValue [▶ 2347]
	DynamicEnumValue [▶ 3048]	Class DynamicEnumValue. Implements the DynamicValue [▶ 2347]
	DynamicInterfaceInstance [▶ 2995]	Dynamic struct instance
	DynamicOversamplingArrayInstance [▶ 2176]	Dynamic Array Instance
	DynamicPointerInstance [▶ 2186]	Dynamic Pointer Instance
	DynamicPointerValue [▶ 2196]	Class DynamicPointerValue.

	Class	Description
	DynamicReferenceInstance [▶ 2202]	Dynamic Reference Instance
	DynamicReferenceValue [▶ 2217]	Class DynamicReferenceValue.
	DynamicStructInstance [▶ 2251]	Dynamic struct instance
 	DynamicSymbol [▶ 2266]	Dynamic Symbol [▶ 2691] object.
	DynamicSymbolsCollection [▶ 2327]	Dynamic (Expandable) Symbols collection.
	DynamicUnionInstance [▶ 2336]	Dynamic union instance
 	DynamicValue [▶ 2347]	Dynamic value (uses RuntimeBinding for ISymbol [▶ 2691] value reading / writing).
	DynamicVirtualStructInstance [▶ 2374]	Dynamic struct instance
	EnumValue.T. [▶ 2384]	Enum Value
	EnumValueCollection [▶ 2391]	Class EnumValueCollection.
	EnumValueCollection.T. [▶ 2407]	Collection of EnumValues [▶ 2384]
	FieldCollection [▶ 2427]	Collection of IField [▶ 2535] objects.
	FluentAlignedMemberCollectionExtension [▶ 2980]	Class FluentStructTypeExtension.
	IDimensionCollectionExtension [▶ 2981]	Class IDimensionCollectionExtension.
	InsufficientAccessRightsException [▶ 2573]	Insufficient rights for access
	MarshalException [▶ 2795]	Common Marshalling Exception
	MemberCollection [▶ 2802]	Collection of IMember [▶ 2561] objects.

	Class	Description
	RawValueChangedEventArgs [▶ 2813]	Event args for the RawValueChanged [▶ 2774] event.
	ReadOnlyDataTypeCollection [▶ 2815]	ReadOnly Collection of IDataType [▶ 2475] objects.
	ReadOnlyDimensionCollection [▶ 2818]	ReadOnly version of the DimensionCollection [▶ 2133]
	ReadOnlyEnumValueCollection [▶ 2824]	Read only version of the EnumValueCollection.T. [▶ 2407]
	ReadOnlyEnumValueCollection.T. [▶ 2833]	Read only version of the EnumValueCollection.T. [▶ 2407]
	ReadOnlyFieldCollection [▶ 2841]	Read only collection of IField [▶ 2535] objects
	ReadOnlyMemberCollection [▶ 2845]	Read only collection of IMember [▶ 2561] objects
	ReadOnlyMethodParameterCollection [▶ 2852]	Read only RpcMethodParameterCollection [▶ 2915].
	ReadOnlyRpcMethodCollection [▶ 2855]	Read only RpcMethodCollection [▶ 2894]
	ReadOnlySymbolCollection [▶ 2861]	ReadOnly collection containing ISymbol [▶ 2691] objects.
	ReadOnlyTypeAttributeCollection [▶ 2866]	Read only version of the TypeAttributeCollection [▶ 2952]
	ResultDataTypes [▶ 2872]	Class representing the asynchronous result of reading a IDataTypeCollection [▶ 2484] via ADS. Implements the ResultValue.TValue. [▶ 1181]
	ResultDynamicSymbols [▶ 2876]	Class representing the asynchronous result of reading a dynamic symbol collection via ADS. Implements the ResultValue.TValue. [▶ 1181]
	ResultSymbols [▶ 2880]	Class representing the asynchronous result of reading an symbol collection of type ISymbolCollection.T. [▶ 2700] via ADS. Implements the ResultValue.TValue. [▶ 1181]
	ResultSymbols.T. [▶ 2884]	Class representing the asynchronous result of reading a symbol enumeration of type IEnumerable.T. via ADS. Implements the ResultValue.TValue. [▶ 1181]
	RpcInvokeException [▶ 2887]	Class RpcInvokeException . Implements the SymbolException [▶ 2933]

	Class	Description
	RpcMethodCollection [▶ 2894]	Collection of RpcMethods . [▶ 2625]
	RpcMethodNotSupportedException [▶ 2910]	Symbol Exception
	RpcMethodParameterCollection [▶ 2915]	Collection of RPC method parameters
	SymbolCollection [▶ 2928]	Interface represents a collection of ISymbol [▶ 2691] objects.
	SymbolException [▶ 2933]	Symbol bound exceptions
	TypeAttribute [▶ 2946]	ADS Attribute
	TypeAttributeCollection [▶ 2952]	Collection of AdsAttributes [▶ 2725]
	ValueChangedBaseEventArgs [▶ 2968]	Event args for the RawValueChanged [▶ 2774] event.
	ValueChangedEventArgs [▶ 2971]	Event args for the ValueChanged [▶ 2790] event.

Structures

	Structure	Description
	UInt32Ptr [▶ 3054]	Represents an 32-Bit Pointer (Process independant)
	UInt64Ptr [▶ 3070]	Represents an 64-Bit Pointer (Process independant)

Interfaces

	Interface	Description
	IAliasInstance [▶ 2433]	Interface representing an instance of an IAliasType [▶ 2436].
	IAliasType [▶ 2436]	Interface representing an Alias Type
	IAnyTypeMarshaler [▶ 2441]	Interface IAnyTypeMarshaler Implements the IGenericTypeMarshaler [▶ 2542]
	IArrayInstance [▶ 2453]	Interface representing an array instance
	IArrayType [▶ 2459]	Interface representing an array DataType [▶ 2475].
	IArrayValue [▶ 2465]	Interface IArrayValue
	IAttributedInstance [▶ 2469]	Interface IAttributedInstance
	IBitSize [▶ 2472]	Interface IBitSize

	Interface	Description
	IDataType [▶ 2475]	Base interface for objects representing data types
	IDataTypeCollection [▶ 2484]	Interface IDataValueCollection Implements the ICollection.T.
	IDataTypeCollection.T. [▶ 2486]	Data Type container interface
	IDimension [▶ 2490]	Interface representing a single Dimension [▶ 2490] of an ArrayType [▶ 2459].
	IDimensionCollection [▶ 2492]	Interface IDimensionCollection
	IDynamicSymbol [▶ 2496]	Interface IDynamicSymbol
	IDynamicSymbolLoader [▶ 2500]	Dynamic symbol loader interface
	IDynamicSymbolsCollection [▶ 2503]	Interface IDynamicSymbolsContainer Implements the IDynamicMetaObjectProvider
	IDynamicValue [▶ 2504]	Interface IDynamicValue Implements the IDynamicMetaObjectProvider Implements the IValue [▶ 2745] Implements the IStructValue [▶ 2678] Implements the IArrayValue [▶ 2465]
	IEnumType [▶ 2507]	Common Enum type interface
	IEnumType.T. [▶ 2516]	Interface representing an enum type
	IEnumValue [▶ 2524]	Generic interface for EnumValues
	IEnumValueCollection [▶ 2527]	Interface IEnumValueCollection
	IEnumValueCollection.TEnumValue, TValue. [▶ 2529]	Interface for collections of IEnumValues [▶ 2524]. Implements the ICollection.T.
	IField [▶ 2535]	Specifies a single field/member of a Struct DataType [▶ 2671].
	IFieldCollection [▶ 2538]	Interface IFieldCollection Implements the IInstanceCollection.T. [▶ 2554]
	IGenericTypeMarshaller [▶ 2542]	Interface IGenericTypeMarshaller Implements the ITypeMarshaller [▶ 2731]
	IHierarchicalSymbol [▶ 2545]	Bindable Symbol interface (for internal use only)
	IInstance [▶ 2549]	Interface specifying instance objects.
	IInstanceCollection.T. [▶ 2554]	Generic InstanceCollection interface.
	IInterfaceInstance [▶ 3014]	Interface representing an instance of a IInterfaceType [▶ 2983]

	Interface	Description
	IInterfaceType [▶ 2983]	Interface representing an Interface Data type. Implements the IDataType [▶ 2475]
	IMember [▶ 2561]	Specifies a single field/member of a Struct DataType [▶ 2671].
	IMemberCollection [▶ 2565]	Interface IMemberCollection Implements the IInstanceCollection.T. [▶ 2554]
	INamespaceCollecti on [▶ 2570]	Interface INamespaceCollection
	INamespaceCollecti on.T. [▶ 2571]	Interface INamespaceCollection
	IOversamplingArrayI nstance [▶ 2576]	Interface IOversamplingArrayInstance
	IPointerType [▶ 2580]	Interface representing an instance of an IPointerType [▶ 2584]
	IPointerType [▶ 2584]	Interface representing a pointer type
	IPrimitiveType [▶ 2588]	Interface IPrimitiveType
	IProcessImageAddr ess [▶ 2593]	Interface describing a Process Image Address
	IReferenceInstance [▶ 2595]	Interface representing an instance of an IReferenceType [▶ 2600]
	IReferenceType [▶ 2600]	Interface representing a reference type
	IRpcCallableInstanc e [▶ 2606]	Interface for an RPC callable PLC Method (Remote procedure call)
	IRpcCallableType [▶ 2624]	Interface representing an RPC callable IStructType [▶ 2671]
	IRpcMethod [▶ 2625]	Interface describes an RPC Method
	IRpcMethodCollecti on [▶ 2629]	Interface for RPC Method collections.
	IRpcMethodParame ter [▶ 2635]	Interface IRpcMethodParameter
	IRpcMethodParame terCollection [▶ 2639]	Interface IRpcMethodParameterCollection
	IRpcStructInstance [▶ 2642]	Obsolete. Interface IRpcStructInstance
	IRpcStructType [▶ 2990]	Obsolete. Interface IRpcStructType Implements the IRpcCallableType [▶ 2624] Implements the IStructType [▶ 2671]

	Interface	Description
	IStringInstance [▶ 2646]	Interface IStringInstance
	IStringMarshaler [▶ 2650]	Common interface for marshalling ADS string values.
	IStringType [▶ 2661]	Interface representing a string IDataType [▶ 2475]
	IStructInstance [▶ 2666]	Interface representing an instance of a IStructType [▶ 2671]
	IStructType [▶ 2671]	Interface representing Struct data types
	IStructValue [▶ 2678]	Interface IStructValue
	ISubRangeType [▶ 2681]	Interface representing a SubRange type
	ISubRangeType.T. [▶ 2686]	Interface representing a SubRange type
	ISymbol [▶ 2691]	Interface specifying Symbols (
	ISymbolCollection [▶ 2697]	Interface ISymbolCollection Implements the IInstanceCollection.T. [▶ 2554]
	ISymbolCollection.T. [▶ 2700]	Interface ISymbolCollection
	ISymbolFactory [▶ 2702]	Symbol Factory Interface
	ISymbolFactoryServicesProvider [▶ 2711]	Symbol Value Access interface
	ISymbolInfo [▶ 2712]	Interface ISymbolInfo
	ISymbolLoader [▶ 2714]	Symbol Loader interface
	ISymbolProvider [▶ 2717]	Symbol Provider interface.
	ISymbolServer [▶ 2719]	Symbol Server Interface
	ITypeAttribute [▶ 2725]	Interface for ADS attributes
	ITypeAttributeCollection [▶ 2726]	Interface ITypeAttributeCollection
	ITypeMarshaler [▶ 2731]	Interface ITypeMarshaler
	IUnionInstance [▶ 2737]	Interface for an Instance of the IUnionType [▶ 2740].
	IUnionType [▶ 2740]	Interface for an union data type.
	IValue [▶ 2745]	Symbol Value Interface
	IValueAccessorProvider [▶ 2752]	Interface IValueAccessorProvider

	Interface	Description
	IValueAnySymbol [▶ 2753]	Interface IValueAnySymbol
	IValueRawSymbol [▶ 2765]	Interface IValueRawSymbol
	IValueSymbol [▶ 2775]	Interface for a ISymbol [▶ 2691] that supports values.
	IVirtualStructInstance [▶ 2790]	Virtual Struct instance interface.

Enumerations

	Enumeration	Description
	DataTypeCategory [▶ 2111]	Category of a DataType / Instance
	DataTypeResolveStrategy [▶ 3042]	Enum DataTypeResolveStrategy
	InstanceCollectionMode [▶ 2573]	Enum InstanceCollectionMode
	MethodParamFlags [▶ 2812]	Flag set specifying the MethodParameter context
	PrimitiveTypeFlags [▶ 2812]	Enum PrimitiveTypeFlags
	StringConvertMode [▶ 2927]	Enum StringConvertMode
	SymbolAccessRights [▶ 2928]	Enum specifying Access Rights to symbols
	SymbolIterationMask [▶ 3019]	Mask Flagset to specify filters for SymbolIterator.T. [▶ 3172].

6.11.1 AnySymbolSpecifier Class

Class AnySymbolSpecifier.

Inheritance Hierarchy

System.Object
 TwinCAT.TypeSystem.AnySymbolSpecifier

Namespace: [TwinCAT.TypeSystem](#) [▶ 2083]

Assembly: TwinCAT.Ads.Abstractions (in TwinCAT.Ads.Abstractions.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public class AnySymbolSpecifier
```

The AnySymbolSpecifier type exposes the following members.

Constructors

	Name	Description
	AnySymbolSpecifier [▶ 2092]	Initializes a new instance of the AnySymbolSpecifier class.

Properties

	Name	Description
	InstancePath [▶ 2093]	Gets the instance path.
	TypeSpecifier [▶ 2093]	Gets the type specifier.

Methods

	Name	Description
	Equals	Determines whether the specified object is equal to the current object. (Inherited from Object.)
	Finalize	Allows an object to try to free resources and perform other cleanup operations before it is reclaimed by garbage collection. (Inherited from Object.)
	GetHashCode	Serves as the default hash function. (Inherited from Object.)
	GetType	Gets the Type of the current instance. (Inherited from Object.)
	MemberwiseClone	Creates a shallow copy of the current Object. (Inherited from Object.)
	ToString	Returns a string that represents the current object. (Inherited from Object.)

Remarks

Specifies an Symbol path together with an [AnyTypeSpecifier](#) [▶ 2094] to address a symbol for an Read/Write operation

Reference

[TwinCAT.TypeSystem Namespace](#) [▶ 2083]

6.11.1.1 AnySymbolSpecifier Constructor

Initializes a new instance of the [AnySymbolSpecifier](#) [▶ 2091] class.

Namespace: [TwinCAT.TypeSystem](#) [▶ 2083]

Assembly: TwinCAT.Ads.Abstractions (in TwinCAT.Ads.Abstractions.dll) Version: 6.0.328+39e3229

Syntax**C#**

```
public AnySymbolSpecifier(
    string instancePath,
    AnyTypeSpecifier spec
)
```

Parameters

instancePath	Type: System.String The instance path.
--------------	---

spec	Type: TwinCAT.TypeSystem.AnyTypeSpecifier [▸ 2094] The spec.
------	---

Reference

[AnySymbolSpecifier Class \[▸ 2091\]](#)

[TwinCAT.TypeSystem Namespace \[▸ 2083\]](#)

6.11.1.2 AnySymbolSpecifier Properties

The [AnySymbolSpecifier \[▸ 2091\]](#) type exposes the following members.

Properties

	Name	Description
	InstancePath [▸ 2093]	Gets the instance path.
	TypeSpecifier [▸ 2093]	Gets the type specifier.

Reference

[AnySymbolSpecifier Class \[▸ 2091\]](#)

[TwinCAT.TypeSystem Namespace \[▸ 2083\]](#)

6.11.1.2.1 AnySymbolSpecifier.InstancePath Property

Gets the instance path.

Namespace: [TwinCAT.TypeSystem \[▸ 2083\]](#)

Assembly: TwinCAT.Ads.Abstractions (in TwinCAT.Ads.Abstractions.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public string InstancePath { get; }
```

Property Value

Type: String

The instance path.

Reference

[AnySymbolSpecifier Class \[▸ 2091\]](#)

[TwinCAT.TypeSystem Namespace \[▸ 2083\]](#)

6.11.1.2.2 AnySymbolSpecifier.TypeSpecifier Property

Gets the type specifier.

Namespace: [TwinCAT.TypeSystem \[▸ 2083\]](#)

Assembly: TwinCAT.Ads.Abstractions (in TwinCAT.Ads.Abstractions.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public AnyTypeSpecifier TypeSpecifier { get; }
```

Property Value

Type: [AnyTypeSpecifier](#) [[▶ 2094](#)]

The type specifier.

Reference

[AnySymbolSpecifier Class](#) [[▶ 2091](#)]

[TwinCAT.TypeSystem Namespace](#) [[▶ 2083](#)]

6.11.1.3 AnySymbolSpecifier Methods

The [AnySymbolSpecifier](#) [[▶ 2091](#)] type exposes the following members.

Methods

	Name	Description
	Equals	Determines whether the specified object is equal to the current object. (Inherited from Object.)
	Finalize	Allows an object to try to free resources and perform other cleanup operations before it is reclaimed by garbage collection. (Inherited from Object.)
	GetHashCode	Serves as the default hash function. (Inherited from Object.)
	GetType	Gets the Type of the current instance. (Inherited from Object.)
	MemberwiseClone	Creates a shallow copy of the current Object. (Inherited from Object.)
	ToString	Returns a string that represents the current object. (Inherited from Object.)

Reference

[AnySymbolSpecifier Class](#) [[▶ 2091](#)]

[TwinCAT.TypeSystem Namespace](#) [[▶ 2083](#)]

6.11.2 AnyTypeSpecifier Class

Class AnyTypeSpecifier.

Inheritance Hierarchy

System.Object

 TwinCAT.TypeSystem.AnyTypeSpecifier

Namespace: [TwinCAT.TypeSystem](#) [[▶ 2083](#)]

Assembly: TwinCAT.Ads.Abstractions (in TwinCAT.Ads.Abstractions.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public class AnyTypeSpecifier
```

The AnyTypeSpecifier type exposes the following members.

Properties

	Name	Description
	Category [▶ 2099]	Category of the AnyTypeSpecifier
	Dimensions [▶ 2101]	Gets the dimensions of an array.
	Element [▶ 2101]	The element type (Arrays)
	Encoding [▶ 2102]	Gets the encoding
	StrLen [▶ 2100]	The String length (only for String [▶ 2111])
	Type [▶ 2101]	Managed type

Methods

	Name	Description
	Create [▶ 2103]	Creates the AnyTypeSpecifier.
	Equals	Determines whether the specified object is equal to the current object. (Inherited from Object.)
	Finalize	Allows an object to try to free resources and perform other cleanup operations before it is reclaimed by garbage collection. (Inherited from Object.)
	GetHashCode	Serves as the default hash function. (Inherited from Object.)
	GetType	Gets the Type of the current instance. (Inherited from Object.)
	MemberwiseClone	Creates a shallow copy of the current Object. (Inherited from Object.)
	ToString	Returns a string that represents the current object. (Inherited from Object.)

Remarks

The AnyTypeSpecifier is used to specify out/return parameters for ReadAny, InvokeRpc-Methods or typed AdsNotifications. The Args parameter: String: Index-0 Length of String String[] Index-0 Length of String Index-1 Length of First Dimension Index-2 Length of Second Dimension Arrays Index-0 Length of Second Dimension Index-2 Length of Second Dimension

6.11.2.3 AnyTypeSpecifier Methods

The [AnyTypeSpecifier](#) [[▶ 2094](#)] type exposes the following members.

Methods

	Name	Description
	Create [▶ 2103]	Creates the AnyTypeSpecifier [▶ 2094].
	Equals	Determines whether the specified object is equal to the current object. (Inherited from Object .)
	Finalize	Allows an object to try to free resources and perform other cleanup operations before it is reclaimed by garbage collection. (Inherited from Object .)
	GetHashCode	Serves as the default hash function. (Inherited from Object .)
	GetType	Gets the Type of the current instance. (Inherited from Object .)
	MemberwiseClone	Creates a shallow copy of the current Object . (Inherited from Object .)

	Name	Description
	ToString	Returns a string that represents the current object. (Inherited from Object.)

Reference

6.11.2.3.1 AnyTypeSpecifier.Create Method

Creates the [AnyTypeSpecifier \[▸ 2094\]](#).

Namespace: [TwinCAT.TypeSystem \[▸ 2083\]](#)

Assembly: TwinCAT.Ads.Abstractions (in TwinCAT.Ads.Abstractions.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public static AnyTypeSpecifier Create(
    Type type,
    int[]? args,
    Encoding? encoding
)
```

Parameters

type	Type: System.Type The data type.
args	Type: .System.Int32. The AnyType arguments.
encoding	Type: System.Text.Encoding The encoding used by the type.

Return Value

Type: [AnyTypeSpecifier \[▸ 2094\]](#)
AnyTypeSpecifier.

Reference

6.11.3 CannotAccessVirtualSymbolException Class

Cannot access virtual Symbol

Inheritance Hierarchy

System.Object
 System.Exception
 [TwinCAT.AdsException \[▸ 61\]](#)
 [TwinCAT.TypeSystem.SymbolException \[▸ 2933\]](#)
 TwinCAT.TypeSystem.CannotAccessVirtualSymbolException

Namespace: [TwinCAT.TypeSystem \[▸ 2083\]](#)

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
[SerializableAttribute]
public sealed class CannotAccessVirtualSymbolException : SymbolException
```

The CannotAccessVirtualSymbolException type exposes the following members.

Constructors

	Name	Description
	CannotAccessVirtualSymbolException [▶ 2105]	Initializes a new instance of the CannotAccessVirtualSymbolException class.

Properties

	Name	Description
	Data	Gets a collection of key/value pairs that provide additional user-defined information about the exception. (Inherited from Exception.)
	HelpLink	Gets or sets a link to the help file associated with this exception. (Inherited from Exception.)
	HResult	Gets or sets HRESULT, a coded numerical value that is assigned to a specific exception. (Inherited from Exception.)
	InnerException	Gets the Exception instance that caused the current exception. (Inherited from Exception.)
	InstancePath [▶ 2944]	Gets the instance path. (Inherited from SymbolException [▶ 2933].)
	Message	Gets a message that describes the current exception. (Inherited from Exception.)
	Source	Gets or sets the name of the application or the object that causes the error. (Inherited from Exception.)
	StackTrace	Gets a string representation of the immediate frames on the call stack. (Inherited from Exception.)
	Symbol [▶ 2944]	Gets the symbol. (Inherited from SymbolException [▶ 2933].)
	TargetSite	Gets the method that throws the current exception. (Inherited from Exception.)

Methods

	Name	Description
	Equals	Determines whether the specified object is equal to the current object. (Inherited from Object.)
	GetBaseException	When overridden in a derived class, returns the Exception that is the root cause of one or more subsequent exceptions. (Inherited from Exception.)
	GetHashCode	Serves as the default hash function. (Inherited from Object.)
	GetObjectData [▶ 2945]	When overridden in a derived class, sets the SerializationInfo with information about the exception. (Inherited from SymbolException [▶ 2933].)
	GetType	Gets the runtime type of the current instance. (Inherited from Exception.)
	ToString	Creates and returns a string representation of the current exception. (Inherited from Exception.)

Properties

	Name	Description
	Data	Gets a collection of key/value pairs that provide additional user-defined information about the exception. (Inherited from Exception.)
	HelpLink	Gets or sets a link to the help file associated with this exception. (Inherited from Exception.)
	HResult	Gets or sets HRESULT, a coded numerical value that is assigned to a specific exception. (Inherited from Exception.)
	InnerException	Gets the Exception instance that caused the current exception. (Inherited from Exception.)
	InstancePath [▶ 2944]	Gets the instance path. (Inherited from SymbolException [▶ 2933] .)
	Message	Gets a message that describes the current exception. (Inherited from Exception.)
	Source	Gets or sets the name of the application or the object that causes the error. (Inherited from Exception.)
	StackTrace	Gets a string representation of the immediate frames on the call stack. (Inherited from Exception.)
	Symbol [▶ 2944]	Gets the symbol. (Inherited from SymbolException [▶ 2933] .)
	TargetSite	Gets the method that throws the current exception. (Inherited from Exception.)

6.11.3.3 CannotAccessVirtualSymbolException Methods

The [CannotAccessVirtualSymbolException \[► 2103\]](#) type exposes the following members.

Methods

	Name	Description
	Equals	Determines whether the specified object is equal to the current object. (Inherited from Object.)
	GetBaseException	When overridden in a derived class, returns the Exception that is the root cause of one or more subsequent exceptions. (Inherited from Exception.)
	GetHashCode	Serves as the default hash function. (Inherited from Object.)
	GetObjectData [► 2945]	When overridden in a derived class, sets the SerializationInfo with information about the exception. (Inherited from SymbolException [► 2933] .)
	GetType	Gets the runtime type of the current instance. (Inherited from Exception.)
	ToString	Creates and returns a string representation of the current exception. (Inherited from Exception.)

Class [CannotResolveDataTypeException](#). Implements the [DataTypeException \[► 2121\]](#)

Inheritance Hierarchy

System.Object
 System.Exception
 [TwinCAT.AdsException \[► 61\]](#)
 [TwinCAT.TypeSystem.DataTypeException \[► 2121\]](#)
 TwinCAT.TypeSystem.CannotResolveDataTypeException

Namespace: [TwinCAT.TypeSystem \[► 2083\]](#)

Assembly: TwinCAT.Ads.Abstractions (in TwinCAT.Ads.Abstractions.dll) Version: 6.0.328+39e3229

Syntax**C#**

```
[SerializableAttribute]
public class CannotResolveDataTypeException : DataTypeException
```

The [CannotResolveDataTypeException](#) type exposes the following members.

Constructors

	Name	Description
	CannotResolveDataTypeException(Instance) [▶ 2109]	Initializes a new instance of the CannotResolveDataTypeException class.
	CannotResolveDataTypeException(String) [▶ 2108]	Initializes a new instance of the CannotResolveDataTypeException class.
	CannotResolveDataTypeException(SerializationInfo, StreamingContext) [▶ 2109]	Initializes a new instance of the CannotResolveDataTypeException class.

Properties

	Name	Description
	Data	Gets a collection of key/value pairs that provide additional user-defined information about the exception. (Inherited from Exception.)
	DataType [▶ 2125]	Gets the type of the data. (Inherited from DataTypeException [▶ 2121].)
	HelpLink	Gets or sets a link to the help file associated with this exception. (Inherited from Exception.)
	HResult	Gets or sets HRESULT, a coded numerical value that is assigned to a specific exception. (Inherited from Exception.)
	InnerException	Gets the Exception instance that caused the current exception. (Inherited from Exception.)
	Message	Gets a message that describes the current exception. (Inherited from Exception.)
	Source	Gets or sets the name of the application or the object that causes the error. (Inherited from Exception.)
	StackTrace	Gets a string representation of the immediate frames on the call stack. (Inherited from Exception.)
	TargetSite	Gets the method that throws the current exception. (Inherited from Exception.)
	TypeName [▶ 2125]	Gets the name of the type. (Inherited from DataTypeException [▶ 2121].)

Methods

	Name	Description
	Equals	Determines whether the specified object is equal to the current object. (Inherited from Object.)
	Finalize	Allows an object to try to free resources and perform other cleanup operations before it is reclaimed by garbage collection. (Inherited from Object.)
	GetBaseException	When overridden in a derived class, returns the Exception that is the root cause of one or more subsequent exceptions. (Inherited from Exception.)
	GetHashCode	Serves as the default hash function. (Inherited from Object.)

	Name	Description
	GetObjectData [▶ 2126]	When overridden in a derived class, sets the SerializationInfo with information about the exception. (Inherited from DataTypeException [▶ 2121].)
	GetType	Gets the runtime type of the current instance. (Inherited from Exception .)
	MemberwiseClone	Creates a shallow copy of the current Object. (Inherited from Object .)
	ToString	Creates and returns a string representation of the current exception. (Inherited from Exception .)

Events

	Name	Description
	SerializeObjectState	Obsolete. Occurs when an exception is serialized to create an exception state object that contains serialized data about the exception. (Inherited from Exception .)

[TwinCAT.TypeSystem.DataTypeCollection](#)

Namespace: [TwinCAT.TypeSystem](#) [► 2083]

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public class DataTypeCollection : DataTypeCollection<IDataType>,
    IDataTypeInfoCollection, IDataTypeInfoCollection<IDataType>, IList<IDataType>,
    ICollection<IDataType>, IEnumerable<IDataType>, IEnumerable
```

The `DataTypeCollection` type exposes the following members.

Constructors

	Name	Description
	DataTypeCollection. [► 2114]	Initializes a new instance of the <code>DataTypeCollection</code> class.

	Name	Description
	DataTypeCollection(IEnumerable.IDataType.) [▶ 2115]	Initializes a new instance of the <code>DataTypeCollection</code> class (Copy constructor).

Properties

	Name	Description
	Count [▶ 3090]	Gets the count of contained IDataType [▶ 2475]s. (Inherited from DataTypeCollection.T. [▶ 3087].)
	Empty [▶ 2116]	Gets the empty collection.
	IsReadOnly [▶ 3091]	Gets a value indicating whether this instance is read only. (Inherited from DataTypeCollection.T. [▶ 3087].)
	Item.Int32. [▶ 3092]	Gets or sets the IDataType [▶ 2475] at the specified index. (Inherited from DataTypeCollection.T. [▶ 3087].)
	Item.String. [▶ 3092]	Gets the IDataType [▶ 2475] with the specified name. (Inherited from DataTypeCollection.T. [▶ 3087].)

Methods

	Name	Description
	Add [▶ 3094]	Adds the specified item to the collection. (Inherited from DataTypeCollection.T. [▶ 3087].)
	AddRange [▶ 3094]	Adds a range of types (Inherited from DataTypeCollection.T. [▶ 3087].)
	AsReadOnly [▶ 2117]	Returns A <code>ReadOnly-Version</code> of the <code>DataTypeCollection</code> .
	Clear [▶ 3095]	Clears the collection. (Inherited from DataTypeCollection.T. [▶ 3087].)
	Clone [▶ 2117]	Clones this <code>DataTypeCollection</code> (Shallow Copy)
	Contains [▶ 3096]	Determines whether this <code>DataTypeCollection</code> contains the specified IDataType [▶ 2475]. (Inherited from DataTypeCollection.T. [▶ 3087].)
	ContainsType [▶ 3096]	Determines whether the container contains the specified IDataType [▶ 2475]. (Inherited from DataTypeCollection.T. [▶ 3087].)
	CopyTo [▶ 3097]	Copies the data types to the specified array, starting at the array index. (Inherited from DataTypeCollection.T. [▶ 3087].)
	Equals	Determines whether the specified object is equal to the current object. (Inherited from <code>Object</code> .)
	Finalize	Allows an object to try to free resources and perform other cleanup operations before it is reclaimed by garbage collection. (Inherited from <code>Object</code> .)
	GetEnumerator [▶ 3098]	Gets the enumerator. (Inherited from DataTypeCollection.T. [▶ 3087].)
	GetHashCode	Serves as the default hash function. (Inherited from <code>Object</code> .)
	GetType	Gets the Type of the current instance. (Inherited from <code>Object</code> .)
	IndexOf [▶ 3098]	Determines the Index of the specified IDataType [▶ 2475]. (Inherited from DataTypeCollection.T. [▶ 3087].)
	Insert [▶ 3099]	Inserts an IDataType [▶ 2475] into the <code>DataTypeCollection</code> . (Inherited from DataTypeCollection.T. [▶ 3087].)

	Name	Description
	LookupType [▶ 3099]	Determines the specified IDataType [▶ 2475] (Inherited from DataTypeCollection.T. [▶ 3087].)
	MemberwiseClone	Creates a shallow copy of the current Object. (Inherited from Object.)
	Remove [▶ 3100]	Removes the specified IDataType [▶ 2475]. (Inherited from DataTypeCollection.T. [▶ 3087].)
	RemoveAt [▶ 3100]	Removes the IDataType [▶ 2475] object at the specified index. (Inherited from DataTypeCollection.T. [▶ 3087].)
	ToString	Returns a string that represents the current object. (Inherited from Object.)
	TryGetType [▶ 3101]	Tries to get the specified IDataType [▶ 2475] from the IDataTypeCollection.T. [▶ 2486]. (Inherited from DataTypeCollection.T. [▶ 3087].)

Fields

	Name	Description
	list [▶ 3102]	Internal list of data types (Inherited from DataTypeCollection.T. [▶ 3087].)

[TwinCAT.TypeSystem Namespace](#) [[▶ 2083](#)]

6.11.7.3 DataTypeEventArgs Methods

The [DataTypeEventArgs](#) [[▶ 2118](#)] type exposes the following members.

Methods

	Name	Description
	Equals	Determines whether the specified object is equal to the current object. (Inherited from Object.)
	Finalize	Allows an object to try to free resources and perform other cleanup operations before it is reclaimed by garbage collection. (Inherited from Object.)
	GetHashCode	Serves as the default hash function. (Inherited from Object.)
	GetType	Gets the Type of the current instance. (Inherited from Object.)
	MemberwiseClone	Creates a shallow copy of the current Object. (Inherited from Object.)
	ToString	Returns a string that represents the current object. (Inherited from Object.)

6.11.8 DataTypeException Class

Data Type Exception

Inheritance Hierarchy

System.Object
 System.Exception
 [TwinCAT.AdsException](#) [▶ 61]
 TwinCAT.TypeSystem.DataTypeException
 [TwinCAT.TypeSystem.CannotResolveDataTypeException](#) [▶ 2106]

Namespace: [TwinCAT.TypeSystem](#) [▶ 2083]

Assembly: TwinCAT.Ads.Abstractions (in TwinCAT.Ads.Abstractions.dll) Version: 6.0.328+39e3229

Syntax

C#

```
[SerializableAttribute]
public class DataTypeException : AdsException
```

The DataTypeException type exposes the following members.

Constructors

	Name	Description
	DataTypeException(SerializationInfo, StreamingContext) [▶ 2123]	Initializes a new instance of the DataTypeException class.
	DataTypeException(String, String) [▶ 2123]	Initializes a new instance of the DataTypeException class.
	DataTypeException(String, IDataTypes) [▶ 2124]	Initializes a new instance of the DataTypeException class.

Properties

	Name	Description
	Data	Gets a collection of key/value pairs that provide additional user-defined information about the exception. (Inherited from Exception.)
	DataType [▶ 2125]	Gets the type of the data.
	HelpLink	Gets or sets a link to the help file associated with this exception. (Inherited from Exception.)
	HResult	Gets or sets HRESULT, a coded numerical value that is assigned to a specific exception. (Inherited from Exception.)
	InnerException	Gets the Exception instance that caused the current exception. (Inherited from Exception.)
	Message	Gets a message that describes the current exception. (Inherited from Exception.)
	Source	Gets or sets the name of the application or the object that causes the error. (Inherited from Exception.)

	Name	Description
	StackTrace	Gets a string representation of the immediate frames on the call stack. (Inherited from Exception.)
	TargetSite	Gets the method that throws the current exception. (Inherited from Exception.)
	TypeName [▶ 2125]	Gets the name of the type.

Methods

	Name	Description
	Equals	Determines whether the specified object is equal to the current object. (Inherited from Object.)
	Finalize	Allows an object to try to free resources and perform other cleanup operations before it is reclaimed by garbage collection. (Inherited from Object.)
	GetBaseException	When overridden in a derived class, returns the Exception that is the root cause of one or more subsequent exceptions. (Inherited from Exception.)
	GetHashCode	Serves as the default hash function. (Inherited from Object.)
	GetObjectData [▶ 2126]	When overridden in a derived class, sets the SerializationInfo with information about the exception. (Overrides Exception.GetObjectData(SerializationInfo, StreamingContext).)
	GetType	Gets the runtime type of the current instance. (Inherited from Exception.)
	MemberwiseClone	Creates a shallow copy of the current Object. (Inherited from Object.)
	ToString	Creates and returns a string representation of the current exception. (Inherited from Exception.)

Events

	Name	Description
	SerializeObjectState	Obsolete. Occurs when an exception is serialized to create an exception state object that contains serialized data about the exception. (Inherited from Exception.)

6.11.11 DimensionCollection Class

Collection class for Array Dimensions

Inheritance Hierarchy

System.Object

TwinCAT.TypeSystem.DimensionCollection

Namespace: [TwinCAT.TypeSystem](#) [▶ 2083]

Assembly: TwinCAT.Ads.Abstractions (in TwinCAT.Ads.Abstractions.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public class DimensionCollection : IDimensionCollection,
    IList<IDimension>, ICollection<IDimension>, IEnumerable<IDimension>,
    IEnumerable
```

The DimensionCollection type exposes the following members.

Constructors

	Name	Description
	DimensionCollection n. [▶ 2135]	Initializes a new instance of the DimensionCollection class.
	DimensionCollection n(IEnumerable.IDimension.) [▶ 2136]	Initializes a new instance of the DimensionCollection class.
	DimensionCollection n(Int32) [▶ 2135]	Initializes a new instance of an 1-Dimensional representing DimensionCollection class.
	DimensionCollection n(.Int32.) [▶ 2136]	Initializes a new instance of the DimensionCollection class.

Properties

	Name	Description
	Count [▶ 2137]	Gets the number of elements contained in the ICollection.T..
	ElementCount [▶ 2138]	Gets the Number of elements in all Dimensions
	Empty [▶ 2140]	Gets an empty DimensionCollection
	IsNonZeroBased [▶ 2141]	Gets a value indicating whether this instance is non zero index based.
	IsReadOnly [▶ 2138]	Gets a value indicating whether the ICollection.T. is read-only.
	Item [▶ 2139]	Gets or sets the element at the specified index.
	LowerBounds [▶ 2139]	Gets the lower bounds.

	Name	Description
	UpperBounds [▶ 2140]	Gets the upper bounds.

Methods

	Name	Description
	Add [▶ 2142]	Adds an item to the ICollection.T..
	AsReadOnly [▶ 2143]	Returns a read only version of this DimensionCollection.
	Clear [▶ 2143]	Removes all items from the ICollection.T..
	Contains [▶ 2144]	Determines whether the ICollection.T. contains a specific value.
	CopyTo [▶ 2144]	Copies to.
	Equals	Determines whether the specified object is equal to the current object. (Inherited from Object.)
	Finalize	Allows an object to try to free resources and perform other cleanup operations before it is reclaimed by garbage collection. (Inherited from Object.)
	GetDimensionLengths [▶ 2145]	Gets an array the specifies the Lengths of each Array Dimension
	GetEnumerator [▶ 2146]	Returns an enumerator that iterates through the collection.
	GetHashCode	Serves as the default hash function. (Inherited from Object.)
	GetType	Gets the Type of the current instance. (Inherited from Object.)
	IndexOf [▶ 2146]	Determines the index of a specific item in the IList.T..
	Insert [▶ 2147]	Inserts an item to the IList.T. at the specified index.
	MemberwiseClone	Creates a shallow copy of the current Object. (Inherited from Object.)
	Remove [▶ 2148]	Removes the first occurrence of a specific object from the ICollection.T..
	RemoveAt [▶ 2148]	Removes the IList.T. item at the specified index.
	ToString	Returns a string that represents the current object. (Inherited from Object.)

Extension Methods

	Name	Description
	AddDimension [▶ 2982]	Adds a Dimension (FluentInterface) (Defined by IDimensionCollectionExtension [▶ 2981] .)

6.11.11.2.1 DimensionCollection.Count Property

Gets the number of elements contained in the ICollection.T..

Namespace: [TwinCAT.TypeSystem \[▸ 2083\]](#)

Assembly: TwinCAT.Ads.Abstractions (in TwinCAT.Ads.Abstractions.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public int Count { get; }
```

Property Value

Type: Int32
The count.

Implements

ICollection.T..Count

Exceptions

Exception	Condition
NotImplementedException	

Reference

[TwinCAT.TypeSystem Namespace](#) [► 2083]

6.11.11.2.2 DimensionCollection.ElementCount Property

Gets the Number of elements in all Dimensions

Namespace: [TwinCAT.TypeSystem](#) [► 2083]

Assembly: TwinCAT.Ads.Abstractions (in TwinCAT.Ads.Abstractions.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public int ElementCount { get; }
```

Property Value

Type: Int32

Implements

[ICollection.ElementCount](#) [► 2494]

Reference

[DimensionCollection Class](#) [► 2133]

[TwinCAT.TypeSystem Namespace](#) [► 2083]

6.11.11.2.3 DimensionCollection.IsReadOnly Property

Gets a value indicating whether the ICollection.T. is read-only.

Namespace: [TwinCAT.TypeSystem](#) [► 2083]

Assembly: TwinCAT.Ads.Abstractions (in TwinCAT.Ads.Abstractions.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public bool IsReadOnly { get; }
```

Property Value

Type: Boolean

true if this instance is read only; otherwise, false.

Implements

ICollection.T..IsReadOnly

Reference

[DimensionCollection Class](#) [► 2133]

[TwinCAT.TypeSystem Namespace](#) [► 2083]

6.11.11.2.4 DimensionCollection.Item Property

Gets or sets the element at the specified index.

Namespace: [TwinCAT.TypeSystem](#) [► 2083]

Assembly: TwinCAT.Ads.Abstractions (in TwinCAT.Ads.Abstractions.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public IDimension this[
    int index
] { get; set; }
```

Parameters

index	Type: System.Int32 The index.
-------	----------------------------------

Return Value

Type: [IDimension](#) [► 2490]

IDimension.

Implements

ICollection.T..Item.Int32.

Exceptions

Exception	Condition
NotSupportedException	

Remarks

Index = 0 is the lowest dimesion.

6.11.11.3 DimensionCollection Methods

The [DimensionCollection](#) [[▶ 2133](#)] type exposes the following members.

Methods

	Name	Description
	Add [▶ 2142]	Adds an item to the ICollection.T..
	AsReadOnly [▶ 2143]	Returns a read only version of this DimensionCollection [▶ 2133].
	Clear [▶ 2143]	Removes all items from the ICollection.T..
	Contains [▶ 2144]	Determines whether the ICollection.T. contains a specific value.
	CopyTo [▶ 2144]	Copies to.
	Equals	Determines whether the specified object is equal to the current object. (Inherited from Object.)
	Finalize	Allows an object to try to free resources and perform other cleanup operations before it is reclaimed by garbage collection. (Inherited from Object.)

	Name	Description
	GetDimensionLengths [▶ 2145]	Gets an array the specifies the Lengths of each Array Dimension
	GetEnumerator [▶ 2146]	Returns an enumerator that iterates through the collection.
	GetHashCode	Serves as the default hash function. (Inherited from Object.)
	GetType	Gets the Type of the current instance. (Inherited from Object.)
	IndexOf [▶ 2146]	Determines the index of a specific item in the IList.T..
	Insert [▶ 2147]	Inserts an item to the IList.T. at the specified index.
	MemberwiseClone	Creates a shallow copy of the current Object. (Inherited from Object.)
	Remove [▶ 2148]	Removes the first occurrence of a specific object from the ICollection.T..
	RemoveAt [▶ 2148]	Removes the IList.T. item at the specified index.
	ToString	Returns a string that represents the current object. (Inherited from Object.)

Extension Methods

	Name	Description
	AddDimension [▶ 2982]	Adds a Dimension (FluentInterface) (Defined by IDimensionCollectionExtension [▶ 2981].)

Reference

[DimensionCollection Class](#) [[▶ 2133](#)]

[TwinCAT.TypeSystem Namespace](#) [[▶ 2083](#)]

6.11.11.3.1 DimensionCollection.Add Method

Adds an item to the ICollection.T..

Namespace: [TwinCAT.TypeSystem](#) [[▶ 2083](#)]

Assembly: TwinCAT.Ads.Abstractions (in TwinCAT.Ads.Abstractions.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public void Add(
    IDimension item
)
```

Parameters

item	Type: TwinCAT.TypeSystem.IDimension [▶ 2490] The object to add to the ICollection.T..
------	--

Implements

ICollection.T..Add(T)

Exceptions

Exception	Condition
NotImplementedException

6.11.12 DynamicAliasInstance Class

Class DynamicAliasInstance. This class cannot be inherited.

Inheritance Hierarchy

System.Object
 System.Dynamic.DynamicObject
 [TwinCAT.TypeSystem.DynamicSymbol](#) [► 2266]
 TwinCAT.TypeSystem.DynamicAliasInstance

Namespace: [TwinCAT.TypeSystem](#) [► 2083]

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public sealed class DynamicAliasInstance : DynamicSymbol,
    IAliasInstance, ISymbol, IAttributedInstance, IInstance, IBitSize
```

The DynamicAliasInstance type exposes the following members.

Properties

	Name	Description
	InnerSymbol [► 2274]	Gets the inner symbol of this DynamicSymbol [► 2266] (Inherited from DynamicSymbol [► 2266].)
	AccessRights [► 2274]	Gets the access rights. (Inherited from DynamicSymbol [► 2266].)
	Attributes [► 2275]	Gets the Symbol Attributes (Inherited from DynamicSymbol [► 2266].)

	Name	Description
	BitSize [▶ 2276]	Gets the size of the IDataType [▶ 2475] in bits. (Inherited from DynamicSymbol [▶ 2266] .)
	ByteSize [▶ 2276]	Gets the (aligned) size of of the Type/Instance in Bytes (Inherited from DynamicSymbol [▶ 2266] .)
	Category [▶ 2277]	Gets the category. (Inherited from DynamicSymbol [▶ 2266] .)
	Comment [▶ 2277]	Gets the comment of the Instance [▶ 2549] (Inherited from DynamicSymbol [▶ 2266] .)
	Connection [▶ 2277]	Gets the connection bound to this DynamicSymbol [▶ 2266] (Inherited from DynamicSymbol [▶ 2266] .)
	DataType [▶ 2278]	Gets the IDataType [▶ 2475] of the Instance [▶ 2549] . (Inherited from DynamicSymbol [▶ 2266] .)
	HasValue [▶ 2278]	Gets a value indicating whether this instance has value (only the non VirtualInstances, what means the Symbols with locations). (Inherited from DynamicSymbol [▶ 2266] .)
	InstanceName [▶ 2279]	Gets the name of the instance (without periods (.)) (Inherited from DynamicSymbol [▶ 2266] .)
	InstancePath [▶ 2279]	Gets the relative / absolute access path to the instance (with periods (.)) (Inherited from DynamicSymbol [▶ 2266] .)
	IsBitType [▶ 2280]	Gets a value indicating whether this instance is not basing on a full DataType but instead of some sort of bit mapping (Inherited from DynamicSymbol [▶ 2266] .)
	IsByteAligned [▶ 2280]	Indicates that the Size of the Object is Byte aligned ($\text{BitSize} \% 8 == 0$) (Inherited from DynamicSymbol [▶ 2266] .)
	IsContainerType [▶ 2281]	Gets a value indicating whether this Symbol is acontainer type. (Inherited from DynamicSymbol [▶ 2266] .)
	IsPersistent [▶ 2281]	Gets a value indicating whether this ISymbol [▶ 2691] is persistent. (Inherited from DynamicSymbol [▶ 2266] .)
	IsPointer [▶ 2282]	Indicates that the Instance [▶ 2549] represents a Pointer type (Pointer TO) (Inherited from DynamicSymbol [▶ 2266] .)
	IsPrimitiveType [▶ 2282]	Gets a value indicating whether this instance is a primitive type. (Inherited from DynamicSymbol [▶ 2266] .)
	IsReadOnly [▶ 2283]	Indicates that this instance is read only. (Inherited from DynamicSymbol [▶ 2266] .)
	IsRecursive [▶ 2283]	Gets a value indicating whether this instance is recursive. (Inherited from DynamicSymbol [▶ 2266] .)
	IsReference [▶ 2284]	Indicates that the Instance [▶ 2549] represents a Reference type (REFERENCE TO) (Inherited from DynamicSymbol [▶ 2266] .)
	IsStatic [▶ 2284]	Gets a value indicating whether this instance is static. (Inherited from DynamicSymbol [▶ 2266] .)
	NormalizedName [▶ 2285]	Gets the normalized instance name (fixed name for dynamic property access that doesn't contain invalid characters), (Inherited from DynamicSymbol [▶ 2266] .)
	NotificationSettings [▶ 2285]	Gets the notification settings. (Inherited from DynamicSymbol [▶ 2266] .)
	Parent [▶ 2286]	Gets the parent Symbol (Inherited from DynamicSymbol [▶ 2266] .)
	Size [▶ 2286]	Gets the size of the Instance [▶ 2549] in bytes. (Inherited from DynamicSymbol [▶ 2266] .)

	Name	Description
	SubSymbols [▶ 2287]	Gets the SubSymbols of the ISymbol [▶ 2691] (Inherited from DynamicSymbol [▶ 2266].)
	TypeName [▶ 2287]	Gets the name of the DataType [▶ 2475] that is used for this Instance [▶ 2549]. (Inherited from DynamicSymbol [▶ 2266].)
	ValueEncoding [▶ 2288]	Gets the value encoding. (Inherited from DynamicSymbol [▶ 2266].)

Methods

	Name	Description
	Equals [▶ 2292]	Equals (Inherited from DynamicSymbol [▶ 2266].)
	GetDynamicMemberNames [▶ 2157]	Returns the enumeration of all dynamic member names. (Overrides DynamicSymbol.GetDynamicMemberNames . [▶ 2293].)
	GetHashCode [▶ 2293]	Gets the HashCode of the Address (Inherited from DynamicSymbol [▶ 2266].)
	GetMetaObject	Provides a DynamicMetaObject that dispatches to the dynamic virtual methods. The object can be encapsulated inside another DynamicMetaObject to provide custom behavior for individual actions. This method supports the Dynamic Language Runtime infrastructure for language implementers and it is not intended to be used directly from your code. (Inherited from DynamicObject .)
	GetType	Gets the Type of the current instance. (Inherited from Object .)
	ReadAnyValue [▶ 2300]	Reads the value of this Value [▶ 2775] into a new created instance of the managed type (Inherited from DynamicSymbol [▶ 2266].)
	ReadRawValue . [▶ 2301]	Reads the raw value of the IValueSymbol [▶ 2775] (Ads Read / Write) (Inherited from DynamicSymbol [▶ 2266].)
	ReadRawValue(Int32) [▶ 2302]	Reads the Symbols raw value (Inherited from DynamicSymbol [▶ 2266].)
	ReadRawValueAsync [▶ 2302]	Read raw value as an asynchronous operation. (Inherited from DynamicSymbol [▶ 2266].)
	ReadValue . [▶ 2303]	Reads the value of this DynamicSymbol [▶ 2266]. (Inherited from DynamicSymbol [▶ 2266].)
	ReadValue(Int32) [▶ 2306]	Reads the value of this DynamicSymbol [▶ 2266]. (Inherited from DynamicSymbol [▶ 2266].)
	ReadValueAsync [▶ 2307]	Reads the Value of the IValueSymbol [▶ 2775] asynchronously. (Inherited from DynamicSymbol [▶ 2266].)
	ToString [▶ 2307]	Returns a String that represents this instance. (Inherited from DynamicSymbol [▶ 2266].)
	TryBinaryOperation	Provides implementation for binary operations. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations such as addition and multiplication. (Inherited from DynamicObject .)
	TryConvert	Provides implementation for type conversion operations. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations that convert an object from one type to another. (Inherited from DynamicObject .)

	Name	Description
	TryCreateInstance	Provides the implementation for operations that initialize a new instance of a dynamic object. This method is not intended for use in C# or Visual Basic. (Inherited from DynamicObject.)
	TryDeleteIndex	Provides the implementation for operations that delete an object by index. This method is not intended for use in C# or Visual Basic. (Inherited from DynamicObject.)
	TryDeleteMember	Provides the implementation for operations that delete an object member. This method is not intended for use in C# or Visual Basic. (Inherited from DynamicObject.)
	TryGetIndex [▶ 2157]	Provides the implementation for operations that get a value by index. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for indexing operations. (Overrides DynamicObject.TryGetIndex(GetIndexBinder, .Object., Object.))
	TryGetMember [▶ 2158]	Provides the implementation for operations that get member values. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations such as getting a value for a property. (Overrides DynamicSymbol.TryGetMember(GetMemberBinder, Object.) [▶ 2308].)
	TryInvoke	Provides the implementation for operations that invoke an object. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations such as invoking an object or a delegate. (Inherited from DynamicObject.)
	TryInvokeMember	Provides the implementation for operations that invoke a member. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations such as calling a method. (Inherited from DynamicObject.)
	TryReadValue [▶ 2309]	Reads the Value of the IValueSymbol [▶ 2775] (Inherited from DynamicSymbol [▶ 2266].)
	TrySetIndex [▶ 2159]	Provides the implementation for operations that set a value by index. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations that access objects by a specified index. (Overrides DynamicObject.TrySetIndex(SetIndexBinder, .Object., Object.))
	TrySetMember [▶ 2159]	Provides the implementation for operations that set member values. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations such as setting a value for a property. (Overrides DynamicObject.TrySetMember(SetMemberBinder, Object.))
	TryUnaryOperation	Provides implementation for unary operations. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations such as negation, increment, or decrement. (Inherited from DynamicObject.)
 	TryWriteValue [▶ 2309]	Writes the specified value to the DynamicSymbol [▶ 2266]. (Inherited from DynamicSymbol [▶ 2266].)
	UpdateAnyValue [▶ 2312]	Reads the value of this Value [▶ 2775] into the specified managed value. (Inherited from DynamicSymbol [▶ 2266].)
	WriteAnyValue [▶ 2313]	Writes the value represented by the managed value to this Value [▶ 2775] (Inherited from DynamicSymbol [▶ 2266].)
	WriteRawValue(Byte) [▶ 2314]	Writes the raw value of the IValueSymbol [▶ 2775] (Ads Read / Write) (Inherited from DynamicSymbol [▶ 2266].)
	WriteRawValue(Byte e., Int32) [▶ 2314]	Writes the raw value of the IValueSymbol [▶ 2775] (Ads Read / Write) (Inherited from DynamicSymbol [▶ 2266].)

	Name	Description
	WriteRawValueAsync [2315]	Writes the raw value of the IValueSymbol [2775] (Ads Read / Write) (Inherited from DynamicSymbol [2266].)
	WriteValue(Object) [2316]	Writes the specified value to the DynamicSymbol [2266]. (Inherited from DynamicSymbol [2266].)
 	WriteValue(Object, Int32) [2319]	Writes the specified value to the DynamicSymbol [2266]. (Inherited from DynamicSymbol [2266].)
	WriteValueAsync [2321]	Writes the Value of the IValueSymbol [2775] (Inherited from DynamicSymbol [2266].)

Events

	Name	Description
	RawValueChanged [2323]	Occurs when the RawValue of the IValueSymbol [2775] has changed. (Inherited from DynamicSymbol [2266].)
	ValueChanged [2323]	Occurs when the (Primitive) value of the IValueSymbol [2775] has changed. (Inherited from DynamicSymbol [2266].)

Extension Methods

	Name	Description
	ReferencesExternalData [3038]	Indicates, that the Instance value includes process memory data, that cannot be read in one memory block. (Defined by DataTypeExtension [3021].)

6.11.12.1 DynamicAliasInstance Properties

The [DynamicAliasInstance](#) [[2149](#)] type exposes the following members.

Properties

	Name	Description
	InnerSymbol [2274]	Gets the inner symbol of this DynamicSymbol [2266] (Inherited from DynamicSymbol [2266].)
	AccessRights [2274]	Gets the access rights. (Inherited from DynamicSymbol [2266].)
	Attributes [2275]	Gets the Symbol Attributes (Inherited from DynamicSymbol [2266].)
	BitSize [2276]	Gets the size of the IDataType [2475] in bits. (Inherited from DynamicSymbol [2266].)
	ByteSize [2276]	Gets the (aligned) size of of the Type/Instance in Bytes (Inherited from DynamicSymbol [2266].)
	Category [2277]	Gets the category. (Inherited from DynamicSymbol [2266].)

	Name	Description
	Comment [▶ 2277]	Gets the comment of the Instance [▶ 2549] (Inherited from DynamicSymbol [▶ 2266].)
	Connection [▶ 2277]	Gets the connection bound to this DynamicSymbol [▶ 2266] (Inherited from DynamicSymbol [▶ 2266].)
	DataType [▶ 2278]	Gets the IDataType [▶ 2475] of the Instance [▶ 2549]. (Inherited from DynamicSymbol [▶ 2266].)
	HasValue [▶ 2278]	Gets a value indicating whether this instance has value (only the non VirtualInstances, what means the Symbols with locations). (Inherited from DynamicSymbol [▶ 2266].)
	InstanceName [▶ 2279]	Gets the name of the instance (without periods (.)) (Inherited from DynamicSymbol [▶ 2266].)
	InstancePath [▶ 2279]	Gets the relative / absolute access path to the instance (with periods (.)) (Inherited from DynamicSymbol [▶ 2266].)
	IsBitType [▶ 2280]	Gets a value indicating whether this instance is not basing on a full DataType but instead of some sort of bit mapping (Inherited from DynamicSymbol [▶ 2266].)
	IsByteAligned [▶ 2280]	Indicates that the Size of the Object is Byte aligned ($\text{BitSize} \% 8 == 0$) (Inherited from DynamicSymbol [▶ 2266].)
	IsContainerType [▶ 2281]	Gets a value indicating whether this Symbol is a container type. (Inherited from DynamicSymbol [▶ 2266].)
	IsPersistent [▶ 2281]	Gets a value indicating whether this ISymbol [▶ 2691] is persistent. (Inherited from DynamicSymbol [▶ 2266].)
	IsPointer [▶ 2282]	Indicates that the Instance [▶ 2549] represents a Pointer type (Pointer TO) (Inherited from DynamicSymbol [▶ 2266].)
	IsPrimitiveType [▶ 2282]	Gets a value indicating whether this instance is a primitive type. (Inherited from DynamicSymbol [▶ 2266].)
	IsReadOnly [▶ 2283]	Indicates that this instance is read only. (Inherited from DynamicSymbol [▶ 2266].)
	IsRecursive [▶ 2283]	Gets a value indicating whether this instance is recursive. (Inherited from DynamicSymbol [▶ 2266].)
	IsReference [▶ 2284]	Indicates that the Instance [▶ 2549] represents a Reference type (REFERENCE TO) (Inherited from DynamicSymbol [▶ 2266].)
	IsStatic [▶ 2284]	Gets a value indicating whether this instance is static. (Inherited from DynamicSymbol [▶ 2266].)
	NormalizedName [▶ 2285]	Gets the normalized instance name (fixed name for dynamic property access that doesn't contain invalid characters), (Inherited from DynamicSymbol [▶ 2266].)
	NotificationSettings [▶ 2285]	Gets the notification settings. (Inherited from DynamicSymbol [▶ 2266].)
	Parent [▶ 2286]	Gets the parent Symbol (Inherited from DynamicSymbol [▶ 2266].)
	Size [▶ 2286]	Gets the size of the Instance [▶ 2549] in bytes. (Inherited from DynamicSymbol [▶ 2266].)
	SubSymbols [▶ 2287]	Gets the SubSymbols of the ISymbol [▶ 2691] (Inherited from DynamicSymbol [▶ 2266].)
	TypeName [▶ 2287]	Gets the name of the DataType [▶ 2475] that is used for this Instance [▶ 2549]. (Inherited from DynamicSymbol [▶ 2266].)
	ValueEncoding [▶ 2288]	Gets the value encoding. (Inherited from DynamicSymbol [▶ 2266].)

6.11.12.2 DynamicAliasInstance Methods

The [DynamicAliasInstance \[▶ 2149\]](#) type exposes the following members.

Methods

	Name	Description
	Equals [▶ 2292]	Equals (Inherited from DynamicSymbol [▶ 2266].)
	GetDynamicMemberNames [▶ 2157]	Returns the enumeration of all dynamic member names. (Overrides DynamicSymbol.GetDynamicMemberNames. [▶ 2293].)
	GetHashCode [▶ 2293]	Gets the GetHashCode of the Address (Inherited from DynamicSymbol [▶ 2266].)
	GetMetaObject	Provides a DynamicMetaObject that dispatches to the dynamic virtual methods. The object can be encapsulated inside another DynamicMetaObject to provide custom behavior for individual actions. This method supports the Dynamic Language Runtime infrastructure for language implementers and it is not intended to be used directly from your code. (Inherited from DynamicObject.)
	GetType	Gets the Type of the current instance. (Inherited from Object.)
	ReadAnyValue [▶ 2300]	Reads the value of this Value [▶ 2775] into a new created instance of the managed type (Inherited from DynamicSymbol [▶ 2266].)
	ReadRawValue. [▶ 2301]	Reads the raw value of the IValueSymbol [▶ 2775] (Ads Read / Write) (Inherited from DynamicSymbol [▶ 2266].)
	ReadRawValue(Int32) [▶ 2302]	Reads the Symbols raw value (Inherited from DynamicSymbol [▶ 2266].)
	ReadRawValueAsync [▶ 2302]	Read raw value as an asynchronous operation. (Inherited from DynamicSymbol [▶ 2266].)
	ReadValue. [▶ 2303]	Reads the value of this DynamicSymbol [▶ 2266]. (Inherited from DynamicSymbol [▶ 2266].)
	ReadValue(Int32) [▶ 2306]	Reads the value of this DynamicSymbol [▶ 2266]. (Inherited from DynamicSymbol [▶ 2266].)
	ReadValueAsync [▶ 2307]	Reads the Value of the IValueSymbol [▶ 2775] asynchronously. (Inherited from DynamicSymbol [▶ 2266].)
	ToString [▶ 2307]	Returns a String that represents this instance. (Inherited from DynamicSymbol [▶ 2266].)
	TryBinaryOperation	Provides implementation for binary operations. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations such as addition and multiplication. (Inherited from DynamicObject.)
	TryConvert	Provides implementation for type conversion operations. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations that convert an object from one type to another. (Inherited from DynamicObject.)

	Name	Description
	TryCreateInstance	Provides the implementation for operations that initialize a new instance of a dynamic object. This method is not intended for use in C# or Visual Basic. (Inherited from DynamicObject.)
	TryDeleteIndex	Provides the implementation for operations that delete an object by index. This method is not intended for use in C# or Visual Basic. (Inherited from DynamicObject.)
	TryDeleteMember	Provides the implementation for operations that delete an object member. This method is not intended for use in C# or Visual Basic. (Inherited from DynamicObject.)
	TryGetIndex [▶ 2157]	Provides the implementation for operations that get a value by index. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for indexing operations. (Overrides DynamicObject.TryGetIndex(GetIndexBinder, .Object., Object.) .)
	TryGetMember [▶ 2158]	Provides the implementation for operations that get member values. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations such as getting a value for a property. (Overrides DynamicSymbol.TryGetMember(GetMemberBinder, Object.) [▶ 2308].)
	TryInvoke	Provides the implementation for operations that invoke an object. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations such as invoking an object or a delegate. (Inherited from DynamicObject.)
	TryInvokeMember	Provides the implementation for operations that invoke a member. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations such as calling a method. (Inherited from DynamicObject.)
	TryReadValue [▶ 2309]	Reads the Value of the IValueSymbol [▶ 2775] (Inherited from DynamicSymbol [▶ 2266].)
	TrySetIndex [▶ 2159]	Provides the implementation for operations that set a value by index. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations that access objects by a specified index. (Overrides DynamicObject.TrySetIndex(SetIndexBinder, .Object., Object.) .)
	TrySetMember [▶ 2159]	Provides the implementation for operations that set member values. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations such as setting a value for a property. (Overrides DynamicObject.TrySetMember(SetMemberBinder, Object.) .)
	TryUnaryOperation	Provides implementation for unary operations. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations such as negation, increment, or decrement. (Inherited from DynamicObject.)
 	TryWriteValue [▶ 2309]	Writes the specified value to the DynamicSymbol [▶ 2266]. (Inherited from DynamicSymbol [▶ 2266].)
	UpdateAnyValue [▶ 2312]	Reads the value of this Value [▶ 2775] into the specified managed value. (Inherited from DynamicSymbol [▶ 2266].)
	WriteAnyValue [▶ 2313]	Writes the value represented by the managed value to this Value [▶ 2775] (Inherited from DynamicSymbol [▶ 2266].)
	WriteRawValue(Byte) [▶ 2314]	Writes the raw value of the IValueSymbol [▶ 2775] (Ads Read / Write) (Inherited from DynamicSymbol [▶ 2266].)
	WriteRawValue(Byte e., Int32) [▶ 2314]	Writes the raw value of the IValueSymbol [▶ 2775] (Ads Read / Write) (Inherited from DynamicSymbol [▶ 2266].)

	Name	Description
	WriteRawValueAsync [▶ 2315]	Writes the raw value of the IValueSymbol [▶ 2775] (Ads Read / Write) (Inherited from DynamicSymbol [▶ 2266].)
	WriteValue(Object) [▶ 2316]	Writes the specified value to the DynamicSymbol [▶ 2266]. (Inherited from DynamicSymbol [▶ 2266].)
 	WriteValue(Object, Int32) [▶ 2319]	Writes the specified value to the DynamicSymbol [▶ 2266]. (Inherited from DynamicSymbol [▶ 2266].)
	WriteValueAsync [▶ 2321]	Writes the Value of the IValueSymbol [▶ 2775] (Inherited from DynamicSymbol [▶ 2266].)

Extension Methods

	Name	Description
	ReferencesExternalData [▶ 3038]	Indicates, that the Instance value includes process memory data, that cannot be read in one memory block. (Defined by DataTypeExtension [▶ 3021].)

Reference

[DynamicAliasInstance Class](#) [[▶ 2149](#)]

[TwinCAT.TypeSystem Namespace](#) [[▶ 2083](#)]

6.11.12.2.1 DynamicAliasInstance.GetDynamicMemberNames Method

Returns the enumeration of all dynamic member names.

Namespace: [TwinCAT.TypeSystem](#) [[▶ 2083](#)]

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public override IEnumerable<string> GetDynamicMemberNames()
```

Return Value

Type: [IEnumerable.String](#).

A sequence that contains dynamic member names.

Reference

[DynamicAliasInstance Class](#) [[▶ 2149](#)]

[TwinCAT.TypeSystem Namespace](#) [[▶ 2083](#)]

6.11.12.2.2 DynamicAliasInstance.TryGetIndex Method

Provides the implementation for operations that get a value by index. Classes derived from the [DynamicObject](#) class can override this method to specify dynamic behavior for indexing operations.

Namespace: [TwinCAT.TypeSystem](#) [[▶ 2083](#)]

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public override bool TryGetIndex(
    GetIndexBinder binder,
    Object[] indexes,
    out Object?? result
)
```

Parameters

binder	Type: System.Dynamic.GetIndexBinder Provides information about the operation.
indexes	Type: System.Object. The indexes that are used in the operation. For example, for the sampleObject[3] operation in C# (sampleObject(3) in Visual Basic), where sampleObject is derived from the DynamicObject class, indexes[0] is equal to 3.
result	Type: System.Object. The result of the index operation.

Return Value

Type: Boolean

true if the operation is successful; otherwise, false. If this method returns false, the run-time binder of the language determines the behavior. (In most cases, a run-time exception is thrown.)

Reference

[TwinCAT.TypeSystem Namespace \[► 2083\]](#)

6.11.12.2.3 DynamicAliasInstance.TryGetMember Method

Provides the implementation for operations that get member values. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations such as getting a value for a property.

Namespace: [TwinCAT.TypeSystem \[► 2083\]](#)

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public override bool TryGetMember(
    GetMemberBinder binder,
    out Object?? result
)
```

Parameters

binder	Type: System.Dynamic.GetMemberBinder Provides information about the object that called the dynamic operation. The binder.Name property provides the name of the member on which the dynamic operation is performed. For example, for the Console.WriteLine(sampleObject.SampleProperty) statement, where sampleObject is an instance of the class derived from the DynamicObject class, binder.Name returns "SampleProperty". The binder.IgnoreCase property specifies whether the member name is case-sensitive.
result	Type: System.Object. The result of the get operation. For example, if the method is called for a property, you can assign the property value to result.

Return Value

Type: Boolean
 true if the operation is successful; otherwise, false. If this method returns false, the run-time binder of the language determines the behavior. (In most cases, a run-time exception is thrown.)

Reference

[DynamicAliasInstance Class \[► 2149\]](#)

[TwinCAT.TypeSystem Namespace \[► 2083\]](#)

6.11.12.2.4 DynamicAliasInstance.TrySetIndex Method

Provides the implementation for operations that set a value by index. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations that access objects by a specified index.

Namespace: [TwinCAT.TypeSystem \[► 2083\]](#)

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public override bool TrySetIndex(
    SetIndexBinder binder,
    Object[] indexes,
    Object? value
)
```

Parameters

binder	Type: System.Dynamic.SetIndexBinder Provides information about the operation.
indexes	Type: .System.Object. The indexes that are used in the operation. For example, for the sampleObject[3] = 10 operation in C# (sampleObject(3) = 10 in Visual Basic), where sampleObject is derived from the DynamicObject class, indexes[] is equal to 3.
value	Type: System.Object The value to set to the object that has the specified index. For example, for the sampleObject[3] = 10 operation in C# (sampleObject(3) = 10 in Visual Basic), where sampleObject is derived from the DynamicObject class, value is equal to 10.

Return Value

Type: Boolean
 true if the operation is successful; otherwise, false. If this method returns false, the run-time binder of the language determines the behavior. (In most cases, a language-specific run-time exception is thrown.)

Reference

[DynamicAliasInstance Class \[► 2149\]](#)

[TwinCAT.TypeSystem Namespace \[► 2083\]](#)

6.11.12.2.5 DynamicAliasInstance.TrySetMember Method

Provides the implementation for operations that set member values. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations such as setting a value for a property.

Namespace: [TwinCAT.TypeSystem](#) [► 2083]

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public override bool TrySetMember(
    SetMemberBinder binder,
    Object? value
)
```

Parameters

binder	Type: System.Dynamic.SetMemberBinder Provides information about the object that called the dynamic operation. The binder.Name property provides the name of the member to which the value is being assigned. For example, for the statement sampleObject.SampleProperty = "Test", where sampleObject is an instance of the class derived from the DynamicObject class, binder.Name returns "SampleProperty". The binder.IgnoreCase property specifies whether the member name is case-sensitive.
value	Type: System.Object The value to set to the member. For example, for sampleObject.SampleProperty = "Test", where sampleObject is an instance of the class derived from the DynamicObject class, the value is "Test".

Return Value

Type: Boolean

true if the operation is successful; otherwise, false. If this method returns false, the run-time binder of the language determines the behavior. (In most cases, a language-specific run-time exception is thrown.)

6.11.13 DynamicArrayInstance Class

Dynamic Array Instance

Inheritance Hierarchy

System.Object
 System.Dynamic.DynamicObject
 TwinCAT.TypeSystem.DynamicSymbol [▶ 2266]
 TwinCAT.TypeSystem.DynamicArrayInstance
 TwinCAT.TypeSystem.DynamicOversamplingArrayInstance [▶ 2176]

Namespace: TwinCAT.TypeSystem [▶ 2083]
Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public class DynamicArrayInstance : DynamicSymbol,
    IArrayInstance, ISymbol, IAttributedInstance, IInstance, IBitSize
```

The DynamicArrayInstance type exposes the following members.

Properties

	Name	Description
	_InnerSymbol [▶ 2274]	Gets the inner symbol of this DynamicSymbol [▶ 2266] (Inherited from DynamicSymbol [▶ 2266].)
	AccessRights [▶ 2274]	Gets the access rights. (Inherited from DynamicSymbol [▶ 2266].)
	AllowGIOAccess [▶ 2275]	Indicates, that the aggregates symbols is an IProcessImageAddress (and most probably IAdsSymbol) (Inherited from DynamicSymbol [▶ 2266].)
	Attributes [▶ 2275]	Gets the Symbol Attributes (Inherited from DynamicSymbol [▶ 2266].)
	BitSize [▶ 2276]	Gets the size of the IDataType [▶ 2475] in bits. (Inherited from DynamicSymbol [▶ 2266].)
	ByteSize [▶ 2276]	Gets the (aligned) size of of the Type/Instance in Bytes (Inherited from DynamicSymbol [▶ 2266].)
	Category [▶ 2277]	Gets the category. (Inherited from DynamicSymbol [▶ 2266].)
	Comment [▶ 2277]	Gets the comment of the IInstance [▶ 2549] (Inherited from DynamicSymbol [▶ 2266].)
	Connection [▶ 2277]	Gets the connection bound to this DynamicSymbol [▶ 2266] (Inherited from DynamicSymbol [▶ 2266].)
	DataType [▶ 2278]	Gets the IDataType [▶ 2475] of the IInstance [▶ 2549]. (Inherited from DynamicSymbol [▶ 2266].)
	Dimensions [▶ 2167]	Gets the dimensions as read only collection.
	Elements [▶ 2168]	Gets the contained Array Elements as read only collection.
	ElementType [▶ 2168]	Gets the type of the contained elements.
	HasValue [▶ 2278]	Gets a value indicating whether this instance has value (only the non VirtualInstances, what means the Symbols with locations). (Inherited from DynamicSymbol [▶ 2266].)
	InstanceName [▶ 2279]	Gets the name of the instance (without periods (.)) (Inherited from DynamicSymbol [▶ 2266].)
	InstancePath [▶ 2279]	Gets the relative / absolute access path to the instance (with periods (.)) (Inherited from DynamicSymbol [▶ 2266].)

	Name	Description
	IsBitType [▶ 2280]	Gets a value indicating whether this instance is not basing on a full DataType but instead of some sort of bit mapping (Inherited from DynamicSymbol [▶ 2266].)
	IsByteAligned [▶ 2280]	Indicates that the Size of the Object is Byte aligned ($\text{BitSize} \% 8 == 0$) (Inherited from DynamicSymbol [▶ 2266].)
	IsContainerType [▶ 2281]	Gets a value indicating whether this Symbol is a container type. (Inherited from DynamicSymbol [▶ 2266].)
	IsPersistent [▶ 2281]	Gets a value indicating whether this ISymbol [▶ 2691] is persistent. (Inherited from DynamicSymbol [▶ 2266].)
	IsPointer [▶ 2282]	Indicates that the Instance [▶ 2549] represents a Pointer type (Pointer TO) (Inherited from DynamicSymbol [▶ 2266].)
	IsPrimitiveType [▶ 2282]	Gets a value indicating whether this instance is a primitive type. (Inherited from DynamicSymbol [▶ 2266].)
	IsReadOnly [▶ 2283]	Indicates that this instance is read only. (Inherited from DynamicSymbol [▶ 2266].)
	IsRecursive [▶ 2283]	Gets a value indicating whether this instance is recursive. (Inherited from DynamicSymbol [▶ 2266].)
	IsReference [▶ 2284]	Indicates that the Instance [▶ 2549] represents a Reference type (REFERENCE TO) (Inherited from DynamicSymbol [▶ 2266].)
	IsStatic [▶ 2284]	Gets a value indicating whether this instance is static. (Inherited from DynamicSymbol [▶ 2266].)
	Item [▶ 2169]	Gets the ISymbol [▶ 2691] with the specified indices.
	NormalizedName [▶ 2285]	Gets the normalized instance name (fixed name for dynamic property access that doesn't contain invalid characters), (Inherited from DynamicSymbol [▶ 2266].)
	NotificationSettings [▶ 2285]	Gets the notification settings. (Inherited from DynamicSymbol [▶ 2266].)
	Parent [▶ 2286]	Gets the parent Symbol (Inherited from DynamicSymbol [▶ 2266].)
	Size [▶ 2286]	Gets the size of the Instance [▶ 2549] in bytes. (Inherited from DynamicSymbol [▶ 2266].)
	SubSymbols [▶ 2287]	Gets the SubSymbols of the ISymbol [▶ 2691] (Inherited from DynamicSymbol [▶ 2266].)
	TypeName [▶ 2287]	Gets the name of the DataType [▶ 2475] that is used for this Instance [▶ 2549]. (Inherited from DynamicSymbol [▶ 2266].)
	ValueEncoding [▶ 2288]	Gets the value encoding. (Inherited from DynamicSymbol [▶ 2266].)

Methods

	Name	Description
	Equals [▶ 2292]	Equals (Inherited from DynamicSymbol [▶ 2266].)
	Finalize	Allows an object to try to free resources and perform other cleanup operations before it is reclaimed by garbage collection. (Inherited from Object .)
	GetDynamicMemberNames [▶ 2293]	Returns the enumeration of all dynamic member names. (Inherited from DynamicSymbol [▶ 2266].)

	Name	Description
	GetHashCode [▶ 2293]	Gets the HashCode of the Address (Inherited from DynamicSymbol [▶ 2266].)
	GetMetaObject	Provides a DynamicMetaObject that dispatches to the dynamic virtual methods. The object can be encapsulated inside another DynamicMetaObject to provide custom behavior for individual actions. This method supports the Dynamic Language Runtime infrastructure for language implementers and it is not intended to be used directly from your code. (Inherited from DynamicObject.)
	GetType	Gets the Type of the current instance. (Inherited from Object.)
	MemberwiseClone	Creates a shallow copy of the current Object. (Inherited from Object.)
	OnReadAnyValue [▶ 2293]	Handler function for reading ADS 'Any' Values. (Inherited from DynamicSymbol [▶ 2266].)
	OnReadRawValue [▶ 2294]	Handler function for reading Raw symbol value. (Inherited from DynamicSymbol [▶ 2266].)
	OnReadRawValueAsync [▶ 2294]	Handler function reading the raw value of the DynamicSymbol [▶ 2266]. (Inherited from DynamicSymbol [▶ 2266].)
	OnReadValue [▶ 2295]	Handler function for the (Inherited from DynamicSymbol [▶ 2266].)
	OnReadValueAsync [▶ 2296]	Handler function reading the DynamicSymbols [▶ 2266] value asynchronously. (Inherited from DynamicSymbol [▶ 2266].)
	OnSetInstanceName [▶ 2296]	Sets a new InstanceName InstancePath (Inherited from DynamicSymbol [▶ 2266].)
	OnTryReadValue [▶ 2297]	Handler function for the (Inherited from DynamicSymbol [▶ 2266].)
	OnTryWriteValue [▶ 2297]	Handler Function for writing value. (Inherited from DynamicSymbol [▶ 2266].)
	OnWriteRawValue [▶ 2298]	Handler function for reading symbols raw value. (Inherited from DynamicSymbol [▶ 2266].)
	OnWriteRawValueAsync [▶ 2298]	Handler function for writing the raw DynamicSymbol [▶ 2266] value. (Inherited from DynamicSymbol [▶ 2266].)
	OnWriteValue [▶ 2299]	Handler Function for writing value. (Inherited from DynamicSymbol [▶ 2266].)
	OnWriteValueAsync [▶ 2300]	Handler Function for writing value. (Inherited from DynamicSymbol [▶ 2266].)
	ReadAnyValue [▶ 2300]	Reads the value of this Value [▶ 2775] into a new created instance of the managed type (Inherited from DynamicSymbol [▶ 2266].)
	ReadRawValue. [▶ 2301]	Reads the raw value of the IValueSymbol [▶ 2775] (Ads Read / Write) (Inherited from DynamicSymbol [▶ 2266].)
	ReadRawValue(Int32) [▶ 2302]	Reads the Symbols raw value (Inherited from DynamicSymbol [▶ 2266].)
	ReadRawValueAsync [▶ 2302]	Read raw value as an asynchronous operation. (Inherited from DynamicSymbol [▶ 2266].)
	ReadValue. [▶ 2303]	Reads the value of this DynamicSymbol [▶ 2266]. (Inherited from DynamicSymbol [▶ 2266].)

	Name	Description
	ReadValue(Int32) [▶ 2306]	Reads the value of this DynamicSymbol [▶ 2266] . (Inherited from DynamicSymbol [▶ 2266] .)
	ReadValueAsync [▶ 2307]	Reads the Value of the IValueSymbol [▶ 2775] asynchronously. (Inherited from DynamicSymbol [▶ 2266] .)
	ToString [▶ 2307]	Returns a String that represents this instance. (Inherited from DynamicSymbol [▶ 2266] .)
	TryBinaryOperation	Provides implementation for binary operations. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations such as addition and multiplication. (Inherited from DynamicObject .)
	TryConvert	Provides implementation for type conversion operations. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations that convert an object from one type to another. (Inherited from DynamicObject .)
	TryCreateInstance	Provides the implementation for operations that initialize a new instance of a dynamic object. This method is not intended for use in C# or Visual Basic. (Inherited from DynamicObject .)
	TryDeleteIndex	Provides the implementation for operations that delete an object by index. This method is not intended for use in C# or Visual Basic. (Inherited from DynamicObject .)
	TryDeleteMember	Provides the implementation for operations that delete an object member. This method is not intended for use in C# or Visual Basic. (Inherited from DynamicObject .)
	TryGetElement(IList.. Int32..., ISymbol.) [▶ 2173]	Tries to get the array element with the specified indices (jagged array support).
	TryGetElement(.Int3 2., ISymbol.) [▶ 2174]	Tries to get the array element
	TryGetIndex [▶ 2174]	Provides the implementation for operations that get a value by index. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for indexing operations. (Overrides DynamicObject.TryGetIndex(GetIndexBinder, .Object., Object.) .)
	TryGetMember [▶ 2308]	Provides the implementation for operations that get member values. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations such as getting a value for a property. (Inherited from DynamicSymbol [▶ 2266] .)
	TryInvoke	Provides the implementation for operations that invoke an object. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations such as invoking an object or a delegate. (Inherited from DynamicObject .)
	TryInvokeMember	Provides the implementation for operations that invoke a member. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations such as calling a method. (Inherited from DynamicObject .)
	TryReadValue [▶ 2309]	Reads the Value of the IValueSymbol [▶ 2775] (Inherited from DynamicSymbol [▶ 2266] .)
	TrySetIndex [▶ 2175]	Provides the implementation for operations that set a value by index. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations that access objects by a specified index. (Overrides DynamicObject.TrySetIndex(SetIndexBinder, .Object., Object.) .)

	Name	Description
	TrySetMember	Provides the implementation for operations that set member values. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations such as setting a value for a property. (Inherited from DynamicObject.)
	TryUnaryOperation	Provides implementation for unary operations. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations such as negation, increment, or decrement. (Inherited from DynamicObject.)
 	TryWriteValue [▶ 2309]	Writes the specified value to the DynamicSymbol [▶ 2266]. (Inherited from DynamicSymbol [▶ 2266].)
	UpdateAnyValue [▶ 2312]	Reads the value of this Value [▶ 2775] into the specified managed value. (Inherited from DynamicSymbol [▶ 2266].)
	WriteAnyValue [▶ 2313]	Writes the value represented by the managed value to this Value [▶ 2775] (Inherited from DynamicSymbol [▶ 2266].)
	WriteRawValue(Byte) [▶ 2314]	Writes the raw value of the IValueSymbol [▶ 2775] (Ads Read / Write) (Inherited from DynamicSymbol [▶ 2266].)
	WriteRawValue(Byte, Int32) [▶ 2314]	Writes the raw value of the IValueSymbol [▶ 2775] (Ads Read / Write) (Inherited from DynamicSymbol [▶ 2266].)
	WriteRawValueAsync [▶ 2315]	Writes the raw value of the IValueSymbol [▶ 2775] (Ads Read / Write) (Inherited from DynamicSymbol [▶ 2266].)
	WriteValue(Object) [▶ 2316]	Writes the specified value to the DynamicSymbol [▶ 2266]. (Inherited from DynamicSymbol [▶ 2266].)
 	WriteValue(Object, Int32) [▶ 2319]	Writes the specified value to the DynamicSymbol [▶ 2266]. (Inherited from DynamicSymbol [▶ 2266].)
	WriteValueAsync [▶ 2321]	Writes the Value of the IValueSymbol [▶ 2775] (Inherited from DynamicSymbol [▶ 2266].)

Events

	Name	Description
	RawValueChanged [▶ 2323]	Occurs when the RawValue of the IValueSymbol [▶ 2775] has changed. (Inherited from DynamicSymbol [▶ 2266].)
	ValueChanged [▶ 2323]	Occurs when the (Primitive) value of the IValueSymbol [▶ 2775] has changed. (Inherited from DynamicSymbol [▶ 2266].)

Fields

	Name	Description
	syncObject [▶ 2327]	Synchronization object (Inherited from DynamicSymbol [▶ 2266].)

Extension Methods

	Name	Description
	ReferencesExternalData [▶ 3038]	Indicates, that the Instance value includes process memory data, that cannot be read in one memory block. (Defined by DataTypeExtension [▶ 3021].)

Reference

[TwinCAT.TypeSystem Namespace](#) [▶ 2083]

6.11.13.1 DynamicArrayInstance Properties

The [DynamicArrayInstance](#) [▶ 2160] type exposes the following members.

Properties

	Name	Description
	InnerSymbol [▶ 2274]	Gets the inner symbol of this DynamicSymbol [▶ 2266] (Inherited from DynamicSymbol [▶ 2266].)
	AccessRights [▶ 2274]	Gets the access rights. (Inherited from DynamicSymbol [▶ 2266].)
	AllowIOAccess [▶ 2275]	Indicates, that the aggregates symbols is an IProcessImageAddress (and most probably IAdsSymbol) (Inherited from DynamicSymbol [▶ 2266].)
	Attributes [▶ 2275]	Gets the Symbol Attributes (Inherited from DynamicSymbol [▶ 2266].)
	BitSize [▶ 2276]	Gets the size of the IDataType [▶ 2475] in bits. (Inherited from DynamicSymbol [▶ 2266].)
	ByteSize [▶ 2276]	Gets the (aligned) size of of the Type/Instance in Bytes (Inherited from DynamicSymbol [▶ 2266].)
	Category [▶ 2277]	Gets the category. (Inherited from DynamicSymbol [▶ 2266].)
	Comment [▶ 2277]	Gets the comment of the IInstance [▶ 2549] (Inherited from DynamicSymbol [▶ 2266].)
	Connection [▶ 2277]	Gets the connection bound to this DynamicSymbol [▶ 2266] (Inherited from DynamicSymbol [▶ 2266].)
	DataType [▶ 2278]	Gets the IDataType [▶ 2475] of the IInstance [▶ 2549]. (Inherited from DynamicSymbol [▶ 2266].)
	Dimensions [▶ 2167]	Gets the dimensions as read only collection.
	Elements [▶ 2168]	Gets the contained Array Elements as read only collection.
	ElementType [▶ 2168]	Gets the type of the contained elements.
	HasValue [▶ 2278]	Gets a value indicating whether this instance has value (only the non VirtualInstances , what means the Symbols with locations). (Inherited from DynamicSymbol [▶ 2266].)
	InstanceName [▶ 2279]	Gets the name of the instance (without periods (.)) (Inherited from DynamicSymbol [▶ 2266].)
	InstancePath [▶ 2279]	Gets the relative / absolute access path to the instance (with periods (.)) (Inherited from DynamicSymbol [▶ 2266].)
	IsBitType [▶ 2280]	Gets a value indicating whether this instance is not basing on a full DataType but instead of some sort of bit mapping (Inherited from DynamicSymbol [▶ 2266].)
	IsByteAligned [▶ 2280]	Indicates that the Size of the Object is Byte aligned ($\text{BitSize} \% 8 == 0$) (Inherited from DynamicSymbol [▶ 2266].)
	IsContainerType [▶ 2281]	Gets a value indicating whether this Symbol is acontainer type. (Inherited from DynamicSymbol [▶ 2266].)
	IsPersistent [▶ 2281]	Gets a value indicating whether this ISymbol [▶ 2691] is persistent. (Inherited from DynamicSymbol [▶ 2266].)

	Name	Description
	IsPointer [▶ 2282]	Indicates that the IInstance [▶ 2549] represents a Pointer type (Pointer TO) (Inherited from DynamicSymbol [▶ 2266].)
	IsPrimitiveType [▶ 2282]	Gets a value indicating whether this instance is a primitive type. (Inherited from DynamicSymbol [▶ 2266].)
	IsReadOnly [▶ 2283]	Indicates that this instance is read only. (Inherited from DynamicSymbol [▶ 2266].)
	IsRecursive [▶ 2283]	Gets a value indicating whether this instance is recursive. (Inherited from DynamicSymbol [▶ 2266].)
	IsReference [▶ 2284]	Indicates that the IInstance [▶ 2549] represents a Reference type (REFERENCE TO) (Inherited from DynamicSymbol [▶ 2266].)
	IsStatic [▶ 2284]	Gets a value indicating whether this instance is static. (Inherited from DynamicSymbol [▶ 2266].)
	Item [▶ 2169]	Gets the ISymbol [▶ 2691] with the specified indices.
	NormalizedName [▶ 2285]	Gets the normalized instance name (fixed name for dynamic property access that doesn't contain invalid characters), (Inherited from DynamicSymbol [▶ 2266].)
	NotificationSettings [▶ 2285]	Gets the notification settings. (Inherited from DynamicSymbol [▶ 2266].)
	Parent [▶ 2286]	Gets the parent Symbol (Inherited from DynamicSymbol [▶ 2266].)
	Size [▶ 2286]	Gets the size of the IInstance [▶ 2549] in bytes. (Inherited from DynamicSymbol [▶ 2266].)
	SubSymbols [▶ 2287]	Gets the SubSymbols of the ISymbol [▶ 2691] (Inherited from DynamicSymbol [▶ 2266].)
	TypeName [▶ 2287]	Gets the name of the DataType [▶ 2475] that is used for this IInstance [▶ 2549]. (Inherited from DynamicSymbol [▶ 2266].)
	ValueEncoding [▶ 2288]	Gets the value encoding. (Inherited from DynamicSymbol [▶ 2266].)

6.11.13.2 DynamicArrayInstance Methods

The [DynamicArrayInstance](#) [▶ 2160] type exposes the following members.

Methods

	Name	Description
	Equals [▶ 2292]	Equals (Inherited from DynamicSymbol [▶ 2266].)
	Finalize	Allows an object to try to free resources and perform other cleanup operations before it is reclaimed by garbage collection. (Inherited from Object.)

	Name	Description
	GetDynamicMemberNames [▶ 2293]	Returns the enumeration of all dynamic member names. (Inherited from DynamicSymbol [▶ 2266].)
	GetHashCode [▶ 2293]	Gets the HashCode of the Address (Inherited from DynamicSymbol [▶ 2266].)
	GetMetaObject	Provides a DynamicMetaObject that dispatches to the dynamic virtual methods. The object can be encapsulated inside another DynamicMetaObject to provide custom behavior for individual actions. This method supports the Dynamic Language Runtime infrastructure for language implementers and it is not intended to be used directly from your code. (Inherited from DynamicObject .)
	GetType	Gets the Type of the current instance. (Inherited from Object .)
	MemberwiseClone	Creates a shallow copy of the current Object. (Inherited from Object .)
	OnReadAnyValue [▶ 2293]	Handler function for reading ADS 'Any' Values. (Inherited from DynamicSymbol [▶ 2266].)
	OnReadRawValue [▶ 2294]	Handler function for reading Raw symbol value. (Inherited from DynamicSymbol [▶ 2266].)
	OnReadRawValueAsync [▶ 2294]	Handler function reading the raw value of the DynamicSymbol [▶ 2266]. (Inherited from DynamicSymbol [▶ 2266].)
	OnReadValue [▶ 2295]	Handler function for the (Inherited from DynamicSymbol [▶ 2266].)
	OnReadValueAsync [▶ 2296]	Handler function reading the DynamicSymbols [▶ 2266] value asynchronously. (Inherited from DynamicSymbol [▶ 2266].)
	OnSetInstanceName [▶ 2296]	Sets a new InstanceName InstancePath (Inherited from DynamicSymbol [▶ 2266].)
	OnTryReadValue [▶ 2297]	Handler function for the (Inherited from DynamicSymbol [▶ 2266].)
	OnTryWriteValue [▶ 2297]	Handler Function for writing value. (Inherited from DynamicSymbol [▶ 2266].)
	OnWriteRawValue [▶ 2298]	Handler function for reading symbols raw value. (Inherited from DynamicSymbol [▶ 2266].)
	OnWriteRawValueAsync [▶ 2298]	Handler function for writing the raw DynamicSymbol [▶ 2266] value. (Inherited from DynamicSymbol [▶ 2266].)
	OnWriteValue [▶ 2299]	Handler Function for writing value. (Inherited from DynamicSymbol [▶ 2266].)
	OnWriteValueAsync [▶ 2300]	Handler Function for writing value. (Inherited from DynamicSymbol [▶ 2266].)
	ReadAnyValue [▶ 2300]	Reads the value of this Value [▶ 2775] into a new created instance of the managed type (Inherited from DynamicSymbol [▶ 2266].)
	ReadRawValue. [▶ 2301]	Reads the raw value of the IValueSymbol [▶ 2775] (Ads Read / Write) (Inherited from DynamicSymbol [▶ 2266].)
	ReadRawValue(Int32) [▶ 2302]	Reads the Symbols raw value (Inherited from DynamicSymbol [▶ 2266].)
	ReadRawValueAsync [▶ 2302]	Read raw value as an asynchronous operation. (Inherited from DynamicSymbol [▶ 2266].)

	Name	Description
	ReadValue. [▶ 2303]	Reads the value of this DynamicSymbol [▶ 2266]. (Inherited from DynamicSymbol [▶ 2266].)
	ReadValue(Int32) [▶ 2306]	Reads the value of this DynamicSymbol [▶ 2266]. (Inherited from DynamicSymbol [▶ 2266].)
	ReadValueAsync [▶ 2307]	Reads the Value of the IValueSymbol [▶ 2775] asynchronously. (Inherited from DynamicSymbol [▶ 2266].)
	ToString [▶ 2307]	Returns a String that represents this instance. (Inherited from DynamicSymbol [▶ 2266].)
	TryBinaryOperation	Provides implementation for binary operations. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations such as addition and multiplication. (Inherited from DynamicObject .)
	TryConvert	Provides implementation for type conversion operations. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations that convert an object from one type to another. (Inherited from DynamicObject .)
	TryCreateInstance	Provides the implementation for operations that initialize a new instance of a dynamic object. This method is not intended for use in C# or Visual Basic. (Inherited from DynamicObject .)
	TryDeleteIndex	Provides the implementation for operations that delete an object by index. This method is not intended for use in C# or Visual Basic. (Inherited from DynamicObject .)
	TryDeleteMember	Provides the implementation for operations that delete an object member. This method is not intended for use in C# or Visual Basic. (Inherited from DynamicObject .)
	TryGetElement(IList.. Int32.., ISymbol.) [▶ 2173]	Tries to get the array element with the specified indices (jagged array support).
	TryGetElement(Int32.., ISymbol.) [▶ 2174]	Tries to get the array element
	TryGetIndex [▶ 2174]	Provides the implementation for operations that get a value by index. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for indexing operations. (Overrides DynamicObject.TryGetIndex(GetIndexBinder, .Object., Object.) .)
	TryGetMember [▶ 2308]	Provides the implementation for operations that get member values. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations such as getting a value for a property. (Inherited from DynamicSymbol [▶ 2266].)
	TryInvoke	Provides the implementation for operations that invoke an object. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations such as invoking an object or a delegate. (Inherited from DynamicObject .)
	TryInvokeMember	Provides the implementation for operations that invoke a member. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations such as calling a method. (Inherited from DynamicObject .)
	TryReadValue [▶ 2309]	Reads the Value of the IValueSymbol [▶ 2775] (Inherited from DynamicSymbol [▶ 2266].)
	TrySetIndex [▶ 2175]	Provides the implementation for operations that set a value by index. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations that access objects by a specified index. (Overrides DynamicObject.TrySetIndex(SetIndexBinder, .Object., Object.) .)

	Name	Description
	TrySetMember	Provides the implementation for operations that set member values. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations such as setting a value for a property. (Inherited from DynamicObject.)
	TryUnaryOperation	Provides implementation for unary operations. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations such as negation, increment, or decrement. (Inherited from DynamicObject.)
 	TryWriteValue [▶ 2309]	Writes the specified value to the DynamicSymbol [▶ 2266]. (Inherited from DynamicSymbol [▶ 2266].)
	UpdateAnyValue [▶ 2312]	Reads the value of this Value [▶ 2775] into the specified managed value. (Inherited from DynamicSymbol [▶ 2266].)
	WriteAnyValue [▶ 2313]	Writes the value represented by the managed value to this Value [▶ 2775] (Inherited from DynamicSymbol [▶ 2266].)
	WriteRawValue(Byte) [▶ 2314]	Writes the raw value of the IValueSymbol [▶ 2775] (Ads Read / Write) (Inherited from DynamicSymbol [▶ 2266].)
	WriteRawValue(Byte, Int32) [▶ 2314]	Writes the raw value of the IValueSymbol [▶ 2775] (Ads Read / Write) (Inherited from DynamicSymbol [▶ 2266].)
	WriteRawValueAsync [▶ 2315]	Writes the raw value of the IValueSymbol [▶ 2775] (Ads Read / Write) (Inherited from DynamicSymbol [▶ 2266].)
	WriteValue(Object) [▶ 2316]	Writes the specified value to the DynamicSymbol [▶ 2266]. (Inherited from DynamicSymbol [▶ 2266].)
 	WriteValue(Object, Int32) [▶ 2319]	Writes the specified value to the DynamicSymbol [▶ 2266]. (Inherited from DynamicSymbol [▶ 2266].)
	WriteValueAsync [▶ 2321]	Writes the Value of the IValueSymbol [▶ 2775] (Inherited from DynamicSymbol [▶ 2266].)

Extension Methods

	Name	Description
	ReferencesExternalData [▶ 3038]	Indicates, that the Instance value includes process memory data, that cannot be read in one memory block. (Defined by DataTypeExtension [▶ 3021].)

6.11.13.2.1.1 DynamicArrayInstance.TryGetElement Method (IList..Int32.., ISymbol.)

Tries to get the array element with the specified indices (jagged array support).

Namespace: [TwinCAT.TypeSystem](#) [▶ 2083]

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public bool TryGetElement(
    IList<int[]> jaggedIndices,
    out ISymbol?? symbol
)
```

Parameters

jaggedIndices	Type: System.Collections.Generic.IList..Int32.. The jagged indices list.
symbol	Type: TwinCAT.TypeSystem.ISymbol [▶ 2691]. The symbol.

Return Value

Type: Boolean
true if found, false if the jagged indices specifiers is out-of-range.

Exceptions

Exception	Condition
ArgumentNullException	jaggedIndices
ArgumentOutOfRangeException	jaggedIndices

Reference

[TwinCAT.TypeSystem Namespace \[► 2083\]](#)

6.11.13.2.1.2 DynamicArrayInstance.TryGetElement Method (.Int32., ISymbol.)

Tries to get the array element

Namespace: [TwinCAT.TypeSystem \[► 2083\]](#)

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public bool TryGetElement(
    int[] indices,
    out ISymbol?? symbol
)
```

Parameters

indices	Type: <code>.System.Int32</code> . The indices.
symbol	Type: TwinCAT.TypeSystem.ISymbol [► 2691] . The found Array element symbol (out-parameter).

Return Value

Type: Boolean

true if found, false if the indices specifiers is out-of-range.

6.11.13.2.2 DynamicArrayInstance.TryGetIndex Method

Provides the implementation for operations that get a value by index. Classes derived from the `DynamicObject` class can override this method to specify dynamic behavior for indexing operations.

Namespace: [TwinCAT.TypeSystem \[► 2083\]](#)

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public override bool TryGetIndex(
    GetIndexBinder binder,
    Object[] indexes,
    out Object?? result
)
```

Parameters

binder	Type: <code>System.Dynamic.GetIndexBinder</code> Provides information about the operation.
--------	---

indexes	Type: <code>.System.Object</code> . The indexes that are used in the operation. For example, for the <code>sampleObject[3]</code> operation in C# (<code>sampleObject(3)</code> in Visual Basic), where <code>sampleObject</code> is derived from the <code>DynamicObject</code> class, <code>indexes[0]</code> is equal to 3.
result	Type: <code>System.Object</code> . The result of the index operation.

Return Value

Type: Boolean

true if the operation is successful; otherwise, false. If this method returns false, the run-time binder of the language determines the behavior. (In most cases, a run-time exception is thrown.)

Reference

[TwinCAT.TypeSystem Namespace](#) |> 2083]

6.11.13.2.3 DynamicArrayInstance.TrySetIndex Method

Provides the implementation for operations that set a value by index. Classes derived from the `DynamicObject` class can override this method to specify dynamic behavior for operations that access objects by a specified index.

Namespace: [TwinCAT.TypeSystem](#) |> 2083]

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public override bool TrySetIndex(
    SetIndexBinder binder,
    Object[] indexes,
    Object? value
)
```

Parameters

binder	Type: <code>System.Dynamic.SetIndexBinder</code> Provides information about the operation.
indexes	Type: <code>.System.Object</code> . The indexes that are used in the operation. For example, for the <code>sampleObject[3] = 10</code> operation in C# (<code>sampleObject(3) = 10</code> in Visual Basic), where <code>sampleObject</code> is derived from the <code>DynamicObject</code> class, <code>indexes[0]</code> is equal to 3.
value	Type: <code>System.Object</code> The value to set to the object that has the specified index. For example, for the <code>sampleObject[3] = 10</code> operation in C# (<code>sampleObject(3) = 10</code> in Visual Basic), where <code>sampleObject</code> is derived from the <code>DynamicObject</code> class, <code>value</code> is equal to 10.

Return Value

Type: Boolean

true if the operation is successful; otherwise, false. If this method returns false, the run-time binder of the language determines the behavior. (In most cases, a language-specific run-time exception is thrown.)

[TwinCAT.TypeSystem.DynamicArrayInstance \[► 2160\]](#)
 TwinCAT.TypeSystem.DynamicOversamplingArrayInstance

Namespace: [TwinCAT.TypeSystem \[► 2083\]](#)

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public sealed class DynamicOversamplingArrayInstance : DynamicArrayInstance,
    IOversamplingArrayInstance, IArrayInstance, ISymbol, IAttributedInstance, IInstance,
    IBitSize
```

The [DynamicOversamplingArrayInstance](#) type exposes the following members.

Properties

	Name	Description
	InnerSymbol [▶ 2274]	Gets the inner symbol of this DynamicSymbol [▶ 2266] (Inherited from DynamicSymbol [▶ 2266] .)
	AccessRights [▶ 2274]	Gets the access rights. (Inherited from DynamicSymbol [▶ 2266] .)
	Attributes [▶ 2275]	Gets the Symbol Attributes (Inherited from DynamicSymbol [▶ 2266] .)
	BitSize [▶ 2276]	Gets the size of the IDataType [▶ 2475] in bits. (Inherited from DynamicSymbol [▶ 2266] .)
	ByteSize [▶ 2276]	Gets the (aligned) size of of the Type/Instance in Bytes (Inherited from DynamicSymbol [▶ 2266] .)
	Category [▶ 2277]	Gets the category. (Inherited from DynamicSymbol [▶ 2266] .)
	Comment [▶ 2277]	Gets the comment of the IInstance [▶ 2549] (Inherited from DynamicSymbol [▶ 2266] .)
	Connection [▶ 2277]	Gets the connection bound to this DynamicSymbol [▶ 2266] (Inherited from DynamicSymbol [▶ 2266] .)
	DataType [▶ 2278]	Gets the IDataType [▶ 2475] of the IInstance [▶ 2549] . (Inherited from DynamicSymbol [▶ 2266] .)
	Dimensions [▶ 2167]	Gets the dimensions as read only collection. (Inherited from DynamicArrayInstance [▶ 2160] .)
	Elements [▶ 2168]	Gets the contained Array Elements as read only collection. (Inherited from DynamicArrayInstance [▶ 2160] .)
	ElementType [▶ 2168]	Gets the type of the contained elements. (Inherited from DynamicArrayInstance [▶ 2160] .)
	HasValue [▶ 2278]	Gets a value indicating whether this instance has value (only the non VirtualInstances, what means the Symbols with locations). (Inherited from DynamicSymbol [▶ 2266] .)
	InstanceName [▶ 2279]	Gets the name of the instance (without periods (.)) (Inherited from DynamicSymbol [▶ 2266] .)
	InstancePath [▶ 2279]	Gets the relative / absolute access path to the instance (with periods (.)) (Inherited from DynamicSymbol [▶ 2266] .)
	IsBitType [▶ 2280]	Gets a value indicating whether this instance is not basing on a full DataType but instead of some sort of bit mapping (Inherited from DynamicSymbol [▶ 2266] .)
	IsByteAligned [▶ 2280]	Indicates that the Size of the Object is Byte aligned ($\text{BitSize} \% 8 == 0$) (Inherited from DynamicSymbol [▶ 2266] .)
	IsContainerType [▶ 2281]	Gets a value indicating whether this Symbol is acontainer type. (Inherited from DynamicSymbol [▶ 2266] .)
	IsPersistent [▶ 2281]	Gets a value indicating whether this ISymbol [▶ 2691] is persistent. (Inherited from DynamicSymbol [▶ 2266] .)
	IsPointer [▶ 2282]	Indicates that the IInstance [▶ 2549] represents a Pointer type (Pointer TO) (Inherited from DynamicSymbol [▶ 2266] .)
	IsPrimitiveType [▶ 2282]	Gets a value indicating whether this instance is a primitive type. (Inherited from DynamicSymbol [▶ 2266] .)
	IsReadOnly [▶ 2283]	Indicates that this instance is read only. (Inherited from DynamicSymbol [▶ 2266] .)
	IsRecursive [▶ 2283]	Gets a value indicating whether this instance is recursive. (Inherited from DynamicSymbol [▶ 2266] .)

	Name	Description
	IsReference [▶ 2284]	Indicates that the IInstance [▶ 2549] represents a Reference type (REFERENCE TO) (Inherited from DynamicSymbol [▶ 2266].)
	IsStatic [▶ 2284]	Gets a value indicating whether this instance is static. (Inherited from DynamicSymbol [▶ 2266].)
	Item [▶ 2169]	Gets the ISymbol [▶ 2691] with the specified indices. (Inherited from DynamicArrayInstance [▶ 2160].)
	NormalizedName [▶ 2285]	Gets the normalized instance name (fixed name for dynamic property access that doesn't contain invalid characters), (Inherited from DynamicSymbol [▶ 2266].)
	NotificationSettings [▶ 2285]	Gets the notification settings. (Inherited from DynamicSymbol [▶ 2266].)
	OversamplingElement [▶ 2182]	Gets the oversampling element.
	Parent [▶ 2286]	Gets the parent Symbol (Inherited from DynamicSymbol [▶ 2266].)
	Size [▶ 2286]	Gets the size of the IInstance [▶ 2549] in bytes. (Inherited from DynamicSymbol [▶ 2266].)
	SubSymbols [▶ 2287]	Gets the SubSymbols of the ISymbol [▶ 2691] (Inherited from DynamicSymbol [▶ 2266].)
	TypeName [▶ 2287]	Gets the name of the DataType [▶ 2475] that is used for this IInstance [▶ 2549]. (Inherited from DynamicSymbol [▶ 2266].)
	ValueEncoding [▶ 2288]	Gets the value encoding. (Inherited from DynamicSymbol [▶ 2266].)

Methods

	Name	Description
	Equals [▶ 2292]	Equals (Inherited from DynamicSymbol [▶ 2266].)
	GetDynamicMemberNames [▶ 2293]	Returns the enumeration of all dynamic member names. (Inherited from DynamicSymbol [▶ 2266].)
	GetHashCode [▶ 2293]	Gets the GetHashCode of the Address (Inherited from DynamicSymbol [▶ 2266].)
	GetMetaObject	Provides a DynamicMetaObject that dispatches to the dynamic virtual methods. The object can be encapsulated inside another DynamicMetaObject to provide custom behavior for individual actions. This method supports the Dynamic Language Runtime infrastructure for language implementers and it is not intended to be used directly from your code. (Inherited from DynamicObject .)
	GetType	Gets the Type of the current instance. (Inherited from Object .)
	ReadAnyValue [▶ 2300]	Reads the value of this Value [▶ 2775] into a new created instance of the managed type (Inherited from DynamicSymbol [▶ 2266].)
	ReadRawValue [▶ 2301]	Reads the raw value of the IValueSymbol [▶ 2775] (Ads Read / Write) (Inherited from DynamicSymbol [▶ 2266].)
	ReadRawValue(Int32) [▶ 2302]	Reads the Symbols raw value (Inherited from DynamicSymbol [▶ 2266].)

	Name	Description
	ReadRawValueAsyn c [▶ 2302]	Read raw value as an asynchronous operation. (Inherited from DynamicSymbol [▶ 2266].)
	ReadValue. [▶ 2303]	Reads the value of this DynamicSymbol [▶ 2266]. (Inherited from DynamicSymbol [▶ 2266].)
	ReadValue(Int32) [▶ 2306]	Reads the value of this DynamicSymbol [▶ 2266]. (Inherited from DynamicSymbol [▶ 2266].)
	ReadValueAsync [▶ 2307]	Reads the Value of the IValueSymbol [▶ 2775] asynchronously. (Inherited from DynamicSymbol [▶ 2266].)
	ToString [▶ 2307]	Returns a String that represents this instance. (Inherited from DynamicSymbol [▶ 2266].)
	TryBinaryOperation	Provides implementation for binary operations. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations such as addition and multiplication. (Inherited from DynamicObject .)
	TryConvert	Provides implementation for type conversion operations. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations that convert an object from one type to another. (Inherited from DynamicObject .)
	TryCreateInstance	Provides the implementation for operations that initialize a new instance of a dynamic object. This method is not intended for use in C# or Visual Basic. (Inherited from DynamicObject .)
	TryDeleteIndex	Provides the implementation for operations that delete an object by index. This method is not intended for use in C# or Visual Basic. (Inherited from DynamicObject .)
	TryDeleteMember	Provides the implementation for operations that delete an object member. This method is not intended for use in C# or Visual Basic. (Inherited from DynamicObject .)
	TryGetElement(IList.. Int32.., ISymbol.) [▶ 2173]	Tries to get the array element with the specified indices (jagged array support). (Inherited from DynamicArrayInstance [▶ 2160].)
	TryGetElement(.Int3 2., ISymbol.) [▶ 2174]	Tries to get the array element (Inherited from DynamicArrayInstance [▶ 2160].)
	TryGetIndex [▶ 2174]	Provides the implementation for operations that get a value by index. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for indexing operations. (Inherited from DynamicArrayInstance [▶ 2160].)
	TryGetMember [▶ 2308]	Provides the implementation for operations that get member values. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations such as getting a value for a property. (Inherited from DynamicSymbol [▶ 2266].)
	TryInvoke	Provides the implementation for operations that invoke an object. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations such as invoking an object or a delegate. (Inherited from DynamicObject .)
	TryInvokeMember	Provides the implementation for operations that invoke a member. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations such as calling a method. (Inherited from DynamicObject .)
	TryReadValue [▶ 2309]	Reads the Value of the IValueSymbol [▶ 2775] (Inherited from DynamicSymbol [▶ 2266].)

	Name	Description
	TrySetIndex [▶ 2175]	Provides the implementation for operations that set a value by index. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations that access objects by a specified index. (Inherited from DynamicArrayInstance [▶ 2160].)
	TrySetMember	Provides the implementation for operations that set member values. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations such as setting a value for a property. (Inherited from DynamicObject .)
	TryUnaryOperation	Provides implementation for unary operations. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations such as negation, increment, or decrement. (Inherited from DynamicObject .)
 	TryWriteValue [▶ 2309]	Writes the specified value to the DynamicSymbol [▶ 2266]. (Inherited from DynamicSymbol [▶ 2266].)
	UpdateAnyValue [▶ 2312]	Reads the value of this Value [▶ 2775] into the specified managed value. (Inherited from DynamicSymbol [▶ 2266].)
	WriteAnyValue [▶ 2313]	Writes the value represented by the managed value to this Value [▶ 2775] (Inherited from DynamicSymbol [▶ 2266].)
	WriteRawValue(Byte) [▶ 2314]	Writes the raw value of the IValueSymbol [▶ 2775] (Ads Read / Write) (Inherited from DynamicSymbol [▶ 2266].)
	WriteRawValue(Byte, Int32) [▶ 2314]	Writes the raw value of the IValueSymbol [▶ 2775] (Ads Read / Write) (Inherited from DynamicSymbol [▶ 2266].)
	WriteRawValueAsync [▶ 2315]	Writes the raw value of the IValueSymbol [▶ 2775] (Ads Read / Write) (Inherited from DynamicSymbol [▶ 2266].)
	WriteValue(Object) [▶ 2316]	Writes the specified value to the DynamicSymbol [▶ 2266]. (Inherited from DynamicSymbol [▶ 2266].)
 	WriteValue(Object, Int32) [▶ 2319]	Writes the specified value to the DynamicSymbol [▶ 2266]. (Inherited from DynamicSymbol [▶ 2266].)
	WriteValueAsync [▶ 2321]	Writes the Value of the IValueSymbol [▶ 2775] (Inherited from DynamicSymbol [▶ 2266].)

Events

	Name	Description
	RawValueChanged [▶ 2323]	Occurs when the RawValue of the IValueSymbol [▶ 2775] has changed. (Inherited from DynamicSymbol [▶ 2266].)
	ValueChanged [▶ 2323]	Occurs when the (Primitive) value of the IValueSymbol [▶ 2775] has changed. (Inherited from DynamicSymbol [▶ 2266].)

Extension Methods

	Name	Description
	ReferencesExternalData [▶ 3038]	Indicates, that the Instance value includes process memory data, that cannot be read in one memory block. (Defined by DataTypeExtension [▶ 3021].)

6.11.14.1 DynamicOversamplingArrayInstance Properties

The [DynamicOversamplingArrayInstance \[▶ 2176\]](#) type exposes the following members.

Properties

	Name	Description
	InnerSymbol [▶ 2274]	Gets the inner symbol of this DynamicSymbol [▶ 2266] (Inherited from DynamicSymbol [▶ 2266] .)
	AccessRights [▶ 2274]	Gets the access rights. (Inherited from DynamicSymbol [▶ 2266] .)
	Attributes [▶ 2275]	Gets the Symbol Attributes (Inherited from DynamicSymbol [▶ 2266] .)
	BitSize [▶ 2276]	Gets the size of the IDataType [▶ 2475] in bits. (Inherited from DynamicSymbol [▶ 2266] .)
	ByteSize [▶ 2276]	Gets the (aligned) size of of the Type/Instance in Bytes (Inherited from DynamicSymbol [▶ 2266] .)
	Category [▶ 2277]	Gets the category. (Inherited from DynamicSymbol [▶ 2266] .)
	Comment [▶ 2277]	Gets the comment of the IInstance [▶ 2549] (Inherited from DynamicSymbol [▶ 2266] .)
	Connection [▶ 2277]	Gets the connection bound to this DynamicSymbol [▶ 2266] (Inherited from DynamicSymbol [▶ 2266] .)
	DataType [▶ 2278]	Gets the IDataType [▶ 2475] of the IInstance [▶ 2549] . (Inherited from DynamicSymbol [▶ 2266] .)
	Dimensions [▶ 2167]	Gets the dimensions as read only collection. (Inherited from DynamicArrayInstance [▶ 2160] .)
	Elements [▶ 2168]	Gets the contained Array Elements as read only collection. (Inherited from DynamicArrayInstance [▶ 2160] .)
	ElementType [▶ 2168]	Gets the type of the contained elements. (Inherited from DynamicArrayInstance [▶ 2160] .)
	HasValue [▶ 2278]	Gets a value indicating whether this instance has value (only the non VirtualInstances, what means the Symbols with locations). (Inherited from DynamicSymbol [▶ 2266] .)
	InstanceName [▶ 2279]	Gets the name of the instance (without periods (.)) (Inherited from DynamicSymbol [▶ 2266] .)
	InstancePath [▶ 2279]	Gets the relative / absolute access path to the instance (with periods (.)) (Inherited from DynamicSymbol [▶ 2266] .)
	IsBitType [▶ 2280]	Gets a value indicating whether this instance is not basing on a full DataType but instead of some sort of bit mapping (Inherited from DynamicSymbol [▶ 2266] .)
	IsByteAligned [▶ 2280]	Indicates that the Size of the Object is Byte aligned ($\text{BitSize} \% 8 == 0$) (Inherited from DynamicSymbol [▶ 2266] .)
	IsContainerType [▶ 2281]	Gets a value indicating whether this Symbol is acontainer type. (Inherited from DynamicSymbol [▶ 2266] .)
	IsPersistent [▶ 2281]	Gets a value indicating whether this ISymbol [▶ 2691] is persistent. (Inherited from DynamicSymbol [▶ 2266] .)
	IsPointer [▶ 2282]	Indicates that the IInstance [▶ 2549] represents a Pointer type (Pointer TO) (Inherited from DynamicSymbol [▶ 2266] .)

	Name	Description
	IsPrimitiveType [▶ 2282]	Gets a value indicating whether this instance is a primitive type. (Inherited from DynamicSymbol [▶ 2266].)
	IsReadOnly [▶ 2283]	Indicates that this instance is read only. (Inherited from DynamicSymbol [▶ 2266].)
	IsRecursive [▶ 2283]	Gets a value indicating whether this instance is recursive. (Inherited from DynamicSymbol [▶ 2266].)
	IsReference [▶ 2284]	Indicates that the Instance [▶ 2549] represents a Reference type (REFERENCE TO) (Inherited from DynamicSymbol [▶ 2266].)
	IsStatic [▶ 2284]	Gets a value indicating whether this instance is static. (Inherited from DynamicSymbol [▶ 2266].)
	Item [▶ 2169]	Gets the ISymbol [▶ 2691] with the specified indices. (Inherited from DynamicArrayInstance [▶ 2160].)
	NormalizedName [▶ 2285]	Gets the normalized instance name (fixed name for dynamic property access that doesn't contain invalid characters), (Inherited from DynamicSymbol [▶ 2266].)
	NotificationSettings [▶ 2285]	Gets the notification settings. (Inherited from DynamicSymbol [▶ 2266].)
	OversamplingElement [▶ 2182]	Gets the oversampling element.
	Parent [▶ 2286]	Gets the parent Symbol (Inherited from DynamicSymbol [▶ 2266].)
	Size [▶ 2286]	Gets the size of the Instance [▶ 2549] in bytes. (Inherited from DynamicSymbol [▶ 2266].)
	SubSymbols [▶ 2287]	Gets the SubSymbols of the ISymbol [▶ 2691] (Inherited from DynamicSymbol [▶ 2266].)
	TypeName [▶ 2287]	Gets the name of the DataType [▶ 2475] that is used for this Instance [▶ 2549]. (Inherited from DynamicSymbol [▶ 2266].)
	ValueEncoding [▶ 2288]	Gets the value encoding. (Inherited from DynamicSymbol [▶ 2266].)

6.11.14.2 DynamicOversamplingArrayInstance Methods

The [DynamicOversamplingArrayInstance](#) [[▶ 2176](#)] type exposes the following members.

Methods

	Name	Description
	Equals [▶ 2292]	Equals (Inherited from DynamicSymbol [▶ 2266].)
	GetDynamicMemberNames [▶ 2293]	Returns the enumeration of all dynamic member names. (Inherited from DynamicSymbol [▶ 2266].)
	GetHashCode [▶ 2293]	Gets the HashCode of the Address (Inherited from DynamicSymbol [▶ 2266].)
	GetMetaObject	Provides a DynamicMetaObject that dispatches to the dynamic virtual methods. The object can be encapsulated inside another DynamicMetaObject to provide custom behavior for individual actions. This method supports the Dynamic Language Runtime infrastructure for language implementers and it is not intended to be used directly from your code. (Inherited from DynamicObject .)
	GetType	Gets the Type of the current instance. (Inherited from Object .)
	ReadAnyValue [▶ 2300]	Reads the value of this Value [▶ 2775] into a new created instance of the managed type (Inherited from DynamicSymbol [▶ 2266].)
	ReadRawValue. [▶ 2301]	Reads the raw value of the IValueSymbol [▶ 2775] (Ads Read / Write) (Inherited from DynamicSymbol [▶ 2266].)
	ReadRawValue(Int32) [▶ 2302]	Reads the Symbols raw value (Inherited from DynamicSymbol [▶ 2266].)
	ReadRawValueAsyn c [▶ 2302]	Read raw value as an asynchronous operation. (Inherited from DynamicSymbol [▶ 2266].)
	ReadValue. [▶ 2303]	Reads the value of this DynamicSymbol [▶ 2266]. (Inherited from DynamicSymbol [▶ 2266].)
	ReadValue(Int32) [▶ 2306]	Reads the value of this DynamicSymbol [▶ 2266]. (Inherited from DynamicSymbol [▶ 2266].)

	Name	Description
	ReadValueAsync [▶ 2307]	Reads the Value of the IValueSymbol [▶ 2775] asynchronously. (Inherited from DynamicSymbol [▶ 2266].)
	ToString [▶ 2307]	Returns a String that represents this instance. (Inherited from DynamicSymbol [▶ 2266].)
	TryBinaryOperation	Provides implementation for binary operations. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations such as addition and multiplication. (Inherited from DynamicObject .)
	TryConvert	Provides implementation for type conversion operations. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations that convert an object from one type to another. (Inherited from DynamicObject .)
	TryCreateInstance	Provides the implementation for operations that initialize a new instance of a dynamic object. This method is not intended for use in C# or Visual Basic. (Inherited from DynamicObject .)
	TryDeleteIndex	Provides the implementation for operations that delete an object by index. This method is not intended for use in C# or Visual Basic. (Inherited from DynamicObject .)
	TryDeleteMember	Provides the implementation for operations that delete an object member. This method is not intended for use in C# or Visual Basic. (Inherited from DynamicObject .)
	TryGetElement(IList.. Int32.. ISymbol.) [▶ 2173]	Tries to get the array element with the specified indices (jagged array support). (Inherited from DynamicArrayInstance [▶ 2160].)
	TryGetElement(.Int32.. ISymbol.) [▶ 2174]	Tries to get the array element (Inherited from DynamicArrayInstance [▶ 2160].)
	TryGetIndex [▶ 2174]	Provides the implementation for operations that get a value by index. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for indexing operations. (Inherited from DynamicArrayInstance [▶ 2160].)
	TryGetMember [▶ 2308]	Provides the implementation for operations that get member values. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations such as getting a value for a property. (Inherited from DynamicSymbol [▶ 2266].)
	TryInvoke	Provides the implementation for operations that invoke an object. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations such as invoking an object or a delegate. (Inherited from DynamicObject .)
	TryInvokeMember	Provides the implementation for operations that invoke a member. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations such as calling a method. (Inherited from DynamicObject .)
	TryReadValue [▶ 2309]	Reads the Value of the IValueSymbol [▶ 2775] (Inherited from DynamicSymbol [▶ 2266].)
	TrySetIndex [▶ 2175]	Provides the implementation for operations that set a value by index. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations that access objects by a specified index. (Inherited from DynamicArrayInstance [▶ 2160].)
	TrySetMember	Provides the implementation for operations that set member values. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations such as setting a value for a property. (Inherited from DynamicObject .)

	Name	Description
	TryUnaryOperation	Provides implementation for unary operations. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations such as negation, increment, or decrement. (Inherited from DynamicObject.)
 	TryWriteValue [▶ 2309]	Writes the specified value to the DynamicSymbol [▶ 2266]. (Inherited from DynamicSymbol [▶ 2266].)
	UpdateAnyValue [▶ 2312]	Reads the value of this Value [▶ 2775] into the specified managed value. (Inherited from DynamicSymbol [▶ 2266].)
	WriteAnyValue [▶ 2313]	Writes the value represented by the managed value to this Value [▶ 2775] (Inherited from DynamicSymbol [▶ 2266].)
	WriteRawValue(Byte) [▶ 2314]	Writes the raw value of the IValueSymbol [▶ 2775] (Ads Read / Write) (Inherited from DynamicSymbol [▶ 2266].)
	WriteRawValue(Byte, Int32) [▶ 2314]	Writes the raw value of the IValueSymbol [▶ 2775] (Ads Read / Write) (Inherited from DynamicSymbol [▶ 2266].)
	WriteRawValueAsync [▶ 2315]	Writes the raw value of the IValueSymbol [▶ 2775] (Ads Read / Write) (Inherited from DynamicSymbol [▶ 2266].)
	WriteValue(Object) [▶ 2316]	Writes the specified value to the DynamicSymbol [▶ 2266]. (Inherited from DynamicSymbol [▶ 2266].)
 	WriteValue(Object, Int32) [▶ 2319]	Writes the specified value to the DynamicSymbol [▶ 2266]. (Inherited from DynamicSymbol [▶ 2266].)
	WriteValueAsync [▶ 2321]	Writes the Value of the IValueSymbol [▶ 2775] (Inherited from DynamicSymbol [▶ 2266].)

Extension Methods

	Name	Description
	ReferencesExternalData [▶ 3038]	Indicates, that the Instance value includes process memory data, that cannot be read in one memory block. (Defined by DataTypeExtension [▶ 3021].)

Syntax

C#

```
public sealed class DynamicPointerInstance : DynamicSymbol,
    IPointerInstance, ISymbol, IAttributedInstance, IInstance, IBitSize
```

The DynamicPointerInstance type exposes the following members.

Properties

	Name	Description
	InnerSymbol [► 2274]	Gets the inner symbol of this DynamicSymbol [► 2266] (Inherited from DynamicSymbol [► 2266].)
	AccessRights [► 2274]	Gets the access rights. (Inherited from DynamicSymbol [► 2266].)
	Attributes [► 2275]	Gets the Symbol Attributes (Inherited from DynamicSymbol [► 2266].)
	BitSize [► 2276]	Gets the size of the IDataType [► 2475] in bits. (Inherited from DynamicSymbol [► 2266].)
	ByteSize [► 2276]	Gets the (aligned) size of of the Type/Instance in Bytes (Inherited from DynamicSymbol [► 2266].)
	Category [► 2277]	Gets the category. (Inherited from DynamicSymbol [► 2266].)
	Comment [► 2277]	Gets the comment of the IInstance [► 2549] (Inherited from DynamicSymbol [► 2266].)
	Connection [► 2277]	Gets the connection bound to this DynamicSymbol [► 2266] (Inherited from DynamicSymbol [► 2266].)
	DataType [► 2278]	Gets the IDataType [► 2475] of the IInstance [► 2549]. (Inherited from DynamicSymbol [► 2266].)
	HasValue [► 2278]	Gets a value indicating whether this instance has value (only the non VirtualInstances, what means the Symbols with locations). (Inherited from DynamicSymbol [► 2266].)
	InstanceName [► 2279]	Gets the name of the instance (without periods (.)) (Inherited from DynamicSymbol [► 2266].)
	InstancePath [► 2279]	Gets the relative / absolute access path to the instance (with periods (.)) (Inherited from DynamicSymbol [► 2266].)

	Name	Description
	IsBitType [▶ 2280]	Gets a value indicating whether this instance is not basing on a full DataType but instead of some sort of bit mapping (Inherited from DynamicSymbol [▶ 2266].)
	IsByteAligned [▶ 2280]	Indicates that the Size of the Object is Byte aligned ($\text{BitSize} \% 8 == 0$) (Inherited from DynamicSymbol [▶ 2266].)
	IsContainerType [▶ 2281]	Gets a value indicating whether this Symbol is a container type. (Inherited from DynamicSymbol [▶ 2266].)
	IsPersistent [▶ 2281]	Gets a value indicating whether this ISymbol [▶ 2691] is persistent. (Inherited from DynamicSymbol [▶ 2266].)
	IsPointer [▶ 2282]	Indicates that the IInstance [▶ 2549] represents a Pointer type (Pointer TO) (Inherited from DynamicSymbol [▶ 2266].)
	IsPrimitiveType [▶ 2282]	Gets a value indicating whether this instance is a primitive type. (Inherited from DynamicSymbol [▶ 2266].)
	IsReadOnly [▶ 2283]	Indicates that this instance is read only. (Inherited from DynamicSymbol [▶ 2266].)
	IsRecursive [▶ 2283]	Gets a value indicating whether this instance is recursive. (Inherited from DynamicSymbol [▶ 2266].)
	IsReference [▶ 2284]	Indicates that the IInstance [▶ 2549] represents a Reference type (REFERENCE TO) (Inherited from DynamicSymbol [▶ 2266].)
	IsStatic [▶ 2284]	Gets a value indicating whether this instance is static. (Inherited from DynamicSymbol [▶ 2266].)
	NormalizedName [▶ 2285]	Gets the normalized instance name (fixed name for dynamic property access that doesn't contain invalid characters), (Inherited from DynamicSymbol [▶ 2266].)
	NotificationSettings [▶ 2285]	Gets the notification settings. (Inherited from DynamicSymbol [▶ 2266].)
	Parent [▶ 2286]	Gets the parent Symbol (Inherited from DynamicSymbol [▶ 2266].)
	Reference [▶ 2191]	Gets the resolved reference of Pointer / Reference (or NULL if PVOID)
	Size [▶ 2286]	Gets the size of the IInstance [▶ 2549] in bytes. (Inherited from DynamicSymbol [▶ 2266].)
	SubSymbols [▶ 2287]	Gets the SubSymbols of the ISymbol [▶ 2691] (Inherited from DynamicSymbol [▶ 2266].)
	TypeName [▶ 2287]	Gets the name of the DataType [▶ 2475] that is used for this IInstance [▶ 2549]. (Inherited from DynamicSymbol [▶ 2266].)
	ValueEncoding [▶ 2288]	Gets the value encoding. (Inherited from DynamicSymbol [▶ 2266].)

Methods

	Name	Description
	Equals [▶ 2292]	Equals (Inherited from DynamicSymbol [▶ 2266].)
	GetDynamicMemberNames [▶ 2194]	Returns the enumeration of all dynamic member names. (Overrides DynamicSymbol.GetDynamicMemberNames . [▶ 2293].)
	GetHashCode [▶ 2293]	Gets the HashCode of the Address (Inherited from DynamicSymbol [▶ 2266].)

	Name	Description
	GetMetaObject	Provides a DynamicMetaObject that dispatches to the dynamic virtual methods. The object can be encapsulated inside another DynamicMetaObject to provide custom behavior for individual actions. This method supports the Dynamic Language Runtime infrastructure for language implementers and it is not intended to be used directly from your code. (Inherited from DynamicObject.)
	GetType	Gets the Type of the current instance. (Inherited from Object.)
	ReadAnyValue [▶ 2300]	Reads the value of this Value [▶ 2775] into a new created instance of the managed type (Inherited from DynamicSymbol [▶ 2266].)
	ReadRawValue. [▶ 2301]	Reads the raw value of the IValueSymbol [▶ 2775] (Ads Read / Write) (Inherited from DynamicSymbol [▶ 2266].)
	ReadRawValue(Int32) [▶ 2302]	Reads the Symbols raw value (Inherited from DynamicSymbol [▶ 2266].)
	ReadRawValueAsyn c [▶ 2302]	Read raw value as an asynchronous operation. (Inherited from DynamicSymbol [▶ 2266].)
	ReadValue. [▶ 2303]	Reads the value of this DynamicSymbol [▶ 2266]. (Inherited from DynamicSymbol [▶ 2266].)
	ReadValue(Int32) [▶ 2306]	Reads the value of this DynamicSymbol [▶ 2266]. (Inherited from DynamicSymbol [▶ 2266].)
	ReadValueAsync [▶ 2307]	Reads the Value of the IValueSymbol [▶ 2775] asynchronously. (Inherited from DynamicSymbol [▶ 2266].)
	ToString [▶ 2307]	Returns a String that represents this instance. (Inherited from DynamicSymbol [▶ 2266].)
	TryBinaryOperation	Provides implementation for binary operations. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations such as addition and multiplication. (Inherited from DynamicObject.)
	TryConvert	Provides implementation for type conversion operations. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations that convert an object from one type to another. (Inherited from DynamicObject.)
	TryCreateInstance	Provides the implementation for operations that initialize a new instance of a dynamic object. This method is not intended for use in C# or Visual Basic. (Inherited from DynamicObject.)
	TryDeleteIndex	Provides the implementation for operations that delete an object by index. This method is not intended for use in C# or Visual Basic. (Inherited from DynamicObject.)
	TryDeleteMember	Provides the implementation for operations that delete an object member. This method is not intended for use in C# or Visual Basic. (Inherited from DynamicObject.)
	TryGetIndex	Provides the implementation for operations that get a value by index. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for indexing operations. (Inherited from DynamicObject.)
	TryGetMember [▶ 2195]	Provides the implementation for operations that get member values. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations such as getting a value for a property. (Overrides DynamicSymbol.TryGetMember(GetMemberBinder, Object.) [▶ 2308].)

	Name	Description
	TryInvoke	Provides the implementation for operations that invoke an object. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations such as invoking an object or a delegate. (Inherited from DynamicObject.)
	TryInvokeMember	Provides the implementation for operations that invoke a member. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations such as calling a method. (Inherited from DynamicObject.)
	TryReadValue [▶ 2309]	Reads the Value of the IValueSymbol [▶ 2775] (Inherited from DynamicSymbol [▶ 2266] .)
	TrySetIndex	Provides the implementation for operations that set a value by index. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations that access objects by a specified index. (Inherited from DynamicObject.)
	TrySetMember	Provides the implementation for operations that set member values. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations such as setting a value for a property. (Inherited from DynamicObject.)
	TryUnaryOperation	Provides implementation for unary operations. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations such as negation, increment, or decrement. (Inherited from DynamicObject.)
 	TryWriteValue [▶ 2309]	Writes the specified value to the DynamicSymbol [▶ 2266] . (Inherited from DynamicSymbol [▶ 2266] .)
	UpdateAnyValue [▶ 2312]	Reads the value of this Value [▶ 2775] into the specified managed value. (Inherited from DynamicSymbol [▶ 2266] .)
	WriteAnyValue [▶ 2313]	Writes the value represented by the managed value to this Value [▶ 2775] (Inherited from DynamicSymbol [▶ 2266] .)
	WriteRawValue(Byte) [▶ 2314]	Writes the raw value of the IValueSymbol [▶ 2775] (Ads Read / Write) (Inherited from DynamicSymbol [▶ 2266] .)
	WriteRawValue(Byte, Int32) [▶ 2314]	Writes the raw value of the IValueSymbol [▶ 2775] (Ads Read / Write) (Inherited from DynamicSymbol [▶ 2266] .)
	WriteRawValueAsync [▶ 2315]	Writes the raw value of the IValueSymbol [▶ 2775] (Ads Read / Write) (Inherited from DynamicSymbol [▶ 2266] .)
	WriteValue(Object) [▶ 2316]	Writes the specified value to the DynamicSymbol [▶ 2266] . (Inherited from DynamicSymbol [▶ 2266] .)
 	WriteValue(Object, Int32) [▶ 2319]	Writes the specified value to the DynamicSymbol [▶ 2266] . (Inherited from DynamicSymbol [▶ 2266] .)
	WriteValueAsync [▶ 2321]	Writes the Value of the IValueSymbol [▶ 2775] (Inherited from DynamicSymbol [▶ 2266] .)

Events

	Name	Description
	RawValueChanged [▶ 2323]	Occurs when the RawValue of the IValueSymbol [▶ 2775] has changed. (Inherited from DynamicSymbol [▶ 2266] .)

	Name	Description
	ValueChanged [▶ 2323]	Occurs when the (Primitive) value of the IValueSymbol [▶ 2775] has changed. (Inherited from DynamicSymbol [▶ 2266].)

Extension Methods

	Name	Description
	ReferencesExternalData [▶ 3038]	Indicates, that the Instance value includes process memory data, that cannot be read in one memory block. (Defined by DataTypeExtension [▶ 3021].)

Reference

6.11.15.1 DynamicPointerInstance Properties

The [DynamicPointerInstance](#) [▶ 2186] type exposes the following members.

Properties

	Name	Description
	_InnerSymbol [▶ 2274]	Gets the inner symbol of this DynamicSymbol [▶ 2266] (Inherited from DynamicSymbol [▶ 2266].)
	AccessRights [▶ 2274]	Gets the access rights. (Inherited from DynamicSymbol [▶ 2266].)
	Attributes [▶ 2275]	Gets the Symbol Attributes (Inherited from DynamicSymbol [▶ 2266].)
	BitSize [▶ 2276]	Gets the size of the IDataType [▶ 2475] in bits. (Inherited from DynamicSymbol [▶ 2266].)
	ByteSize [▶ 2276]	Gets the (aligned) size of of the Type/Instance in Bytes (Inherited from DynamicSymbol [▶ 2266].)
	Category [▶ 2277]	Gets the category. (Inherited from DynamicSymbol [▶ 2266].)
	Comment [▶ 2277]	Gets the comment of the IInstance [▶ 2549] (Inherited from DynamicSymbol [▶ 2266].)
	Connection [▶ 2277]	Gets the connection bound to this DynamicSymbol [▶ 2266] (Inherited from DynamicSymbol [▶ 2266].)
	DataType [▶ 2278]	Gets the IDataType [▶ 2475] of the IInstance [▶ 2549]. (Inherited from DynamicSymbol [▶ 2266].)
	HasValue [▶ 2278]	Gets a value indicating whether this instance has value (only the non VirtualInstances, what means the Symbols with locations). (Inherited from DynamicSymbol [▶ 2266].)
	InstanceName [▶ 2279]	Gets the name of the instance (without periods (.)) (Inherited from DynamicSymbol [▶ 2266].)
	InstancePath [▶ 2279]	Gets the relative / absolute access path to the instance (with periods (.)) (Inherited from DynamicSymbol [▶ 2266].)
	IsBitType [▶ 2280]	Gets a value indicating whether this instance is not basing on a full DataType but instead of some sort of bit mapping (Inherited from DynamicSymbol [▶ 2266].)
	IsByteAligned [▶ 2280]	Indicates that the Size of the Object is Byte aligned ($\text{BitSize} \% 8 == 0$) (Inherited from DynamicSymbol [▶ 2266].)

	Name	Description
	IsContainerType [▶ 2281]	Gets a value indicating whether this Symbol is a container type. (Inherited from DynamicSymbol [▶ 2266].)
	IsPersistent [▶ 2281]	Gets a value indicating whether this ISymbol [▶ 2691] is persistent. (Inherited from DynamicSymbol [▶ 2266].)
	IsPointer [▶ 2282]	Indicates that the IInstance [▶ 2549] represents a Pointer type (Pointer TO) (Inherited from DynamicSymbol [▶ 2266].)
	IsPrimitiveType [▶ 2282]	Gets a value indicating whether this instance is a primitive type. (Inherited from DynamicSymbol [▶ 2266].)
	IsReadOnly [▶ 2283]	Indicates that this instance is read only. (Inherited from DynamicSymbol [▶ 2266].)
	IsRecursive [▶ 2283]	Gets a value indicating whether this instance is recursive. (Inherited from DynamicSymbol [▶ 2266].)
	IsReference [▶ 2284]	Indicates that the IInstance [▶ 2549] represents a Reference type (REFERENCE TO) (Inherited from DynamicSymbol [▶ 2266].)
	IsStatic [▶ 2284]	Gets a value indicating whether this instance is static. (Inherited from DynamicSymbol [▶ 2266].)
	NormalizedName [▶ 2285]	Gets the normalized instance name (fixed name for dynamic property access that doesn't contain invalid characters), (Inherited from DynamicSymbol [▶ 2266].)
	NotificationSettings [▶ 2285]	Gets the notification settings. (Inherited from DynamicSymbol [▶ 2266].)
	Parent [▶ 2286]	Gets the parent Symbol (Inherited from DynamicSymbol [▶ 2266].)
	Reference [▶ 2191]	Gets the resolved reference of Pointer / Reference (or NULL if PVOID)
	Size [▶ 2286]	Gets the size of the IInstance [▶ 2549] in bytes. (Inherited from DynamicSymbol [▶ 2266].)
	SubSymbols [▶ 2287]	Gets the SubSymbols of the ISymbol [▶ 2691] (Inherited from DynamicSymbol [▶ 2266].)
	TypeName [▶ 2287]	Gets the name of the DataType [▶ 2475] that is used for this IInstance [▶ 2549]. (Inherited from DynamicSymbol [▶ 2266].)
	ValueEncoding [▶ 2288]	Gets the value encoding. (Inherited from DynamicSymbol [▶ 2266].)

6.11.15.2 DynamicPointerInstance Methods

The [DynamicPointerInstance](#) [▶ 2186] type exposes the following members.

Methods

	Name	Description
	Equals [▶ 2292]	Equals (Inherited from DynamicSymbol [▶ 2266].)
	GetDynamicMemberNames [▶ 2194]	Returns the enumeration of all dynamic member names. (Overrides DynamicSymbol.GetDynamicMemberNames . [▶ 2293].)
	GetHashCode [▶ 2293]	Gets the HashCode of the Address (Inherited from DynamicSymbol [▶ 2266].)
	GetMetaObject	Provides a DynamicMetaObject that dispatches to the dynamic virtual methods. The object can be encapsulated inside another DynamicMetaObject to provide custom behavior for individual actions. This method supports the Dynamic Language Runtime infrastructure for language implementers and it is not intended to be used directly from your code. (Inherited from DynamicObject .)
	GetType	Gets the Type of the current instance. (Inherited from Object .)
	ReadAnyValue [▶ 2300]	Reads the value of this Value [▶ 2775] into a new created instance of the managed type (Inherited from DynamicSymbol [▶ 2266].)
	ReadRawValue . [▶ 2301]	Reads the raw value of the IValueSymbol [▶ 2775] (Ads Read / Write) (Inherited from DynamicSymbol [▶ 2266].)
	ReadRawValue(Int32) [▶ 2302]	Reads the Symbols raw value (Inherited from DynamicSymbol [▶ 2266].)
	ReadRawValueAsync [▶ 2302]	Read raw value as an asynchronous operation. (Inherited from DynamicSymbol [▶ 2266].)
	ReadValue . [▶ 2303]	Reads the value of this DynamicSymbol [▶ 2266]. (Inherited from DynamicSymbol [▶ 2266].)
	ReadValue(Int32) [▶ 2306]	Reads the value of this DynamicSymbol [▶ 2266]. (Inherited from DynamicSymbol [▶ 2266].)
	ReadValueAsync [▶ 2307]	Reads the Value of the IValueSymbol [▶ 2775] asynchronously. (Inherited from DynamicSymbol [▶ 2266].)
	ToString [▶ 2307]	Returns a String that represents this instance. (Inherited from DynamicSymbol [▶ 2266].)

	Name	Description
	TryBinaryOperation	Provides implementation for binary operations. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations such as addition and multiplication. (Inherited from DynamicObject.)
	TryConvert	Provides implementation for type conversion operations. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations that convert an object from one type to another. (Inherited from DynamicObject.)
	TryCreateInstance	Provides the implementation for operations that initialize a new instance of a dynamic object. This method is not intended for use in C# or Visual Basic. (Inherited from DynamicObject.)
	TryDeleteIndex	Provides the implementation for operations that delete an object by index. This method is not intended for use in C# or Visual Basic. (Inherited from DynamicObject.)
	TryDeleteMember	Provides the implementation for operations that delete an object member. This method is not intended for use in C# or Visual Basic. (Inherited from DynamicObject.)
	TryGetIndex	Provides the implementation for operations that get a value by index. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for indexing operations. (Inherited from DynamicObject.)
	TryGetMember [▶ 2195]	Provides the implementation for operations that get member values. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations such as getting a value for a property. (Overrides DynamicSymbol.TryGetMember(GetMemberBinder, Object.) [▶ 2308].)
	TryInvoke	Provides the implementation for operations that invoke an object. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations such as invoking an object or a delegate. (Inherited from DynamicObject.)
	TryInvokeMember	Provides the implementation for operations that invoke a member. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations such as calling a method. (Inherited from DynamicObject.)
	TryReadValue [▶ 2309]	Reads the Value of the IValueSymbol [▶ 2775] (Inherited from DynamicSymbol [▶ 2266].)
	TrySetIndex	Provides the implementation for operations that set a value by index. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations that access objects by a specified index. (Inherited from DynamicObject.)
	TrySetMember	Provides the implementation for operations that set member values. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations such as setting a value for a property. (Inherited from DynamicObject.)
	TryUnaryOperation	Provides implementation for unary operations. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations such as negation, increment, or decrement. (Inherited from DynamicObject.)
 	TryWriteValue [▶ 2309]	Writes the specified value to the DynamicSymbol [▶ 2266] . (Inherited from DynamicSymbol [▶ 2266].)
	UpdateAnyValue [▶ 2312]	Reads the value of this Value [▶ 2775] into the specified managed value. (Inherited from DynamicSymbol [▶ 2266] .)
	WriteAnyValue [▶ 2313]	Writes the value represented by the managed value to this Value [▶ 2775] (Inherited from DynamicSymbol [▶ 2266] .)

	Name	Description
	WriteRawValue(Byte) [▶ 2314]	Writes the raw value of the IValueSymbol [▶ 2775] (Ads Read / Write) (Inherited from DynamicSymbol [▶ 2266] .)
	WriteRawValue(Byte, Int32) [▶ 2314]	Writes the raw value of the IValueSymbol [▶ 2775] (Ads Read / Write) (Inherited from DynamicSymbol [▶ 2266] .)
	WriteRawValueAsync [▶ 2315]	Writes the raw value of the IValueSymbol [▶ 2775] (Ads Read / Write) (Inherited from DynamicSymbol [▶ 2266] .)
	WriteValue(Object) [▶ 2316]	Writes the specified value to the DynamicSymbol [▶ 2266] . (Inherited from DynamicSymbol [▶ 2266] .)
 	WriteValue(Object, Int32) [▶ 2319]	Writes the specified value to the DynamicSymbol [▶ 2266] . (Inherited from DynamicSymbol [▶ 2266] .)
	WriteValueAsync [▶ 2321]	Writes the Value of the IValueSymbol [▶ 2775] (Inherited from DynamicSymbol [▶ 2266] .)

Extension Methods

	Name	Description
	ReferencesExternalData [▶ 3038]	Indicates, that the Instance value includes process memory data, that cannot be read in one memory block. (Defined by DataTypeExtension [▶ 3021] .)

Reference

[DynamicPointerInstance Class \[▶ 2186\]](#)

[TwinCAT.TypeSystem Namespace \[▶ 2083\]](#)

6.11.15.2.1 **DynamicPointerInstance.GetDynamicMemberNames Method**

Returns the enumeration of all dynamic member names.

Namespace: [TwinCAT.TypeSystem \[▶ 2083\]](#)

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public override IEnumerable<string> GetDynamicMemberNames()
```

Return Value

Type: [IEnumerable.String](#).

A sequence that contains dynamic member names.

Reference

[DynamicPointerInstance Class \[▶ 2186\]](#)

[TwinCAT.TypeSystem Namespace \[▶ 2083\]](#)

6.11.15.2 DynamicPointerInstance.TryGetMember Method

Provides the implementation for operations that get member values. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations such as getting a value for a property.

Namespace: [TwinCAT.TypeSystem](#) [[▶ 2083](#)]

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public override bool TryGetMember(
    GetMemberBinder binder,
    out Object?? result
)
```

Parameters

binder	Type: System.Dynamic.GetMemberBinder Provides information about the object that called the dynamic operation. The binder.Name property provides the name of the member on which the dynamic operation is performed. For example, for the Console.WriteLine(sampleObject.SampleProperty) statement, where sampleObject is an instance of the class derived from the DynamicObject class, binder.Name returns "SampleProperty". The binder.IgnoreCase property specifies whether the member name is case-sensitive.
result	Type: System.Object. The result of the get operation. For example, if the method is called for a property, you can assign the property value to result.

Return Value

Type: Boolean

true if the operation is successful; otherwise, false. If this method returns false, the run-time binder of the language determines the behavior. (In most cases, a run-time exception is thrown.)

6.11.16 DynamicPointerValue Class

Class DynamicPointerValue.

Inheritance Hierarchy

System.Object
 System.Dynamic.DynamicObject
 TwinCAT.TypeSystem.DynamicValue [▶ 2347]
 TwinCAT.TypeSystem.DynamicPointerValue

Namespace: TwinCAT.TypeSystem [▶ 2083]

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public class DynamicPointerValue : DynamicValue
```

The DynamicPointerValue type exposes the following members.

Properties

	Name	Description
	Age [▶ 2351]	Gets the age of the value (last successful read of the value) (Inherited from DynamicValue [▶ 2347].)
	CachedRaw [▶ 2351]	Gets the cached Raw internal Data. (Inherited from DynamicValue [▶ 2347].)
	DataType [▶ 2352]	Gets the data type bound to this IValue [▶ 2745] (Inherited from DynamicValue [▶ 2347].)
	IsPrimitive [▶ 2353]	Gets a value indicating whether this IValue [▶ 2745] is a primitive value. (Inherited from DynamicValue [▶ 2347].)
	ParentValue [▶ 2356]	Gets the parent value. (Inherited from DynamicValue [▶ 2347].)
	ResolvedType [▶ 2353]	Gets the resolved type. (Inherited from DynamicValue [▶ 2347].)
	Symbol [▶ 2353]	Gets the symbol that is bound to this value. (Inherited from DynamicValue [▶ 2347].)
	TimeStamp [▶ 2354]	Gets the Time stamp of the last successful read of the Value. (Inherited from DynamicValue [▶ 2347].)
	UpdateMode [▶ 2354]	Gets / Sets the update mode (Inherited from DynamicValue [▶ 2347].)
	ValueFactory [▶ 2355]	The value factory (Inherited from DynamicValue [▶ 2347].)

Methods

	Name	Description
	Equals	Determines whether the specified object is equal to the current object. (Inherited from Object.)
	Finalize	Allows an object to try to free resources and perform other cleanup operations before it is reclaimed by garbage collection. (Inherited from Object.)
	GetDynamicMemberNames [▶ 2201]	Returns the enumeration of all dynamic member names. (Overrides DynamicValue.GetDynamicMemberNames. [▶ 2358].)
	GetHashCode	Serves as the default hash function. (Inherited from Object.)

	Name	Description
	GetMetaObject	Provides a DynamicMetaObject that dispatches to the dynamic virtual methods. The object can be encapsulated inside another DynamicMetaObject to provide custom behavior for individual actions. This method supports the Dynamic Language Runtime infrastructure for language implementers and it is not intended to be used directly from your code. (Inherited from DynamicObject.)
	GetType	Gets the Type of the current instance. (Inherited from Object.)
	MemberwiseClone	Creates a shallow copy of the current Object. (Inherited from Object.)
	Read [▶ 2359]	Reads the value (via ADS) (Inherited from DynamicValue [▶ 2347].)
	ReadAsync [▶ 2359]	read as an asynchronous operation. (Inherited from DynamicValue [▶ 2347].)
	ResolveValue [▶ 2360]	Resolves the Value object to its primitive value. (Inherited from DynamicValue [▶ 2347].)
	setMemberValue [▶ 2374]	Writes the specified member element. (Inherited from DynamicValue [▶ 2347].)
	ToString [▶ 2361]	Returns a String that represents this instance. (Inherited from DynamicValue [▶ 2347].)
	TryBinaryOperation	Provides implementation for binary operations. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations such as addition and multiplication. (Inherited from DynamicObject.)
	TryConvert [▶ 2361]	Provides implementation for type conversion operations. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations that convert an object from one type to another. (Inherited from DynamicValue [▶ 2347].)
	TryCreateInstance	Provides the implementation for operations that initialize a new instance of a dynamic object. This method is not intended for use in C# or Visual Basic. (Inherited from DynamicObject.)
	TryDeleteIndex	Provides the implementation for operations that delete an object by index. This method is not intended for use in C# or Visual Basic. (Inherited from DynamicObject.)
	TryDeleteMember	Provides the implementation for operations that delete an object member. This method is not intended for use in C# or Visual Basic. (Inherited from DynamicObject.)
	TryGetArrayElementValues [▶ 2362]	Returns Array Element values. (Inherited from DynamicValue [▶ 2347].)
	TryGetIndex [▶ 2363]	Provides the implementation for operations that get a value by index. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for indexing operations. (Inherited from DynamicValue [▶ 2347].)
	TryGetIndexValue (.Int32., Object.) [▶ 2364]	Reads the specified array element. (Inherited from DynamicValue [▶ 2347].)
	TryGetIndexValue (.Object., Object.) [▶ 2364]	Tries the get index value. (Inherited from DynamicValue [▶ 2347].)
	TryGetMember [▶ 2365]	Provides the implementation for operations that get member values. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations such as getting a value for a property. (Inherited from DynamicValue [▶ 2347].)

	Name	Description
	TryGetMemberValue [▶ 2202]	Tries the get member value. (Overrides DynamicValue.TryGetMemberValue(String, Object.) [▶ 2366].)
	TryInvoke [▶ 2366]	Provides the implementation for operations that invoke an object. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations such as invoking an object or a delegate. (Inherited from DynamicValue [▶ 2347].)
	TryInvokeMember [▶ 2367]	Provides the implementation for operations that invoke a member. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations such as calling a method. (Inherited from DynamicValue [▶ 2347].)
	TryResolveValue [▶ 2368]	Tries to resolves the Value object to its primitive value. (Inherited from DynamicValue [▶ 2347].)
	TrySetIndex [▶ 2369]	Provides the implementation for operations that set a value by index. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations that access objects by a specified index. (Inherited from DynamicValue [▶ 2347].)
	TrySetIndexValue(Int32, Object) [▶ 2370]	Tries to set the indexed value on Arrays (Inherited from DynamicValue [▶ 2347].)
	TrySetIndexValue(Object, Object) [▶ 2370]	Tries to set the indexed value on Arrays (Inherited from DynamicValue [▶ 2347].)
	TrySetMember [▶ 2371]	Provides the implementation for operations that set member values. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations such as setting a value for a property. (Inherited from DynamicValue [▶ 2347].)
	TrySetMemberValue [▶ 2372]	Tries to Set a Member/Property Value (Inherited from DynamicValue [▶ 2347].)
	TryUnaryOperation	Provides implementation for unary operations. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations such as negation, increment, or decrement. (Inherited from DynamicObject .)
	Write [▶ 2372]	Writes the value (via ADS) (Inherited from DynamicValue [▶ 2347].)
	WriteAsync [▶ 2373]	write as an asynchronous operation. (Inherited from DynamicValue [▶ 2347].)

6.11.16.1 DynamicPointerValue Properties

The [DynamicPointerValue](#) [[▶ 2196](#)] type exposes the following members.

Properties

	Name	Description
	Age [▶ 2351]	Gets the age of the value (last successful read of the value) (Inherited from DynamicValue [▶ 2347].)
	CachedRaw [▶ 2351]	Gets the cached Raw internal Data. (Inherited from DynamicValue [▶ 2347].)
	DataType [▶ 2352]	Gets the data type bound to this IValue [▶ 2745] (Inherited from DynamicValue [▶ 2347].)
	IsPrimitive [▶ 2353]	Gets a value indicating whether this IValue [▶ 2745] is a primitive value. (Inherited from DynamicValue [▶ 2347].)
	ParentValue [▶ 2356]	Gets the parent value. (Inherited from DynamicValue [▶ 2347].)
	ResolvedType [▶ 2353]	Gets the resolved type. (Inherited from DynamicValue [▶ 2347].)
	Symbol [▶ 2353]	Gets the symbol that is bound to this value. (Inherited from DynamicValue [▶ 2347].)
	TimeStamp [▶ 2354]	Gets the Time stamp of the last successful read of the Value. (Inherited from DynamicValue [▶ 2347].)
	UpdateMode [▶ 2354]	Gets / Sets the update mode (Inherited from DynamicValue [▶ 2347].)
	ValueFactory [▶ 2355]	The value factory (Inherited from DynamicValue [▶ 2347].)

6.11.16.2 DynamicPointerValue Methods

The [DynamicPointerValue \[▶ 2196\]](#) type exposes the following members.

Methods

	Name	Description
	Equals	Determines whether the specified object is equal to the current object. (Inherited from Object.)
	Finalize	Allows an object to try to free resources and perform other cleanup operations before it is reclaimed by garbage collection. (Inherited from Object.)
	GetDynamicMemberNames [▶ 2201]	Returns the enumeration of all dynamic member names. (Overrides DynamicValue.GetDynamicMemberNames. [▶ 2358].)
	GetHashCode	Serves as the default hash function. (Inherited from Object.)
	GetMetaObject	Provides a DynamicMetaObject that dispatches to the dynamic virtual methods. The object can be encapsulated inside another DynamicMetaObject to provide custom behavior for individual actions. This method supports the Dynamic Language Runtime infrastructure for language implementers and it is not intended to be used directly from your code. (Inherited from DynamicObject.)
	GetType	Gets the Type of the current instance. (Inherited from Object.)
	MemberwiseClone	Creates a shallow copy of the current Object. (Inherited from Object.)

	Name	Description
	Read [▶ 2359]	Reads the value (via ADS) (Inherited from DynamicValue [▶ 2347].)
	ReadAsync [▶ 2359]	read as an asynchronous operation. (Inherited from DynamicValue [▶ 2347].)
	ResolveValue [▶ 2360]	Resolves the Value object to its primitive value. (Inherited from DynamicValue [▶ 2347].)
	setMemberValue [▶ 2374]	Writes the specified member element. (Inherited from DynamicValue [▶ 2347].)
	ToString [▶ 2361]	Returns a String that represents this instance. (Inherited from DynamicValue [▶ 2347].)
	TryBinaryOperation	Provides implementation for binary operations. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations such as addition and multiplication. (Inherited from DynamicObject.)
	TryConvert [▶ 2361]	Provides implementation for type conversion operations. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations that convert an object from one type to another. (Inherited from DynamicValue [▶ 2347].)
	TryCreateInstance	Provides the implementation for operations that initialize a new instance of a dynamic object. This method is not intended for use in C# or Visual Basic. (Inherited from DynamicObject.)
	TryDeleteIndex	Provides the implementation for operations that delete an object by index. This method is not intended for use in C# or Visual Basic. (Inherited from DynamicObject.)
	TryDeleteMember	Provides the implementation for operations that delete an object member. This method is not intended for use in C# or Visual Basic. (Inherited from DynamicObject.)
	TryGetArrayElement Values [▶ 2362]	Returns Array Element values. (Inherited from DynamicValue [▶ 2347].)
	TryGetIndex [▶ 2363]	Provides the implementation for operations that get a value by index. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for indexing operations. (Inherited from DynamicValue [▶ 2347].)
	TryGetIndexValue(.I nt32., Object.) [▶ 2364]	Reads the specified array element. (Inherited from DynamicValue [▶ 2347].)
	TryGetIndexValue(. Object., Object.) [▶ 2364]	Tries the get index value. (Inherited from DynamicValue [▶ 2347].)
	TryGetMember [▶ 2365]	Provides the implementation for operations that get member values. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations such as getting a value for a property. (Inherited from DynamicValue [▶ 2347].)
	TryGetMemberValu e [▶ 2202]	Tries the get member value. (Overrides DynamicValue.TryGetMemberValue(String, Object.) [▶ 2366].)
	TryInvoke [▶ 2366]	Provides the implementation for operations that invoke an object. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations such as invoking an object or a delegate. (Inherited from DynamicValue [▶ 2347].)

	Name	Description
	TryInvokeMember [▶ 2367]	Provides the implementation for operations that invoke a member. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations such as calling a method. (Inherited from DynamicValue [▶ 2347].)
	TryResolveValue [▶ 2368]	Tries to resolves the Value object to its primitive value. (Inherited from DynamicValue [▶ 2347].)
	TrySetIndex [▶ 2369]	Provides the implementation for operations that set a value by index. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations that access objects by a specified index. (Inherited from DynamicValue [▶ 2347].)
	TrySetIndexValue(Int32, Object) [▶ 2370]	Tries to set the indexed value on Arrays (Inherited from DynamicValue [▶ 2347].)
	TrySetIndexValue(Object, Object) [▶ 2370]	Tries to set the indexed value on Arrays (Inherited from DynamicValue [▶ 2347].)
	TrySetMember [▶ 2371]	Provides the implementation for operations that set member values. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations such as setting a value for a property. (Inherited from DynamicValue [▶ 2347].)
	TrySetMemberValue [▶ 2372]	Tries to Set a Member/Property Value (Inherited from DynamicValue [▶ 2347].)
	TryUnaryOperation	Provides implementation for unary operations. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations such as negation, increment, or decrement. (Inherited from DynamicObject .)
	Write [▶ 2372]	Writes the value (via ADS) (Inherited from DynamicValue [▶ 2347].)
	WriteAsync [▶ 2373]	write as an asynchronous operation. (Inherited from DynamicValue [▶ 2347].)

6.11.16.2.1 DynamicPointerValue.GetDynamicMemberNames Method

Returns the enumeration of all dynamic member names.

Namespace: [TwinCAT.TypeSystem](#) [▶ 2083]

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public override IEnumerable<string> GetDynamicMemberNames ()
```

Return Value

Type: IEnumerable.String.
A sequence that contains dynamic member names.

Reference

6.11.16.2.2 DynamicPointerValue.TryGetMemberValue Method

Tries the get member value.

Namespace: [TwinCAT.TypeSystem \[▸ 2083\]](#)

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax**C#**

```
public override bool TryGetMemberValue(
    string name,
    out Object?? result
)
```

Parameters

name	Type: System.String The name.
result	Type: System.Object. The result.

Return Value

Type: Boolean
true if the member value is returned, false otherwise.

Implements

[IStructValue.TryGetMemberValue\(String, Object.\) \[▸ 2680\]](#)

Exceptions

Exception	Condition
SymbolException [▸ 2933]

6.11.17 DynamicReferenceInstance Class

Dynamic Reference Instance

Inheritance Hierarchy

System.Object
 System.Dynamic.DynamicObject
 TwinCAT.TypeSystem.DynamicSymbol [▶ 2266]
 TwinCAT.TypeSystem.DynamicReferenceInstance

Namespace: TwinCAT.TypeSystem [▶ 2083]

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public class DynamicReferenceInstance : DynamicSymbol,
    IReferenceInstance, ISymbol, IAttributedInstance, IInstance, IBitSize
```

The DynamicReferenceInstance type exposes the following members.

Properties

	Name	Description
	InnerSymbol [▶ 2274]	Gets the inner symbol of this DynamicSymbol [▶ 2266] (Inherited from DynamicSymbol [▶ 2266].)
	AccessRights [▶ 2274]	Gets the access rights. (Inherited from DynamicSymbol [▶ 2266].)
	AllowGIOAccess [▶ 2275]	Indicates, that the aggregates symbols is an IProcessImageAddress (and most probably IAdsSymbol) (Inherited from DynamicSymbol [▶ 2266].)
	Attributes [▶ 2275]	Gets the Symbol Attributes (Inherited from DynamicSymbol [▶ 2266].)
	BitSize [▶ 2276]	Gets the size of the IDataType [▶ 2475] in bits. (Inherited from DynamicSymbol [▶ 2266].)
	ByteSize [▶ 2276]	Gets the (aligned) size of of the Type/Instance in Bytes (Inherited from DynamicSymbol [▶ 2266].)
	Category [▶ 2277]	Gets the category. (Inherited from DynamicSymbol [▶ 2266].)
	Comment [▶ 2277]	Gets the comment of the IInstance [▶ 2549] (Inherited from DynamicSymbol [▶ 2266].)
	Connection [▶ 2277]	Gets the connection bound to this DynamicSymbol [▶ 2266] (Inherited from DynamicSymbol [▶ 2266].)
	DataType [▶ 2278]	Gets the IDataType [▶ 2475] of the IInstance [▶ 2549]. (Inherited from DynamicSymbol [▶ 2266].)
	HasValue [▶ 2278]	Gets a value indicating whether this instance has value (only the non VirtualInstances, what means the Symbols with locations). (Inherited from DynamicSymbol [▶ 2266].)
	InstanceName [▶ 2279]	Gets the name of the instance (without periods (.)) (Inherited from DynamicSymbol [▶ 2266].)
	InstancePath [▶ 2279]	Gets the relative / absolute access path to the instance (with periods (.)) (Inherited from DynamicSymbol [▶ 2266].)
	IsBitType [▶ 2280]	Gets a value indicating whether this instance is not basing on a full DataType but instead of some sort of bit mapping (Inherited from DynamicSymbol [▶ 2266].)
	IsByteAligned [▶ 2280]	Indicates that the Size of the Object is Byte aligned (BitSize % 8 == 0) (Inherited from DynamicSymbol [▶ 2266].)
	IsContainerType [▶ 2281]	Gets a value indicating whether this Symbol is acontainer type. (Inherited from DynamicSymbol [▶ 2266].)

	Name	Description
	IsPersistent [▶ 2281]	Gets a value indicating whether this ISymbol [▶ 2691] is persistent. (Inherited from DynamicSymbol [▶ 2266].)
	IsPointer [▶ 2282]	Indicates that the IInstance [▶ 2549] represents a Pointer type (Pointer TO) (Inherited from DynamicSymbol [▶ 2266].)
	IsPrimitiveType [▶ 2282]	Gets a value indicating whether this instance is a primitive type. (Inherited from DynamicSymbol [▶ 2266].)
	IsReadOnly [▶ 2283]	Indicates that this instance is read only. (Inherited from DynamicSymbol [▶ 2266].)
	IsRecursive [▶ 2283]	Gets a value indicating whether this instance is recursive. (Inherited from DynamicSymbol [▶ 2266].)
	IsReference [▶ 2284]	Indicates that the IInstance [▶ 2549] represents a Reference type (REFERENCE TO) (Inherited from DynamicSymbol [▶ 2266].)
	IsStatic [▶ 2284]	Gets a value indicating whether this instance is static. (Inherited from DynamicSymbol [▶ 2266].)
	NormalizedName [▶ 2285]	Gets the normalized instance name (fixed name for dynamic property access that doesn't contain invalid characters), (Inherited from DynamicSymbol [▶ 2266].)
	NotificationSettings [▶ 2285]	Gets the notification settings. (Inherited from DynamicSymbol [▶ 2266].)
	Parent [▶ 2286]	Gets the parent Symbol (Inherited from DynamicSymbol [▶ 2266].)
	ReferencedType [▶ 2209]	Gets the referenced type of the IReferenceInstance [▶ 2595]
	ResolvedByteSize [▶ 2210]	Gets the resolved byte size of the IReferenceInstance [▶ 2595].
	ResolvedCategory [▶ 2210]	Gets the Category of the Referenced Symbol.
	ResolvedType [▶ 2211]	Gets the resolved type of the IReferenceInstance [▶ 2595].
	Size [▶ 2286]	Gets the size of the IInstance [▶ 2549] in bytes. (Inherited from DynamicSymbol [▶ 2266].)
	SubSymbols [▶ 2287]	Gets the SubSymbols of the ISymbol [▶ 2691] (Inherited from DynamicSymbol [▶ 2266].)
	TypeName [▶ 2287]	Gets the name of the DataType [▶ 2475] that is used for this IInstance [▶ 2549]. (Inherited from DynamicSymbol [▶ 2266].)
	ValueEncoding [▶ 2288]	Gets the value encoding. (Inherited from DynamicSymbol [▶ 2266].)

Methods

	Name	Description
	Equals [▶ 2292]	Equals (Inherited from DynamicSymbol [▶ 2266].)
	Finalize	Allows an object to try to free resources and perform other cleanup operations before it is reclaimed by garbage collection. (Inherited from Object .)
	GetDynamicMemberNames [▶ 2293]	Returns the enumeration of all dynamic member names. (Inherited from DynamicSymbol [▶ 2266].)
	GetHashCode [▶ 2293]	Gets the GetHashCode of the Address (Inherited from DynamicSymbol [▶ 2266].)

	Name	Description
	GetMetaObject	Provides a DynamicMetaObject that dispatches to the dynamic virtual methods. The object can be encapsulated inside another DynamicMetaObject to provide custom behavior for individual actions. This method supports the Dynamic Language Runtime infrastructure for language implementers and it is not intended to be used directly from your code. (Inherited from DynamicObject.)
	GetType	Gets the Type of the current instance. (Inherited from Object.)
	MemberwiseClone	Creates a shallow copy of the current Object. (Inherited from Object.)
	OnReadAnyValue [▶ 2293]	Handler function for reading ADS 'Any' Values. (Inherited from DynamicSymbol [▶ 2266].)
	OnReadRawValue [▶ 2294]	Handler function for reading Raw symbol value. (Inherited from DynamicSymbol [▶ 2266].)
	OnReadRawValueAsync [▶ 2294]	Handler function reading the raw value of the DynamicSymbol [▶ 2266]. (Inherited from DynamicSymbol [▶ 2266].)
	OnReadValue [▶ 2295]	Handler function for the (Inherited from DynamicSymbol [▶ 2266].)
	OnReadValueAsync [▶ 2296]	Handler function reading the DynamicSymbols [▶ 2266] value asynchronously. (Inherited from DynamicSymbol [▶ 2266].)
	OnSetInstanceName [▶ 2296]	Sets a new InstanceName InstancePath (Inherited from DynamicSymbol [▶ 2266].)
	OnTryReadValue [▶ 2297]	Handler function for the (Inherited from DynamicSymbol [▶ 2266].)
	OnTryWriteValue [▶ 2297]	Handler Function for writing value. (Inherited from DynamicSymbol [▶ 2266].)
	OnWriteRawValue [▶ 2298]	Handler function for reading symbols raw value. (Inherited from DynamicSymbol [▶ 2266].)
	OnWriteRawValueAsync [▶ 2298]	Handler function for writing the raw DynamicSymbol [▶ 2266] value. (Inherited from DynamicSymbol [▶ 2266].)
	OnWriteValue [▶ 2299]	Handler Function for writing value. (Inherited from DynamicSymbol [▶ 2266].)
	OnWriteValueAsync [▶ 2300]	Handler Function for writing value. (Inherited from DynamicSymbol [▶ 2266].)
	ReadAnyValue [▶ 2300]	Reads the value of this Value [▶ 2775] into a new created instance of the managed type (Inherited from DynamicSymbol [▶ 2266].)
	ReadRawValue. [▶ 2301]	Reads the raw value of the IValueSymbol [▶ 2775] (Ads Read / Write) (Inherited from DynamicSymbol [▶ 2266].)
	ReadRawValue(Int32) [▶ 2302]	Reads the Symbols raw value (Inherited from DynamicSymbol [▶ 2266].)
	ReadRawValueAsync [▶ 2302]	Read raw value as an asynchronous operation. (Inherited from DynamicSymbol [▶ 2266].)
	ReadValue. [▶ 2303]	Reads the value of this DynamicSymbol [▶ 2266]. (Inherited from DynamicSymbol [▶ 2266].)
	ReadValue(Int32) [▶ 2306]	Reads the value of this DynamicSymbol [▶ 2266]. (Inherited from DynamicSymbol [▶ 2266].)

	Name	Description
	ReadValueAsync [▶ 2307]	Reads the Value of the IValueSymbol [▶ 2775] asynchronously. (Inherited from DynamicSymbol [▶ 2266].)
	ToString [▶ 2307]	Returns a String that represents this instance. (Inherited from DynamicSymbol [▶ 2266].)
	TryBinaryOperation	Provides implementation for binary operations. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations such as addition and multiplication. (Inherited from DynamicObject .)
	TryConvert	Provides implementation for type conversion operations. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations that convert an object from one type to another. (Inherited from DynamicObject .)
	TryCreateInstance	Provides the implementation for operations that initialize a new instance of a dynamic object. This method is not intended for use in C# or Visual Basic. (Inherited from DynamicObject .)
	TryDeleteIndex	Provides the implementation for operations that delete an object by index. This method is not intended for use in C# or Visual Basic. (Inherited from DynamicObject .)
	TryDeleteMember	Provides the implementation for operations that delete an object member. This method is not intended for use in C# or Visual Basic. (Inherited from DynamicObject .)
	TryGetIndex [▶ 2214]	Provides the implementation for operations that get a value by index. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for indexing operations. (Overrides DynamicObject.TryGetIndex(GetIndexBinder, .Object., Object.) .)
	TryGetMember [▶ 2308]	Provides the implementation for operations that get member values. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations such as getting a value for a property. (Inherited from DynamicSymbol [▶ 2266].)
	TryInvoke	Provides the implementation for operations that invoke an object. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations such as invoking an object or a delegate. (Inherited from DynamicObject .)
	TryInvokeMember	Provides the implementation for operations that invoke a member. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations such as calling a method. (Inherited from DynamicObject .)
	TryReadValue [▶ 2309]	Reads the Value of the IValueSymbol [▶ 2775] (Inherited from DynamicSymbol [▶ 2266].)
	TrySetIndex [▶ 2215]	Provides the implementation for operations that set a value by index. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations that access objects by a specified index. (Overrides DynamicObject.TrySetIndex(SetIndexBinder, .Object., Object.) .)
	TrySetMember	Provides the implementation for operations that set member values. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations such as setting a value for a property. (Inherited from DynamicObject .)
	TryUnaryOperation	Provides implementation for unary operations. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations such as negation, increment, or decrement. (Inherited from DynamicObject .)
 	TryWriteValue [▶ 2309]	Writes the specified value to the DynamicSymbol [▶ 2266]. (Inherited from DynamicSymbol [▶ 2266].)

	Name	Description
	UpdateAnyValue [▶ 2312]	Reads the value of this Value [▶ 2775] into the specified managed value. (Inherited from DynamicSymbol [▶ 2266].)
	WriteAnyValue [▶ 2313]	Writes the value represented by the managed value to this Value [▶ 2775] (Inherited from DynamicSymbol [▶ 2266].)
	WriteRawValue(Byte) [▶ 2314]	Writes the raw value of the IValueSymbol [▶ 2775] (Ads Read / Write) (Inherited from DynamicSymbol [▶ 2266].)
	WriteRawValue(Byte, Int32) [▶ 2314]	Writes the raw value of the IValueSymbol [▶ 2775] (Ads Read / Write) (Inherited from DynamicSymbol [▶ 2266].)
	WriteRawValueAsync [▶ 2315]	Writes the raw value of the IValueSymbol [▶ 2775] (Ads Read / Write) (Inherited from DynamicSymbol [▶ 2266].)
	WriteValue(Object) [▶ 2316]	Writes the specified value to the DynamicSymbol [▶ 2266]. (Inherited from DynamicSymbol [▶ 2266].)
 	WriteValue(Object, Int32) [▶ 2319]	Writes the specified value to the DynamicSymbol [▶ 2266]. (Inherited from DynamicSymbol [▶ 2266].)
	WriteValueAsync [▶ 2321]	Writes the Value of the IValueSymbol [▶ 2775] (Inherited from DynamicSymbol [▶ 2266].)

Events

	Name	Description
	RawValueChanged [▶ 2323]	Occurs when the RawValue of the IValueSymbol [▶ 2775] has changed. (Inherited from DynamicSymbol [▶ 2266].)
	ValueChanged [▶ 2323]	Occurs when the (Primitive) value of the IValueSymbol [▶ 2775] has changed. (Inherited from DynamicSymbol [▶ 2266].)

Fields

	Name	Description
	resolvedReferenceType [▶ 2217]	The resolved alias type
	syncObject [▶ 2327]	Synchronization object (Inherited from DynamicSymbol [▶ 2266].)

Extension Methods

	Name	Description
	ReferencesExternalData [▶ 3038]	Indicates, that the Instance value includes process memory data, that cannot be read in one memory block. (Defined by DataTypeExtension [▶ 3021].)

Reference

[TwinCAT.TypeSystem Namespace](#) [▶ 2083]

6.11.17.1 DynamicReferenceInstance Properties

The [DynamicReferenceInstance](#) [▶ 2202] type exposes the following members.

Properties

	Name	Description
	InnerSymbol [▶ 2274]	Gets the inner symbol of this DynamicSymbol [▶ 2266] (Inherited from DynamicSymbol [▶ 2266].)
	AccessRights [▶ 2274]	Gets the access rights. (Inherited from DynamicSymbol [▶ 2266].)
	AllowIIOAccess [▶ 2275]	Indicates, that the aggregates symbols is an IProcessImageAddress (and most probably IAdsSymbol) (Inherited from DynamicSymbol [▶ 2266].)
	Attributes [▶ 2275]	Gets the Symbol Attributes (Inherited from DynamicSymbol [▶ 2266].)
	BitSize [▶ 2276]	Gets the size of the IDataType [▶ 2475] in bits. (Inherited from DynamicSymbol [▶ 2266].)
	ByteSize [▶ 2276]	Gets the (aligned) size of of the Type/Instance in Bytes (Inherited from DynamicSymbol [▶ 2266].)
	Category [▶ 2277]	Gets the category. (Inherited from DynamicSymbol [▶ 2266].)
	Comment [▶ 2277]	Gets the comment of the IInstance [▶ 2549] (Inherited from DynamicSymbol [▶ 2266].)
	Connection [▶ 2277]	Gets the connection bound to this DynamicSymbol [▶ 2266] (Inherited from DynamicSymbol [▶ 2266].)
	DataType [▶ 2278]	Gets the IDataType [▶ 2475] of the IInstance [▶ 2549]. (Inherited from DynamicSymbol [▶ 2266].)
	HasValue [▶ 2278]	Gets a value indicating whether this instance has value (only the non VirtualInstances , what means the Symbols with locations). (Inherited from DynamicSymbol [▶ 2266].)
	InstanceName [▶ 2279]	Gets the name of the instance (without periods (.)) (Inherited from DynamicSymbol [▶ 2266].)
	InstancePath [▶ 2279]	Gets the relative / absolute access path to the instance (with periods (.)) (Inherited from DynamicSymbol [▶ 2266].)
	IsBitType [▶ 2280]	Gets a value indicating whether this instance is not basing on a full DataType but instead of some sort of bit mapping (Inherited from DynamicSymbol [▶ 2266].)
	IsByteAligned [▶ 2280]	Indicates that the Size of the Object is Byte aligned ($\text{BitSize} \% 8 == 0$) (Inherited from DynamicSymbol [▶ 2266].)
	IsContainerType [▶ 2281]	Gets a value indicating whether this Symbol is acontainer type. (Inherited from DynamicSymbol [▶ 2266].)
	IsPersistent [▶ 2281]	Gets a value indicating whether this ISymbol [▶ 2691] is persistent. (Inherited from DynamicSymbol [▶ 2266].)
	IsPointer [▶ 2282]	Indicates that the IInstance [▶ 2549] represents a Pointer type (Pointer TO) (Inherited from DynamicSymbol [▶ 2266].)
	IsPrimitiveType [▶ 2282]	Gets a value indicating whether this instance is a primitive type. (Inherited from DynamicSymbol [▶ 2266].)
	IsReadOnly [▶ 2283]	Indicates that this instance is read only. (Inherited from DynamicSymbol [▶ 2266].)
	IsRecursive [▶ 2283]	Gets a value indicating whether this instance is recursive. (Inherited from DynamicSymbol [▶ 2266].)
	IsReference [▶ 2284]	Indicates that the IInstance [▶ 2549] represents a Reference type (REFERENCE TO) (Inherited from DynamicSymbol [▶ 2266].)
	IsStatic [▶ 2284]	Gets a value indicating whether this instance is static. (Inherited from DynamicSymbol [▶ 2266].)

	Name	Description
	NormalizedName [▶ 2285]	Gets the normalized instance name (fixed name for dynamic property access that doesn't contain invalid characters), (Inherited from DynamicSymbol [▶ 2266].)
	NotificationSettings [▶ 2285]	Gets the notification settings. (Inherited from DynamicSymbol [▶ 2266].)
	Parent [▶ 2286]	Gets the parent Symbol (Inherited from DynamicSymbol [▶ 2266].)
	ReferencedType [▶ 2209]	Gets the referenced type of the IReferenceInstance [▶ 2595]
	ResolvedByteSize [▶ 2210]	Gets the resolved byte size of the IReferenceInstance [▶ 2595].
	ResolvedCategory [▶ 2210]	Gets the Category of the Referenced Symbol.
	ResolvedType [▶ 2211]	Gets the resolved type of the IReferenceInstance [▶ 2595].
	Size [▶ 2286]	Gets the size of the IInstance [▶ 2549] in bytes. (Inherited from DynamicSymbol [▶ 2266].)
	SubSymbols [▶ 2287]	Gets the SubSymbols of the ISymbol [▶ 2691] (Inherited from DynamicSymbol [▶ 2266].)
	TypeName [▶ 2287]	Gets the name of the DataType [▶ 2475] that is used for this IInstance [▶ 2549]. (Inherited from DynamicSymbol [▶ 2266].)
	ValueEncoding [▶ 2288]	Gets the value encoding. (Inherited from DynamicSymbol [▶ 2266].)

6.11.17.2 DynamicReferenceInstance Methods

The [DynamicReferenceInstance \[▶ 2202\]](#) type exposes the following members.

Methods

	Name	Description
	Equals [▶ 2292]	Equals (Inherited from DynamicSymbol [▶ 2266] .)
	Finalize	Allows an object to try to free resources and perform other cleanup operations before it is reclaimed by garbage collection. (Inherited from Object.)
	GetDynamicMemberNames [▶ 2293]	Returns the enumeration of all dynamic member names. (Inherited from DynamicSymbol [▶ 2266] .)
	GetHashCode [▶ 2293]	Gets the HashCode of the Address (Inherited from DynamicSymbol [▶ 2266] .)
	GetMetaObject	Provides a DynamicMetaObject that dispatches to the dynamic virtual methods. The object can be encapsulated inside another DynamicMetaObject to provide custom behavior for individual actions. This method supports the Dynamic Language Runtime infrastructure for language implementers and it is not intended to be used directly from your code. (Inherited from DynamicObject.)
	GetType	Gets the Type of the current instance. (Inherited from Object.)

	Name	Description
	MemberwiseClone	Creates a shallow copy of the current Object. (Inherited from Object.)
	OnReadAnyValue [▶ 2293]	Handler function for reading ADS 'Any' Values. (Inherited from DynamicSymbol [▶ 2266].)
	OnReadRawValue [▶ 2294]	Handler function for reading Raw symbol value. (Inherited from DynamicSymbol [▶ 2266].)
	OnReadRawValueAsync [▶ 2294]	Handler function reading the raw value of the DynamicSymbol [▶ 2266]. (Inherited from DynamicSymbol [▶ 2266].)
	OnReadValue [▶ 2295]	Handler function for the (Inherited from DynamicSymbol [▶ 2266].)
	OnReadValueAsync [▶ 2296]	Handler function reading the DynamicSymbols [▶ 2266] value asynchronously. (Inherited from DynamicSymbol [▶ 2266].)
	OnSetInstanceName [▶ 2296]	Sets a new InstanceName InstancePath (Inherited from DynamicSymbol [▶ 2266].)
	OnTryReadValue [▶ 2297]	Handler function for the (Inherited from DynamicSymbol [▶ 2266].)
	OnTryWriteValue [▶ 2297]	Handler Function for writing value. (Inherited from DynamicSymbol [▶ 2266].)
	OnWriteRawValue [▶ 2298]	Handler function for reading symbols raw value. (Inherited from DynamicSymbol [▶ 2266].)
	OnWriteRawValueAsync [▶ 2298]	Handler function for writing the raw DynamicSymbol [▶ 2266] value. (Inherited from DynamicSymbol [▶ 2266].)
	OnWriteValue [▶ 2299]	Handler Function for writing value. (Inherited from DynamicSymbol [▶ 2266].)
	OnWriteValueAsync [▶ 2300]	Handler Function for writing value. (Inherited from DynamicSymbol [▶ 2266].)
	ReadAnyValue [▶ 2300]	Reads the value of this Value [▶ 2775] into a new created instance of the managed type (Inherited from DynamicSymbol [▶ 2266].)
	ReadRawValue. [▶ 2301]	Reads the raw value of the IValueSymbol [▶ 2775] (Ads Read / Write) (Inherited from DynamicSymbol [▶ 2266].)
	ReadRawValue(Int32) [▶ 2302]	Reads the Symbols raw value (Inherited from DynamicSymbol [▶ 2266].)
	ReadRawValueAsync [▶ 2302]	Read raw value as an asynchronous operation. (Inherited from DynamicSymbol [▶ 2266].)
	ReadValue. [▶ 2303]	Reads the value of this DynamicSymbol [▶ 2266]. (Inherited from DynamicSymbol [▶ 2266].)
	ReadValue(Int32) [▶ 2306]	Reads the value of this DynamicSymbol [▶ 2266]. (Inherited from DynamicSymbol [▶ 2266].)
	ReadValueAsync [▶ 2307]	Reads the Value of the IValueSymbol [▶ 2775] asynchronously. (Inherited from DynamicSymbol [▶ 2266].)
	ToString [▶ 2307]	Returns a String that represents this instance. (Inherited from DynamicSymbol [▶ 2266].)
	TryBinaryOperation	Provides implementation for binary operations. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations such as addition and multiplication. (Inherited from DynamicObject .)

	Name	Description
	TryConvert	Provides implementation for type conversion operations. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations that convert an object from one type to another. (Inherited from DynamicObject.)
	TryCreateInstance	Provides the implementation for operations that initialize a new instance of a dynamic object. This method is not intended for use in C# or Visual Basic. (Inherited from DynamicObject.)
	TryDeleteIndex	Provides the implementation for operations that delete an object by index. This method is not intended for use in C# or Visual Basic. (Inherited from DynamicObject.)
	TryDeleteMember	Provides the implementation for operations that delete an object member. This method is not intended for use in C# or Visual Basic. (Inherited from DynamicObject.)
	TryGetIndex [▶ 2214]	Provides the implementation for operations that get a value by index. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for indexing operations. (Overrides DynamicObject.TryGetIndex(GetIndexBinder, .Object., Object.).)
	TryGetMember [▶ 2308]	Provides the implementation for operations that get member values. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations such as getting a value for a property. (Inherited from DynamicSymbol [▶ 2266].)
	TryInvoke	Provides the implementation for operations that invoke an object. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations such as invoking an object or a delegate. (Inherited from DynamicObject.)
	TryInvokeMember	Provides the implementation for operations that invoke a member. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations such as calling a method. (Inherited from DynamicObject.)
	TryReadValue [▶ 2309]	Reads the Value of the IValueSymbol [▶ 2775] (Inherited from DynamicSymbol [▶ 2266].)
	TrySetIndex [▶ 2215]	Provides the implementation for operations that set a value by index. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations that access objects by a specified index. (Overrides DynamicObject.TrySetIndex(SetIndexBinder, .Object., Object.).)
	TrySetMember	Provides the implementation for operations that set member values. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations such as setting a value for a property. (Inherited from DynamicObject.)
	TryUnaryOperation	Provides implementation for unary operations. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations such as negation, increment, or decrement. (Inherited from DynamicObject.)
 	TryWriteValue [▶ 2309]	Writes the specified value to the DynamicSymbol [▶ 2266]. (Inherited from DynamicSymbol [▶ 2266].)
	UpdateAnyValue [▶ 2312]	Reads the value of this Value [▶ 2775] into the specified managed value. (Inherited from DynamicSymbol [▶ 2266].)
	WriteAnyValue [▶ 2313]	Writes the value represented by the managed value to this Value [▶ 2775] (Inherited from DynamicSymbol [▶ 2266].)
	WriteRawValue(.Byte) [▶ 2314]	Writes the raw value of the IValueSymbol [▶ 2775] (Ads Read / Write) (Inherited from DynamicSymbol [▶ 2266].)

	Name	Description
	WriteRawValue(Byte, Int32) [▶ 2314]	Writes the raw value of the IValueSymbol [▶ 2775] (Ads Read / Write) (Inherited from DynamicSymbol [▶ 2266] .)
	WriteRawValueAsync [▶ 2315]	Writes the raw value of the IValueSymbol [▶ 2775] (Ads Read / Write) (Inherited from DynamicSymbol [▶ 2266] .)
	WriteValue(Object) [▶ 2316]	Writes the specified value to the DynamicSymbol [▶ 2266] . (Inherited from DynamicSymbol [▶ 2266] .)
 	WriteValue(Object, Int32) [▶ 2319]	Writes the specified value to the DynamicSymbol [▶ 2266] . (Inherited from DynamicSymbol [▶ 2266] .)
	WriteValueAsync [▶ 2321]	Writes the Value of the IValueSymbol [▶ 2775] (Inherited from DynamicSymbol [▶ 2266] .)

Extension Methods

	Name	Description
	ReferencesExternalData [▶ 3038]	Indicates, that the Instance value includes process memory data, that cannot be read in one memory block. (Defined by DataTypeExtension [▶ 3021] .)

Reference

[DynamicReferenceInstance Class \[▶ 2202\]](#)

[TwinCAT.TypeSystem Namespace \[▶ 2083\]](#)

6.11.17.2.1 DynamicReferenceInstance.TryGetIndex Method

Provides the implementation for operations that get a value by index. Classes derived from the [DynamicObject](#) class can override this method to specify dynamic behavior for indexing operations.

Namespace: [TwinCAT.TypeSystem \[▶ 2083\]](#)

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public override bool TryGetIndex(
    GetIndexBinder binder,
    Object[] indexes,
    out Object?? result
)
```

Parameters

binder	Type: System.Dynamic.GetIndexBinder Provides information about the operation.
indexes	Type: System.Object. The indexes that are used in the operation. For example, for the <code>sampleObject[3]</code> operation in C# (<code>sampleObject(3)</code> in Visual Basic), where <code>sampleObject</code> is derived from the <code>DynamicObject</code> class, <code>indexes[0]</code> is equal to 3.
result	Type: System.Object. The result of the index operation.

Return Value

Type: Boolean

true if the operation is successful; otherwise, false. If this method returns false, the run-time binder of the language determines the behavior. (In most cases, a run-time exception is thrown.)

Reference

6.11.17.2 DynamicReferenceInstance.TrySetIndex Method

Provides the implementation for operations that set a value by index. Classes derived from the `DynamicObject` class can override this method to specify dynamic behavior for operations that access objects by a specified index.

Namespace: [TwinCAT.TypeSystem \[► 2083\]](#)

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax**C#**

```
public override bool TrySetIndex(
    SetIndexBinder binder,
    Object[] indexes,
    Object? value
)
```

Parameters

binder	Type: System.Dynamic.SetIndexBinder Provides information about the operation.
indexes	Type: System.Object. The indexes that are used in the operation. For example, for the <code>sampleObject[3] = 10</code> operation in C# (<code>sampleObject(3) = 10</code> in Visual Basic), where <code>sampleObject</code> is derived from the <code>DynamicObject</code> class, <code>indexes[0]</code> is equal to 3.
value	Type: System.Object The value to set to the object that has the specified index. For example, for the <code>sampleObject[3] = 10</code> operation in C# (<code>sampleObject(3) = 10</code> in Visual Basic), where <code>sampleObject</code> is derived from the <code>DynamicObject</code> class, <code>value</code> is equal to 10.

Return Value

Type: Boolean

true if the operation is successful; otherwise, false. If this method returns false, the run-time binder of the language determines the behavior. (In most cases, a language-specific run-time exception is thrown.)

Syntax

C#

```
public class DynamicReferenceValue : DynamicValue
```

The DynamicReferenceValue type exposes the following members.

Properties

	Name	Description
	Age [▸ 2351]	Gets the age of the value (last successful read of the value) (Inherited from DynamicValue [▸ 2347] .)
	CachedRaw [▸ 2351]	Gets the cached Raw internal Data. (Inherited from DynamicValue [▸ 2347] .)
	DataType [▸ 2352]	Gets the data type bound to this IValue [▸ 2745] (Inherited from DynamicValue [▸ 2347] .)
	IsPrimitive [▸ 2353]	Gets a value indicating whether this IValue [▸ 2745] is a primitive value. (Inherited from DynamicValue [▸ 2347] .)
	ParentValue [▸ 2356]	Gets the parent value. (Inherited from DynamicValue [▸ 2347] .)
	ResolvedType [▸ 2353]	Gets the resolved type. (Inherited from DynamicValue [▸ 2347] .)

	Name	Description
	Symbol [▶ 2353]	Gets the symbol that is bound to this value. (Inherited from DynamicValue [▶ 2347].)
	TimeStamp [▶ 2354]	Gets the Time stamp of the last successful read of the Value. (Inherited from DynamicValue [▶ 2347].)
	UpdateMode [▶ 2354]	Gets / Sets the update mode (Inherited from DynamicValue [▶ 2347].)
	ValueFactory [▶ 2355]	The value factory (Inherited from DynamicValue [▶ 2347].)

Methods

	Name	Description
	Equals	Determines whether the specified object is equal to the current object. (Inherited from Object.)
	Finalize	Allows an object to try to free resources and perform other cleanup operations before it is reclaimed by garbage collection. (Inherited from Object.)
	GetDynamicMemberNames [▶ 2358]	Returns the enumeration of all dynamic member names. (Inherited from DynamicValue [▶ 2347].)
	GetHashCode	Serves as the default hash function. (Inherited from Object.)
	GetMetaObject	Provides a DynamicMetaObject that dispatches to the dynamic virtual methods. The object can be encapsulated inside another DynamicMetaObject to provide custom behavior for individual actions. This method supports the Dynamic Language Runtime infrastructure for language implementers and it is not intended to be used directly from your code. (Inherited from DynamicObject .)
	GetType	Gets the Type of the current instance. (Inherited from Object.)
	MemberwiseClone	Creates a shallow copy of the current Object. (Inherited from Object.)
	Read [▶ 2359]	Reads the value (via ADS) (Inherited from DynamicValue [▶ 2347].)
	ReadAsync [▶ 2359]	read as an asynchronous operation. (Inherited from DynamicValue [▶ 2347].)
	ResolveValue [▶ 2360]	Resolves the Value object to its primitive value. (Inherited from DynamicValue [▶ 2347].)
	setMemberValue [▶ 2374]	Writes the specified member element. (Inherited from DynamicValue [▶ 2347].)
	ToString [▶ 2361]	Returns a String that represents this instance. (Inherited from DynamicValue [▶ 2347].)
	TryBinaryOperation	Provides implementation for binary operations. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations such as addition and multiplication. (Inherited from DynamicObject .)
	TryConvert [▶ 2361]	Provides implementation for type conversion operations. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations that convert an object from one type to another. (Inherited from DynamicValue [▶ 2347].)
	TryCreateInstance	Provides the implementation for operations that initialize a new instance of a dynamic object. This method is not intended for use in C# or Visual Basic. (Inherited from DynamicObject .)
	TryDeleteIndex	Provides the implementation for operations that delete an object by index. This method is not intended for use in C# or Visual Basic. (Inherited from DynamicObject .)

	Name	Description
	TryDeleteMember	Provides the implementation for operations that delete an object member. This method is not intended for use in C# or Visual Basic. (Inherited from DynamicObject.)
	TryGetArrayElement Values [▶ 2362]	Returns Array Element values. (Inherited from DynamicValue [▶ 2347].)
	TryGetIndex [▶ 2363]	Provides the implementation for operations that get a value by index. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for indexing operations. (Inherited from DynamicValue [▶ 2347].)
	TryGetIndexValue(.Int32., Object.) [▶ 2364]	Reads the specified array element. (Inherited from DynamicValue [▶ 2347].)
	TryGetIndexValue(Object., Object.) [▶ 2364]	Tries the get index value. (Inherited from DynamicValue [▶ 2347].)
	TryGetMember [▶ 2365]	Provides the implementation for operations that get member values. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations such as getting a value for a property. (Inherited from DynamicValue [▶ 2347].)
	TryGetMemberValue [▶ 2366]	Tries the get member value. (Inherited from DynamicValue [▶ 2347].)
	TryInvoke [▶ 2366]	Provides the implementation for operations that invoke an object. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations such as invoking an object or a delegate. (Inherited from DynamicValue [▶ 2347].)
	TryInvokeMember [▶ 2367]	Provides the implementation for operations that invoke a member. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations such as calling a method. (Inherited from DynamicValue [▶ 2347].)
	TryResolveValue [▶ 2368]	Tries to resolves the Value object to its primitive value. (Inherited from DynamicValue [▶ 2347].)
	TrySetIndex [▶ 2369]	Provides the implementation for operations that set a value by index. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations that access objects by a specified index. (Inherited from DynamicValue [▶ 2347].)
	TrySetIndexValue(Int32., Object.) [▶ 2370]	Tries to set the indexed value on Arrays (Inherited from DynamicValue [▶ 2347].)
	TrySetIndexValue(Object., Object.) [▶ 2370]	Tries to set the indexed value on Arrays (Inherited from DynamicValue [▶ 2347].)
	TrySetMember [▶ 2371]	Provides the implementation for operations that set member values. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations such as setting a value for a property. (Inherited from DynamicValue [▶ 2347].)
	TrySetMemberValue [▶ 2372]	Tries to Set a Member/Property Value (Inherited from DynamicValue [▶ 2347].)

	Name	Description
	TryUnaryOperation	Provides implementation for unary operations. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations such as negation, increment, or decrement. (Inherited from DynamicObject.)
	Write [▶ 2372]	Writes the value (via ADS) (Inherited from DynamicValue [▶ 2347].)
	WriteAsync [▶ 2373]	write as an asynchronous operation. (Inherited from DynamicValue [▶ 2347].)

6.11.18.1 DynamicReferenceValue Properties

The [DynamicReferenceValue \[▶ 2217\]](#) type exposes the following members.

Properties

	Name	Description
	Age [▶ 2351]	Gets the age of the value (last successful read of the value) (Inherited from DynamicValue [▶ 2347].)
	CachedRaw [▶ 2351]	Gets the cached Raw internal Data. (Inherited from DynamicValue [▶ 2347].)
	DataType [▶ 2352]	Gets the data type bound to this IValue [▶ 2745] (Inherited from DynamicValue [▶ 2347].)
	IsPrimitive [▶ 2353]	Gets a value indicating whether this IValue [▶ 2745] is a primitive value. (Inherited from DynamicValue [▶ 2347].)
	ParentValue [▶ 2356]	Gets the parent value. (Inherited from DynamicValue [▶ 2347].)
	ResolvedType [▶ 2353]	Gets the resolved type. (Inherited from DynamicValue [▶ 2347].)
	Symbol [▶ 2353]	Gets the symbol that is bound to this value. (Inherited from DynamicValue [▶ 2347].)
	TimeStamp [▶ 2354]	Gets the Time stamp of the last successful read of the Value. (Inherited from DynamicValue [▶ 2347].)
	UpdateMode [▶ 2354]	Gets / Sets the update mode (Inherited from DynamicValue [▶ 2347].)
	ValueFactory [▶ 2355]	The value factory (Inherited from DynamicValue [▶ 2347].)

6.11.18.2 DynamicReferenceValue Methods

The [DynamicReferenceValue](#) [[▶ 2217](#)] type exposes the following members.

Methods

	Name	Description
	Equals	Determines whether the specified object is equal to the current object. (Inherited from Object.)
	Finalize	Allows an object to try to free resources and perform other cleanup operations before it is reclaimed by garbage collection. (Inherited from Object.)
	GetDynamicMemberNames [▶ 2358]	Returns the enumeration of all dynamic member names. (Inherited from DynamicValue [▶ 2347].)
	GetHashCode	Serves as the default hash function. (Inherited from Object.)
	GetMetaObject	Provides a DynamicMetaObject that dispatches to the dynamic virtual methods. The object can be encapsulated inside another DynamicMetaObject to provide custom behavior for individual actions. This method supports the Dynamic Language Runtime infrastructure for language implementers and it is not intended to be used directly from your code. (Inherited from DynamicObject .)
	GetType	Gets the Type of the current instance. (Inherited from Object.)
	MemberwiseClone	Creates a shallow copy of the current Object. (Inherited from Object.)
	Read [▶ 2359]	Reads the value (via ADS) (Inherited from DynamicValue [▶ 2347].)
	ReadAsync [▶ 2359]	read as an asynchronous operation. (Inherited from DynamicValue [▶ 2347].)
	ResolveValue [▶ 2360]	Resolves the Value object to its primitive value. (Inherited from DynamicValue [▶ 2347].)
	setMemberValue [▶ 2374]	Writes the specified member element. (Inherited from DynamicValue [▶ 2347].)
	ToString [▶ 2361]	Returns a String that represents this instance. (Inherited from DynamicValue [▶ 2347].)
	TryBinaryOperation	Provides implementation for binary operations. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations such as addition and multiplication. (Inherited from DynamicObject .)
	TryConvert [▶ 2361]	Provides implementation for type conversion operations. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations that convert an object from one type to another. (Inherited from DynamicValue [▶ 2347].)
	TryCreateInstance	Provides the implementation for operations that initialize a new instance of a dynamic object. This method is not intended for use in C# or Visual Basic. (Inherited from DynamicObject .)
	TryDeleteIndex	Provides the implementation for operations that delete an object by index. This method is not intended for use in C# or Visual Basic. (Inherited from DynamicObject .)
	TryDeleteMember	Provides the implementation for operations that delete an object member. This method is not intended for use in C# or Visual Basic. (Inherited from DynamicObject .)
	TryGetArrayElementValues [▶ 2362]	Returns Array Element values. (Inherited from DynamicValue [▶ 2347].)

	Name	Description
	TryGetIndex [▶ 2363]	Provides the implementation for operations that get a value by index. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for indexing operations. (Inherited from DynamicValue [▶ 2347].)
	TryGetIndexValue(Int32, Object) [▶ 2364]	Reads the specified array element. (Inherited from DynamicValue [▶ 2347].)
	TryGetIndexValue(Object, Object) [▶ 2364]	Tries the get index value. (Inherited from DynamicValue [▶ 2347].)
	TryGetMember [▶ 2365]	Provides the implementation for operations that get member values. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations such as getting a value for a property. (Inherited from DynamicValue [▶ 2347].)
	TryGetMemberValue [▶ 2366]	Tries the get member value. (Inherited from DynamicValue [▶ 2347].)
	TryInvoke [▶ 2366]	Provides the implementation for operations that invoke an object. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations such as invoking an object or a delegate. (Inherited from DynamicValue [▶ 2347].)
	TryInvokeMember [▶ 2367]	Provides the implementation for operations that invoke a member. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations such as calling a method. (Inherited from DynamicValue [▶ 2347].)
	TryResolveValue [▶ 2368]	Tries to resolve the Value object to its primitive value. (Inherited from DynamicValue [▶ 2347].)
	TrySetIndex [▶ 2369]	Provides the implementation for operations that set a value by index. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations that access objects by a specified index. (Inherited from DynamicValue [▶ 2347].)
	TrySetIndexValue(Int32, Object) [▶ 2370]	Tries to set the indexed value on Arrays (Inherited from DynamicValue [▶ 2347].)
	TrySetIndexValue(Object, Object) [▶ 2370]	Tries to set the indexed value on Arrays (Inherited from DynamicValue [▶ 2347].)
	TrySetMember [▶ 2371]	Provides the implementation for operations that set member values. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations such as setting a value for a property. (Inherited from DynamicValue [▶ 2347].)
	TrySetMemberValue [▶ 2372]	Tries to Set a Member/Property Value (Inherited from DynamicValue [▶ 2347].)
	TryUnaryOperation	Provides implementation for unary operations. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations such as negation, increment, or decrement. (Inherited from DynamicObject .)
	Write [▶ 2372]	Writes the value (via ADS) (Inherited from DynamicValue [▶ 2347].)
	WriteAsync [▶ 2373]	write as an asynchronous operation. (Inherited from DynamicValue [▶ 2347].)

6.11.18.2.1 DynamicReferenceValue.ReadMember Method

Reads the specified member element.

Namespace: [TwinCAT.TypeSystem](#) [[▶ 2083](#)]

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.116+a71ced3

Syntax

C#

```
protected override Object ReadMember(  
    ISymbol memberInstance  
)
```

Parameters

memberInstance Type: [TwinCAT.TypeSystem.ISymbol](#) [[▶ 2691](#)]
The member instance.

Return Value

Type: [Object](#)

Namespace: [TwinCAT.TypeSystem](#) [[▶ 2083](#)]

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.95+cf8c3f5

Syntax

C#

```
public sealed class DynamicRpcStructInstance : DynamicStructInstance,
    IRpcStructInstance, IStructInstance, ISymbol, IAttributedInstance, IInstance,
    IBitSize, IRpcCallableInstance
```

The DynamicRpcStructInstance type exposes the following members.

Properties

	Name	Description
	InnerSymbol [▶ 2274]	Gets the inner symbol of this DynamicSymbol [▶ 2266] (Inherited from DynamicSymbol [▶ 2266].)
	AccessRights [▶ 2274]	Gets the access rights. (Inherited from DynamicSymbol [▶ 2266].)
	Attributes [▶ 2275]	Gets the Symbol Attributes (Inherited from DynamicSymbol [▶ 2266].)
	BitSize [▶ 2276]	Gets the size of the IDataType [▶ 2475] in bits. (Inherited from DynamicSymbol [▶ 2266].)
	ByteSize [▶ 2276]	Gets the (aligned) size of of the Type/Instance in Bytes (Inherited from DynamicSymbol [▶ 2266].)
	Category [▶ 2277]	Gets the category. (Inherited from DynamicSymbol [▶ 2266].)
	Comment [▶ 2277]	Gets the comment of the IInstance [▶ 2549] (Inherited from DynamicSymbol [▶ 2266].)
	Connection [▶ 2277]	Gets the connection bound to this DynamicSymbol [▶ 2266] (Inherited from DynamicSymbol [▶ 2266].)
	DataType [▶ 2278]	Gets the IDataType [▶ 2475] of the IInstance [▶ 2549]. (Inherited from DynamicSymbol [▶ 2266].)
	HasRpcMethods [▶ 2258]	Gets a value indicating whether this instance has RPC methods (Inherited from DynamicStructInstance [▶ 2251].)
	HasValue [▶ 2278]	Gets a value indicating whether this instance has value (only the non VirtualInstances, what means the Symbols with locations). (Inherited from DynamicSymbol [▶ 2266].)
	InstanceName [▶ 2279]	Gets the name of the instance (without periods (.)) (Inherited from DynamicSymbol [▶ 2266].)
	InstancePath [▶ 2279]	Gets the relative / absolute access path to the instance (with periods (.)) (Inherited from DynamicSymbol [▶ 2266].)
	IsBitType [▶ 2280]	Gets a value indicating whether this instance is not basing on a full DataType but instead of some sort of bit mapping (Inherited from DynamicSymbol [▶ 2266].)
	IsByteAligned [▶ 2280]	Indicates that the Size of the Object is Byte aligned ($\text{BitSize} \% 8 == 0$) (Inherited from DynamicSymbol [▶ 2266].)
	IsContainerType [▶ 2281]	Gets a value indicating whether this Symbol is a container type. (Inherited from DynamicSymbol [▶ 2266].)
	IsPersistent [▶ 2281]	Gets a value indicating whether this ISymbol [▶ 2691] is persistent. (Inherited from DynamicSymbol [▶ 2266].)
	IsPointer [▶ 2282]	Indicates that the IInstance [▶ 2549] represents a Pointer type (Pointer TO) (Inherited from DynamicSymbol [▶ 2266].)
	IsPrimitiveType [▶ 2282]	Gets a value indicating whether this instance is a primitive type. (Inherited from DynamicSymbol [▶ 2266].)

	Name	Description
	IsReadOnly [▶ 2283]	Indicates that this instance is read only. (Inherited from DynamicSymbol [▶ 2266].)
	IsRecursive [▶ 2283]	Gets a value indicating whether this instance is recursive. (Inherited from DynamicSymbol [▶ 2266].)
	IsReference [▶ 2284]	Indicates that the Instance [▶ 2549] represents a Reference type (REFERENCE TO) (Inherited from DynamicSymbol [▶ 2266].)
	IsStatic [▶ 2284]	Gets a value indicating whether this instance is static. (Inherited from DynamicSymbol [▶ 2266].)
	MemberInstances [▶ 2259]	Gets the member instances of the Struct Instance [▶ 2666]. (Inherited from DynamicStructInstance [▶ 2251].)
	NormalizedName [▶ 2285]	Gets the normalized instance name (fixed name for dynamic property access that doesn't contain invalid characters), (Inherited from DynamicSymbol [▶ 2266].)
	NotificationSettings [▶ 2285]	Gets the notification settings. (Inherited from DynamicSymbol [▶ 2266].)
	Parent [▶ 2286]	Gets the parent Symbol (Inherited from DynamicSymbol [▶ 2266].)
	RpcMethods [▶ 2229]	Gets the Method descriptions for the IRpcCallableType [▶ 2624]
	Size [▶ 2286]	Gets the size of the Instance [▶ 2549] in bytes. (Inherited from DynamicSymbol [▶ 2266].)
	SubSymbols [▶ 2287]	Gets the SubSymbols of the ISymbol [▶ 2691] (Inherited from DynamicSymbol [▶ 2266].)
	TypeName [▶ 2287]	Gets the name of the DataType [▶ 2475] that is used for this Instance [▶ 2549]. (Inherited from DynamicSymbol [▶ 2266].)
	ValueEncoding [▶ 2288]	Gets the value encoding. (Inherited from DynamicSymbol [▶ 2266].)

Methods

	Name	Description
	Equals [▶ 2292]	Equals (Inherited from DynamicSymbol [▶ 2266].)
	GetDynamicMemberNames [▶ 2263]	Returns the enumeration of all dynamic member names. (Inherited from DynamicStructInstance [▶ 2251].)
	GetHashCode [▶ 2293]	Gets the HashCode of the Address (Inherited from DynamicSymbol [▶ 2266].)
	GetMetaObject	Provides a DynamicMetaObject that dispatches to the dynamic virtual methods. The object can be encapsulated inside another DynamicMetaObject to provide custom behavior for individual actions. This method supports the Dynamic Language Runtime infrastructure for language implementers and it is not intended to be used directly from your code. (Inherited from DynamicObject .)
	GetType	Gets the Type of the current instance. (Inherited from Object .)
 	InvokeRpcMethodAsync [▶ 2238]	Invokes the specified RPC Method asynchronously
	ReadAnyValue [▶ 2300]	Reads the value of this Value [▶ 2775] into a new created instance of the managed type (Inherited from DynamicSymbol [▶ 2266].)

	Name	Description
	ReadRawValue. [▶ 2301]	Reads the raw value of the IValueSymbol [▶ 2775] (Ads Read / Write) (Inherited from DynamicSymbol [▶ 2266].)
	ReadRawValue(Int32) [▶ 2302]	Reads the Symbols raw value (Inherited from DynamicSymbol [▶ 2266].)
	ReadRawValueAsyn c [▶ 2302]	Read raw value as an asynchronous operation. (Inherited from DynamicSymbol [▶ 2266].)
	ReadValue. [▶ 2303]	Reads the value of this DynamicSymbol [▶ 2266]. (Inherited from DynamicSymbol [▶ 2266].)
	ReadValue(Int32) [▶ 2306]	Reads the value of this DynamicSymbol [▶ 2266]. (Inherited from DynamicSymbol [▶ 2266].)
	ReadValueAsyn c [▶ 2307]	Reads the Value of the IValueSymbol [▶ 2775] asynchronously. (Inherited from DynamicSymbol [▶ 2266].)
	ToString [▶ 2307]	Returns a String that represents this instance. (Inherited from DynamicSymbol [▶ 2266].)
	TryBinaryOperation	Provides implementation for binary operations. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations such as addition and multiplication. (Inherited from DynamicObject .)
	TryConvert	Provides implementation for type conversion operations. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations that convert an object from one type to another. (Inherited from DynamicObject .)
	TryCreateInstance	Provides the implementation for operations that initialize a new instance of a dynamic object. This method is not intended for use in C# or Visual Basic. (Inherited from DynamicObject .)
	TryDeleteIndex	Provides the implementation for operations that delete an object by index. This method is not intended for use in C# or Visual Basic. (Inherited from DynamicObject .)
	TryDeleteMember	Provides the implementation for operations that delete an object member. This method is not intended for use in C# or Visual Basic. (Inherited from DynamicObject .)
	TryGetIndex	Provides the implementation for operations that get a value by index. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for indexing operations. (Inherited from DynamicObject .)
	TryGetMember [▶ 2243]	Provides the implementation for operations that get member values. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations such as getting a value for a property. (Overrides DynamicStructInstance.TryGetMember(GetMemberBinder, Object.) [▶ 2264].)
	TryInvoke	Provides the implementation for operations that invoke an object. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations such as invoking an object or a delegate. (Inherited from DynamicObject .)
	TryInvokeMember [▶ 2244]	Provides the implementation for operations that invoke a member. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations such as calling a method. (Overrides DynamicObject.TryInvokeMember(InvokeMemberBinder, .Object., Object.) .)

	Name	Description
 	TryInvokeRpcMethod(String, Object, Object.) [▶ 2245]	Invokes the specified RPC Method
 	TryInvokeRpcMethod(String, Object, Object, Object.) [▶ 2247]	Invokes the specified RPC Method
	TryReadValue [▶ 2309]	Reads the Value of the IValueSymbol [▶ 2775] (Inherited from DynamicSymbol [▶ 2266].)
	TrySetIndex	Provides the implementation for operations that set a value by index. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations that access objects by a specified index. (Inherited from DynamicObject .)
	TrySetMember [▶ 2250]	Provides the implementation for operations that set member values. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations such as setting a value for a property. (Overrides DynamicStructInstance.TrySetMember(SetMemberBinder, Object) [▶ 2264].)
	TryUnaryOperation	Provides implementation for unary operations. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations such as negation, increment, or decrement. (Inherited from DynamicObject .)
 	TryWriteValue [▶ 2309]	Writes the specified value to the DynamicSymbol [▶ 2266]. (Inherited from DynamicSymbol [▶ 2266].)
	UpdateAnyValue [▶ 2312]	Reads the value of this Value [▶ 2775] into the specified managed value. (Inherited from DynamicSymbol [▶ 2266].)
	WriteAnyValue [▶ 2313]	Writes the value represented by the managed value to this Value [▶ 2775] (Inherited from DynamicSymbol [▶ 2266].)
	WriteRawValue(Byte.) [▶ 2314]	Writes the raw value of the IValueSymbol [▶ 2775] (Ads Read / Write) (Inherited from DynamicSymbol [▶ 2266].)
	WriteRawValue(Byte, Int32) [▶ 2314]	Writes the raw value of the IValueSymbol [▶ 2775] (Ads Read / Write) (Inherited from DynamicSymbol [▶ 2266].)
	WriteRawValueAsync [▶ 2315]	Writes the raw value of the IValueSymbol [▶ 2775] (Ads Read / Write) (Inherited from DynamicSymbol [▶ 2266].)
	WriteValue(Object) [▶ 2316]	Writes the specified value to the DynamicSymbol [▶ 2266]. (Inherited from DynamicSymbol [▶ 2266].)
 	WriteValue(Object, Int32) [▶ 2319]	Writes the specified value to the DynamicSymbol [▶ 2266]. (Inherited from DynamicSymbol [▶ 2266].)
	WriteValueAsync [▶ 2321]	Writes the Value of the IValueSymbol [▶ 2775] (Inherited from DynamicSymbol [▶ 2266].)

Events

	Name	Description
	RawValueChanged [▶ 2323]	Occurs when the RawValue of the IValueSymbol [▶ 2775] has changed. (Inherited from DynamicSymbol [▶ 2266].)
	ValueChanged [▶ 2323]	Occurs when the (Primitive) value of the IValueSymbol [▶ 2775] has changed. (Inherited from DynamicSymbol [▶ 2266].)

6.11.19.1 DynamicRpcStructInstance Properties

The [DynamicRpcStructInstance](#) [▶ 2223] type exposes the following members.

Properties

	Name	Description
	InnerSymbol [▶ 2274]	Gets the inner symbol of this DynamicSymbol [▶ 2266] (Inherited from DynamicSymbol [▶ 2266].)
	AccessRights [▶ 2274]	Gets the access rights. (Inherited from DynamicSymbol [▶ 2266].)
	Attributes [▶ 2275]	Gets the Symbol Attributes (Inherited from DynamicSymbol [▶ 2266].)
	BitSize [▶ 2276]	Gets the size of the IDataType [▶ 2475] in bits. (Inherited from DynamicSymbol [▶ 2266].)
	ByteSize [▶ 2276]	Gets the (aligned) size of the Type/Instance in Bytes (Inherited from DynamicSymbol [▶ 2266].)
	Category [▶ 2277]	Gets the category. (Inherited from DynamicSymbol [▶ 2266].)
	Comment [▶ 2277]	Gets the comment of the IInstance [▶ 2549] (Inherited from DynamicSymbol [▶ 2266].)
	Connection [▶ 2277]	Gets the connection bound to this DynamicSymbol [▶ 2266] (Inherited from DynamicSymbol [▶ 2266].)
	DataType [▶ 2278]	Gets the IDataType [▶ 2475] of the IInstance [▶ 2549]. (Inherited from DynamicSymbol [▶ 2266].)
	HasRpcMethods [▶ 2258]	Gets a value indicating whether this instance has RPC methods (Inherited from DynamicStructInstance [▶ 2251].)
	HasValue [▶ 2278]	Gets a value indicating whether this instance has value (only the non VirtualInstances, what means the Symbols with locations). (Inherited from DynamicSymbol [▶ 2266].)
	InstanceName [▶ 2279]	Gets the name of the instance (without periods (.)) (Inherited from DynamicSymbol [▶ 2266].)
	InstancePath [▶ 2279]	Gets the relative / absolute access path to the instance (with periods (.)) (Inherited from DynamicSymbol [▶ 2266].)

	Name	Description
	IsBitType [▶ 2280]	Gets a value indicating whether this instance is not basing on a full DataType but instead of some sort of bit mapping (Inherited from DynamicSymbol [▶ 2266].)
	IsByteAligned [▶ 2280]	Indicates that the Size of the Object is Byte aligned ($\text{BitSize} \% 8 == 0$) (Inherited from DynamicSymbol [▶ 2266].)
	IsContainerType [▶ 2281]	Gets a value indicating whether this Symbol is acontainer type. (Inherited from DynamicSymbol [▶ 2266].)
	IsPersistent [▶ 2281]	Gets a value indicating whether this ISymbol [▶ 2691] is persistent. (Inherited from DynamicSymbol [▶ 2266].)
	IsPointer [▶ 2282]	Indicates that the IInstance [▶ 2549] represents a Pointer type (Pointer TO) (Inherited from DynamicSymbol [▶ 2266].)
	IsPrimitiveType [▶ 2282]	Gets a value indicating whether this instance is a primitive type. (Inherited from DynamicSymbol [▶ 2266].)
	IsReadOnly [▶ 2283]	Indicates that this instance is read only. (Inherited from DynamicSymbol [▶ 2266].)
	IsRecursive [▶ 2283]	Gets a value indicating whether this instance is recursive. (Inherited from DynamicSymbol [▶ 2266].)
	IsReference [▶ 2284]	Indicates that the IInstance [▶ 2549] represents a Reference type (REFERENCE TO) (Inherited from DynamicSymbol [▶ 2266].)
	IsStatic [▶ 2284]	Gets a value indicating whether this instance is static. (Inherited from DynamicSymbol [▶ 2266].)
	MemberInstances [▶ 2259]	Gets the member instances of the Struct Instance [▶ 2666]. (Inherited from DynamicStructInstance [▶ 2251].)
	NormalizedName [▶ 2285]	Gets the normalized instance name (fixed name for dynamic property access that doesn't contain invalid characters), (Inherited from DynamicSymbol [▶ 2266].)
	NotificationSettings [▶ 2285]	Gets the notification settings. (Inherited from DynamicSymbol [▶ 2266].)
	Parent [▶ 2286]	Gets the parent Symbol (Inherited from DynamicSymbol [▶ 2266].)
	RpcMethods [▶ 2229]	Gets the Method descriptions for the IRpcCallableType [▶ 2624]
	Size [▶ 2286]	Gets the size of the IInstance [▶ 2549] in bytes. (Inherited from DynamicSymbol [▶ 2266].)
	SubSymbols [▶ 2287]	Gets the SubSymbols of the ISymbol [▶ 2691] (Inherited from DynamicSymbol [▶ 2266].)
	TypeName [▶ 2287]	Gets the name of the DataType [▶ 2475] that is used for this IInstance [▶ 2549]. (Inherited from DynamicSymbol [▶ 2266].)
	ValueEncoding [▶ 2288]	Gets the value encoding. (Inherited from DynamicSymbol [▶ 2266].)

6.11.19.2 DynamicRpcStructInstance Methods

The [DynamicRpcStructInstance](#) [▶ 2223] type exposes the following members.

Methods

	Name	Description
	Equals [▶ 2292]	Equals (Inherited from DynamicSymbol [▶ 2266].)
	GetDynamicMemberNames [▶ 2263]	Returns the enumeration of all dynamic member names. (Inherited from DynamicStructInstance [▶ 2251].)
	GetHashCode [▶ 2293]	Gets the HashCode of the Address (Inherited from DynamicSymbol [▶ 2266].)
	GetMetaObject	Provides a DynamicMetaObject that dispatches to the dynamic virtual methods. The object can be encapsulated inside another DynamicMetaObject to provide custom behavior for individual actions. This method supports the Dynamic Language Runtime infrastructure for language implementers and it is not intended to be used directly from your code. (Inherited from DynamicObject .)
	GetType	Gets the Type of the current instance. (Inherited from Object .)
 	InvokeRpcMethodAsync [▶ 2238]	Invokes the specified RPC Method asynchronously
	ReadAnyValue [▶ 2300]	Reads the value of this Value [▶ 2775] into a new created instance of the managed type (Inherited from DynamicSymbol [▶ 2266].)
	ReadRawValue [▶ 2301]	Reads the raw value of the IValueSymbol [▶ 2775] (Ads Read / Write) (Inherited from DynamicSymbol [▶ 2266].)
	ReadRawValue(Int32) [▶ 2302]	Reads the Symbols raw value (Inherited from DynamicSymbol [▶ 2266].)

	Name	Description
	ReadRawValueAsyn c [▶ 2302]	Read raw value as an asynchronous operation. (Inherited from DynamicSymbol [▶ 2266].)
	ReadValue. [▶ 2303]	Reads the value of this DynamicSymbol [▶ 2266]. (Inherited from DynamicSymbol [▶ 2266].)
	ReadValue(Int32) [▶ 2306]	Reads the value of this DynamicSymbol [▶ 2266]. (Inherited from DynamicSymbol [▶ 2266].)
	ReadValueAsync [▶ 2307]	Reads the Value of the IValueSymbol [▶ 2775] asynchronously. (Inherited from DynamicSymbol [▶ 2266].)
	ToString [▶ 2307]	Returns a String that represents this instance. (Inherited from DynamicSymbol [▶ 2266].)
	TryBinaryOperation	Provides implementation for binary operations. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations such as addition and multiplication. (Inherited from DynamicObject.)
	TryConvert	Provides implementation for type conversion operations. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations that convert an object from one type to another. (Inherited from DynamicObject.)
	TryCreateInstance	Provides the implementation for operations that initialize a new instance of a dynamic object. This method is not intended for use in C# or Visual Basic. (Inherited from DynamicObject.)
	TryDeleteIndex	Provides the implementation for operations that delete an object by index. This method is not intended for use in C# or Visual Basic. (Inherited from DynamicObject.)
	TryDeleteMember	Provides the implementation for operations that delete an object member. This method is not intended for use in C# or Visual Basic. (Inherited from DynamicObject.)
	TryGetIndex	Provides the implementation for operations that get a value by index. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for indexing operations. (Inherited from DynamicObject.)
	TryGetMember [▶ 2243]	Provides the implementation for operations that get member values. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations such as getting a value for a property. (Overrides DynamicStructInstance.TryGetMember(GetMemberBinder, Object.) [▶ 2264].)
	TryInvoke	Provides the implementation for operations that invoke an object. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations such as invoking an object or a delegate. (Inherited from DynamicObject.)
	TryInvokeMember [▶ 2244]	Provides the implementation for operations that invoke a member. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations such as calling a method. (Overrides DynamicObject.TryInvokeMember(InvokeMemberBinder, Object, Object.) .)
 	TryInvokeRpcMetho d(String, Object, Object.) [▶ 2245]	Invokes the specified RPC Method

	Name	Description
 	TryInvokeRpcMethod(String, Object, Object, Object) [2247]	Invokes the specified RPC Method
	TryReadValue [2309]	Reads the Value of the IValueSymbol [2775] (Inherited from DynamicSymbol [2266].)
	TrySetIndex	Provides the implementation for operations that set a value by index. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations that access objects by a specified index. (Inherited from DynamicObject .)
	TrySetMember [2250]	Provides the implementation for operations that set member values. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations such as setting a value for a property. (Overrides DynamicStructInstance.TrySetMember(SetMemberBinder, Object) [2264].)
	TryUnaryOperation	Provides implementation for unary operations. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations such as negation, increment, or decrement. (Inherited from DynamicObject .)
 	TryWriteValue [2309]	Writes the specified value to the DynamicSymbol [2266]. (Inherited from DynamicSymbol [2266].)
	UpdateAnyValue [2312]	Reads the value of this Value [2775] into the specified managed value. (Inherited from DynamicSymbol [2266].)
	WriteAnyValue [2313]	Writes the value represented by the managed value to this Value [2775] (Inherited from DynamicSymbol [2266].)
	WriteRawValue(Byte) [2314]	Writes the raw value of the IValueSymbol [2775] (Ads Read / Write) (Inherited from DynamicSymbol [2266].)
	WriteRawValue(Byte, Int32) [2314]	Writes the raw value of the IValueSymbol [2775] (Ads Read / Write) (Inherited from DynamicSymbol [2266].)
	WriteRawValueAsync [2315]	Writes the raw value of the IValueSymbol [2775] (Ads Read / Write) (Inherited from DynamicSymbol [2266].)
	WriteValue(Object) [2316]	Writes the specified value to the DynamicSymbol [2266]. (Inherited from DynamicSymbol [2266].)
 	WriteValue(Object, Int32) [2319]	Writes the specified value to the DynamicSymbol [2266]. (Inherited from DynamicSymbol [2266].)
	WriteValueAsync [2321]	Writes the Value of the IValueSymbol [2775] (Inherited from DynamicSymbol [2266].)

Reference

[TwinCAT.TypeSystem Namespace](#) [[2083](#)]

6.11.19.2.1 DynamicRpcStructInstance.GetDynamicMemberNames Method

Gets the dynamic member names.

Namespace: [TwinCAT.TypeSystem](#) [[▸ 2083](#)]

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 5.0.294+Branch.releases-5.0.Sha.90bb9a1b43b6095934fddca3e72bc0ea15da1c14

Syntax

C#

```
public override IEnumerable<string> GetDynamicMemberNames ()
```

Return Value

Type: [IEnumerable.String](#).
[IEnumerable<System.String>](#).

Reference

[DynamicRpcStructInstance Class](#) [[▸ 2223](#)]

[TwinCAT.TypeSystem Namespace](#) [[▸ 2083](#)]

6.11.19.2.2 DynamicRpcStructInstance.InvokeRpcMethod Method

Overload List

	Name	Description
	InvokeRpcMethod(String, .Object.) [▸ 2233]	Invokes the specified RPC Method
	InvokeRpcMethod(String, .Object., .Object.) [▸ 2235]	Invokes the specified RPC Method
	InvokeRpcMethod(String, .Object., .AnyTypeSpecifier., .AnyTypeSpecifier., .Object.) [▸ 2237]	Invokes the specified RPC Method

Reference

[DynamicRpcStructInstance Class](#) [[▸ 2223](#)]

[TwinCAT.TypeSystem Namespace](#) [[▸ 2083](#)]

6.11.19.2.2.1 DynamicRpcStructInstance.InvokeRpcMethod Method (String, .Object.)

Invokes the specified RPC Method

Namespace: [TwinCAT.TypeSystem](#) [[▸ 2083](#)]

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 5.0.294+Branch.releases-5.0.Sha.90bb9a1b43b6095934fddca3e72bc0ea15da1c14

Syntax

C#

```
public Object InvokeRpcMethod(
    string methodName,
    Object[] inParameters
)
```

Parameters

methodName	Type: System.String The method name.
inParameters	Type: .System.Object . The input parameters or NULL

Return Value

Type: [Object](#)
The return value of the Method (as object).

Implements

[IRpcCallableInstance.InvokeRpcMethod\(String, .Object.\)](#) [▶ 2609]

Remarks

This method only supports primitive data types as inParameters. Any available outparameters will be ignored. Complex types will fall back to byte[] arrays.

Examples

The following sample shows how to call (Remote Procedures / Methods) within the PLC.

Dynamic Tree Mode

```
class RpcCallVirtualProgram
{
    /// <summary>
    /// Defines the entry point of the application.
    /// </summary>
    /// <param name="args">The arguments.</param>
    static void Main(string[] args)
    {
        // Get the AdsAddress from command-line arguments
        AmsAddress address = ArgParser.Parse(args);

        using (AdsClient client = new AdsClient())
        {
            //client.Synchronize = false;

            // Connect to the target device
            client.Connect(address);

            SymbolLoaderSettings settings = new SymbolLoaderSettings(SymbolLoadMode.VirtualTree);
            ISymbolLoader loader = SymbolLoaderFactory.Create(client, settings);

            // Get the Symbols (Dynamic Symbols)

            IRpcStructInstance main = (IRpcStructInstance)loader.Symbols["MAIN"]; // Gets the MAIN Instance of the PLC Program

            // Call a Method that has the following signature (within MAIN Program)
            /* {attribute 'TcRpcEnable'}
            METHOD PUBLIC M_Add : INT
            VAR_INPUT
                i1 : INT := 0;
                i2 : INT := 0;
            END_VAR
            */
        }
    }
}
```

```
short result = (short)main.InvokeRpcMethod("M_Add", new object[] {(short) 3, (short) 4});

// Call a Method that has no parameter and returns VOID
main.InvokeRpcMethod("M_Method1", new object[] {});

//Browsing RpcMethods
foreach(IRpcMethod method in main.RpcMethods)
{
    string methodName = method.Name;

    foreach(IRpcMethodParameter parameter in method.Parameters)
    {
        string parameterName = parameter.Name;
        string parameterType = parameter.TypeName;
    }
}
}
```

Reference

[DynamicRpcStructInstance Class](#) [► 2223]

[InvokeRpcMethod Overload](#) [► 2233]

[TwinCAT.TypeSystem Namespace](#) [► 2083]

6.11.19.2.2 DynamicRpcStructInstance.InvokeRpcMethod Method (String, .Object., .Object..)

Invokes the specified RPC Method

Namespace: [TwinCAT.TypeSystem](#) [► 2083]

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version:

5.0.294+Branch.releases-5.0.Sha.90bb9a1b43b6095934 addedca3e72bc0ea15da1c14

Syntax

C#

```
public Object InvokeRpcMethod(
    string methodName,
    Object[] inParameters,
    out Object[] outParameters
)
```

Parameters

methodName	Type: System.String The method name.
inParameters	Type: .System.Object . The input parameters or NULL
outParameters	Type: .System.Object.. The output parameters.

Return Value

Type: [Object](#)

The return value of the Method (as object).

Implements

[IRpcCallableInstance.InvokeRpcMethod\(String, .Object., .Object..\) \[► 2610\]](#)

Remarks

Because this overload doesn't provide any [AnyTypeSpecifier \[▸ 2094\]](#) specifications, only primitive datatypes will be correctly marshalled by this method. Complex types will fall back to byte[] arrays.

Examples

The following sample shows how to call (Remote Procedures / Methods) within the PLC.

Dynamic Tree Mode

```
class RpcCallVirtualProgram
{
    /// <summary>
    /// Defines the entry point of the application.
    /// </summary>
    /// <param name="args">The arguments.</param>
    static void Main(string[] args)
    {
        // Get the AdsAddress from command-line arguments
        AmsAddress address = ArgParser.Parse(args);

        using (AdsClient client = new AdsClient())
        {
            //client.Synchronize = false;

            // Connect to the target device
            client.Connect(address);

            SymbolLoaderSettings settings = new SymbolLoaderSettings(SymbolLoadMode.VirtualTree);
            ISymbolLoader loader = SymbolLoaderFactory.Create(client, settings);

            // Get the Symbols (Dynamic Symbols)

            IRpcStructInstance main = (IRpcStructInstance)loader.Symbols["MAIN"]; // Gets the MAIN Instance of the PLC Program

            // Call a Method that has the following signature (within MAIN Program)
            /* {attribute 'TcRpcEnable'}
            METHOD PUBLIC M_Add : INT
            VAR_INPUT
                i1 : INT := 0;
                i2 : INT := 0;
            END_VAR
            */

            short result = (short)main.InvokeRpcMethod("M_Add", new object[] {(short) 3, (short) 4});

            // Call a Method that has no parameter and returns VOID
            main.InvokeRpcMethod("M_Method1", new object[] {});

            //Browsing RpcMethods
            foreach(IRpcMethod method in main.RpcMethods)
            {
                string methodName = method.Name;

                foreach(IRpcMethodParameter parameter in method.Parameters)
                {
                    string parameterName = parameter.Name;
                    string parameterType = parameter.TypeName;
                }
            }
        }
    }
}
```

Reference

[TwinCAT.TypeSystem Namespace \[▸ 2083\]](#)

6.11.19.2.2.3 DynamicRpcStructInstance.InvokeRpcMethod Method (String, .Object., .AnyTypeSpecifier., AnyTypeSpecifier, .Object..)

Invokes the specified RPC Method

Namespace: [TwinCAT.TypeSystem](#) [[▶ 2083](#)]

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version:

5.0.294+Branch.releases-5.0.Sha.90bb9a1b43b6095934fddca3e72bc0ea15da1c14

Syntax

C#

```
public Object InvokeRpcMethod(  
    string methodName,  
    Object[] inParameters,  
    AnyTypeSpecifier[] outSpecifiers,  
    AnyTypeSpecifier retSpecifier,  
    out Object[] outParameters  
)
```

Parameters

methodName	Type: System.String The method name.
inParameters	Type: .System.Object. The parameters.
outSpecifiers	Type: .TwinCAT.TypeSystem.AnyTypeSpecifier [▶ 2094]. The out specifiers (specifying the out types) or NULL.
retSpecifier	Type: TwinCAT.TypeSystem.AnyTypeSpecifier [▶ 2094] The ret specifier (specifying the return value) or NULL.
outParameters	Type: .System.Object. The out parameters.

Return Value

Type: [Object](#)
The return value of the Method (as object).

Implements

[IRpcCallableInstance.InvokeRpcMethod\(String, .Object., .AnyTypeSpecifier., AnyTypeSpecifier, .Object..\)](#)
[\[▶ 2612\]](#)

Remarks

The RpcMethod optionally support In-Parameters, Out-Parameters and Return values. Therefore the parameters inParameters, outParameters, outSpecifiers, retSpecifier are allowed to be empty or NULL. In case of using primitive datatypes, the type specifier parameters (outSpecifiers and retSpecifier) are not necessary and should not be set.

Examples

The following sample shows how to call (Remote Procedures / Methods) within the PLC.

Dynamic Tree Mode

```
class RpcCallVirtualProgram  
{  
    /// <summary>  
    /// Defines the entry point of the application.  
    /// </summary>  
    /// <param name="args">The arguments.</param>
```

```

static void Main(string[] args)
{
    // Get the AdsAddress from command-line arguments
    AmsAddress address = ArgParser.Parse(args);

    using (AdsClient client = new AdsClient())
    {
        //client.Synchronize = false;

        // Connect to the target device
        client.Connect(address);

        SymbolLoaderSettings settings = new SymbolLoaderSettings(SymbolsLoadMode.VirtualTree);
        ISymbolLoader loader = SymbolLoaderFactory.Create(client, settings);

        // Get the Symbols (Dynamic Symbols)

        IRpcStructInstance main = (IRpcStructInstance)loader.Symbols["MAIN"]; // Gets the MAIN Instance of the PLC Program

        // Call a Method that has the following signature (within MAIN Program)
        /* {attribute 'TcRpcEnable'}
        METHOD PUBLIC M_Add : INT
        VAR_INPUT
            i1 : INT := 0;
            i2 : INT := 0;
        END_VAR
        */

        short result = (short)main.InvokeRpcMethod("M_Add", new object[] {(short) 3, (short) 4});

        // Call a Method that has no parameter and returns VOID
        main.InvokeRpcMethod("M_Method1", new object[] {});

        //Browsing RpcMethods
        foreach(IRpcMethod method in main.RpcMethods)
        {
            string methodName = method.Name;

            foreach(IRpcMethodParameter parameter in method.Parameters)
            {
                string parameterName = parameter.Name;
                string parameterType = parameter.TypeName;
            }
        }
    }
}

6.11.19.2.3 DynamicRpcStructInstance.InvokeRpcMethodAsync Method

Invokes the specified RPC Method asynchronously

Namespace: [TwinCAT.TypeSystem \[► 2083\]](#)

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.95+cf8c3f5

Syntax

C#

```

public Task<ResultRpcMethodAccess> InvokeRpcMethodAsync(
    string methodName,
    Object[]? inParameters,
    CancellationToken cancel
)

```

Parameters

methodName	Type: System.String The method name.
inParameters	Type: .System.Object . The parameters.
cancel	Type: System.Threading.CancellationToken The cancellation token

Return Value

Type: [Task.ResultRpcMethodAccess](#) [▸ 3213].

A task that represents the asynchronous 'InvokeRpcMethod' operation. The [ResultRpcMethodAccess](#) [▸ 3213] results contains the return value ([ReturnValue](#) [▸ 3216]) together with the output parameters. The succeeded communication is indicated by the [ErrorCode](#) property ([ErrorCode](#) [▸ 3202]) after the communication.

Implements

[IRpcCallableInstance.InvokeRpcMethodAsync\(String, .Object., CancellationToken\)](#) [▸ 2614]

Remarks

Because this overload doesn't provide any [AnyTypeSpecifier](#) [▸ 2094] specifications, only primitive datatypes will be correctly marshalled by this method. Complex types will fall back to byte[] arrays.

Examples

The following sample shows how to call (Remote Procedures / Methods) within the PLC.

6.11.19.2.3.2 DynamicRpcStructInstance.InvokeRpcMethodAsync Method (String, .Object., .AnyTypeSpecifier., AnyTypeSpecifier, CancellationToken)

Invokes the specified RPC Method asynchronously

Namespace: [TwinCAT.TypeSystem](#) [▶ 2083]

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version:

5.0.294+Branch.releases-5.0.Sha.90bb9a1b43b6095934fddca3e72bc0ea15da1c14

Syntax

C#

```
public Task<ResultRpcMethodAccess> InvokeRpcMethodAsync (
    string methodName,
    Object[] inParameters,
    AnyTypeSpecifier[] outSpecifiers,
    AnyTypeSpecifier retSpecifier,
    CancellationToken cancel
)
```

Parameters

methodName	Type: System.String The method name.
inParameters	Type: .System.Object . The parameters.
outSpecifiers	Type: .TwinCAT.TypeSystem.AnyTypeSpecifier [▶ 2094]. The out specifiers (specifying the out types) or NULL.
retSpecifier	Type: TwinCAT.TypeSystem.AnyTypeSpecifier [▶ 2094] The ret specifier (specifying the return value) or NULL.
cancel	Type: System.Threading.CancellationToken The cancellation token

Return Value

Type: [Task.ResultRpcMethodAccess](#) [▶ 3213].

A task that represents the asynchronous 'InvokeRpcMethod' operation. The [ResultRpcMethodAccess](#) [▶ 3213] results contains the return value ([ReturnValue](#) [▶ 3216]) together with the output parameters. The succeeded communication is indicated by the [ErrorCode](#) property ([ErrorCode](#) [▶ 3202]) after the communication.

Implements

[IRpcCallableInstance.InvokeRpcMethodAsync\(String, .Object., .AnyTypeSpecifier., AnyTypeSpecifier, CancellationToken\)](#) [▶ 2617]

Remarks

The RpcMethod optionally support In-Parameters, Out-Parameters and Return values. Therefore the parameters inParameters, outSpecifiers, retSpecifier are allowed to be empty or NULL. In case of using primitive datatypes, the type specifier parameters (outSpecifiers and retSpecifier) are not necessary and should not be set.

Examples

The following sample shows how to call (Remote Procedures / Methods) within the PLC.

Dynamic Tree Mode

```

6.11.19.2.4 DynamicRpcStructInstance.TryGetMember Method

Provides the implementation for operations that get member values. Classes derived from the [DynamicObject](#) class can override this method to specify dynamic behavior for operations such as getting a value for a property.

Namespace: [TwinCAT.TypeSystem \[► 2083\]](#)

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.95+cf8c3f5

Syntax

C#

```
public override bool TryGetMember(  
    GetMemberBinder binder,  
    out Object?? result  
)
```

Parameters

binder	Type: System.Dynamic.GetMemberBinder Provides information about the object that called the dynamic operation. The binder.Name property provides the name of the member on which the dynamic operation is performed. For example, for the Console.WriteLine(sampleObject.SampleProperty) statement, where sampleObject is an instance of the class derived from the DynamicObject class, binder.Name returns "SampleProperty". The binder.IgnoreCase property specifies whether the member name is case-sensitive.
result	Type: System.Object . The result of the get operation. For example, if the method is called for a property, you can assign the property value to result.

Return Value

Type: [Boolean](#)
true if the operation is successful; otherwise, false. If this method returns false, the run-time binder of the language determines the behavior. (In most cases, a run-time exception is thrown.)

6.11.19.2.5 DynamicRpcStructInstance.TryInvokeMember Method

Provides the implementation for operations that invoke a member. Classes derived from the [DynamicObject](#) class can override this method to specify dynamic behavior for operations such as calling a method.

Namespace: [TwinCAT.TypeSystem](#) [► 2083]

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.95+cf8c3f5

Syntax

C#

```
public override bool TryInvokeMember(  
    InvokeMemberBinder binder,  
    Object?[]? args,  
    out Object?? returnValue  
)
```

Parameters

binder	Type: System.Dynamic.InvokeMemberBinder Provides information about the dynamic operation. The binder.Name property provides the name of the member on which the dynamic operation is performed. For example, for the statement sampleObject.SampleMethod(100), where sampleObject is an instance of the class derived from the DynamicObject class, binder.Name returns "SampleMethod". The binder.IgnoreCase property specifies whether the member name is case-sensitive.
--------	--

args Type: .System.Object.
 The arguments that are passed to the object member during the invoke operation. For example, for the statement sampleObject.SampleMethod(100), where sampleObject is derived from the DynamicObject class, args[] is equal to 100.

returnValue Type: System.Object.
 The result of the member invocation.

Return Value

Type: Boolean
 true if the operation is successful; otherwise, false. If this method returns false, the run-time binder of the language determines the behavior. (In most cases, a language-specific run-time exception is thrown.)

6.11.19.2.6.1 DynamicRpcStructInstance.TryInvokeRpcMethod Method (String, .Object., Object.)

Invokes the specified RPC Method

Namespace: [TwinCAT.TypeSystem \[▶ 2083\]](#)
Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.95+cf8c3f5

Syntax

C#

```
public int TryInvokeRpcMethod(
    string methodName,
    Object[]? inParameters,
    out Object?? retValue
)
```

Parameters

methodName	Type: System.String The method name.
inParameters	Type: .System.Object . The parameters.
retValue	Type: System.Object . The return value of the RPC method as object.

Return Value

Type: [Int32](#)
The return value of the Method (as object).

Implements

[IRpcCallableInstance.TryInvokeRpcMethod\(String, .Object., Object.\)](#) [► 2619]

Remarks

Because this overload doesn't provide any [AnyTypeSpecifier](#) [► 2094] specifications, only primitive datatypes will be correctly marshalled by this method. Complex types will fall back to byte[] arrays.

Examples

The following sample shows how to call (Remote Procedures / Methods) within the PLC.

Dynamic Tree Mode

```
class RpcCallVirtualProgram
{
    /// <summary>
    /// Defines the entry point of the application.
    /// </summary>
    /// <param name="args">The arguments.</param>
    static void Main(string[] args)
    {
        // Get the AdsAddress from command-line arguments
        AmsAddress address = ArgParser.Parse(args);

6.11.19.2.6.2 DynamicRpcStructInstance.TryInvokeRpcMethod Method (String, .Object., .Object., Object.)

Invokes the specified RPC Method

Namespace: [TwinCAT.TypeSystem](#) [► 2083]

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.95+cf8c3f5

Syntax

C#

```
public int TryInvokeRpcMethod(
    string methodName,
    Object[]? inParameters,
    out Object[]? outParameters,
    out Object?? retValue
)
```

Parameters

methodName	Type: System.String The method name.
inParameters	Type: .System.Object. The parameters.
outParameters	Type: .System.Object.. The out parameters.
retValue	Type: System.Object. The return value of the RPC method as object.

Return Value

Type: [Int32](#)
The ADS Error Code.

Implements

[IRpcCallableInstance.TryInvokeRpcMethod\(String, .Object., .Object., Object.\)](#) [► 2620]

Remarks

Because this overload doesn't provide any [AnyTypeSpecifier \[▸ 2094\]](#) specifications, only primitive datatypes will be correctly marshalled by this method. Complex types will fall back to byte[] arrays.

Examples

The following sample shows how to call (Remote Procedures / Methods) within the PLC.

Dynamic Tree Mode

```
class RpcCallVirtualProgram
{
    /// <summary>
    /// Defines the entry point of the application.
    /// </summary>
    /// <param name="args">The arguments.</param>
    static void Main(string[] args)
    {
        // Get the AdsAddress from command-line arguments
        AmsAddress address = ArgParser.Parse(args);

        using (AdsClient client = new AdsClient())
        {
            //client.Synchronize = false;

            // Connect to the target device
            client.Connect(address);

            SymbolLoaderSettings settings = new SymbolLoaderSettings(SymbolLoadMode.VirtualTree);
            ISymbolLoader loader = SymbolLoaderFactory.Create(client, settings);

            // Get the Symbols (Dynamic Symbols)

            IRpcStructInstance main = (IRpcStructInstance)loader.Symbols["MAIN"]; // Gets the MAIN Instance of the PLC Program

            // Call a Method that has the following signature (within MAIN Program)
            /* {attribute 'TcRpcEnable'}
            METHOD PUBLIC M_Add : INT
            VAR_INPUT
                i1 : INT := 0;
                i2 : INT := 0;
            END_VAR
            */

            short result = (short)main.InvokeRpcMethod("M_Add", new object[] {(short) 3, (short) 4});

            // Call a Method that has no parameter and returns VOID
            main.InvokeRpcMethod("M_Method1", new object[] {});

            //Browsing RpcMethods
            foreach(IRpcMethod method in main.RpcMethods)
            {
                string methodName = method.Name;

                foreach(IRpcMethodParameter parameter in method.Parameters)
                {
                    string parameterName = parameter.Name;
                    string parameterType = parameter.TypeName;
                }
            }
        }
    }
}
```

Reference

[TwinCAT.TypeSystem Namespace \[▸ 2083\]](#)

6.11.19.2.6.3 DynamicRpcStructInstance.TryInvokeRpcMethod Method (String, .Object., .AnyTypeSpecifier., AnyTypeSpecifier, .Object., Object.)

Invokes the the specified RpcMethod of the [IRpcCallableInstance](#) [▶ 2606].

Namespace: [TwinCAT.TypeSystem](#) [▶ 2083]

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version:

5.0.294+Branch.releases-5.0.Sha.90bb9a1b43b6095934fddca3e72bc0ea15da1c14

Syntax

C#

```
public int TryInvokeRpcMethod(  
    string methodName,  
    Object[] inParameters,  
    AnyTypeSpecifier[] outSpecifiers,  
    AnyTypeSpecifier retSpecifier,  
    out Object[] outParameters,  
    out Object retVal  
)
```

Parameters

methodName	Type: System.String Name of the method.
inParameters	Type: .System.Object . The parameters.
outSpecifiers	Type: .TwinCAT.TypeSystem.AnyTypeSpecifier [▶ 2094]. The out specifiers (specifying the out types) or NULL.
retSpecifier	Type: TwinCAT.TypeSystem.AnyTypeSpecifier [▶ 2094] The ret specifier (specifying the return value) or NULL.
outParameters	Type: .System.Object . The out parameters.
retValue	Type: System.Object . The return value of the RPC method./>

Return Value

Type: [Int32](#)
AdsErrorCode.

Implements

[IRpcCallableInstance.TryInvokeRpcMethod\(String, .Object., .AnyTypeSpecifier., AnyTypeSpecifier, .Object., Object.\)](#) [▶ 2622]

Remarks

The RpcMethod optionally support In-Parameters, Out-Parameters and Return values. Therefore the parameters inParameters, outParameters, outSpecifiers, retSpecifier are allowed to be empty or NULL. In case of using primitive datatypes, the type specifier parameters (outSpecifiers and retSpecifier) are not necessary and should not be set.

Examples

The following sample shows how to call (Remote Procedures / Methods) within the PLC.

Dynamic Tree Mode

```

class RpcCallVirtualProgram
{
    /// <summary>
    /// Defines the entry point of the application.
    /// </summary>

6.11.19.2.7 DynamicRpcStructInstance.TrySetMember Method

Provides the implementation for operations that set member values. Classes derived from the [DynamicObject](#) class can override this method to specify dynamic behavior for operations such as setting a value for a property.

Namespace: [TwinCAT.TypeSystem \[► 2083\]](#)

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.95+cf8c3f5

Syntax

C#

```
public override bool TrySetMember(
    SetMemberBinder binder,
    Object? value
)
```

Parameters

- binder** Type: [System.Dynamic.SetMemberBinder](#)
 Provides information about the object that called the dynamic operation. The binder.Name property provides the name of the member to which the value is being assigned. For example, for the statement sampleObject.SampleProperty = "Test", where sampleObject is an instance of the class derived from the [DynamicObject](#) class, binder.Name returns "SampleProperty". The binder.IgnoreCase property specifies whether the member name is case-sensitive.
- value** Type: [System.Object](#)
 The value to set to the member. For example, for sampleObject.SampleProperty = "Test", where sampleObject is an instance of the class derived from the [DynamicObject](#) class, the value is "Test".

Return Value

Type: [Boolean](#)
 true if the operation is successful; otherwise, false. If this method returns false, the run-time binder of the language determines the behavior. (In most cases, a language-specific run-time exception is thrown.)

Namespace: TwinCAT.TypeSystem [[▶ 2083](#)]

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public class DynamicStructInstance : DynamicInterfaceInstance,
    IRpcStructInstance, IStructInstance, IInterfaceInstance, ISymbol, IAttributedInstance,
    IInstance, IBitSize, IRpcCallableInstance
```

The DynamicStructInstance type exposes the following members.

Properties

	Name	Description
	InnerSymbol [▶ 2274]	Gets the inner symbol of this DynamicSymbol [▶ 2266] (Inherited from DynamicSymbol [▶ 2266].)
	AccessRights [▶ 2274]	Gets the access rights. (Inherited from DynamicSymbol [▶ 2266].)
	AllowGIOAccess [▶ 2275]	Indicates, that the aggregates symbols is an IProcessImageAddress (and most probably IAdsSymbol) (Inherited from DynamicSymbol [▶ 2266].)
	Attributes [▶ 2275]	Gets the Symbol Attributes (Inherited from DynamicSymbol [▶ 2266].)
	BitSize [▶ 2276]	Gets the size of the IDataType [▶ 2475] in bits. (Inherited from DynamicSymbol [▶ 2266].)
	ByteSize [▶ 2276]	Gets the (aligned) size of of the Type/Instance in Bytes (Inherited from DynamicSymbol [▶ 2266].)
	Category [▶ 2277]	Gets the category. (Inherited from DynamicSymbol [▶ 2266].)
	Comment [▶ 2277]	Gets the comment of the IInstance [▶ 2549] (Inherited from DynamicSymbol [▶ 2266].)
	Connection [▶ 2277]	Gets the connection bound to this DynamicSymbol [▶ 2266] (Inherited from DynamicSymbol [▶ 2266].)
	DataType [▶ 2278]	Gets the IDataType [▶ 2475] of the IInstance [▶ 2549]. (Inherited from DynamicSymbol [▶ 2266].)
	HasRpcMethods [▶ 3001]	Gets a value indicating whether this instance has RPC methods (Inherited from DynamicInterfaceInstance [▶ 2995].)
	HasValue [▶ 2278]	Gets a value indicating whether this instance has value (only the non VirtualInstances, what means the Symbols with locations). (Inherited from DynamicSymbol [▶ 2266].)
	InstanceName [▶ 2279]	Gets the name of the instance (without periods (.)) (Inherited from DynamicSymbol [▶ 2266].)
	InstancePath [▶ 2279]	Gets the relative / absolute access path to the instance (with periods (.)) (Inherited from DynamicSymbol [▶ 2266].)
	IsBitType [▶ 2280]	Gets a value indicating whether this instance is not basing on a full DataType but instead of some sort of bit mapping (Inherited from DynamicSymbol [▶ 2266].)

	Name	Description
	IsByteAligned [▶ 2280]	Indicates that the Size of the Object is Byte aligned (BitSize % 8 == 0) (Inherited from DynamicSymbol [▶ 2266].)
	IsContainerType [▶ 2281]	Gets a value indicating whether this Symbol is acontainer type. (Inherited from DynamicSymbol [▶ 2266].)
	IsPersistent [▶ 2281]	Gets a value indicating whether this ISymbol [▶ 2691] is persistent. (Inherited from DynamicSymbol [▶ 2266].)
	IsPointer [▶ 2282]	Indicates that the IInstance [▶ 2549] represents a Pointer type (Pointer TO) (Inherited from DynamicSymbol [▶ 2266].)
	IsPrimitiveType [▶ 2282]	Gets a value indicating whether this instance is a primitive type. (Inherited from DynamicSymbol [▶ 2266].)
	IsReadOnly [▶ 2283]	Indicates that this instance is read only. (Inherited from DynamicSymbol [▶ 2266].)
	IsRecursive [▶ 2283]	Gets a value indicating whether this instance is recursive. (Inherited from DynamicSymbol [▶ 2266].)
	IsReference [▶ 2284]	Indicates that the IInstance [▶ 2549] represents a Reference type (REFERENCE TO) (Inherited from DynamicSymbol [▶ 2266].)
	IsStatic [▶ 2284]	Gets a value indicating whether this instance is static. (Inherited from DynamicSymbol [▶ 2266].)
	MemberInstances [▶ 3002]	Gets the member instances of the Struct Instance [▶ 2666]. (Inherited from DynamicInterfaceInstance [▶ 2995].)
	NormalizedName [▶ 2285]	Gets the normalized instance name (fixed name for dynamic property access that doesn't contain invalid characters), (Inherited from DynamicSymbol [▶ 2266].)
	NotificationSettings [▶ 2285]	Gets the notification settings. (Inherited from DynamicSymbol [▶ 2266].)
	Parent [▶ 2286]	Gets the parent Symbol (Inherited from DynamicSymbol [▶ 2266].)
	RpcMethods [▶ 3003]	Gets the Method descriptions for the IRpcCallableType [▶ 2624] (Inherited from DynamicInterfaceInstance [▶ 2995].)
	Size [▶ 2286]	Gets the size of the IInstance [▶ 2549] in bytes. (Inherited from DynamicSymbol [▶ 2266].)
	SubSymbols [▶ 2287]	Gets the SubSymbols of the ISymbol [▶ 2691] (Inherited from DynamicSymbol [▶ 2266].)
	TypeName [▶ 2287]	Gets the name of the DataType [▶ 2475] that is used for this IInstance [▶ 2549]. (Inherited from DynamicSymbol [▶ 2266].)
	ValueEncoding [▶ 2288]	Gets the value encoding. (Inherited from DynamicSymbol [▶ 2266].)

Methods

	Name	Description
	Equals [▶ 2292]	Equals (Inherited from DynamicSymbol [▶ 2266].)
	Finalize	Allows an object to try to free resources and perform other cleanup operations before it is reclaimed by garbage collection. (Inherited from Object.)
	GetDynamicMemberNames [▶ 3006]	Returns the enumeration of all dynamic member names. (Inherited from DynamicInterfaceInstance [▶ 2995].)
	GetHashCode [▶ 2293]	Gets the HashCode of the Address (Inherited from DynamicSymbol [▶ 2266].)

	Name	Description
	GetMetaObject	Provides a DynamicMetaObject that dispatches to the dynamic virtual methods. The object can be encapsulated inside another DynamicMetaObject to provide custom behavior for individual actions. This method supports the Dynamic Language Runtime infrastructure for language implementers and it is not intended to be used directly from your code. (Inherited from DynamicObject.)
	GetType	Gets the Type of the current instance. (Inherited from Object.)
 	InvokeRpcMethodAsync [▶ 3007]	Invokes the specified RPC Method asynchronously (Inherited from DynamicInterfaceInstance [▶ 2995].)
	MemberwiseClone	Creates a shallow copy of the current Object. (Inherited from Object.)
	OnReadAnyValue [▶ 2293]	Handler function for reading ADS 'Any' Values. (Inherited from DynamicSymbol [▶ 2266].)
	OnReadRawValue [▶ 2294]	Handler function for reading Raw symbol value. (Inherited from DynamicSymbol [▶ 2266].)
	OnReadRawValueAsync [▶ 2294]	Handler function reading the raw value of the DynamicSymbol [▶ 2266]. (Inherited from DynamicSymbol [▶ 2266].)
	OnReadValue [▶ 2295]	Handler function for the (Inherited from DynamicSymbol [▶ 2266].)
	OnReadValueAsync [▶ 2296]	Handler function reading the DynamicSymbols [▶ 2266] value asynchronously. (Inherited from DynamicSymbol [▶ 2266].)
	OnSetInstanceName [▶ 2296]	Sets a new InstanceName InstancePath (Inherited from DynamicSymbol [▶ 2266].)
	OnTryReadValue [▶ 2297]	Handler function for the (Inherited from DynamicSymbol [▶ 2266].)
	OnTryWriteValue [▶ 2297]	Handler Function for writing value. (Inherited from DynamicSymbol [▶ 2266].)
	OnWriteRawValue [▶ 2298]	Handler function for reading symbols raw value. (Inherited from DynamicSymbol [▶ 2266].)
	OnWriteRawValueAsync [▶ 2298]	Handler function for writing the raw DynamicSymbol [▶ 2266] value. (Inherited from DynamicSymbol [▶ 2266].)
	OnWriteValue [▶ 2299]	Handler Function for writing value. (Inherited from DynamicSymbol [▶ 2266].)
	OnWriteValueAsync [▶ 2300]	Handler Function for writing value. (Inherited from DynamicSymbol [▶ 2266].)
	ReadAnyValue [▶ 2300]	Reads the value of this Value [▶ 2775] into a new created instance of the managed type (Inherited from DynamicSymbol [▶ 2266].)
	ReadRawValue. [▶ 2301]	Reads the raw value of the IValueSymbol [▶ 2775] (Ads Read / Write) (Inherited from DynamicSymbol [▶ 2266].)
	ReadRawValue(Int32) [▶ 2302]	Reads the Symbols raw value (Inherited from DynamicSymbol [▶ 2266].)
	ReadRawValueAsync [▶ 2302]	Read raw value as an asynchronous operation. (Inherited from DynamicSymbol [▶ 2266].)

	Name	Description
	ReadValue. [▶ 2303]	Reads the value of this DynamicSymbol [▶ 2266]. (Inherited from DynamicSymbol [▶ 2266].)
	ReadValue(Int32) [▶ 2306]	Reads the value of this DynamicSymbol [▶ 2266]. (Inherited from DynamicSymbol [▶ 2266].)
	ReadValueAsync [▶ 2307]	Reads the Value of the IValueSymbol [▶ 2775] asynchronously. (Inherited from DynamicSymbol [▶ 2266].)
	ToString [▶ 2307]	Returns a String that represents this instance. (Inherited from DynamicSymbol [▶ 2266].)
	TryBinaryOperation	Provides implementation for binary operations. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations such as addition and multiplication. (Inherited from DynamicObject .)
	TryConvert	Provides implementation for type conversion operations. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations that convert an object from one type to another. (Inherited from DynamicObject .)
	TryCreateInstance	Provides the implementation for operations that initialize a new instance of a dynamic object. This method is not intended for use in C# or Visual Basic. (Inherited from DynamicObject .)
	TryDeleteIndex	Provides the implementation for operations that delete an object by index. This method is not intended for use in C# or Visual Basic. (Inherited from DynamicObject .)
	TryDeleteMember	Provides the implementation for operations that delete an object member. This method is not intended for use in C# or Visual Basic. (Inherited from DynamicObject .)
	TryGetIndex	Provides the implementation for operations that get a value by index. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for indexing operations. (Inherited from DynamicObject .)
	TryGetMember [▶ 3008]	Provides the implementation for operations that get member values. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations such as getting a value for a property. (Inherited from DynamicInterfaceInstance [▶ 2995].)
	TryInvoke	Provides the implementation for operations that invoke an object. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations such as invoking an object or a delegate. (Inherited from DynamicObject .)
	TryInvokeMember [▶ 3009]	Provides the implementation for operations that invoke a member. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations such as calling a method. (Inherited from DynamicInterfaceInstance [▶ 2995].)
 	TryInvokeRpcMethod(String, Object, Object) [▶ 3010]	Invokes the specified RPC Method (Inherited from DynamicInterfaceInstance [▶ 2995].)
 	TryInvokeRpcMethod(String, Object, Object, Object) [▶ 3012]	Invokes the specified RPC Method (Inherited from DynamicInterfaceInstance [▶ 2995].)
	TryReadValue [▶ 2309]	Reads the Value of the IValueSymbol [▶ 2775] (Inherited from DynamicSymbol [▶ 2266].)

	Name	Description
	TrySetIndex	Provides the implementation for operations that set a value by index. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations that access objects by a specified index. (Inherited from DynamicObject.)
	TrySetMember [▶ 3013]	Provides the implementation for operations that set member values. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations such as setting a value for a property. (Inherited from DynamicInterfaceInstance [▶ 2995].)
	TryUnaryOperation	Provides implementation for unary operations. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations such as negation, increment, or decrement. (Inherited from DynamicObject.)
 	TryWriteValue [▶ 2309]	Writes the specified value to the DynamicSymbol [▶ 2266]. (Inherited from DynamicSymbol [▶ 2266].)
	UpdateAnyValue [▶ 2312]	Reads the value of this Value [▶ 2775] into the specified managed value. (Inherited from DynamicSymbol [▶ 2266].)
	WriteAnyValue [▶ 2313]	Writes the value represented by the managed value to this Value [▶ 2775] (Inherited from DynamicSymbol [▶ 2266].)
	WriteRawValue(.Byte) [▶ 2314]	Writes the raw value of the IValueSymbol [▶ 2775] (Ads Read / Write) (Inherited from DynamicSymbol [▶ 2266].)
	WriteRawValue(.Byte, Int32) [▶ 2314]	Writes the raw value of the IValueSymbol [▶ 2775] (Ads Read / Write) (Inherited from DynamicSymbol [▶ 2266].)
	WriteRawValueAsync [▶ 2315]	Writes the raw value of the IValueSymbol [▶ 2775] (Ads Read / Write) (Inherited from DynamicSymbol [▶ 2266].)
	WriteValue(Object) [▶ 2316]	Writes the specified value to the DynamicSymbol [▶ 2266]. (Inherited from DynamicSymbol [▶ 2266].)
 	WriteValue(Object, Int32) [▶ 2319]	Writes the specified value to the DynamicSymbol [▶ 2266]. (Inherited from DynamicSymbol [▶ 2266].)
	WriteValueAsync [▶ 2321]	Writes the Value of the IValueSymbol [▶ 2775] (Inherited from DynamicSymbol [▶ 2266].)

Events

	Name	Description
	RawValueChanged [▶ 2323]	Occurs when the RawValue of the IValueSymbol [▶ 2775] has changed. (Inherited from DynamicSymbol [▶ 2266].)
	ValueChanged [▶ 2323]	Occurs when the (Primitive) value of the IValueSymbol [▶ 2775] has changed. (Inherited from DynamicSymbol [▶ 2266].)

Fields

	Name	Description
	syncObject [▶ 2327]	Synchronization object (Inherited from DynamicSymbol [▶ 2266].)

Extension Methods

	Name	Description
	ReferencesExternalData [▶ 3038]	Indicates, that the Instance value includes process memory data, that cannot be read in one memory block. (Defined by DataTypeExtension [▶ 3021].)

Reference

[TwinCAT.TypeSystem Namespace](#) [[▶ 2083](#)]

6.11.20.1 DynamicStructInstance Properties

The [DynamicStructInstance](#) [[▶ 2251](#)] type exposes the following members.

Properties

	Name	Description
	InnerSymbol [▶ 2274]	Gets the inner symbol of this DynamicSymbol [▶ 2266] (Inherited from DynamicSymbol [▶ 2266].)
	AccessRights [▶ 2274]	Gets the access rights. (Inherited from DynamicSymbol [▶ 2266].)
	AllowGIOAccess [▶ 2275]	Indicates, that the aggregates symbols is an IProcessImageAddress (and most probably IAdsSymbol) (Inherited from DynamicSymbol [▶ 2266].)
	Attributes [▶ 2275]	Gets the Symbol Attributes (Inherited from DynamicSymbol [▶ 2266].)
	BitSize [▶ 2276]	Gets the size of the IDataType [▶ 2475] in bits. (Inherited from DynamicSymbol [▶ 2266].)
	ByteSize [▶ 2276]	Gets the (aligned) size of of the Type/Instance in Bytes (Inherited from DynamicSymbol [▶ 2266].)
	Category [▶ 2277]	Gets the category. (Inherited from DynamicSymbol [▶ 2266].)
	Comment [▶ 2277]	Gets the comment of the Instance [▶ 2549] (Inherited from DynamicSymbol [▶ 2266].)
	Connection [▶ 2277]	Gets the connection bound to this DynamicSymbol [▶ 2266] (Inherited from DynamicSymbol [▶ 2266].)
	DataType [▶ 2278]	Gets the IDataType [▶ 2475] of the Instance [▶ 2549]. (Inherited from DynamicSymbol [▶ 2266].)
	HasRpcMethods [▶ 3001]	Gets a value indicating whether this instance has RPC methods (Inherited from DynamicInterfaceInstance [▶ 2995].)
	HasValue [▶ 2278]	Gets a value indicating whether this instance has value (only the non VirtualInstances , what means the Symbols with locations). (Inherited from DynamicSymbol [▶ 2266].)
	InstanceName [▶ 2279]	Gets the name of the instance (without periods (.)) (Inherited from DynamicSymbol [▶ 2266].)
	InstancePath [▶ 2279]	Gets the relative / absolute access path to the instance (with periods (.)) (Inherited from DynamicSymbol [▶ 2266].)
	IsBitType [▶ 2280]	Gets a value indicating whether this instance is not basing on a full DataType but instead of some sort of bit mapping (Inherited from DynamicSymbol [▶ 2266].)
	IsByteAligned [▶ 2280]	Indicates that the Size of the Object is Byte aligned ($BitSize \% 8 == 0$) (Inherited from DynamicSymbol [▶ 2266].)

	Name	Description
	IsContainerType [▶ 2281]	Gets a value indicating whether this Symbol is a container type. (Inherited from DynamicSymbol [▶ 2266].)
	IsPersistent [▶ 2281]	Gets a value indicating whether this ISymbol [▶ 2691] is persistent. (Inherited from DynamicSymbol [▶ 2266].)
	IsPointer [▶ 2282]	Indicates that the IInstance [▶ 2549] represents a Pointer type (Pointer TO) (Inherited from DynamicSymbol [▶ 2266].)
	IsPrimitiveType [▶ 2282]	Gets a value indicating whether this instance is a primitive type. (Inherited from DynamicSymbol [▶ 2266].)
	IsReadOnly [▶ 2283]	Indicates that this instance is read only. (Inherited from DynamicSymbol [▶ 2266].)
	IsRecursive [▶ 2283]	Gets a value indicating whether this instance is recursive. (Inherited from DynamicSymbol [▶ 2266].)
	IsReference [▶ 2284]	Indicates that the IInstance [▶ 2549] represents a Reference type (REFERENCE TO) (Inherited from DynamicSymbol [▶ 2266].)
	IsStatic [▶ 2284]	Gets a value indicating whether this instance is static. (Inherited from DynamicSymbol [▶ 2266].)
	MemberInstances [▶ 3002]	Gets the member instances of the Struct Instance [▶ 2666]. (Inherited from DynamicInterfaceInstance [▶ 2995].)
	NormalizedName [▶ 2285]	Gets the normalized instance name (fixed name for dynamic property access that doesn't contain invalid characters), (Inherited from DynamicSymbol [▶ 2266].)
	NotificationSettings [▶ 2285]	Gets the notification settings. (Inherited from DynamicSymbol [▶ 2266].)
	Parent [▶ 2286]	Gets the parent Symbol (Inherited from DynamicSymbol [▶ 2266].)
	RpcMethods [▶ 3003]	Gets the Method descriptions for the IRpcCallableType [▶ 2624] (Inherited from DynamicInterfaceInstance [▶ 2995].)
	Size [▶ 2286]	Gets the size of the IInstance [▶ 2549] in bytes. (Inherited from DynamicSymbol [▶ 2266].)
	SubSymbols [▶ 2287]	Gets the SubSymbols of the ISymbol [▶ 2691] (Inherited from DynamicSymbol [▶ 2266].)
	TypeName [▶ 2287]	Gets the name of the DataType [▶ 2475] that is used for this IInstance [▶ 2549]. (Inherited from DynamicSymbol [▶ 2266].)
	ValueEncoding [▶ 2288]	Gets the value encoding. (Inherited from DynamicSymbol [▶ 2266].)

Reference

[DynamicStructInstance Class](#) [▶ 2251]

[TwinCAT.TypeSystem Namespace](#) [▶ 2083]

6.11.20.1.1 DynamicStructInstance.HasRpcMethods Property

Gets a value indicating whether this instance has RPC methods

Namespace: [TwinCAT.TypeSystem](#) [▶ 2083]

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.95+cf8c3f5

Syntax

C#

```
public bool HasRpcMethods { get; }
```

Property Value

Type: [Boolean](#)

true if this instance has RPC methods; otherwise, false.

Implements

[IStructInstance.HasRpcMethods](#) [[▶ 2670](#)]

Remarks

If the struct instance supports RPC Methods, then the instance class is also supporting [IRpcStructInstance](#) [[▶ 2642](#)]

Reference

[TwinCAT.TypeSystem.IRpcMethodParameter](#) [[▶ 2635](#)]

6.11.20.1.2 DynamicStructInstance.MemberInstances Property

Gets the member instances of the [Struct Instance](#) [[▶ 2666](#)].

Namespace: [TwinCAT.TypeSystem](#) [[▶ 2083](#)]

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.95+cf8c3f5

Syntax

C#

```
public ISymbolCollection<ISymbol> MemberInstances { get; }
```

Property Value

Type: [ISymbolCollection](#) [[▶ 2700](#)].[ISymbol](#) [[▶ 2691](#)].

The member instances.

Implements

[IStructInstance.MemberInstances](#) [[▶ 2670](#)]

Reference

[DynamicStructInstance Class](#) [[▶ 2251](#)]

6.11.20.2 DynamicStructInstance Methods

The [DynamicStructInstance](#) [▶ 2251] type exposes the following members.

Methods

	Name	Description
	Equals [▶ 2292]	Equals (Inherited from DynamicSymbol [▶ 2266].)
	Finalize	Allows an object to try to free resources and perform other cleanup operations before it is reclaimed by garbage collection. (Inherited from Object.)
	GetDynamicMemberNames [▶ 3006]	Returns the enumeration of all dynamic member names. (Inherited from DynamicInterfaceInstance [▶ 2995].)
	GetHashCode [▶ 2293]	Gets the HashCode of the Address (Inherited from DynamicSymbol [▶ 2266].)
	GetMetaObject	Provides a DynamicMetaObject that dispatches to the dynamic virtual methods. The object can be encapsulated inside another DynamicMetaObject to provide custom behavior for individual actions. This method supports the Dynamic Language Runtime infrastructure for language implementers and it is not intended to be used directly from your code. (Inherited from DynamicObject .)
	GetType	Gets the Type of the current instance. (Inherited from Object.)
 	InvokeRpcMethodAsync [▶ 3007]	Invokes the specified RPC Method asynchronously (Inherited from DynamicInterfaceInstance [▶ 2995].)
	MemberwiseClone	Creates a shallow copy of the current Object. (Inherited from Object.)
	OnReadAnyValue [▶ 2293]	Handler function for reading ADS 'Any' Values. (Inherited from DynamicSymbol [▶ 2266].)
	OnReadRawValue [▶ 2294]	Handler function for reading Raw symbol value. (Inherited from DynamicSymbol [▶ 2266].)

	Name	Description
	OnReadRawValueAsync [▶ 2294]	Handler function reading the raw value of the DynamicSymbol [▶ 2266]. (Inherited from DynamicSymbol [▶ 2266].)
	OnReadValue [▶ 2295]	Handler function for the (Inherited from DynamicSymbol [▶ 2266].)
	OnReadValueAsync [▶ 2296]	Handler function reading the DynamicSymbols [▶ 2266] value asynchronously. (Inherited from DynamicSymbol [▶ 2266].)
	OnSetInstanceName [▶ 2296]	Sets a new InstanceName InstancePath (Inherited from DynamicSymbol [▶ 2266].)
	OnTryReadValue [▶ 2297]	Handler function for the (Inherited from DynamicSymbol [▶ 2266].)
	OnTryWriteValue [▶ 2297]	Handler Function for writing value. (Inherited from DynamicSymbol [▶ 2266].)
	OnWriteRawValue [▶ 2298]	Handler function for reading symbols raw value. (Inherited from DynamicSymbol [▶ 2266].)
	OnWriteRawValueAsync [▶ 2298]	Handler function for writing the raw DynamicSymbol [▶ 2266] value. (Inherited from DynamicSymbol [▶ 2266].)
	OnWriteValue [▶ 2299]	Handler Function for writing value. (Inherited from DynamicSymbol [▶ 2266].)
	OnWriteValueAsync [▶ 2300]	Handler Function for writing value. (Inherited from DynamicSymbol [▶ 2266].)
	ReadAnyValue [▶ 2300]	Reads the value of this Value [▶ 2775] into a new created instance of the managed type (Inherited from DynamicSymbol [▶ 2266].)
	ReadRawValue. [▶ 2301]	Reads the raw value of the IValueSymbol [▶ 2775] (Ads Read / Write) (Inherited from DynamicSymbol [▶ 2266].)
	ReadRawValue(Int32) [▶ 2302]	Reads the Symbols raw value (Inherited from DynamicSymbol [▶ 2266].)
	ReadRawValueAsync [▶ 2302]	Read raw value as an asynchronous operation. (Inherited from DynamicSymbol [▶ 2266].)
	ReadValue. [▶ 2303]	Reads the value of this DynamicSymbol [▶ 2266]. (Inherited from DynamicSymbol [▶ 2266].)
	ReadValue(Int32) [▶ 2306]	Reads the value of this DynamicSymbol [▶ 2266]. (Inherited from DynamicSymbol [▶ 2266].)
	ReadValueAsync [▶ 2307]	Reads the Value of the IValueSymbol [▶ 2775] asynchronously. (Inherited from DynamicSymbol [▶ 2266].)
	ToString [▶ 2307]	Returns a String that represents this instance. (Inherited from DynamicSymbol [▶ 2266].)
	TryBinaryOperation	Provides implementation for binary operations. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations such as addition and multiplication. (Inherited from DynamicObject .)
	TryConvert	Provides implementation for type conversion operations. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations that convert an object from one type to another. (Inherited from DynamicObject .)

	Name	Description
	TryCreateInstance	Provides the implementation for operations that initialize a new instance of a dynamic object. This method is not intended for use in C# or Visual Basic. (Inherited from DynamicObject.)
	TryDeleteIndex	Provides the implementation for operations that delete an object by index. This method is not intended for use in C# or Visual Basic. (Inherited from DynamicObject.)
	TryDeleteMember	Provides the implementation for operations that delete an object member. This method is not intended for use in C# or Visual Basic. (Inherited from DynamicObject.)
	TryGetIndex	Provides the implementation for operations that get a value by index. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for indexing operations. (Inherited from DynamicObject.)
	TryGetMember ▶ 3008	Provides the implementation for operations that get member values. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations such as getting a value for a property. (Inherited from DynamicInterfaceInstance ▶ 2995 .)
	TryInvoke	Provides the implementation for operations that invoke an object. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations such as invoking an object or a delegate. (Inherited from DynamicObject.)
	TryInvokeMember ▶ 3009	Provides the implementation for operations that invoke a member. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations such as calling a method. (Inherited from DynamicInterfaceInstance ▶ 2995 .)
 	TryInvokeRpcMethod(String, Object, Object.) ▶ 3010	Invokes the specified RPC Method (Inherited from DynamicInterfaceInstance ▶ 2995 .)
 	TryInvokeRpcMethod(String, Object, Object, Object.) ▶ 3012	Invokes the specified RPC Method (Inherited from DynamicInterfaceInstance ▶ 2995 .)
	TryReadValue ▶ 2309	Reads the Value of the IValueSymbol ▶ 2775 (Inherited from DynamicSymbol ▶ 2266 .)
	TrySetIndex	Provides the implementation for operations that set a value by index. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations that access objects by a specified index. (Inherited from DynamicObject.)
	TrySetMember ▶ 3013	Provides the implementation for operations that set member values. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations such as setting a value for a property. (Inherited from DynamicInterfaceInstance ▶ 2995 .)
	TryUnaryOperation	Provides implementation for unary operations. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations such as negation, increment, or decrement. (Inherited from DynamicObject.)
 	TryWriteValue ▶ 2309	Writes the specified value to the DynamicSymbol ▶ 2266 . (Inherited from DynamicSymbol ▶ 2266 .)
	UpdateAnyValue ▶ 2312	Reads the value of this Value ▶ 2775 into the specified managed value. (Inherited from DynamicSymbol ▶ 2266 .)

	Name	Description
	WriteAnyValue [▶ 2313]	Writes the value represented by the managed value to this Value [▶ 2775] (Inherited from DynamicSymbol [▶ 2266].)
	WriteRawValue(Byte) [▶ 2314]	Writes the raw value of the IValueSymbol [▶ 2775] (Ads Read / Write) (Inherited from DynamicSymbol [▶ 2266].)
	WriteRawValue(Byte, Int32) [▶ 2314]	Writes the raw value of the IValueSymbol [▶ 2775] (Ads Read / Write) (Inherited from DynamicSymbol [▶ 2266].)
	WriteRawValueAsync [▶ 2315]	Writes the raw value of the IValueSymbol [▶ 2775] (Ads Read / Write) (Inherited from DynamicSymbol [▶ 2266].)
	WriteValue(Object) [▶ 2316]	Writes the specified value to the DynamicSymbol [▶ 2266]. (Inherited from DynamicSymbol [▶ 2266].)
 	WriteValue(Object, Int32) [▶ 2319]	Writes the specified value to the DynamicSymbol [▶ 2266]. (Inherited from DynamicSymbol [▶ 2266].)
	WriteValueAsync [▶ 2321]	Writes the Value of the IValueSymbol [▶ 2775] (Inherited from DynamicSymbol [▶ 2266].)

Extension Methods

	Name	Description
	ReferencesExternalData [▶ 3038]	Indicates, that the Instance value includes process memory data, that cannot be read in one memory block. (Defined by DataTypeExtension [▶ 3021].)

Reference

[DynamicStructInstance Class](#) [▶ 2251]

[TwinCAT.TypeSystem Namespace](#) [▶ 2083]

6.11.20.2.1 DynamicStructInstance.GetDynamicMemberNames Method

Returns the enumeration of all dynamic member names.

Namespace: [TwinCAT.TypeSystem](#) [▶ 2083]

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.95+cf8c3f5

Syntax

C#

```
public override IEnumerable<string> GetDynamicMemberNames()
```

Return Value

Type: [IEnumerable.String](#).

A sequence that contains dynamic member names.

Reference

[DynamicStructInstance Class](#) [▶ 2251]

[TwinCAT.TypeSystem Namespace](#) [▶ 2083]

6.11.20.2.2 **DynamicStructInstance.TryGetMember Method**

Provides the implementation for operations that get member values. Classes derived from the [DynamicObject](#) class can override this method to specify dynamic behavior for operations such as getting a value for a property.

Namespace: [TwinCAT.TypeSystem](#) [[▶ 2083](#)]

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.95+cf8c3f5

Syntax

C#

```
public override bool TryGetMember(  
    GetMemberBinder binder,  
    out Object?? result  
)
```

Parameters

binder	Type: System.Dynamic.GetMemberBinder Provides information about the object that called the dynamic operation. The binder.Name property provides the name of the member on which the dynamic operation is performed. For example, for the Console.WriteLine(sampleObject.SampleProperty) statement, where sampleObject is an instance of the class derived from the DynamicObject class, binder.Name returns "SampleProperty". The binder.IgnoreCase property specifies whether the member name is case-sensitive.
result	Type: System.Object . The result of the get operation. For example, if the method is called for a property, you can assign the property value to result.

Return Value

Type: [Boolean](#)

true if the operation is successful; otherwise, false. If this method returns false, the run-time binder of the language determines the behavior. (In most cases, a run-time exception is thrown.)

Reference

[DynamicStructInstance Class](#) [[▶ 2251](#)]

[TwinCAT.TypeSystem Namespace](#) [[▶ 2083](#)]

6.11.20.2.3 **DynamicStructInstance.TrySetMember Method**

Provides the implementation for operations that set member values. Classes derived from the [DynamicObject](#) class can override this method to specify dynamic behavior for operations such as setting a value for a property.

Namespace: [TwinCAT.TypeSystem](#) [[▶ 2083](#)]

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.95+cf8c3f5

Syntax

C#

```
public override bool TrySetMember(  
    SetMemberBinder binder,  
    Object? value  
)
```

Parameters

- binder Type: [System.Dynamic.SetMemberBinder](#)
 Provides information about the object that called the dynamic operation. The binder.Name property provides the name of the member to which the value is being assigned. For example, for the statement sampleObject.SampleProperty = "Test", where sampleObject is an instance of the class derived from the [DynamicObject](#) class, binder.Name returns "SampleProperty". The binder.IgnoreCase property specifies whether the member name is case-sensitive.
- value Type: [System.Object](#)
 The value to set to the member. For example, for sampleObject.SampleProperty = "Test", where sampleObject is an instance of the class derived from the [DynamicObject](#) class, the value is "Test".

Return Value

Type: [Boolean](#)
 true if the operation is successful; otherwise, false. If this method returns false, the run-time binder of the language determines the behavior. (In most cases, a language-specific run-time exception is thrown.)

6.11.20.3 DynamicStructInstance Events

The [DynamicStructInstance \[▶ 2251\]](#) type exposes the following members.

Events

	Name	Description
	RawValueChanged [▶ 2323]	Occurs when the RawValue of the IValueSymbol [▶ 2775] has changed. (Inherited from DynamicSymbol [▶ 2266] .)
	ValueChanged [▶ 2323]	Occurs when the (Primitive) value of the IValueSymbol [▶ 2775] has changed. (Inherited from DynamicSymbol [▶ 2266] .)

6.11.21 DynamicSymbol Class

Dynamic [Symbol \[▸ 2691\]](#) object.

Inheritance Hierarchy

System.Object
 System.Dynamic.DynamicObject
 TwinCAT.TypeSystem.DynamicSymbol
[More... \[▸ 2272\]](#)

Namespace: [TwinCAT.TypeSystem \[▸ 2083\]](#)

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public class DynamicSymbol : DynamicObject,
    IDynamicSymbol, ISymbol, IAttributedInstance, IInstance, IBitSize,
    ISymbolFactoryServicesProvider, IValueSymbol, IValueRawSymbol, IHierarchicalSymbol, IValueAccess
    orProvider,
    IContextMaskProvider
```

The DynamicSymbol type exposes the following members.

Properties

	Name	Description
	InnerSymbol [▸ 2274]	Gets the inner symbol of this DynamicSymbol
	AccessRights [▸ 2274]	Gets the access rights.
	AllowGIOAccess [▸ 2275]	Indicates, that the aggregates symbols is an IProcessImageAddress (and most probably IAdsSymbol)
	Attributes [▸ 2275]	Gets the Symbol Attributes
	BitSize [▸ 2276]	Gets the size of the IDataType [▸ 2475] in bits.
	ByteSize [▸ 2276]	Gets the (aligned) size of of the Type/Instance in Bytes
	Category [▸ 2277]	Gets the category.
	Comment [▸ 2277]	Gets the comment of the Instance [▸ 2549]
	Connection [▸ 2277]	Gets the connection bound to this DynamicSymbol
	DataType [▸ 2278]	Gets the IDataType [▸ 2475] of the Instance [▸ 2549] .
	HasValue [▸ 2278]	Gets a value indicating whether this instance has value (only the non VirtualInstances, what means the Symbols with locations).
	InstanceName [▸ 2279]	Gets the name of the instance (without periods (.))
	InstancePath [▸ 2279]	Gets the relative / absolute access path to the instance (with periods (.))
	IsBitType [▸ 2280]	Gets a value indicating whether this instance is not basing on a full DataType but instead of some sort of bit mapping

	Name	Description
	IsByteAligned [▶ 2280]	Indicates that the Size of the Object is Byte aligned (BitSize % 8 == 0)
	IsContainerType [▶ 2281]	Gets a value indicating whether this Symbol is a container type.
	IsPersistent [▶ 2281]	Gets a value indicating whether this ISymbol [▶ 2691] is persistent.
	IsPointer [▶ 2282]	Indicates that the IInstance [▶ 2549] represents a Pointer type (Pointer TO)
	IsPrimitiveType [▶ 2282]	Gets a value indicating whether this instance is a primitive type.
	IsReadOnly [▶ 2283]	Indicates that this instance is read only.
	IsRecursive [▶ 2283]	Gets a value indicating whether this instance is recursive.
	IsReference [▶ 2284]	Indicates that the IInstance [▶ 2549] represents a Reference type (REFERENCE TO)
	IsStatic [▶ 2284]	Gets a value indicating whether this instance is static.
	NormalizedName [▶ 2285]	Gets the normalized instance name (fixed name for dynamic property access that doesn't contain invalid characters),
	NotificationSettings [▶ 2285]	Gets the notification settings.
	Parent [▶ 2286]	Gets the parent Symbol
	Size [▶ 2286]	Gets the size of the IInstance [▶ 2549] in bytes.
	SubSymbols [▶ 2287]	Gets the SubSymbols of the ISymbol [▶ 2691]
	TypeName [▶ 2287]	Gets the name of the DataType [▶ 2475] that is used for this IInstance [▶ 2549].
	ValueEncoding [▶ 2288]	Gets the value encoding.

Methods

	Name	Description
	Equals [▶ 2292]	Equals (Overrides Object.Equals(Object).)
	Finalize	Allows an object to try to free resources and perform other cleanup operations before it is reclaimed by garbage collection. (Inherited from Object.)
	GetDynamicMemberNames [▶ 2293]	Returns the enumeration of all dynamic member names. (Overrides DynamicObject.GetDynamicMemberNames..)
	GetHashCode [▶ 2293]	Gets the GetHashCode of the Address (Overrides Object.GetHashCode..)
	GetMetaObject	Provides a DynamicMetaObject that dispatches to the dynamic virtual methods. The object can be encapsulated inside another DynamicMetaObject to provide custom behavior for individual actions. This method supports the Dynamic Language Runtime infrastructure for language implementers and it is not intended to be used directly from your code. (Inherited from DynamicObject.)
	GetType	Gets the Type of the current instance. (Inherited from Object.)

	Name	Description
	MemberwiseClone	Creates a shallow copy of the current Object. (Inherited from Object.)
	OnReadAnyValue [▶ 2293]	Handler function for reading ADS 'Any' Values.
	OnReadRawValue [▶ 2294]	Handler function for reading Raw symbol value.
	OnReadRawValueAsync [▶ 2294]	Handler function reading the raw value of the DynamicSymbol.
	OnReadValue [▶ 2295]	Handler function for the
	OnReadValueAsync [▶ 2296]	Handler function reading the DynamicSymbols value asynchronously.
	OnSetInstanceName [▶ 2296]	Sets a new InstanceName InstancePath
	OnTryReadValue [▶ 2297]	Handler function for the
	OnTryWriteValue [▶ 2297]	Handler Function for writing value.
	OnWriteRawValue [▶ 2298]	Handler function for reading symbols raw value.
	OnWriteRawValueAsync [▶ 2298]	Handler function for writing the raw DynamicSymbol value.
	OnWriteValue [▶ 2299]	Handler Function for writing value.
	OnWriteValueAsync [▶ 2300]	Handler Function for writing value.
	ReadAnyValue [▶ 2300]	Reads the value of this Value [▶ 2775] into a new created instance of the managed type
	ReadRawValue. [▶ 2301]	Reads the raw value of the IValueSymbol [▶ 2775] (Ads Read / Write)
	ReadRawValue(Int32) [▶ 2302]	Reads the Symbols raw value
	ReadRawValueAsync [▶ 2302]	Read raw value as an asynchronous operation.
	ReadValue. [▶ 2303]	Reads the value of this DynamicSymbol.
	ReadValue(Int32) [▶ 2306]	Reads the value of this DynamicSymbol.
	ReadValueAsync [▶ 2307]	Reads the Value of the IValueSymbol [▶ 2775] asynchronously.
	ToString [▶ 2307]	Returns a String that represents this instance. (Overrides Object.ToString..)
	TryBinaryOperation	Provides implementation for binary operations. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations such as addition and multiplication. (Inherited from DynamicObject.)

	Name	Description
	TryConvert	Provides implementation for type conversion operations. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations that convert an object from one type to another. (Inherited from DynamicObject.)
	TryCreateInstance	Provides the implementation for operations that initialize a new instance of a dynamic object. This method is not intended for use in C# or Visual Basic. (Inherited from DynamicObject.)
	TryDeleteIndex	Provides the implementation for operations that delete an object by index. This method is not intended for use in C# or Visual Basic. (Inherited from DynamicObject.)
	TryDeleteMember	Provides the implementation for operations that delete an object member. This method is not intended for use in C# or Visual Basic. (Inherited from DynamicObject.)
	TryGetIndex	Provides the implementation for operations that get a value by index. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for indexing operations. (Inherited from DynamicObject.)
	TryGetMember [▶ 2308]	Provides the implementation for operations that get member values. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations such as getting a value for a property. (Overrides DynamicObject.TryGetMember(GetMemberBinder, Object).)
	TryInvoke	Provides the implementation for operations that invoke an object. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations such as invoking an object or a delegate. (Inherited from DynamicObject.)
	TryInvokeMember	Provides the implementation for operations that invoke a member. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations such as calling a method. (Inherited from DynamicObject.)
	TryReadValue [▶ 2309]	Reads the Value of the IValueSymbol [▶ 2775]
	TrySetIndex	Provides the implementation for operations that set a value by index. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations that access objects by a specified index. (Inherited from DynamicObject.)
	TrySetMember	Provides the implementation for operations that set member values. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations such as setting a value for a property. (Inherited from DynamicObject.)
	TryUnaryOperation	Provides implementation for unary operations. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations such as negation, increment, or decrement. (Inherited from DynamicObject.)
 	TryWriteValue [▶ 2309]	Writes the specified value to the DynamicSymbol.
	UpdateAnyValue [▶ 2312]	Reads the value of this Value [▶ 2775] into the specified managed value.
	WriteAnyValue [▶ 2313]	Writes the value represented by the managed value to this Value [▶ 2775]
	WriteRawValue(Byte. e.) [▶ 2314]	Writes the raw value of the IValueSymbol [▶ 2775] (Ads Read / Write)

	Name	Description
	WriteRawValue(Byte, Int32) [▶ 2314]	Writes the raw value of the IValueSymbol [▶ 2775] (Ads Read / Write)
	WriteRawValueAsync [▶ 2315]	Writes the raw value of the IValueSymbol [▶ 2775] (Ads Read / Write)
	WriteValue(Object) [▶ 2316]	Writes the specified value to the DynamicSymbol.
 	WriteValue(Object, Int32) [▶ 2319]	Writes the specified value to the DynamicSymbol.
	WriteValueAsync [▶ 2321]	Writes the Value of the IValueSymbol [▶ 2775]

Events

	Name	Description
	RawValueChanged [▶ 2323]	Occurs when the RawValue of the IValueSymbol [▶ 2775] has changed.
	ValueChanged [▶ 2323]	Occurs when the (Primitive) value of the IValueSymbol [▶ 2775] has changed.

Operators

	Name	Description
 	Equality [▶ 2325]	Operator==
 	Inequality [▶ 2326]	Implements the != operator.

Fields

	Name	Description
	syncObject [▶ 2327]	Synchronization object

Extension Methods

	Name	Description
	PollValues(IObservableUnit) [▶ 1355]	Overloaded. Poll symbol values on trigger signals. (Defined by ValueSymbolExtensions [▶ 1333] .)
 	PollValues(TimeSpan) [▶ 1356]	Overloaded. Polls the symbol as value sequence of object values with a specified period time. (Defined by ValueSymbolExtensions [▶ 1333] .)
	PollValues(IObservableUnit, Boolean) [▶ 1357]	Overloaded. Polls symbol values on trigger signals. (Defined by ValueSymbolExtensions [▶ 1333] .)

	Name	Description
	PollValues(TimeSpan, Boolean) [▶ 1358]	Overloaded. Polls the symbol as value sequence of object values with a specified period time. (Defined by ValueSymbolExtensions [▶ 1333].)
	PollValues.T.(IObservable.Unit.) [▶ 1362]	Overloaded. Poll symbol values as a value sequence on trigger signals (typed) (Defined by ValueSymbolExtensions [▶ 1333].)
	PollValues.T.(TimeSpan) [▶ 1363]	Overloaded. Polls the symbol as value sequence of object values with a specified period time (typed) (Defined by ValueSymbolExtensions [▶ 1333].)
	PollValues.T.(IObservable.Unit., Func.ResultReadValueAccess2.IValueSymbol, Object., T.) [▶ 1365]	Overloaded. Poll symbol values on trigger signals (typed) (Defined by ValueSymbolExtensions [▶ 1333].)
	PollValues.T.(IObservable.Unit., Boolean) [▶ 1364]	Overloaded. Poll symbol values on trigger signals (typed) (Defined by ValueSymbolExtensions [▶ 1333].)
	PollValues.T.(TimeSpan, Boolean) [▶ 1367]	Overloaded. Polls the symbol as value sequence of object values with a specified period time (typed) (Defined by ValueSymbolExtensions [▶ 1333].)
	PollValues2(IObservable.Unit.) [▶ 1368]	Overloaded. Poll symbol values as a sequence of annotated results (Value + ErrorCode) (Defined by ValueSymbolExtensions [▶ 1333].)
	PollValues2(TimeSpan) [▶ 1369]	Overloaded. Poll symbol values with communication return codes. (Defined by ValueSymbolExtensions [▶ 1333].)
	ReferencesExternalData [▶ 3038]	Indicates, that the Instance value includes process memory data, that cannot be read in one memory block. (Defined by DataTypeExtension [▶ 3021].)
	WhenValueChanged [▶ 1344]	Gets an observable sequence when the value of the IValueSymbol [▶ 2775] has changed. (Defined by ValueSymbolExtensions [▶ 1333].)
	WriteValues(IObservable.Object.) [▶ 1347]	Overloaded. Subscribes the IValueSymbol [▶ 2775] to an observable sequence of values and writes them to the IValueSymbol [▶ 2775]. (Defined by ValueSymbolExtensions [▶ 1333].)
	WriteValues(IObservable.Object., Action.Exception.) [▶ 1348]	Overloaded. Subscribes the IValueSymbol [▶ 2775] to an observable sequence of values and writes them to the IValueSymbol [▶ 2775]. (Defined by ValueSymbolExtensions [▶ 1333].)
	WriteValues(IObservable.Object., CancellationToken) [▶ 1349]	Overloaded. Subscribes the IValueSymbol [▶ 2775] to an observable sequence of values and writes them to the IValueSymbol [▶ 2775]. (Defined by ValueSymbolExtensions [▶ 1333].)

	Name	Description
	WriteValues(IObservable.Object., Action.Exception., CancellationToken) [▶ 1350]	Overloaded. Subscribes the IValueSymbol [▶ 2775] to an observable sequence of values and writes them to the IValueSymbol [▶ 2775] . (Defined by ValueSymbolExtensions [▶ 1333] .)

Remarks

The DynamicSymbol adds dynamic run time behaviour to the [ISymbol \[▶ 2691\]](#)/[IValueSymbol \[▶ 2775\]](#). That means e.g. for StructSymbols that .NET Properties are defined and dispatched at runtime to the structs fields like they are defined in TwinCAT / ADS Types. Indexed access to Array Symbols is another example where the dynamic runtime support takes place.

Examples

Sample for the dynamic resolution of Symbols:

Dynamic Symbol access

```

/// <summary>
/// Defines the entry point of the application.
/// </summary>
/// <param name="args">The arguments.</param>
static async void Main(string[] args)
{
    // Get the AdsAddress from command-line arguments
    AmsAddress address = ArgParser.Parse(args);

    CancellationTokenSource cancelSource = new CancellationTokenSource();
    CancellationToken cancel = cancelSource.Token;

    using (AdsClient client = new AdsClient())
    {
        // Connect to the target device
        client.Connect(address);

        // Usage of "dynamic" Type and Symbols (>= .NET4 only)
        SymbolLoaderSettings settings = new SymbolLoaderSettings(SymbolLoaderMode.DynamicTree);
        IAdsSymbolLoader dynLoader = (IAdsSymbolLoader)SymbolLoaderFactory.Create(client, settings);
    }
}

```

6.11.21.1 DynamicSymbol Properties

The [DynamicSymbol](#) [▶ 2266] type exposes the following members.

Properties

	Name	Description
	InnerSymbol [▶ 2274]	Gets the inner symbol of this DynamicSymbol [▶ 2266]
	AccessRights [▶ 2274]	Gets the access rights.
	AllowGIOAccess [▶ 2275]	Indicates, that the aggregates symbols is an IProcessImageAddress (and most probably IAdsSymbol)
	Attributes [▶ 2275]	Gets the Symbol Attributes
	BitSize [▶ 2276]	Gets the size of the IDataType [▶ 2475] in bits.
	ByteSize [▶ 2276]	Gets the (aligned) size of of the Type/Instance in Bytes
	Category [▶ 2277]	Gets the category.
	Comment [▶ 2277]	Gets the comment of the IInstance [▶ 2549]
	Connection [▶ 2277]	Gets the connection bound to this DynamicSymbol [▶ 2266]
	DataType [▶ 2278]	Gets the IDataType [▶ 2475] of the IInstance [▶ 2549].
	HasValue [▶ 2278]	Gets a value indicating whether this instance has value (only the non VirtualInstances , what means the Symbols with locations).
	InstanceName [▶ 2279]	Gets the name of the instance (without periods (.))
	InstancePath [▶ 2279]	Gets the relative / absolute access path to the instance (with periods (.))
	IsBitType [▶ 2280]	Gets a value indicating whether this instance is not basing on a full DataType but instead of some sort of bit mapping
	IsByteAligned [▶ 2280]	Indicates that the Size of the Object is Byte aligned ($BitSize \% 8 == 0$)
	IsContainerType [▶ 2281]	Gets a value indicating whether this Symbol is acontainer type.
	IsPersistent [▶ 2281]	Gets a value indicating whether this ISymbol [▶ 2691] is persistent.
	IsPointer [▶ 2282]	Indicates that the IInstance [▶ 2549] represents a Pointer type (Pointer TO)
	IsPrimitiveType [▶ 2282]	Gets a value indicating whether this instance is a primitive type.
	IsReadOnly [▶ 2283]	Indicates that this instance is read only.
	IsRecursive [▶ 2283]	Gets a value indicating whether this instance is recursive.
	IsReference [▶ 2284]	Indicates that the IInstance [▶ 2549] represents a Reference type (REFERENCE TO)
	IsStatic [▶ 2284]	Gets a value indicating whether this instance is static.
	NormalizedName [▶ 2285]	Gets the normalized instance name (fixed name for dynamic property access that doesn't contain invalid characters),

	Name	Description
	NotificationSettings [▶ 2285]	Gets the notification settings.
	Parent [▶ 2286]	Gets the parent Symbol
	Size [▶ 2286]	Gets the size of the Instance [▶ 2549] in bytes.
	SubSymbols [▶ 2287]	Gets the SubSymbols of the ISymbol [▶ 2691]
	TypeName [▶ 2287]	Gets the name of the DataType [▶ 2475] that is used for this Instance [▶ 2549].
	ValueEncoding [▶ 2288]	Gets the value encoding.

[TwinCAT.TypeSystem Namespace](#) [▶ 2083]

6.11.21.1.1 DynamicSymbol._InnerSymbol Property

Gets the inner symbol of this [DynamicSymbol](#) [▶ 2266]

Namespace: [TwinCAT.TypeSystem](#) [▶ 2083]

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public IValueSymbol _InnerSymbol { get; }
```

Property Value

Type: [IValueSymbol](#) [▶ 2775]

The inner symbol.

Reference

[DynamicSymbol Class](#) [▶ 2266]

[TwinCAT.TypeSystem Namespace](#) [▶ 2083]

6.11.21.1.2 DynamicSymbol.AccessRights Property

Gets the access rights.

Namespace: [TwinCAT.TypeSystem](#) [▶ 2083]

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public SymbolAccessRights AccessRights { get; }
```

Property Value

Type: [SymbolAccessRights](#) [▶ 2928]
The access rights.

Implements

[IValueSymbol.AccessRights](#) [▶ 2780]

Reference

[DynamicSymbol Class](#) [▶ 2266]

[TwinCAT.TypeSystem Namespace](#) [▶ 2083]

6.11.21.1.3 DynamicSymbol.AllowIGIOAccess Property

Indicates, that the aggregates symbols is an IProcessImageAddress (and most probably IAdsSymbol)

Namespace: [TwinCAT.TypeSystem](#) [▶ 2083]

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
protected bool AllowIGIOAccess { get; }
```

Property Value

Type: Boolean

Reference

[DynamicSymbol Class](#) [▶ 2266]

[TwinCAT.TypeSystem Namespace](#) [▶ 2083]

6.11.21.1.4 DynamicSymbol.Attributes Property

Gets the Symbol Attributes

Namespace: [TwinCAT.TypeSystem](#) [▶ 2083]

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public ITypeAttributeCollection Attributes { get; }
```

Property Value

Type: [ITypeAttributeCollection](#) [▶ 2726]
The attributes.

Implements

[IAttributedInstance.Attributes](#) [▶ 2471]

Reference

[DynamicSymbol Class](#) [► 2266]

[TwinCAT.TypeSystem Namespace](#) [► 2083]

6.11.21.1.5 DynamicSymbol.BitSize Property

Gets the size of the [IDataType](#) [► 2475] in bits.

Namespace: [TwinCAT.TypeSystem](#) [► 2083]

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public int BitSize { get; }
```

Property Value

Type: Int32

The size of the bit.

Implements

[IBitSize.BitSize](#) [► 2473]

Reference

[DynamicSymbol Class](#) [► 2266]

[TwinCAT.TypeSystem Namespace](#) [► 2083]

6.11.21.1.6 DynamicSymbol.ByteSize Property

Gets the (aligned) size of of the Type/Instance in Bytes

Namespace: [TwinCAT.TypeSystem](#) [► 2083]

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public int ByteSize { get; }
```

Property Value

Type: Int32

The size of the byte.

Implements

[IBitSize.ByteSize](#) [► 2474]

Reference

[DynamicSymbol Class](#) [► 2266]

[TwinCAT.TypeSystem Namespace](#) [► 2083]

6.11.21.1.7 DynamicSymbol.Category Property

Gets the category.

Namespace: [TwinCAT.TypeSystem](#) [[▶ 2083](#)]

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public DataTypeCategory Category { get; }
```

Property Value

Type: [DataTypeCategory](#) [[▶ 2111](#)]

The category.

Implements

[ISymbol.Category](#) [[▶ 2694](#)]

Reference

[DynamicSymbol Class](#) [[▶ 2266](#)]

[TwinCAT.TypeSystem Namespace](#) [[▶ 2083](#)]

6.11.21.1.8 DynamicSymbol.Comment Property

Gets the comment of the [IInstance](#) [[▶ 2549](#)]

Namespace: [TwinCAT.TypeSystem](#) [[▶ 2083](#)]

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public string Comment { get; }
```

Property Value

Type: String

The comment.

Implements

[IInstance.Comment](#) [[▶ 2550](#)]

Reference

[DynamicSymbol Class](#) [[▶ 2266](#)]

[TwinCAT.TypeSystem Namespace](#) [[▶ 2083](#)]

6.11.21.1.9 DynamicSymbol.Connection Property

Gets the connection bound to this [DynamicSymbol](#) [[▶ 2266](#)]

Namespace: [TwinCAT.TypeSystem](#) [▶ 2083]

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public IConnection? Connection { get; }
```

Property Value

Type: [IConnection](#) [▶ 79]

The connection.

Implements

[IValueSymbol.Connection](#) [▶ 2781]

Reference

[DynamicSymbol Class](#) [▶ 2266]

[TwinCAT.TypeSystem Namespace](#) [▶ 2083]

6.11.21.1.10 DynamicSymbol.DataType Property

Gets the [IDataType](#) [▶ 2475] of the [IInstance](#) [▶ 2549].

Namespace: [TwinCAT.TypeSystem](#) [▶ 2083]

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public IDataType? DataType { get; }
```

Property Value

Type: [IDataType](#) [▶ 2475]

The type of the data.

Implements

[IInstance.DataType](#) [▶ 2551]

Reference

[DynamicSymbol Class](#) [▶ 2266]

[TwinCAT.TypeSystem Namespace](#) [▶ 2083]

6.11.21.1.11 DynamicSymbol.HasValue Property

Gets a value indicating whether this instance has value (only the non VirtualInstances, what means the Symbols with locations).

Namespace: [TwinCAT.TypeSystem](#) [▶ 2083]

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public bool HasValue { get; }
```

Property Value

Type: Boolean
true if this instance has value; otherwise, false.

Implements

[IValueRawSymbol.HasValue](#) [[▶ 2768](#)]

Reference

[DynamicSymbol Class](#) [[▶ 2266](#)]

[TwinCAT.TypeSystem Namespace](#) [[▶ 2083](#)]

6.11.21.1.12 DynamicSymbol.InstanceName Property

Gets the name of the instance (without periods (.))

Namespace: [TwinCAT.TypeSystem](#) [[▶ 2083](#)]

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public string InstanceName { get; }
```

Property Value

Type: String
The name of the instance.

Implements

[IInstance.InstanceName](#) [[▶ 2551](#)]

Reference

[DynamicSymbol Class](#) [[▶ 2266](#)]

[TwinCAT.TypeSystem Namespace](#) [[▶ 2083](#)]

6.11.21.1.13 DynamicSymbol.InstancePath Property

Gets the relative / absolute access path to the instance (with periods (.))

Namespace: [TwinCAT.TypeSystem](#) [[▶ 2083](#)]

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public string InstancePath { get; }
```

Property Value

Type: String
The instance path.

Implements

[IInstance.InstancePath](#) [[▶ 2552](#)]

Remarks

If this path is relative or absolute depends on the context. [IMember](#) [[▶ 2561](#)] are using relative paths, [ISymbol](#) [[▶ 2691](#)]s are using absolute ones.

Reference

[DynamicSymbol Class](#) [[▶ 2266](#)]

[TwinCAT.TypeSystem Namespace](#) [[▶ 2083](#)]

6.11.21.1.14 DynamicSymbol.IsBitType Property

Gets a value indicating whether this instance is not basing on a full DataType but instead of some sort of bit mapping

Namespace: [TwinCAT.TypeSystem](#) [[▶ 2083](#)]

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public bool IsBitType { get; }
```

Property Value

Type: Boolean
true if this instance is bit mapping; otherwise, false.

Implements

[IBitSize.IsBitType](#) [[▶ 2474](#)]

Reference

[DynamicSymbol Class](#) [[▶ 2266](#)]

[TwinCAT.TypeSystem Namespace](#) [[▶ 2083](#)]

6.11.21.1.15 DynamicSymbol.IsByteAligned Property

Indicates that the Size of the Object is Byte aligned (BitSize % 8 == 0)

Namespace: [TwinCAT.TypeSystem](#) [[▶ 2083](#)]

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public bool IsByteAligned { get; }
```

Property Value

Type: Boolean
true if this instance is byte aligned; otherwise, false.

Implements

[IBitSize.IsByteAligned](#) [[▶ 2475](#)]

Reference

[DynamicSymbol Class](#) [[▶ 2266](#)]

[TwinCAT.TypeSystem Namespace](#) [[▶ 2083](#)]

6.11.21.1.16 DynamicSymbol.IsContainerType Property

Gets a value indicating whether this Symbol is acontainer type.

Namespace: [TwinCAT.TypeSystem](#) [[▶ 2083](#)]

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public bool IsContainerType { get; }
```

Property Value

Type: Boolean
true if this instance is container type; otherwise, false.

Implements

[ISymbol.IsContainerType](#) [[▶ 2694](#)]

Reference

[DynamicSymbol Class](#) [[▶ 2266](#)]

[TwinCAT.TypeSystem Namespace](#) [[▶ 2083](#)]

6.11.21.1.17 DynamicSymbol.IsPersistent Property

Gets a value indicating whether this [ISymbol](#) [[▶ 2691](#)] is persistent.

Namespace: [TwinCAT.TypeSystem](#) [[▶ 2083](#)]

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public bool IsPersistent { get; }
```

Property Value

Type: Boolean
true if this instance is persistent; otherwise, false.

Implements

[ISymbol.IsPersistent](#) [► 2694]

Reference

[DynamicSymbol Class](#) [► 2266]

[TwinCAT.TypeSystem Namespace](#) [► 2083]

6.11.21.1.18 DynamicSymbol.IsPointer Property

Indicates that the [Instance](#) [► 2549] represents a Pointer type (Pointer TO)

Namespace: [TwinCAT.TypeSystem](#) [► 2083]

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public bool IsPointer { get; }
```

Property Value

Type: Boolean
true if is ReferenceTo, otherwise false.

Implements

[Instance.IsPointer](#) [► 2552]

Reference

[DynamicSymbol Class](#) [► 2266]

[TwinCAT.TypeSystem Namespace](#) [► 2083]

6.11.21.1.19 DynamicSymbol.IsPrimitiveType Property

Gets a value indicating whether this instance is a primitive type.

Namespace: [TwinCAT.TypeSystem](#) [► 2083]

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public bool IsPrimitiveType { get; }
```

Property Value

Type: Boolean
true if this instance is primitive type; otherwise, false.

Implements

[ISymbol.IsPrimitiveType](#) [[▶ 2695](#)]

Reference

[DynamicSymbol Class](#) [[▶ 2266](#)]

[TwinCAT.TypeSystem Namespace](#) [[▶ 2083](#)]

6.11.21.1.20 DynamicSymbol.IsReadOnly Property

Indicates that this instance is read only.

Namespace: [TwinCAT.TypeSystem](#) [[▶ 2083](#)]

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public bool IsReadOnly { get; }
```

Property Value

Type: Boolean

Implements

[ISymbol.IsReadOnly](#) [[▶ 2695](#)]

Remarks

Actually, this Flag is restricted to TcCOM-Objects readonly Parameters. Within the PLC this is used for the ApplicationName and ProjectName of PLC instances. Write-Access on these Modules will create an [DeviceAccessDenied](#) [[▶ 664](#)] error.

Reference

[DynamicSymbol Class](#) [[▶ 2266](#)]

[TwinCAT.TypeSystem Namespace](#) [[▶ 2083](#)]

6.11.21.1.21 DynamicSymbol.IsRecursive Property

Gets a value indicating whether this instance is recursive.

Namespace: [TwinCAT.TypeSystem](#) [[▶ 2083](#)]

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public bool IsRecursive { get; }
```

Property Value

Type: Boolean

true if this instance is recursive; otherwise, false.

Implements

[ISymbol.IsRecursive](#) [[▶ 2696](#)]

Reference

[DynamicSymbol Class](#) [[▶ 2266](#)]

[TwinCAT.TypeSystem Namespace](#) [[▶ 2083](#)]

6.11.21.1.22 DynamicSymbol.IsReference Property

Indicates that the [IInstance](#) [[▶ 2549](#)] represents a Reference type (REFERENCE TO)

Namespace: [TwinCAT.TypeSystem](#) [[▶ 2083](#)]

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public bool IsReference { get; }
```

Property Value

Type: Boolean

true if is ReferenceTo, otherwise false.

Implements

[IInstance.IsReference](#) [[▶ 2552](#)]

Reference

[DynamicSymbol Class](#) [[▶ 2266](#)]

[TwinCAT.TypeSystem Namespace](#) [[▶ 2083](#)]

6.11.21.1.23 DynamicSymbol.IsStatic Property

Gets a value indicating whether this instance is static.

Namespace: [TwinCAT.TypeSystem](#) [[▶ 2083](#)]

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public bool IsStatic { get; }
```

Property Value

Type: Boolean

true if this instance is static; otherwise, false.

Implements

[IInstance.IsStatic](#) [[▶ 2553](#)]

Reference

[DynamicSymbol Class](#) [[▶ 2266](#)]

[TwinCAT.TypeSystem Namespace](#) [[▶ 2083](#)]

6.11.21.1.24 DynamicSymbol.NormalizedName Property

Gets the normalized instance name (fixed name for dynamic property access that doesn't contain invalid characters),

Namespace: [TwinCAT.TypeSystem](#) [[▶ 2083](#)]

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public string NormalizedName { get; }
```

Property Value

Type: String

The normalized instance name (can be the same like [InstanceName](#) [[▶ 2551](#)])

Implements

[IDynamicSymbol.NormalizedName](#) [[▶ 2499](#)]

Reference

[DynamicSymbol Class](#) [[▶ 2266](#)]

[TwinCAT.TypeSystem Namespace](#) [[▶ 2083](#)]

[IInstance.InstanceName](#) [[▶ 2551](#)]

6.11.21.1.25 DynamicSymbol.NotificationSettings Property

Gets the notification settings.

Namespace: [TwinCAT.TypeSystem](#) [[▶ 2083](#)]

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public INotificationSettings? NotificationSettings { get; set; }
```

Property Value

Type: [INotificationSettings](#) [[▶ 1098](#)]

The notification settings.

Implements

[IValueSymbol.NotificationSettings](#) [[▶ 2781](#)]

Reference

[DynamicSymbol Class](#) [[▶ 2266](#)]

[TwinCAT.TypeSystem Namespace](#) [[▶ 2083](#)]

6.11.21.1.26 DynamicSymbol.Parent Property

Gets the parent Symbol

Namespace: [TwinCAT.TypeSystem](#) [[▶ 2083](#)]

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public ISymbol? Parent { get; }
```

Property Value

Type: [ISymbol](#) [[▶ 2691](#)]

The parent.

Implements

[ISymbol.Parent](#) [[▶ 2696](#)]

Reference

[DynamicSymbol Class](#) [[▶ 2266](#)]

[TwinCAT.TypeSystem Namespace](#) [[▶ 2083](#)]

6.11.21.1.27 DynamicSymbol.Size Property

Gets the size of the [Instance](#) [[▶ 2549](#)] in bytes.

Namespace: [TwinCAT.TypeSystem](#) [[▶ 2083](#)]

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public int Size { get; }
```

Property Value

Type: Int32

The size of the [Instance](#) [[▶ 2549](#)] in bytes.

Implements

[IBitSize.Size](#) [[▶ 2475](#)]

Reference

[DynamicSymbol Class](#) [[▶ 2266](#)]

[TwinCAT.TypeSystem Namespace \[► 2083\]](#)

6.11.21.1.28 DynamicSymbol.SubSymbols Property

Gets the SubSymbols of the [ISymbol \[► 2691\]](#)

Namespace: [TwinCAT.TypeSystem \[► 2083\]](#)

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public ISymbolCollection<ISymbol> SubSymbols { get; }
```

Property Value

Type: [ISymbolCollection \[► 2700\]](#).[ISymbol \[► 2691\]](#).

Implements

[ISymbol.SubSymbols \[► 2696\]](#)

Remarks

Only used for Array and Struct instances. Otherwise empty

Reference

[DynamicSymbol Class \[► 2266\]](#)

[TwinCAT.TypeSystem Namespace \[► 2083\]](#)

6.11.21.1.29 DynamicSymbol.TypeName Property

Gets the name of the [DataType \[► 2475\]](#) that is used for this [IInstance \[► 2549\]](#).

Namespace: [TwinCAT.TypeSystem \[► 2083\]](#)

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public string TypeName { get; }
```

Property Value

Type: String
The name of the type.

Implements

[IInstance.TypeName \[► 2553\]](#)

Reference

[DynamicSymbol Class \[► 2266\]](#)

[TwinCAT.TypeSystem Namespace \[► 2083\]](#)

6.11.21.1.30 DynamicSymbol.ValueEncoding Property

Gets the value encoding.

Namespace: [TwinCAT.TypeSystem \[► 2083\]](#)

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public Encoding ValueEncoding { get; }
```

Property Value

Type: Encoding

The value encoding.

Implements

[IAttributedInstance.ValueEncoding \[► 2472\]](#)

Reference

[DynamicSymbol Class \[► 2266\]](#)

[TwinCAT.TypeSystem Namespace \[► 2083\]](#)

6.11.21.2 DynamicSymbol Methods

The [DynamicSymbol \[► 2266\]](#) type exposes the following members.

Methods

	Name	Description
	Equals [► 2292]	Equals (Overrides Object.Equals(Object).)
	Finalize	Allows an object to try to free resources and perform other cleanup operations before it is reclaimed by garbage collection. (Inherited from Object.)
	GetDynamicMemberNames [► 2293]	Returns the enumeration of all dynamic member names. (Overrides DynamicObject.GetDynamicMemberNames..)
	GetHashCode [► 2293]	Gets the GetHashCode of the Address (Overrides Object.GetHashCode..)
	GetMetaObject	Provides a DynamicMetaObject that dispatches to the dynamic virtual methods. The object can be encapsulated inside another DynamicMetaObject to provide custom behavior for individual actions. This method supports the Dynamic Language Runtime infrastructure for language implementers and it is not intended to be used directly from your code. (Inherited from DynamicObject.)
	GetType	Gets the Type of the current instance. (Inherited from Object.)
	MemberwiseClone	Creates a shallow copy of the current Object. (Inherited from Object.)
	OnReadAnyValue [► 2293]	Handler function for reading ADS 'Any' Values.

	Name	Description
	OnReadRawValue [▶ 2294]	Handler function for reading Raw symbol value.
	OnReadRawValueAsync [▶ 2294]	Handler function reading the raw value of the DynamicSymbol [▶ 2266].
	OnReadValue [▶ 2295]	Handler function for the
	OnReadValueAsync [▶ 2296]	Handler function reading the DynamicSymbols [▶ 2266] value asynchronously.
	OnSetInstanceName [▶ 2296]	Sets a new InstanceName InstancePath
	OnTryReadValue [▶ 2297]	Handler function for the
	OnTryWriteValue [▶ 2297]	Handler Function for writing value.
	OnWriteRawValue [▶ 2298]	Handler function for reading symbols raw value.
	OnWriteRawValueAsync [▶ 2298]	Handler function for writing the raw DynamicSymbol [▶ 2266] value.
	OnWriteValue [▶ 2299]	Handler Function for writing value.
	OnWriteValueAsync [▶ 2300]	Handler Function for writing value.
	ReadAnyValue [▶ 2300]	Reads the value of this Value [▶ 2775] into a new created instance of the managed type
	ReadRawValue. [▶ 2301]	Reads the raw value of the IValueSymbol [▶ 2775] (Ads Read / Write)
	ReadRawValue(Int32) [▶ 2302]	Reads the Symbols raw value
	ReadRawValueAsync [▶ 2302]	Read raw value as an asynchronous operation.
	ReadValue. [▶ 2303]	Reads the value of this DynamicSymbol [▶ 2266].
	ReadValue(Int32) [▶ 2306]	Reads the value of this DynamicSymbol [▶ 2266].
	ReadValueAsync [▶ 2307]	Reads the Value of the IValueSymbol [▶ 2775] asynchronously.
	ToString [▶ 2307]	Returns a String that represents this instance. (Overrides Object.ToString..)
	TryBinaryOperation	Provides implementation for binary operations. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations such as addition and multiplication. (Inherited from DynamicObject.)
	TryConvert	Provides implementation for type conversion operations. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations that convert an object from one type to another. (Inherited from DynamicObject.)

	Name	Description
	TryCreateInstance	Provides the implementation for operations that initialize a new instance of a dynamic object. This method is not intended for use in C# or Visual Basic. (Inherited from DynamicObject.)
	TryDeleteIndex	Provides the implementation for operations that delete an object by index. This method is not intended for use in C# or Visual Basic. (Inherited from DynamicObject.)
	TryDeleteMember	Provides the implementation for operations that delete an object member. This method is not intended for use in C# or Visual Basic. (Inherited from DynamicObject.)
	TryGetIndex	Provides the implementation for operations that get a value by index. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for indexing operations. (Inherited from DynamicObject.)
	TryGetMember [▶ 2308]	Provides the implementation for operations that get member values. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations such as getting a value for a property. (Overrides DynamicObject.TryGetMember(GetMemberBinder, Object.).)
	TryInvoke	Provides the implementation for operations that invoke an object. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations such as invoking an object or a delegate. (Inherited from DynamicObject.)
	TryInvokeMember	Provides the implementation for operations that invoke a member. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations such as calling a method. (Inherited from DynamicObject.)
	TryReadValue [▶ 2309]	Reads the Value of the IValueSymbol [▶ 2775]
	TrySetIndex	Provides the implementation for operations that set a value by index. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations that access objects by a specified index. (Inherited from DynamicObject.)
	TrySetMember	Provides the implementation for operations that set member values. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations such as setting a value for a property. (Inherited from DynamicObject.)
	TryUnaryOperation	Provides implementation for unary operations. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations such as negation, increment, or decrement. (Inherited from DynamicObject.)
 	TryWriteValue [▶ 2309]	Writes the specified value to the DynamicSymbol [▶ 2266] .
	UpdateAnyValue [▶ 2312]	Reads the value of this Value [▶ 2775] into the specified managed value.
	WriteAnyValue [▶ 2313]	Writes the value represented by the managed value to this Value [▶ 2775]
	WriteRawValue(.Byte) [▶ 2314]	Writes the raw value of the IValueSymbol [▶ 2775] (Ads Read / Write)
	WriteRawValue(.Byte, e., Int32) [▶ 2314]	Writes the raw value of the IValueSymbol [▶ 2775] (Ads Read / Write)

	Name	Description
	WriteRawValueAsyn c [▶ 2315]	Writes the raw value of the IValueSymbol [▶ 2775] (Ads Read / Write)
	WriteValue(Object) [▶ 2316]	Writes the specified value to the DynamicSymbol [▶ 2266] .
 	WriteValue(Object, Int32) [▶ 2319]	Writes the specified value to the DynamicSymbol [▶ 2266] .
	WriteValueAsync [▶ 2321]	Writes the Value of the IValueSymbol [▶ 2775]

Extension Methods

	Name	Description
	PollValues(IObserva ble.Unit.) [▶ 1355]	Overloaded. Poll symbol values on trigger signals. (Defined by ValueSymbolExtensions [▶ 1333] .)
 	PollValues(TimeSpa n) [▶ 1356]	Overloaded. Polls the symbol as value sequence of object values with a specified period time. (Defined by ValueSymbolExtensions [▶ 1333] .)
	PollValues(IObserva ble.Unit., Boolean) [▶ 1357]	Overloaded. Polls symbol values on trigger signals. (Defined by ValueSymbolExtensions [▶ 1333] .)
 	PollValues(TimeSpa n, Boolean) [▶ 1358]	Overloaded. Polls the symbol as value sequence of object values with a specified period time. (Defined by ValueSymbolExtensions [▶ 1333] .)
	PollValues.T. (IObservable.Unit.) [▶ 1362]	Overloaded. Poll symbol values as a value sequence on trigger signals (typed) (Defined by ValueSymbolExtensions [▶ 1333] .)
 	PollValues.T. (TimeSpan) [▶ 1363]	Overloaded. Polls the symbol as value sequence of object values with a specified period time (typed) (Defined by ValueSymbolExtensions [▶ 1333] .)
 	PollValues.T. (IObservable.Unit., Func.ResultReadVal ueAccess2.IValueSy mbol, Object., T.) [▶ 1365]	Overloaded. Poll symbol values on trigger signals (typed) (Defined by ValueSymbolExtensions [▶ 1333] .)
	PollValues.T. (IObservable.Unit., Boolean) [▶ 1364]	Overloaded. Poll symbol values on trigger signals (typed) (Defined by ValueSymbolExtensions [▶ 1333] .)
	PollValues.T. (TimeSpan, Boolean) [▶ 1367]	Overloaded. Polls the symbol as value sequence of object values with a specified period time (typed) (Defined by ValueSymbolExtensions [▶ 1333] .)
	PollValues2(IObserv able.Unit.) [▶ 1368]	Overloaded. Poll symbol values as a sequence of annotated results (Value + ErrorCode) (Defined by ValueSymbolExtensions [▶ 1333] .)

	Name	Description
	PollValues2(TimeSpan) [▶ 1369]	Overloaded. Poll symbol values with communication return codes. (Defined by ValueSymbolExtensions [▶ 1333].)
	ReferencesExternalData [▶ 3038]	Indicates, that the Instance value includes process memory data, that cannot be read in one memory block. (Defined by DataTypeExtension [▶ 3021].)
 	WhenValueChanged [▶ 1344]	Gets an observable sequence when the value of the IValueSymbol [▶ 2775] has changed. (Defined by ValueSymbolExtensions [▶ 1333].)
 	WriteValues(IObservableObject) [▶ 1347]	Overloaded. Subscribes the IValueSymbol [▶ 2775] to an observable sequence of values and writes them to the IValueSymbol [▶ 2775]. (Defined by ValueSymbolExtensions [▶ 1333].)
	WriteValues(IObservableObject, Action.Exception) [▶ 1348]	Overloaded. Subscribes the IValueSymbol [▶ 2775] to an observable sequence of values and writes them to the IValueSymbol [▶ 2775]. (Defined by ValueSymbolExtensions [▶ 1333].)
	WriteValues(IObservableObject, CancellationToken) [▶ 1349]	Overloaded. Subscribes the IValueSymbol [▶ 2775] to an observable sequence of values and writes them to the IValueSymbol [▶ 2775]. (Defined by ValueSymbolExtensions [▶ 1333].)
	WriteValues(IObservableObject, Action.Exception, CancellationToken) [▶ 1350]	Overloaded. Subscribes the IValueSymbol [▶ 2775] to an observable sequence of values and writes them to the IValueSymbol [▶ 2775]. (Defined by ValueSymbolExtensions [▶ 1333].)

Reference

6.11.21.2.1 DynamicSymbol.Equals Method

Equals

Namespace: [TwinCAT.TypeSystem](#) [[▶ 2083](#)]

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public override bool Equals(
    Object? obj
)
```

Parameters

obj	Type: System.Object The object to compare with the current object.
-----	---

Return Value

Type: Boolean

true if the specified Object is equal to this instance; otherwise, false.

Reference

[DynamicSymbol Class](#) [► 2266]

[TwinCAT.TypeSystem Namespace](#) [► 2083]

6.11.21.2.2 DynamicSymbol.GetDynamicMemberNames Method

Returns the enumeration of all dynamic member names.

Namespace: [TwinCAT.TypeSystem](#) [► 2083]

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public override IEnumerable<string> GetDynamicMemberNames ()
```

Return Value

Type: IEnumerable.String.

A sequence that contains dynamic member names.

Reference

[DynamicSymbol Class](#) [► 2266]

[TwinCAT.TypeSystem Namespace](#) [► 2083]

6.11.21.2.3 DynamicSymbol.GetHashCode Method

Gets the HashCode of the Address

Namespace: [TwinCAT.TypeSystem](#) [► 2083]

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public override int GetHashCode ()
```

Return Value

Type: Int32

A hash code for this instance, suitable for use in hashing algorithms and data structures like a hash table.

Reference

6.11.21.2.4 DynamicSymbol.OnReadAnyValue Method

Handler function for reading ADS 'Any' Values.

Namespace: [TwinCAT.TypeSystem](#) [[▶ 2083](#)]

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
protected virtual Object OnReadAnyValue(
    Type managedType
)
```

Parameters

managedType	Type: System.Type Managed type to read.
-------------	--

Return Value

Type: Object
System.Object.

Reference

[DynamicSymbol Class](#) [[▶ 2266](#)]

[TwinCAT.TypeSystem Namespace](#) [[▶ 2083](#)]

6.11.21.2.5 DynamicSymbol.OnReadRawValue Method

Handler function for reading Raw symbol value.

Namespace: [TwinCAT.TypeSystem](#) [[▶ 2083](#)]

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
protected virtual byte[] OnReadRawValue(
    int timeout
)
```

Parameters

timeout	Type: System.Int32 The timeout.
---------	------------------------------------

Return Value

Type: .Byte.
System.Byte[].

Reference

[DynamicSymbol Class](#) [[▶ 2266](#)]

[TwinCAT.TypeSystem Namespace](#) [[▶ 2083](#)]

6.11.21.2.6 DynamicSymbol.OnReadRawValueAsync Method

Handler function reading the raw value of the [DynamicSymbol](#) [[▶ 2266](#)].

Namespace: [TwinCAT.TypeSystem \[▸ 2083\]](#)
Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
protected virtual Task<ResultReadRawAccess> OnReadRawValueAsync(
    CancellationToken cancel
)
```

Parameters

cancel	Type: System.Threading.CancellationToken The cancellation token.
--------	---

Return Value

Type: [Task.ResultReadRawAccess \[▸ 3206\]](#).
 Task<ResultReadRawAccess>.

Reference

6.11.21.2.8 DynamicSymbol.OnReadValueAsync Method

Handler function reading the [DynamicSymbols \[► 2266\]](#) value asynchronously.

Namespace: [TwinCAT.TypeSystem \[► 2083\]](#)

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
protected virtual Task<ResultReadValueAccess> OnReadValueAsync (
    CancellationToken cancel
)
```

Parameters

cancel	Type: System.Threading.CancellationToken The cancellation token.
--------	---

Return Value

Type: [Task.ResultReadValueAccess \[► 3209\]](#).

An asynchronous task returning the [ResultReadValueAccess \[► 3209\]](#) as result.

Exceptions

Exception	Condition
CannotAccessVirtualSymbolException [► 2103]	

Reference

[ReadValue Overload \[► 2303\]](#)

[TwinCAT.TypeSystem Namespace \[► 2083\]](#)

6.11.21.2.19.2 DynamicSymbol.ReadValue Method (Int32)

Reads the value of this [DynamicSymbol \[► 2266\]](#).

Namespace: [TwinCAT.TypeSystem \[► 2083\]](#)

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public Object ReadValue(
    int timeout
)
```

Parameters

timeout	Type: System.Int32 The timeout in ms.
---------	--

Field Value

Type: Object
The value.

Return Value

Type: Object
System.Object.

Implements

[IValueSymbol.ReadValue\(Int32\) \[► 2785\]](#)

Remarks

Calling on primitive types, a call of this method will return the primitive value. On complex types (structures and arrays) it depends on the [ISymbolLoader \[▸ 2714\]](#) settings what will happen. In non dynamic modes: the raw byte Array will be returned, in dynamic mode: A Value will be created on the fly. A negative timeout indicates that the Default Timeout for the communication will be used. 0 means timeout is switched off.

6.11.21.2.20 DynamicSymbol.ReadValueAsync Method

Reads the Value of the [IValueSymbol \[▸ 2775\]](#) asynchronously.

Namespace: [TwinCAT.TypeSystem \[▸ 2083\]](#)

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax**C#**

```
public Task<ResultReadValueAccess> ReadValueAsync (
    CancellationToken cancel
)
```

Parameters

cancel	Type: System.Threading.CancellationToken The cancellation token.
--------	---

Return Value

Type: Task.[ResultReadValueAccess \[▸ 3209\]](#).

A tasks that represents the asynchronous 'ReadValue' operation. The read result is stored in the [ResultReadValueAccess \[▸ 3209\]](#) return value and contains the [Value \[▸ 3213\]](#) and the [ErrorCode \[▸ 3202\]](#).

Implements

[IValueSymbol.ReadValueAsync\(CancellationToken\) \[▸ 2785\]](#)

Remarks

Calling on primitive types, a call of this method will return the primitive value. On complex types (structures and arrays) it depends on the [ISymbolLoader \[▸ 2714\]](#) settings what will happen. In non dynamic modes: the raw byte Array will be returned, in dynamic mode: A Value will be created on the fly.

6.11.21.2.21 DynamicSymbol.ToString Method

Returns a String that represents this instance.

Namespace: [TwinCAT.TypeSystem \[► 2083\]](#)

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public override string ToString()
```

Return Value

Type: String

A String that represents this instance.

Reference

[DynamicSymbol Class \[► 2266\]](#)

[TwinCAT.TypeSystem Namespace \[► 2083\]](#)

6.11.21.2.22 DynamicSymbol.TryGetMember Method

Provides the implementation for operations that get member values. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations such as getting a value for a property.

Namespace: [TwinCAT.TypeSystem \[► 2083\]](#)

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public override bool TryGetMember(
    GetMemberBinder binder,
    out Object?? result
)
```

Parameters

binder	Type: System.Dynamic.GetMemberBinder Provides information about the object that called the dynamic operation. The binder.Name property provides the name of the member on which the dynamic operation is performed. For example, for the Console.WriteLine(sampleObject.SampleProperty) statement, where sampleObject is an instance of the class derived from the DynamicObject class, binder.Name returns "SampleProperty". The binder.IgnoreCase property specifies whether the member name is case-sensitive.
result	Type: System.Object. The result of the get operation. For example, if the method is called for a property, you can assign the property value to result.

Return Value

Type: Boolean

true if the operation is successful; otherwise, false. If this method returns false, the run-time binder of the language determines the behavior. (In most cases, a run-time exception is thrown.)

Reference

[TwinCAT.TypeSystem Namespace \[► 2083\]](#)

6.11.21.2.23 DynamicSymbol.TryReadValue Method

Reads the Value of the [IValueSymbol](#) [[▶ 2775](#)]

Namespace: [TwinCAT.TypeSystem](#) [[▶ 2083](#)]

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public int TryReadValue(  
    int timeout,  
    out Object?? value  
)
```

Parameters

timeout	Type: System.Int32 The timeout in ms.
value	Type: System.Object. The symbol value.

Return Value

Type: Int32

The error code.

Implements

[IValueSymbol.TryReadValue\(Int32, Object.\)](#) [[▶ 2786](#)]

Remarks

Calling on primitive types, a call of this method will return the primitive value. On complex types (structures and arrays) it depends on the [ISymbolLoader](#) [[▶ 2714](#)] settings what will happen. In non dynamic modes: the raw byte Array will be returned, in dynamic mode: A Value will be created on the fly. A negative timeout indicates that the Default Timeout for the communication will be used. 0 means timeout is switched off.

Reference

[DynamicSymbol Class](#) [[▶ 2266](#)]

[TwinCAT.TypeSystem Namespace](#) [[▶ 2083](#)]

6.11.21.2.24 DynamicSymbol.TryWriteValue Method

Writes the specified value to the [DynamicSymbol](#) [[▶ 2266](#)].

Namespace: [TwinCAT.TypeSystem](#) [[▶ 2083](#)]

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public int TryWriteValue(  
    Object value,  
    int timeout  
)
```

Parameters

value	Type: System.Object The value.
timeout	Type: System.Int32 The timeout in ms.

Return Value

Type: Int32
The error code.

Implements

[IValueSymbol.TryWriteValue\(Object, Int32\)](#) [► 2787]

Remarks

Calling on primitive types, a call of this method will directly write this Value. On complex types (structs and arrays) it depends on the [ISymbolLoader](#) [► 2714] settings what will happen. In non dynamic modes: Only byte Arrays (of correct size) can be written) in dynamic mode: A Value that represents the value will be accepted also. A negative timeout indicates that the Default Timeout for the communication will be used. 0 means timeout is switched off.

Examples**Dynamic Write access**

6.11.21.2.25 DynamicSymbol.UpdateAnyValue Method

Reads the value of this [Value](#) [► 2775] into the specified managed value.

Namespace: [TwinCAT.TypeSystem](#) [► 2083]

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public void UpdateAnyValue(
    ref Object valueObject
)
```

Parameters

valueObject	Type: System.Object. The managed object.
-------------	---

Return Value

Type:
Read value (System.Object).

Reference

- [DynamicSymbol Class \[▶ 2266\]](#)

6.11.21.2.27 DynamicSymbol.WriteRawValue Method

Overload List

	Name	Description
	WriteRawValue(Byte e.) [▶ 2314]	Writes the raw value of the IValueSymbol [▶ 2775] (Ads Read / Write)
	WriteRawValue(Byte e., Int32) [▶ 2314]	Writes the raw value of the IValueSymbol [▶ 2775] (Ads Read / Write)

Reference

- [DynamicSymbol Class \[▶ 2266\]](#)
- [TwinCAT.TypeSystem Namespace \[▶ 2083\]](#)

6.11.21.2.27.1 DynamicSymbol.WriteRawValue Method (.Byte.)

Writes the raw value of the [IValueSymbol](#) [[▶ 2775](#)] (Ads Read / Write)

Namespace: [TwinCAT.TypeSystem](#) [[▶ 2083](#)]

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public void WriteRawValue(
    byte[] rawValue
)
```

Parameters

rawValue	Type: .System.Byte. The value as byte array.
----------	---

Implements

[IValueRawSymbol.WriteRawValue\(Byte.\)](#) [[▶ 2772](#)]

Reference

[DynamicSymbol Class](#) [[▶ 2266](#)]

[WriteRawValue Overload](#) [[▶ 2313](#)]

[TwinCAT.TypeSystem Namespace](#) [[▶ 2083](#)]

6.11.21.2.27.2 DynamicSymbol.WriteRawValue Method (.Byte., Int32)

Writes the raw value of the [IValueSymbol](#) [[▶ 2775](#)] (Ads Read / Write)

Namespace: [TwinCAT.TypeSystem](#) [[▶ 2083](#)]

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public void WriteRawValue(
    byte[] rawValue,
    int timeout
)
```

Parameters

rawValue	Type: .System.Byte. The value as byte array.
timeout	Type: System.Int32 The timeout.

Field Value

Type:
The value.

Implements

[IValueRawSymbol.WriteRawValue\(Byte, Int32\) \[► 2773\]](#)

Remarks

A negative timeout indicates that the Default Timeout for the communication will be used. 0 means timeout is switched off.

Reference

6.11.21.2.28 DynamicSymbol.WriteRawValueAsync Method

Writes the raw value of the [IValueSymbol \[► 2775\]](#) (Ads Read / Write)

Namespace: [TwinCAT.TypeSystem \[► 2083\]](#)

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax**C#**

```
public Task<ResultWriteAccess> WriteRawValueAsync (
    byte[] rawValue,
    CancellationToken cancel
)
```

Parameters

rawValue	Type: <code>.System.Byte</code> . The value as byte array.
cancel	Type: <code>System.Threading.CancellationToken</code> The cancellation token.

Return Value

Type: `Task.ResultWriteAccess [► 3217]`.

A task that represents the asynchronous read operation. The [ResultRead \[► 1143\]](#) parameter contains the total number of bytes read into the buffer ([ReadBytes \[► 1145\]](#)) and the [ErrorCode \[► 1120\]](#) after execution..

Implements

```

Reference

[DynamicSymbol Class \[► 2266\]](#)

[WriteValue Overload \[► 2316\]](#)

[TwinCAT.TypeSystem Namespace \[► 2083\]](#)

6.11.21.2.29.2 DynamicSymbol.WriteValue Method (Object, Int32)

Writes the specified value to the [DynamicSymbol](#) [[▶ 2266](#)].

Namespace: [TwinCAT.TypeSystem](#) [[▶ 2083](#)]

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public void WriteValue(
    Object value,
    int timeout
)
```

Parameters

value	Type: System.Object The value.
timeout	Type: System.Int32 The timeout in ms.

Implements

[IValueSymbol.WriteValue\(Object, Int32\)](#) [[▶ 2788](#)]

Remarks

Calling on primitive types, a call of this method will directly write this Value. On complex types (structs and arrays) it depends on the [ISymbolLoader](#) [[▶ 2714](#)] settings what will happen. In non dynamic modes: Only byte Arrays (of correct size) can be written) in dynamic mode: A Value that represents the value will be accepted also. A negative timeout indicates that the Default Timeout for the communication will be used. 0 means timeout is switched off.

Examples

Dynamic Write access

Writes the Value of the [IValueSymbol \[► 2775\]](#)

Namespace: [TwinCAT.TypeSystem \[► 2083\]](#)

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public Task<ResultWriteAccess> WriteValueAsync (
    Object value,
    CancellationToken cancel
)
```

Parameters

value	Type: System.Object The value.
cancel	Type: System.Threading.CancellationToken The cancellation token.

Return Value

Type: [Task.ResultWriteAccess](#) [[▶ 3217](#)].

A tasks that represents the asynchronous 'ReadValue' operation. The read result is stored in the [ResultWriteAccess](#) [[▶ 3217](#)] return value and contains the [ErrorCode](#) [[▶ 3202](#)].

Implements

[IValueSymbol.WriteValueAsync\(Object, CancellationToken\)](#) [[▶ 2789](#)]

Remarks

Calling on primitive types, a call of this method will directly write this Value. On complex types (structs and arrays) it depends on the [ISymbolLoader](#) [[▶ 2714](#)] settings what will happen. In non dynamic modes: Only byte Arrays (of correct size) can be written) in dynamic mode: A Value that represents the value will be accepted also.

Reference

6.11.21.3 DynamicSymbol Events

The [DynamicSymbol](#) [[▶ 2266](#)] type exposes the following members.

Events

	Name	Description
	RawValueChanged [▶ 2323]	Occurs when the RawValue of the IValueSymbol [▶ 2775] has changed.
	ValueChanged [▶ 2323]	Occurs when the (Primitive) value of the IValueSymbol [▶ 2775] has changed.

Reference

[DynamicSymbol Class](#) [[▶ 2266](#)]

[TwinCAT.TypeSystem Namespace](#) [[▶ 2083](#)]

6.11.21.3.1 DynamicSymbol.RawValueChanged Event

Occurs when the RawValue of the [IValueSymbol](#) [▸ 2775] has changed.

Namespace: [TwinCAT.TypeSystem](#) [▸ 2083]

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public event EventHandler<RawValueChangedEventArgs> RawValueChanged
```

Value

Type: [System.EventHandler.RawValueChangedEventArgs](#) [▸ 2813].

Implements

[IValueRawSymbol.RawValueChanged](#) [▸ 2774]

Reference

[DynamicSymbol Class](#) [▸ 2266]

[TwinCAT.TypeSystem Namespace](#) [▸ 2083]

6.11.21.3.2 DynamicSymbol.ValueChanged Event

Occurs when the (Primitive) value of the [IValueSymbol](#) [▸ 2775] has changed.

Namespace: [TwinCAT.TypeSystem](#) [▸ 2083]

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public event EventHandler<ValueChangedEventArgs> ValueChanged
```

Value

Type: [System.EventHandler.ValueChangedEventArgs](#) [▸ 2971].

Implements

[IValueSymbol.ValueChanged](#) [▸ 2790]

Remarks

Examples

Use Dynamic Notifications

Operator==

Namespace: [TwinCAT.TypeSystem \[► 2083\]](#)

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```

public static bool operator ==(
    DynamicSymbol? o1,
    DynamicSymbol? o2
)

```

Parameters

o1	Type: TwinCAT.TypeSystem.DynamicSymbol [► 2266] The o1.
o2	Type: TwinCAT.TypeSystem.DynamicSymbol [► 2266] The o2.

Return Value

Type: Boolean
The result of the operator.

Reference

Dynamic (Expandable) Symbols collection.

Inheritance Hierarchy

System.Object
 System.Dynamic.DynamicObject
 TwinCAT.TypeSystem.DynamicSymbolsCollection

Namespace: [TwinCAT.TypeSystem \[▸ 2083\]](#)

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public sealed class DynamicSymbolsCollection : DynamicObject,
    IDynamicSymbolsCollection, IDynamicMetaObjectProvider, IEnumerable<ISymbol>, IEnumerable
```

The DynamicSymbolsCollection type exposes the following members.

Constructors

	Name	Description
	DynamicSymbolsCollection(IEnumerable<ISymbol>) [▸ 2330]	Initializes a new instance of the DynamicSymbolsCollection class (for internal use only)
	DynamicSymbolsCollection(SymbolCollection.ISymbol) [▸ 2330]	Initializes a new instance of the DynamicSymbolsCollection class (for internal use only)

Properties

	Name	Description
	Empty [▶ 2332]	Gets an empty collection.
	Item [▶ 2331]	Gets the DynamicSymbol [▶ 2266] with the specified name.

Methods

	Name	Description
	Equals	Determines whether the specified object is equal to the current object. (Inherited from Object.)
	GetDynamicMemberNames [▶ 2334]	Returns the enumeration of all dynamic member names. (Overrides DynamicObject.GetDynamicMemberNames..)
	GetEnumerator [▶ 2334]	Gets the enumerator.
	GetHashCode	Serves as the default hash function. (Inherited from Object.)
	GetMetaObject	Provides a DynamicMetaObject that dispatches to the dynamic virtual methods. The object can be encapsulated inside another DynamicMetaObject to provide custom behavior for individual actions. This method supports the Dynamic Language Runtime infrastructure for language implementers and it is not intended to be used directly from your code. (Inherited from DynamicObject .)
	GetType	Gets the Type of the current instance. (Inherited from Object.)
	ToString	Returns a string that represents the current object. (Inherited from Object.)
	TryBinaryOperation	Provides implementation for binary operations. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations such as addition and multiplication. (Inherited from DynamicObject .)
	TryConvert	Provides implementation for type conversion operations. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations that convert an object from one type to another. (Inherited from DynamicObject .)
	TryCreateInstance	Provides the implementation for operations that initialize a new instance of a dynamic object. This method is not intended for use in C# or Visual Basic. (Inherited from DynamicObject .)
	TryDeleteIndex	Provides the implementation for operations that delete an object by index. This method is not intended for use in C# or Visual Basic. (Inherited from DynamicObject .)
	TryDeleteMember	Provides the implementation for operations that delete an object member. This method is not intended for use in C# or Visual Basic. (Inherited from DynamicObject .)
	TryGetIndex	Provides the implementation for operations that get a value by index. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for indexing operations. (Inherited from DynamicObject .)
	TryGetInstance [▶ 2335]	Tries to get the Instance [▶ 2549]. of the specified path.

	Name	Description
	TryGetMember [▶ 2335]	Provides the implementation for operations that get member values. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations such as getting a value for a property. (Overrides DynamicObject.TryGetMember(GetMemberBinder, Object.))
	TryInvoke	Provides the implementation for operations that invoke an object. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations such as invoking an object or a delegate. (Inherited from DynamicObject.)
	TryInvokeMember	Provides the implementation for operations that invoke a member. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations such as calling a method. (Inherited from DynamicObject.)
	TrySetIndex	Provides the implementation for operations that set a value by index. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations that access objects by a specified index. (Inherited from DynamicObject.)
	TrySetMember	Provides the implementation for operations that set member values. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations such as setting a value for a property. (Inherited from DynamicObject.)
	TryUnaryOperation	Provides implementation for unary operations. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations such as negation, increment, or decrement. (Inherited from DynamicObject.)

Remarks

The DynamicSymbolsCollection collection adds dynamically its child Symbols as Members (for access like "Main.Symbol")

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public IEnumerator<ISymbol> GetEnumerator ()
```

Return Value

Type: [IEnumerator.ISymbol](#) [▶ 2691].
A [IEnumerator.T](#). that can be used to iterate through the collection.

Implements

[IEnumerable.T](#).GetEnumerator.

Reference[DynamicSymbolsCollection Class \[► 2327\]](#)[TwinCAT.TypeSystem Namespace \[► 2083\]](#)**6.11.22.3.4 DynamicSymbolsCollection.TryGetInstance Method**

Tries to get the [Instance \[► 2549\]](#). of the specified path.

Namespace: [TwinCAT.TypeSystem \[► 2083\]](#)

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax**C#**

```
public bool TryGetInstance(
    string instanceSpecifier,
    out ISymbol?? symbol
)
```

Parameters

instanceSpecifier	Type: System.String The instance path or Instance Name (dependent of Mode [► 3111] setting)
symbol	Type: TwinCAT.TypeSystem.ISymbol [► 2691] . The symbol.

Return Value

Type: Boolean

true if the [Instance \[► 2549\]](#) is found; otherwise, false

Exceptions

Exception	Condition
ArgumentNullException	instancePath
ArgumentException	

Reference[DynamicSymbolsCollection Class \[► 2327\]](#)[TwinCAT.TypeSystem Namespace \[► 2083\]](#)**6.11.22.3.5 DynamicSymbolsCollection.TryGetMember Method**

Provides the implementation for operations that get member values. Classes derived from the [DynamicObject](#) class can override this method to specify dynamic behavior for operations such as getting a value for a property.

Namespace: [TwinCAT.TypeSystem \[► 2083\]](#)

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public override bool TryGetMember(
    GetMemberBinder binder,
    out Object?? result
)
```

Parameters

binder	Type: System.Dynamic.GetMemberBinder Provides information about the object that called the dynamic operation. The binder.Name property provides the name of the member on which the dynamic operation is performed. For example, for the Console.WriteLine(sampleObject.SampleProperty) statement, where sampleObject is an instance of the class derived from the DynamicObject class, binder.Name returns "SampleProperty". The binder.IgnoreCase property specifies whether the member name is case-sensitive.
result	Type: System.Object. The result of the get operation. For example, if the method is called for a property, you can assign the property value to result.

Return Value

Type: Boolean

true if the operation is successful; otherwise, false. If this method returns false, the run-time binder of the language determines the behavior. (In most cases, a run-time exception is thrown.)

public sealed class DynamicUnionInstance : DynamicSymbol,
    IUnionInstance, ISymbol, IAttributedInstance, IInstance, IBitSize
```

The DynamicUnionInstance type exposes the following members.

Properties

	Name	Description
	InnerSymbol [► 2274]	Gets the inner symbol of this DynamicSymbol [► 2266] (Inherited from DynamicSymbol [► 2266] .)

	Name	Description
	AccessRights [▶ 2274]	Gets the access rights. (Inherited from DynamicSymbol [▶ 2266].)
	Attributes [▶ 2275]	Gets the Symbol Attributes (Inherited from DynamicSymbol [▶ 2266].)
	BitSize [▶ 2276]	Gets the size of the IDataType [▶ 2475] in bits. (Inherited from DynamicSymbol [▶ 2266].)
	ByteSize [▶ 2276]	Gets the (aligned) size of of the Type/Instance in Bytes (Inherited from DynamicSymbol [▶ 2266].)
	Category [▶ 2277]	Gets the category. (Inherited from DynamicSymbol [▶ 2266].)
	Comment [▶ 2277]	Gets the comment of the IInstance [▶ 2549] (Inherited from DynamicSymbol [▶ 2266].)
	Connection [▶ 2277]	Gets the connection bound to this DynamicSymbol [▶ 2266] (Inherited from DynamicSymbol [▶ 2266].)
	DataType [▶ 2278]	Gets the IDataType [▶ 2475] of the IInstance [▶ 2549]. (Inherited from DynamicSymbol [▶ 2266].)
	FieldInstances [▶ 2342]	Gets the member instances of the Struct Instance [▶ 2666].
	HasValue [▶ 2278]	Gets a value indicating whether this instance has value (only the non VirtualInstances , what means the Symbols with locations). (Inherited from DynamicSymbol [▶ 2266].)
	InstanceName [▶ 2279]	Gets the name of the instance (without periods (.)) (Inherited from DynamicSymbol [▶ 2266].)
	InstancePath [▶ 2279]	Gets the relative / absolute access path to the instance (with periods (.)) (Inherited from DynamicSymbol [▶ 2266].)
	IsBitType [▶ 2280]	Gets a value indicating whether this instance is not basing on a full DataType but instead of some sort of bit mapping (Inherited from DynamicSymbol [▶ 2266].)
	IsByteAligned [▶ 2280]	Indicates that the Size of the Object is Byte aligned ($\text{BitSize} \% 8 == 0$) (Inherited from DynamicSymbol [▶ 2266].)
	IsContainerType [▶ 2281]	Gets a value indicating whether this Symbol is acontainer type. (Inherited from DynamicSymbol [▶ 2266].)
	IsPersistent [▶ 2281]	Gets a value indicating whether this ISymbol [▶ 2691] is persistent. (Inherited from DynamicSymbol [▶ 2266].)
	IsPointer [▶ 2282]	Indicates that the IInstance [▶ 2549] represents a Pointer type (Pointer TO) (Inherited from DynamicSymbol [▶ 2266].)
	IsPrimitiveType [▶ 2282]	Gets a value indicating whether this instance is a primitive type. (Inherited from DynamicSymbol [▶ 2266].)
	IsReadOnly [▶ 2283]	Indicates that this instance is read only. (Inherited from DynamicSymbol [▶ 2266].)
	IsRecursive [▶ 2283]	Gets a value indicating whether this instance is recursive. (Inherited from DynamicSymbol [▶ 2266].)
	IsReference [▶ 2284]	Indicates that the IInstance [▶ 2549] represents a Reference type (REFERENCE TO) (Inherited from DynamicSymbol [▶ 2266].)
	IsStatic [▶ 2284]	Gets a value indicating whether this instance is static. (Inherited from DynamicSymbol [▶ 2266].)
	NormalizedName [▶ 2285]	Gets the normalized instance name (fixed name for dynamic property access that doesn't contain invalid characters), (Inherited from DynamicSymbol [▶ 2266].)

	Name	Description
	NotificationSettings [▶ 2285]	Gets the notification settings. (Inherited from DynamicSymbol [▶ 2266].)
	Parent [▶ 2286]	Gets the parent Symbol (Inherited from DynamicSymbol [▶ 2266].)
	Size [▶ 2286]	Gets the size of the Instance [▶ 2549] in bytes. (Inherited from DynamicSymbol [▶ 2266].)
	SubSymbols [▶ 2287]	Gets the SubSymbols of the ISymbol [▶ 2691] (Inherited from DynamicSymbol [▶ 2266].)
	TypeName [▶ 2287]	Gets the name of the DataType [▶ 2475] that is used for this Instance [▶ 2549]. (Inherited from DynamicSymbol [▶ 2266].)
	ValueEncoding [▶ 2288]	Gets the value encoding. (Inherited from DynamicSymbol [▶ 2266].)

Methods

	Name	Description
	Equals [▶ 2292]	Equals (Inherited from DynamicSymbol [▶ 2266].)
	GetDynamicMemberNames [▶ 2345]	Returns the enumeration of all dynamic member names. (Overrides DynamicSymbol.GetDynamicMemberNames . [▶ 2293].)
	GetHashCode [▶ 2293]	Gets the HashCode of the Address (Inherited from DynamicSymbol [▶ 2266].)
	GetMetaObject	Provides a DynamicMetaObject that dispatches to the dynamic virtual methods. The object can be encapsulated inside another DynamicMetaObject to provide custom behavior for individual actions. This method supports the Dynamic Language Runtime infrastructure for language implementers and it is not intended to be used directly from your code. (Inherited from DynamicObject .)
	GetType	Gets the Type of the current instance. (Inherited from Object .)
	ReadAnyValue [▶ 2300]	Reads the value of this Value [▶ 2775] into a new created instance of the managed type (Inherited from DynamicSymbol [▶ 2266].)
	ReadRawValue . [▶ 2301]	Reads the raw value of the IValueSymbol [▶ 2775] (Ads Read / Write) (Inherited from DynamicSymbol [▶ 2266].)
	ReadRawValue(Int32) [▶ 2302]	Reads the Symbols raw value (Inherited from DynamicSymbol [▶ 2266].)
	ReadRawValueAsync [▶ 2302]	Read raw value as an asynchronous operation. (Inherited from DynamicSymbol [▶ 2266].)
	ReadValue . [▶ 2303]	Reads the value of this DynamicSymbol [▶ 2266]. (Inherited from DynamicSymbol [▶ 2266].)
	ReadValue(Int32) [▶ 2306]	Reads the value of this DynamicSymbol [▶ 2266]. (Inherited from DynamicSymbol [▶ 2266].)
	ReadValueAsync [▶ 2307]	Reads the Value of the IValueSymbol [▶ 2775] asynchronously. (Inherited from DynamicSymbol [▶ 2266].)
	ToString [▶ 2307]	Returns a String that represents this instance. (Inherited from DynamicSymbol [▶ 2266].)
	TryBinaryOperation	Provides implementation for binary operations. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations such as addition and multiplication. (Inherited from DynamicObject .)

	Name	Description
	TryConvert	Provides implementation for type conversion operations. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations that convert an object from one type to another. (Inherited from DynamicObject.)
	TryCreateInstance	Provides the implementation for operations that initialize a new instance of a dynamic object. This method is not intended for use in C# or Visual Basic. (Inherited from DynamicObject.)
	TryDeleteIndex	Provides the implementation for operations that delete an object by index. This method is not intended for use in C# or Visual Basic. (Inherited from DynamicObject.)
	TryDeleteMember	Provides the implementation for operations that delete an object member. This method is not intended for use in C# or Visual Basic. (Inherited from DynamicObject.)
	TryGetIndex	Provides the implementation for operations that get a value by index. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for indexing operations. (Inherited from DynamicObject.)
	TryGetMember [▶ 2345]	Provides the implementation for operations that get member values. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations such as getting a value for a property. (Overrides DynamicSymbol.TryGetMember(GetMemberBinder, Object.) [▶ 2308].)
	TryInvoke	Provides the implementation for operations that invoke an object. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations such as invoking an object or a delegate. (Inherited from DynamicObject.)
	TryInvokeMember	Provides the implementation for operations that invoke a member. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations such as calling a method. (Inherited from DynamicObject.)
	TryReadValue [▶ 2309]	Reads the Value of the IValueSymbol [▶ 2775] (Inherited from DynamicSymbol [▶ 2266].)
	TrySetIndex	Provides the implementation for operations that set a value by index. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations that access objects by a specified index. (Inherited from DynamicObject.)
	TrySetMember [▶ 2346]	Provides the implementation for operations that set member values. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations such as setting a value for a property. (Overrides DynamicObject.TrySetMember(SetMemberBinder, Object.) .)
	TryUnaryOperation	Provides implementation for unary operations. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations such as negation, increment, or decrement. (Inherited from DynamicObject.)
 	TryWriteValue [▶ 2309]	Writes the specified value to the DynamicSymbol [▶ 2266]. (Inherited from DynamicSymbol [▶ 2266].)
	UpdateAnyValue [▶ 2312]	Reads the value of this Value [▶ 2775] into the specified managed value. (Inherited from DynamicSymbol [▶ 2266].)
	WriteAnyValue [▶ 2313]	Writes the value represented by the managed value to this Value [▶ 2775] (Inherited from DynamicSymbol [▶ 2266].)
	WriteRawValue(Byte. e.) [▶ 2314]	Writes the raw value of the IValueSymbol [▶ 2775] (Ads Read / Write) (Inherited from DynamicSymbol [▶ 2266].)

	Name	Description
	WriteRawValue(Byte, Int32) [▶ 2314]	Writes the raw value of the IValueSymbol [▶ 2775] (Ads Read / Write) (Inherited from DynamicSymbol [▶ 2266] .)
	WriteRawValueAsync [▶ 2315]	Writes the raw value of the IValueSymbol [▶ 2775] (Ads Read / Write) (Inherited from DynamicSymbol [▶ 2266] .)
	WriteValue(Object) [▶ 2316]	Writes the specified value to the DynamicSymbol [▶ 2266] . (Inherited from DynamicSymbol [▶ 2266] .)
 	WriteValue(Object, Int32) [▶ 2319]	Writes the specified value to the DynamicSymbol [▶ 2266] . (Inherited from DynamicSymbol [▶ 2266] .)
	WriteValueAsync [▶ 2321]	Writes the Value of the IValueSymbol [▶ 2775] (Inherited from DynamicSymbol [▶ 2266] .)

Events

	Name	Description
	RawValueChanged [▶ 2323]	Occurs when the RawValue of the IValueSymbol [▶ 2775] has changed. (Inherited from DynamicSymbol [▶ 2266] .)
	ValueChanged [▶ 2323]	Occurs when the (Primitive) value of the IValueSymbol [▶ 2775] has changed. (Inherited from DynamicSymbol [▶ 2266] .)

Extension Methods

	Name	Description
	ReferencesExternalData [▶ 3038]	Indicates, that the Instance value includes process memory data, that cannot be read in one memory block. (Defined by DataTypeExtension [▶ 3021] .)

Reference

6.11.23.1 DynamicUnionInstance Properties

The [DynamicUnionInstance \[▶ 2336\]](#) type exposes the following members.

Properties

	Name	Description
	InnerSymbol [▶ 2274]	Gets the inner symbol of this DynamicSymbol [▶ 2266] (Inherited from DynamicSymbol [▶ 2266] .)
	AccessRights [▶ 2274]	Gets the access rights. (Inherited from DynamicSymbol [▶ 2266] .)
	Attributes [▶ 2275]	Gets the Symbol Attributes (Inherited from DynamicSymbol [▶ 2266] .)
	BitSize [▶ 2276]	Gets the size of the IDataType [▶ 2475] in bits. (Inherited from DynamicSymbol [▶ 2266] .)
	ByteSize [▶ 2276]	Gets the (aligned) size of of the Type/Instance in Bytes (Inherited from DynamicSymbol [▶ 2266] .)
	Category [▶ 2277]	Gets the category. (Inherited from DynamicSymbol [▶ 2266] .)

	Name	Description
	Comment [▶ 2277]	Gets the comment of the IInstance [▶ 2549] (Inherited from DynamicSymbol [▶ 2266].)
	Connection [▶ 2277]	Gets the connection bound to this DynamicSymbol [▶ 2266] (Inherited from DynamicSymbol [▶ 2266].)
	DataType [▶ 2278]	Gets the IDataType [▶ 2475] of the IInstance [▶ 2549]. (Inherited from DynamicSymbol [▶ 2266].)
	FieldInstances [▶ 2342]	Gets the member instances of the Struct Instance [▶ 2666].
	HasValue [▶ 2278]	Gets a value indicating whether this instance has value (only the non VirtualInstances , what means the Symbols with locations). (Inherited from DynamicSymbol [▶ 2266].)
	InstanceName [▶ 2279]	Gets the name of the instance (without periods (.)) (Inherited from DynamicSymbol [▶ 2266].)
	InstancePath [▶ 2279]	Gets the relative / absolute access path to the instance (with periods (.)) (Inherited from DynamicSymbol [▶ 2266].)
	IsBitType [▶ 2280]	Gets a value indicating whether this instance is not basing on a full DataType but instead of some sort of bit mapping (Inherited from DynamicSymbol [▶ 2266].)
	IsByteAligned [▶ 2280]	Indicates that the Size of the Object is Byte aligned ($\text{BitSize} \% 8 == 0$) (Inherited from DynamicSymbol [▶ 2266].)
	IsContainerType [▶ 2281]	Gets a value indicating whether this Symbol is acontainer type. (Inherited from DynamicSymbol [▶ 2266].)
	IsPersistent [▶ 2281]	Gets a value indicating whether this ISymbol [▶ 2691] is persistent. (Inherited from DynamicSymbol [▶ 2266].)
	IsPointer [▶ 2282]	Indicates that the IInstance [▶ 2549] represents a Pointer type (Pointer TO) (Inherited from DynamicSymbol [▶ 2266].)
	IsPrimitiveType [▶ 2282]	Gets a value indicating whether this instance is a primitive type. (Inherited from DynamicSymbol [▶ 2266].)
	IsReadOnly [▶ 2283]	Indicates that this instance is read only. (Inherited from DynamicSymbol [▶ 2266].)
	IsRecursive [▶ 2283]	Gets a value indicating whether this instance is recursive. (Inherited from DynamicSymbol [▶ 2266].)
	IsReference [▶ 2284]	Indicates that the IInstance [▶ 2549] represents a Reference type (REFERENCE TO) (Inherited from DynamicSymbol [▶ 2266].)
	IsStatic [▶ 2284]	Gets a value indicating whether this instance is static. (Inherited from DynamicSymbol [▶ 2266].)
	NormalizedName [▶ 2285]	Gets the normalized instance name (fixed name for dynamic property access that doesn't contain invalid characters), (Inherited from DynamicSymbol [▶ 2266].)
	NotificationSettings [▶ 2285]	Gets the notification settings. (Inherited from DynamicSymbol [▶ 2266].)
	Parent [▶ 2286]	Gets the parent Symbol (Inherited from DynamicSymbol [▶ 2266].)
	Size [▶ 2286]	Gets the size of the IInstance [▶ 2549] in bytes. (Inherited from DynamicSymbol [▶ 2266].)
	SubSymbols [▶ 2287]	Gets the SubSymbols of the ISymbol [▶ 2691] (Inherited from DynamicSymbol [▶ 2266].)
	TypeName [▶ 2287]	Gets the name of the DataType [▶ 2475] that is used for this IInstance [▶ 2549]. (Inherited from DynamicSymbol [▶ 2266].)

	Name	Description
	ValueEncoding [▶ 2288]	Gets the value encoding. (Inherited from DynamicSymbol [▶ 2266].)

6.11.23.2 DynamicUnionInstance Methods

The [DynamicUnionInstance](#) [▶ 2336] type exposes the following members.

Methods

	Name	Description
	Equals [▶ 2292]	Equals (Inherited from DynamicSymbol [▶ 2266].)
	GetDynamicMemberNames [▶ 2345]	Returns the enumeration of all dynamic member names. (Overrides DynamicSymbol.GetDynamicMemberNames . [▶ 2293].)
	GetHashCode [▶ 2293]	Gets the HashCode of the Address (Inherited from DynamicSymbol [▶ 2266].)
	GetMetaObject	Provides a DynamicMetaObject that dispatches to the dynamic virtual methods. The object can be encapsulated inside another DynamicMetaObject to provide custom behavior for individual actions. This method supports the Dynamic Language Runtime infrastructure for language implementers and it is not intended to be used directly from your code. (Inherited from DynamicObject .)

	Name	Description
	GetType	Gets the Type of the current instance. (Inherited from Object.)
	ReadAnyValue [▶ 2300]	Reads the value of this Value [▶ 2775] into a new created instance of the managed type (Inherited from DynamicSymbol [▶ 2266].)
	ReadRawValue. [▶ 2301]	Reads the raw value of the IValueSymbol [▶ 2775] (Ads Read / Write) (Inherited from DynamicSymbol [▶ 2266].)
	ReadRawValue(Int32) [▶ 2302]	Reads the Symbols raw value (Inherited from DynamicSymbol [▶ 2266].)
	ReadRawValueAsyn c [▶ 2302]	Read raw value as an asynchronous operation. (Inherited from DynamicSymbol [▶ 2266].)
	ReadValue. [▶ 2303]	Reads the value of this DynamicSymbol [▶ 2266]. (Inherited from DynamicSymbol [▶ 2266].)
	ReadValue(Int32) [▶ 2306]	Reads the value of this DynamicSymbol [▶ 2266]. (Inherited from DynamicSymbol [▶ 2266].)
	ReadValueAsync [▶ 2307]	Reads the Value of the IValueSymbol [▶ 2775] asynchronously. (Inherited from DynamicSymbol [▶ 2266].)
	ToString [▶ 2307]	Returns a String that represents this instance. (Inherited from DynamicSymbol [▶ 2266].)
	TryBinaryOperation	Provides implementation for binary operations. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations such as addition and multiplication. (Inherited from DynamicObject.)
	TryConvert	Provides implementation for type conversion operations. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations that convert an object from one type to another. (Inherited from DynamicObject.)
	TryCreateInstance	Provides the implementation for operations that initialize a new instance of a dynamic object. This method is not intended for use in C# or Visual Basic. (Inherited from DynamicObject.)
	TryDeleteIndex	Provides the implementation for operations that delete an object by index. This method is not intended for use in C# or Visual Basic. (Inherited from DynamicObject.)
	TryDeleteMember	Provides the implementation for operations that delete an object member. This method is not intended for use in C# or Visual Basic. (Inherited from DynamicObject.)
	TryGetIndex	Provides the implementation for operations that get a value by index. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for indexing operations. (Inherited from DynamicObject.)
	TryGetMember [▶ 2345]	Provides the implementation for operations that get member values. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations such as getting a value for a property. (Overrides DynamicSymbol.TryGetMember(GetMemberBinder, Object.) [▶ 2308].)
	TryInvoke	Provides the implementation for operations that invoke an object. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations such as invoking an object or a delegate. (Inherited from DynamicObject.)
	TryInvokeMember	Provides the implementation for operations that invoke a member. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations such as calling a method. (Inherited from DynamicObject.)

	Name	Description
	TryReadValue [▶ 2309]	Reads the Value of the IValueSymbol [▶ 2775] (Inherited from DynamicSymbol [▶ 2266].)
	TrySetIndex	Provides the implementation for operations that set a value by index. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations that access objects by a specified index. (Inherited from DynamicObject .)
	TrySetMember [▶ 2346]	Provides the implementation for operations that set member values. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations such as setting a value for a property. (Overrides DynamicObject.TrySetMember(SetMemberBinder, Object) .)
	TryUnaryOperation	Provides implementation for unary operations. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations such as negation, increment, or decrement. (Inherited from DynamicObject .)
 	TryWriteValue [▶ 2309]	Writes the specified value to the DynamicSymbol [▶ 2266]. (Inherited from DynamicSymbol [▶ 2266].)
	UpdateAnyValue [▶ 2312]	Reads the value of this Value [▶ 2775] into the specified managed value. (Inherited from DynamicSymbol [▶ 2266].)
	WriteAnyValue [▶ 2313]	Writes the value represented by the managed value to this Value [▶ 2775] (Inherited from DynamicSymbol [▶ 2266].)
	WriteRawValue(Byte) [▶ 2314]	Writes the raw value of the IValueSymbol [▶ 2775] (Ads Read / Write) (Inherited from DynamicSymbol [▶ 2266].)
	WriteRawValue(Byte, Int32) [▶ 2314]	Writes the raw value of the IValueSymbol [▶ 2775] (Ads Read / Write) (Inherited from DynamicSymbol [▶ 2266].)
	WriteRawValueAsync [▶ 2315]	Writes the raw value of the IValueSymbol [▶ 2775] (Ads Read / Write) (Inherited from DynamicSymbol [▶ 2266].)
	WriteValue(Object) [▶ 2316]	Writes the specified value to the DynamicSymbol [▶ 2266]. (Inherited from DynamicSymbol [▶ 2266].)
 	WriteValue(Object, Int32) [▶ 2319]	Writes the specified value to the DynamicSymbol [▶ 2266]. (Inherited from DynamicSymbol [▶ 2266].)
	WriteValueAsync [▶ 2321]	Writes the Value of the IValueSymbol [▶ 2775] (Inherited from DynamicSymbol [▶ 2266].)

Extension Methods

	Name	Description
	ReferencesExternalData [▶ 3038]	Indicates, that the Instance value includes process memory data, that cannot be read in one memory block. (Defined by DataTypeExtension [▶ 3021].)

Reference

[DynamicUnionInstance Class](#) [▶ 2336]

[TwinCAT.TypeSystem Namespace](#) [▶ 2083]

6.11.23.2.1 DynamicUnionInstance.GetDynamicMemberNames Method

Returns the enumeration of all dynamic member names.

Namespace: [TwinCAT.TypeSystem](#) [[▶ 2083](#)]

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public override IEnumerable<string> GetDynamicMemberNames ()
```

Return Value

Type: [IEnumerable.String](#).

A sequence that contains dynamic member names.

Reference

[DynamicUnionInstance Class](#) [[▶ 2336](#)]

[TwinCAT.TypeSystem Namespace](#) [[▶ 2083](#)]

6.11.23.2.2 DynamicUnionInstance.TryGetMember Method

Provides the implementation for operations that get member values. Classes derived from the [DynamicObject](#) class can override this method to specify dynamic behavior for operations such as getting a value for a property.

Namespace: [TwinCAT.TypeSystem](#) [[▶ 2083](#)]

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public override bool TryGetMember (
    GetMemberBinder binder,
    out Object?? result
)
```

Parameters

binder	Type: System.Dynamic.GetMemberBinder Provides information about the object that called the dynamic operation. The <code>binder.Name</code> property provides the name of the member on which the dynamic operation is performed. For example, for the <code>Console.WriteLine(sampleObject.SampleProperty)</code> statement, where <code>sampleObject</code> is an instance of the class derived from the DynamicObject class, <code>binder.Name</code> returns "SampleProperty". The <code>binder.IgnoreCase</code> property specifies whether the member name is case-sensitive.
result	Type: System.Object . The result of the get operation. For example, if the method is called for a property, you can assign the property value to <code>result</code> .

Return Value

Type: [Boolean](#)

true if the operation is successful; otherwise, false. If this method returns false, the run-time binder of the language determines the behavior. (In most cases, a run-time exception is thrown.)

6.11.23.2.3 DynamicUnionInstance.TrySetMember Method

Provides the implementation for operations that set member values. Classes derived from the `DynamicObject` class can override this method to specify dynamic behavior for operations such as setting a value for a property.

Namespace: [TwinCAT.TypeSystem \[► 2083\]](#)

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public override bool TrySetMember(
    SetMemberBinder binder,
    Object? value
)
```

Parameters

binder	Type: <code>System.Dynamic.SetMemberBinder</code> Provides information about the object that called the dynamic operation. The <code>binder.Name</code> property provides the name of the member to which the value is being assigned. For example, for the statement <code>sampleObject.SampleProperty = "Test"</code> , where <code>sampleObject</code> is an instance of the class derived from the <code>DynamicObject</code> class, <code>binder.Name</code> returns "SampleProperty". The <code>binder.IgnoreCase</code> property specifies whether the member name is case-sensitive.
value	Type: <code>System.Object</code> The value to set to the member. For example, for <code>sampleObject.SampleProperty = "Test"</code> , where <code>sampleObject</code> is an instance of the class derived from the <code>DynamicObject</code> class, the value is "Test".

Return Value

Type: `Boolean`

true if the operation is successful; otherwise, false. If this method returns false, the run-time binder of the language determines the behavior. (In most cases, a language-specific run-time exception is thrown.)

Namespace: [TwinCAT.TypeSystem](#) [▶ 2083]

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public class DynamicValue : DynamicObject,
    IDynamicValue, IDynamicMetaObjectProvider, IValue, IStructValue, IArrayValue
```

The [DynamicValue](#) type exposes the following members.

Properties

	Name	Description
	Age [▶ 2351]	Gets the age of the value (last successful read of the value)
	CachedRaw [▶ 2351]	Gets the cached Raw internal Data.
	DataType [▶ 2352]	Gets the data type bound to this IValue [▶ 2745]
	IsPrimitive [▶ 2353]	Gets a value indicating whether this IValue [▶ 2745] is a primitive value.
	ParentValue [▶ 2356]	Gets the parent value.
	ResolvedType [▶ 2353]	Gets the resolved type.
	Symbol [▶ 2353]	Gets the symbol that is bound to this value.
	TimeStamp [▶ 2354]	Gets the Time stamp of the last successful read of the Value.
	UpdateMode [▶ 2354]	Gets / Sets the update mode
	ValueFactory [▶ 2355]	The value factory

Methods

	Name	Description
	Equals	Determines whether the specified object is equal to the current object. (Inherited from Object.)
	Finalize	Allows an object to try to free resources and perform other cleanup operations before it is reclaimed by garbage collection. (Inherited from Object.)
	GetDynamicMemberNames [▶ 2358]	Returns the enumeration of all dynamic member names. (Overrides DynamicObject.GetDynamicMemberNames..)
	GetHashCode	Serves as the default hash function. (Inherited from Object.)
	GetMetaObject	Provides a DynamicMetaObject that dispatches to the dynamic virtual methods. The object can be encapsulated inside another DynamicMetaObject to provide custom behavior for individual actions. This method supports the Dynamic Language Runtime infrastructure for language implementers and it is not intended to be used directly from your code. (Inherited from DynamicObject.)
	GetType	Gets the Type of the current instance. (Inherited from Object.)
	MemberwiseClone	Creates a shallow copy of the current Object. (Inherited from Object.)
	Read [▶ 2359]	Reads the value (via ADS)
	ReadAsync [▶ 2359]	read as an asynchronous operation.
	ResolveValue [▶ 2360]	Resolves the Value object to its primitive value.
	setMemberValue [▶ 2374]	Writes the specified member element.
	ToString [▶ 2361]	Returns a String that represents this instance. (Overrides Object.ToString..)
	TryBinaryOperation	Provides implementation for binary operations. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations such as addition and multiplication. (Inherited from DynamicObject.)
	TryConvert [▶ 2361]	Provides implementation for type conversion operations. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations that convert an object from one type to another. (Overrides DynamicObject.TryConvert(ConvertBinder, Object..).)
	TryCreateInstance	Provides the implementation for operations that initialize a new instance of a dynamic object. This method is not intended for use in C# or Visual Basic. (Inherited from DynamicObject.)
	TryDeleteIndex	Provides the implementation for operations that delete an object by index. This method is not intended for use in C# or Visual Basic. (Inherited from DynamicObject.)
	TryDeleteMember	Provides the implementation for operations that delete an object member. This method is not intended for use in C# or Visual Basic. (Inherited from DynamicObject.)
	TryGetArrayElementValues [▶ 2362]	Returns Array Element values.
	TryGetIndex [▶ 2363]	Provides the implementation for operations that get a value by index. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for indexing operations. (Overrides DynamicObject.TryGetIndex(GetIndexBinder, .Object., Object..).)

	Name	Description
	TryGetIndexValue(Int32, Object.) [▶ 2364]	Reads the specified array element.
	TryGetIndexValue(Object, Object.) [▶ 2364]	Tries the get index value.
	TryGetMember [▶ 2365]	Provides the implementation for operations that get member values. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations such as getting a value for a property. (Overrides DynamicObject.TryGetMember(GetMemberBinder, Object.))
	TryGetMemberValue [▶ 2366]	Tries the get member value.
	TryInvoke [▶ 2366]	Provides the implementation for operations that invoke an object. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations such as invoking an object or a delegate. (Overrides DynamicObject.TryInvoke(InvokeBinder, .Object., Object.))
	TryInvokeMember [▶ 2367]	Provides the implementation for operations that invoke a member. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations such as calling a method. (Overrides DynamicObject.TryInvokeMember(InvokeMemberBinder, .Object., Object.))
	TryResolveValue [▶ 2368]	Tries to resolves the Value object to its primitive value.
	TrySetIndex [▶ 2369]	Provides the implementation for operations that set a value by index. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations that access objects by a specified index. (Overrides DynamicObject.TrySetIndex(SetIndexBinder, .Object., Object.))
	TrySetIndexValue(Int32, Object) [▶ 2370]	Tries to set the indexed value on Arrays
	TrySetIndexValue(Object, Object) [▶ 2370]	Tries to set the indexed value on Arrays
	TrySetMember [▶ 2371]	Provides the implementation for operations that set member values. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations such as setting a value for a property. (Overrides DynamicObject.TrySetMember(SetMemberBinder, Object.))
	TrySetMemberValue [▶ 2372]	Tries to Set a Member/Property Value
	TryUnaryOperation	Provides implementation for unary operations. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations such as negation, increment, or decrement. (Inherited from DynamicObject.)
	Write [▶ 2372]	Writes the value (via ADS)
	WriteAsync [▶ 2373]	write as an asynchronous operation.

Remarks

The DynamicValue adds dynamic run time behaviour to the [IValue \[▸ 2745\]](#)/[Value \[▸ 2745\]](#). That means e.g. for struct values that .NET Properties are on-the-fly defined and dispatched at runtime just like defined in the structs structs data type definition. Another example is the access of Array Element values through indexes.

Examples

Sample for the dynamic resolution of Symbols and reading values:

Dynamic Symbol access

```

/// <summary>
/// Defines the entry point of the application.
/// </summary>
/// <param name="args">The arguments.</param>
static async void Main(string[] args)
{
    // Get the AdsAddress from command-line arguments
    AmsAddress address = ArgParser.Parse(args);

    CancellationTokenSource cancelSource = new CancellationTokenSource();
    CancellationToken cancel = cancelSource.Token;

    using (AdsClient client = new AdsClient())
    {
        // Connect to the target device
        client.Connect(address);

        // Usage of "dynamic" Type and Symbols (>= .NET4 only)
        SymbolLoaderSettings settings = new SymbolLoaderSettings(SymbolLoadMode.DynamicTree);
        IAdsSymbolLoader dynLoader = (IAdsSymbolLoader)SymbolLoaderFactory.Create(client, settings);
    }
}

```

6.11.24.1 DynamicValue Properties

The [DynamicValue \[▸ 2347\]](#) type exposes the following members.

Properties

	Name	Description
	Age [▸ 2351]	Gets the age of the value (last successful read of the value)
	CachedRaw [▸ 2351]	Gets the cached Raw internal Data.
	DataType [▸ 2352]	Gets the data type bound to this IValue [▸ 2745]
	IsPrimitive [▸ 2353]	Gets a value indicating whether this IValue [▸ 2745] is a primitive value.

	Name	Description
	ParentValue [▶ 2356]	Gets the parent value.
	ResolvedType [▶ 2353]	Gets the resolved type.
	Symbol [▶ 2353]	Gets the symbol that is bound to this value.
	TimeStamp [▶ 2354]	Gets the Time stamp of the last successful read of the Value.
	UpdateMode [▶ 2354]	Gets / Sets the update mode
	ValueFactory [▶ 2355]	The value factory

[TwinCAT.TypeSystem Namespace](#) [[▶ 2083](#)]

6.11.24.1.1 DynamicValue.Age Property

Gets the age of the value (last successful read of the value)

Namespace: [TwinCAT.TypeSystem](#) [[▶ 2083](#)]

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public TimeSpan Age { get; }
```

Property Value

Type: TimeSpan

The age.

Implements

[IValue.Age](#) [[▶ 2746](#)]

Exceptions

Exception	Condition
NotImplementedException	

Reference

6.11.24.1.2 DynamicValue.CachedRaw Property

Gets the cached Raw internal Data.

Namespace: [TwinCAT.TypeSystem](#) [▶ 2083]

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public ReadOnlyMemory<byte> CachedRaw { get; }
```

Property Value

Type: [ReadOnlyMemory.Byte](#).
The raw cached data.

Implements

[IValue.CachedRaw](#) [▶ 2746]

Reference

[DynamicValue Class](#) [▶ 2347]

[TwinCAT.TypeSystem Namespace](#) [▶ 2083]

6.11.24.1.3 DynamicValue.DataType Property

Gets the data type bound to this [IValue](#) [▶ 2745]

Namespace: [TwinCAT.TypeSystem](#) [▶ 2083]

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public IDataType? DataType { get; }
```

Property Value

Type: [IDataType](#) [▶ 2475]
The type of the data.

Implements

[IValue.DataType](#) [▶ 2747]

Exceptions

Exception	Condition
NotImplementedException	

Reference

[DynamicValue Class](#) [▶ 2347]

[TwinCAT.TypeSystem Namespace](#) [▶ 2083]

6.11.24.1.4 DynamicValue.IsPrimitive Property

Gets a value indicating whether this [IValue](#) [▸ 2745] is a primitive value.

Namespace: [TwinCAT.TypeSystem](#) [▸ 2083]

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public bool IsPrimitive { get; }
```

Property Value

Type: Boolean

true if this instance is primitive; otherwise, false.

Implements

[IValue.IsPrimitive](#) [▸ 2747]

Reference

[DynamicValue Class](#) [▸ 2347]

[TwinCAT.TypeSystem Namespace](#) [▸ 2083]

6.11.24.1.5 DynamicValue.ResolvedType Property

Gets the resolved type.

Namespace: [TwinCAT.TypeSystem](#) [▸ 2083]

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
protected IDataType? ResolvedType { get; }
```

Property Value

Type: [IDataType](#) [▸ 2475]

Resolved type.

Reference

[DynamicValue Class](#) [▸ 2347]

[TwinCAT.TypeSystem Namespace](#) [▸ 2083]

6.11.24.1.6 DynamicValue.Symbol Property

Gets the symbol that is bound to this value.

Namespace: [TwinCAT.TypeSystem](#) [▸ 2083]

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public ISymbol Symbol { get; }
```

Property Value

Type: [ISymbol](#) [[▶ 2691](#)]

The symbol.

Implements

[IValue.Symbol](#) [[▶ 2748](#)]

Reference

[DynamicValue Class](#) [[▶ 2347](#)]

[TwinCAT.TypeSystem Namespace](#) [[▶ 2083](#)]

6.11.24.1.7 DynamicValue.TimeStamp Property

Gets the Time stamp of the last successful read of the Value.

Namespace: [TwinCAT.TypeSystem](#) [[▶ 2083](#)]

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public DateTimeOffset TimeStamp { get; }
```

Property Value

Type: DateTimeOffset

The read time stamp.

Implements

[IValue.TimeStamp](#) [[▶ 2748](#)]

Reference

[DynamicValue Class](#) [[▶ 2347](#)]

[TwinCAT.TypeSystem Namespace](#) [[▶ 2083](#)]

6.11.24.1.8 DynamicValue.UpdateMode Property

Gets / Sets the update mode

Namespace: [TwinCAT.TypeSystem](#) [[▶ 2083](#)]

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public ValueUpdateMode UpdateMode { get; set; }
```

Property Value

Type: [ValueUpdateMode](#) [▶ 3229]

The update mode.

Implements

[IValue.UpdateMode](#) [▶ 2748]

Remarks

The default value is initialized by the creating Value Factory.

Mode	Description
Immediately [▶ 3229]	Writes the values of this DynamicValue [▶ 2347]"/> instantly when setting its value or the value of its child members/elements.
Triggered [▶ 3229]	Caches internally the value of this DynamicValue [▶ 2347]"/> until the Write . [▶ 2372] method is called. This reduces ADS roundtrips, if one or more member/element values should be changed. Furthermore the write on the destination system happens consistently in one ADS Write operation, which could be important for dependent properties/members/elements.

[TwinCAT.TypeSystem Namespace](#) [► 2083]

6.11.24.2 DynamicValue Methods

The [DynamicValue](#) [► 2347] type exposes the following members.

Methods

	Name	Description
	Equals	Determines whether the specified object is equal to the current object. (Inherited from Object.)
	Finalize	Allows an object to try to free resources and perform other cleanup operations before it is reclaimed by garbage collection. (Inherited from Object.)
	GetDynamicMemberNames [► 2358]	Returns the enumeration of all dynamic member names. (Overrides DynamicObject.GetDynamicMemberNames..)
	GetHashCode	Serves as the default hash function. (Inherited from Object.)
	GetMetaObject	Provides a DynamicMetaObject that dispatches to the dynamic virtual methods. The object can be encapsulated inside another DynamicMetaObject to provide custom behavior for individual actions. This method supports the Dynamic Language Runtime infrastructure for language implementers and it is not intended to be used directly from your code. (Inherited from DynamicObject .)
	GetType	Gets the Type of the current instance. (Inherited from Object.)

	Name	Description
	MemberwiseClone	Creates a shallow copy of the current Object. (Inherited from Object.)
	Read [▶ 2359]	Reads the value (via ADS)
	ReadAsync [▶ 2359]	read as an asynchronous operation.
	ResolveValue [▶ 2360]	Resolves the Value object to its primitive value.
	setMemberValue [▶ 2374]	Writes the specified member element.
	ToString [▶ 2361]	Returns a String that represents this instance. (Overrides Object.ToString..)
	TryBinaryOperation	Provides implementation for binary operations. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations such as addition and multiplication. (Inherited from DynamicObject.)
	TryConvert [▶ 2361]	Provides implementation for type conversion operations. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations that convert an object from one type to another. (Overrides DynamicObject.TryConvert(ConvertBinder, Object..))
	TryCreateInstance	Provides the implementation for operations that initialize a new instance of a dynamic object. This method is not intended for use in C# or Visual Basic. (Inherited from DynamicObject.)
	TryDeleteIndex	Provides the implementation for operations that delete an object by index. This method is not intended for use in C# or Visual Basic. (Inherited from DynamicObject.)
	TryDeleteMember	Provides the implementation for operations that delete an object member. This method is not intended for use in C# or Visual Basic. (Inherited from DynamicObject.)
	TryGetArrayElement Values [▶ 2362]	Returns Array Element values.
	TryGetIndex [▶ 2363]	Provides the implementation for operations that get a value by index. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for indexing operations. (Overrides DynamicObject.TryGetIndex(GetIndexBinder, .Object., Object..))
	TryGetIndexValue(.Int32., Object.) [▶ 2364]	Reads the specified array element.
	TryGetIndexValue(.Object., Object.) [▶ 2364]	Tries the get index value.
	TryGetMember [▶ 2365]	Provides the implementation for operations that get member values. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations such as getting a value for a property. (Overrides DynamicObject.TryGetMember(GetMemberBinder, Object..))
	TryGetMemberValue [▶ 2366]	Tries the get member value.
	TryInvoke [▶ 2366]	Provides the implementation for operations that invoke an object. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations such as invoking an object or a delegate. (Overrides DynamicObject.TryInvoke(InvokeBinder, .Object., Object..))

	Name	Description
	TryInvokeMember [▶ 2367]	Provides the implementation for operations that invoke a member. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations such as calling a method. (Overrides DynamicObject.TryInvokeMember(InvokeMemberBinder, .Object., Object).)
	TryResolveValue [▶ 2368]	Tries to resolves the Value object to its primitive value.
	TrySetIndex [▶ 2369]	Provides the implementation for operations that set a value by index. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations that access objects by a specified index. (Overrides DynamicObject.TrySetIndex(SetIndexBinder, .Object., Object).)
	TrySetIndexValue(Int32, Object) [▶ 2370]	Tries to set the indexed value on Arrays
	TrySetIndexValue(Object, Object) [▶ 2370]	Tries to set the indexed value on Arrays
	TrySetMember [▶ 2371]	Provides the implementation for operations that set member values. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations such as setting a value for a property. (Overrides DynamicObject.TrySetMember(SetMemberBinder, Object).)
	TrySetMemberValue [▶ 2372]	Tries to Set a Member/Property Value
	TryUnaryOperation	Provides implementation for unary operations. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations such as negation, increment, or decrement. (Inherited from DynamicObject.)
	Write [▶ 2372]	Writes the value (via ADS)
	WriteAsync [▶ 2373]	write as an asynchronous operation.

6.11.24.2.1 DynamicValue.GetDynamicMemberNames Method

Returns the enumeration of all dynamic member names.

Namespace: [TwinCAT.TypeSystem](#) [▶ 2083]

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public override IEnumerable<string> GetDynamicMemberNames ()
```

Return Value

Type: `IEnumerable.String`.
A sequence that contains dynamic member names.

Reference

[DynamicValue Class](#) [► 2347]

[TwinCAT.TypeSystem Namespace](#) [► 2083]

6.11.24.2.2 DynamicValue.Read Method

Reads the value (via ADS)

Namespace: [TwinCAT.TypeSystem](#) [► 2083]

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public void Read()
```

Implements

[IValue.Read.](#) [► 2749]

Exceptions

Exception	Condition
SymbolException [► 2933]	

Reference

[DynamicValue Class](#) [► 2347]

[TwinCAT.TypeSystem Namespace](#) [► 2083]

6.11.24.2.3 DynamicValue.ReadAsync Method

read as an asynchronous operation.

Namespace: [TwinCAT.TypeSystem](#) [► 2083]

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public Task<ResultAccess> ReadAsync(  
    CancellationToken cancel  
)
```

Parameters

cancel	Type: System.Threading.CancellationToken The cancellation token.
--------	---

Return Value

Type: [Task.ResultAccess](#) [[▶ 3197](#)].
[Task<ReadValueResult>](#).

Implements

[IValue.ReadAsync\(CancellationToken\)](#) [[▶ 2750](#)]

Reference

[DynamicValue Class](#) [[▶ 2347](#)]

[TwinCAT.TypeSystem Namespace](#) [[▶ 2083](#)]

6.11.24.2.4 DynamicValue.ReadMember Method

Reads the specified member element.

Namespace: [TwinCAT.TypeSystem](#) [[▶ 2083](#)]

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.116+a71ced3

Syntax

C#

```
protected virtual Object ReadMember(  
    ISymbol memberInstance  
)
```

Parameters

memberInstance Type: [TwinCAT.TypeSystem.ISymbol](#) [[▶ 2691](#)]
The member instance.

Return Value

Type: [Object](#)

Reference

[DynamicValue Class](#) [[▶ 2347](#)]

[TwinCAT.TypeSystem Namespace](#) [[▶ 2083](#)]

6.11.24.2.5 DynamicValue.ResolveValue Method

Resolves the Value object to its primitive value.

Namespace: [TwinCAT.TypeSystem](#) [[▶ 2083](#)]

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public Object ResolveValue(  
    bool resolveEnumToPrimitive  
)
```

Parameters

resolveEnumToPrimitive	Type: System.Boolean if set to true EnumValue [2524]s are resolved to their primitives also.
------------------------	---

Return Value

Type: Object
System.Object.

Implements

[IValue.ResolveValue\(Boolean\)](#) [[2750](#)]

Remarks

If the value is not primitive, this method returns the [IValue](#) [[2745](#)] itself.

Reference

[DynamicValue Class](#) [[2347](#)]

[TwinCAT.TypeSystem Namespace](#) [[2083](#)]

6.11.24.2.6 DynamicValue.ToString Method

Returns a String that represents this instance.

Namespace: [TwinCAT.TypeSystem](#) [[2083](#)]

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public override string ToString()
```

Return Value

Type: String
A String that represents this instance.

Reference

[DynamicValue Class](#) [[2347](#)]

[TwinCAT.TypeSystem Namespace](#) [[2083](#)]

6.11.24.2.7 DynamicValue.TryConvert Method

Provides implementation for type conversion operations. Classes derived from the `DynamicObject` class can override this method to specify dynamic behavior for operations that convert an object from one type to another.

Namespace: [TwinCAT.TypeSystem](#) [[▶ 2083](#)]

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public override bool TryConvert(
    ConvertBinder binder,
    out Object?? result
)
```

Parameters

binder	Type: System.Dynamic.ConvertBinder Provides information about the conversion operation. The binder.Type property provides the type to which the object must be converted. For example, for the statement (String)sampleObject in C# (CType(sampleObject, Type) in Visual Basic), where sampleObject is an instance of the class derived from the DynamicObject class, binder.Type returns the String type. The binder.Explicit property provides information about the kind of conversion that occurs. It returns true for explicit conversion and false for implicit conversion.
result	Type: System.Object. The result of the type conversion operation.

Return Value

Type: Boolean

true if the operation is successful; otherwise, false. If this method returns false, the run-time binder of the language determines the behavior. (In most cases, a language-specific run-time exception is thrown.)

Reference

[DynamicValue Class](#) [[▶ 2347](#)]

[TwinCAT.TypeSystem Namespace](#) [[▶ 2083](#)]

6.11.24.2.8 DynamicValue.TryGetArrayElementValues Method

Returns Array Element values.

Namespace: [TwinCAT.TypeSystem](#) [[▶ 2083](#)]

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public bool TryGetArrayElementValues(
    out IEnumerable<Object>? elementValues
)
```

Parameters

elementValues	Type: System.Collections.Generic.IEnumerable.Object.. The element values.
---------------	--

Return Value

Type: Boolean

true if the values are returned, false otherwise.

Implements

[IArrayValue.TryGetArrayElementValues\(IEnumerable.Object..\) \[▸ 2468\]](#)

Reference

[DynamicValue Class \[▸ 2347\]](#)

[TwinCAT.TypeSystem Namespace \[▸ 2083\]](#)

6.11.24.2.9 DynamicValue.TryGetIndex Method

Provides the implementation for operations that get a value by index. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for indexing operations.

Namespace: [TwinCAT.TypeSystem \[▸ 2083\]](#)

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public override bool TryGetIndex(
    GetIndexBinder binder,
    Object[] indexes,
    out Object?? result
)
```

Parameters

binder	Type: System.Dynamic.GetIndexBinder Provides information about the operation.
indexes	Type: System.Object. The indexes that are used in the operation. For example, for the sampleObject[3] operation in C# (sampleObject(3) in Visual Basic), where sampleObject is derived from the DynamicObject class, indexes[0] is equal to 3.
result	Type: System.Object. The result of the index operation.

Return Value

Type: Boolean
true if the operation is successful; otherwise, false. If this method returns false, the run-time binder of the language determines the behavior. (In most cases, a run-time exception is thrown.)

6.11.24.2.10.1 DynamicValue.TryGetIndexValue Method (.Int32., Object.)

Reads the specified array element.

Namespace: [TwinCAT.TypeSystem](#) [▶ 2083]

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public bool TryGetIndexValue(
    int[] indices,
    out Object?? value
)
```

Parameters

indices	Type: .System.Int32. The indices.
value	Type: System.Object. The value.

Return Value

Type: Boolean
System.Object.

Implements

[IArrayValue.TryGetIndexValue\(.Int32., Object.\)](#) [▶ 2468]

6.11.24.2.11 DynamicValue.TryGetMember Method

Provides the implementation for operations that get member values. Classes derived from the `DynamicObject` class can override this method to specify dynamic behavior for operations such as getting a value for a property.

Namespace: [TwinCAT.TypeSystem](#) [► 2083]

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public override bool TryGetMember(
    GetMemberBinder binder,
    out Object?? result
)
```

Parameters

binder	Type: System.Dynamic.GetMemberBinder Provides information about the object that called the dynamic operation. The <code>binder.Name</code> property provides the name of the member on which the dynamic operation is performed. For example, for the <code>Console.WriteLine(sampleObject.SampleProperty)</code> statement, where <code>sampleObject</code> is an instance of the class derived from the <code>DynamicObject</code> class, <code>binder.Name</code> returns "SampleProperty". The <code>binder.IgnoreCase</code> property specifies whether the member name is case-sensitive.
result	Type: System.Object. The result of the get operation. For example, if the method is called for a property, you can assign the property value to <code>result</code> .

Return Value

Type: Boolean

true if the operation is successful; otherwise, false. If this method returns false, the run-time binder of the language determines the behavior. (In most cases, a run-time exception is thrown.)

6.11.24.2.13 DynamicValue.TryInvoke Method

Provides the implementation for operations that invoke an object. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations such as invoking an object or a delegate.

Namespace: [TwinCAT.TypeSystem \[▸ 2083\]](#)
Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public override bool TryInvoke(
    InvokeBinder binder,
    Object?[]? args,
    out Object?? result
)
```

Parameters

binder	Type: System.Dynamic.InvokeBinder Provides information about the invoke operation.
args	Type: .System.Object. The arguments that are passed to the object during the invoke operation. For example, for the sampleObject(100) operation, where sampleObject is derived from the DynamicObject class, args is equal to 100.
result	Type: System.Object. The result of the object invocation.

Return Value

Type: Boolean
 true if the operation is successful; otherwise, false. If this method returns false, the run-time binder of the language determines the behavior. (In most cases, a language-specific run-time exception is thrown.)

6.11.24.2.14 DynamicValue.TryInvokeMember Method

Provides the implementation for operations that invoke a member. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations such as calling a method.

Namespace: [TwinCAT.TypeSystem \[▸ 2083\]](#)
Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public override bool TryInvokeMember(
    InvokeMemberBinder binder,
    Object?[]? args,
    out Object?? result
)
```

Parameters

binder	Type: System.Dynamic.InvokeMemberBinder Provides information about the dynamic operation. The binder.Name property provides the name of the member on which the dynamic operation is performed. For example, for the statement sampleObject.SampleMethod(100), where sampleObject is an instance of the class derived from the DynamicObject class, binder.Name returns "SampleMethod". The binder.IgnoreCase property specifies whether the member name is case-sensitive.
--------	--

args	Type: .System.Object. The arguments that are passed to the object member during the invoke operation. For example, for the statement sampleObject.SampleMethod(100), where sampleObject is derived from the DynamicObject class, args[0] is equal to 100.
result	Type: System.Object. The result of the member invocation.

Return Value

Type: Boolean

true if the operation is successful; otherwise, false. If this method returns false, the run-time binder of the language determines the behavior. (In most cases, a language-specific run-time exception is thrown.)

6.11.24.2.15 DynamicValue.TryResolveValue Method

Tries to resolves the Value object to its primitive value.

Namespace: [TwinCAT.TypeSystem](#) [► 2083]

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax**C#**

```
public bool TryResolveValue(
    bool resolveEnumToPrimitive,
    out Object?? value
)
```

Parameters

resolveEnumToPrimitive	Type: System.Boolean if set to true EnumValue [► 2524]s are resolved to their primitives also.
value	Type: System.Object. The value.

Return Value

Type: Boolean

true if value can be resolved, false otherwise.

Implements

[IValue.TryResolveValue\(Boolean, Object.\)](#) [► 2751]

Reference

6.11.24.2.16 DynamicValue.TrySetIndex Method

Provides the implementation for operations that set a value by index. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations that access objects by a specified index.

Namespace: [TwinCAT.TypeSystem](#) [[▶ 2083](#)]

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public override bool TrySetIndex(
    SetIndexBinder binder,
    Object[] indexes,
    Object? value
)
```

Parameters

binder	Type: System.Dynamic.SetIndexBinder Provides information about the operation.
indexes	Type: .System.Object. The indexes that are used in the operation. For example, for the sampleObject[3] = 10 operation in C# (sampleObject(3) = 10 in Visual Basic), where sampleObject is derived from the DynamicObject class, indexes[0] is equal to 3.
value	Type: System.Object The value to set to the object that has the specified index. For example, for the sampleObject[3] = 10 operation in C# (sampleObject(3) = 10 in Visual Basic), where sampleObject is derived from the DynamicObject class, value is equal to 10.

Return Value

Type: Boolean

true if the operation is successful; otherwise, false. If this method returns false, the run-time binder of the language determines the behavior. (In most cases, a language-specific run-time exception is thrown.)

6.11.24.2.18 DynamicValue.TrySetMember Method

Provides the implementation for operations that set member values. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations such as setting a value for a property.

Namespace: [TwinCAT.TypeSystem \[▸ 2083\]](#)

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public override bool TrySetMember(
    SetMemberBinder binder,
    Object? value
)
```

Parameters

binder	Type: System.Dynamic.SetMemberBinder Provides information about the object that called the dynamic operation. The binder.Name property provides the name of the member to which the value is being assigned. For example, for the statement sampleObject.SampleProperty = "Test", where sampleObject is an instance of the class derived from the DynamicObject class, binder.Name returns "SampleProperty". The binder.IgnoreCase property specifies whether the member name is case-sensitive.
value	Type: System.Object The value to set to the member. For example, for sampleObject.SampleProperty = "Test", where sampleObject is an instance of the class derived from the DynamicObject class, the value is "Test".

Return Value

Type: Boolean
true if the operation is successful; otherwise, false. If this method returns false, the run-time binder of the language determines the behavior. (In most cases, a language-specific run-time exception is thrown.)

Namespace: [TwinCAT.TypeSystem](#) [[2083](#)]**Assembly:** TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public sealed class DynamicVirtualStructInstance : DynamicStructInstance,
    IVirtualStructInstance, IStructInstance, IInterfaceInstance, ISymbol, IAttributedInstance,
    IInstance, IBitSize, IRpcCallableInstance
```

The DynamicVirtualStructInstance type exposes the following members.

Properties

	Name	Description
	InnerSymbol [▶ 2274]	Gets the inner symbol of this DynamicSymbol [▶ 2266] (Inherited from DynamicSymbol [▶ 2266] .)
	AccessRights [▶ 2274]	Gets the access rights. (Inherited from DynamicSymbol [▶ 2266] .)
	Attributes [▶ 2275]	Gets the Symbol Attributes (Inherited from DynamicSymbol [▶ 2266] .)
	BitSize [▶ 2276]	Gets the size of the IDataType [▶ 2475] in bits. (Inherited from DynamicSymbol [▶ 2266] .)
	ByteSize [▶ 2276]	Gets the (aligned) size of of the Type/Instance in Bytes (Inherited from DynamicSymbol [▶ 2266] .)
	Category [▶ 2277]	Gets the category. (Inherited from DynamicSymbol [▶ 2266] .)
	Comment [▶ 2277]	Gets the comment of the IInstance [▶ 2549] (Inherited from DynamicSymbol [▶ 2266] .)
	Connection [▶ 2277]	Gets the connection bound to this DynamicSymbol [▶ 2266] (Inherited from DynamicSymbol [▶ 2266] .)
	DataType [▶ 2278]	Gets the IDataType [▶ 2475] of the IInstance [▶ 2549] . (Inherited from DynamicSymbol [▶ 2266] .)
	HasRpcMethods [▶ 3001]	Gets a value indicating whether this instance has RPC methods (Inherited from DynamicInterfaceInstance [▶ 2995] .)
	HasValue [▶ 2278]	Gets a value indicating whether this instance has value (only the non VirtualInstances, what means the Symbols with locations). (Inherited from DynamicSymbol [▶ 2266] .)
	InstanceName [▶ 2279]	Gets the name of the instance (without periods (.)) (Inherited from DynamicSymbol [▶ 2266] .)
	InstancePath [▶ 2279]	Gets the relative / absolute access path to the instance (with periods (.)) (Inherited from DynamicSymbol [▶ 2266] .)
	IsBitType [▶ 2280]	Gets a value indicating whether this instance is not basing on a full DataType but instead of some sort of bit mapping (Inherited from DynamicSymbol [▶ 2266] .)
	IsByteAligned [▶ 2280]	Indicates that the Size of the Object is Byte aligned ($\text{BitSize} \% 8 == 0$) (Inherited from DynamicSymbol [▶ 2266] .)
	IsContainerType [▶ 2281]	Gets a value indicating whether this Symbol is acontainer type. (Inherited from DynamicSymbol [▶ 2266] .)
	IsPersistent [▶ 2281]	Gets a value indicating whether this ISymbol [▶ 2691] is persistent. (Inherited from DynamicSymbol [▶ 2266] .)
	IsPointer [▶ 2282]	Indicates that the IInstance [▶ 2549] represents a Pointer type (Pointer TO) (Inherited from DynamicSymbol [▶ 2266] .)
	IsPrimitiveType [▶ 2282]	Gets a value indicating whether this instance is a primitive type. (Inherited from DynamicSymbol [▶ 2266] .)

	Name	Description
	IsReadOnly [▶ 2283]	Indicates that this instance is read only. (Inherited from DynamicSymbol [▶ 2266].)
	IsRecursive [▶ 2283]	Gets a value indicating whether this instance is recursive. (Inherited from DynamicSymbol [▶ 2266].)
	IsReference [▶ 2284]	Indicates that the IInstance [▶ 2549] represents a Reference type (REFERENCE TO) (Inherited from DynamicSymbol [▶ 2266].)
	IsStatic [▶ 2284]	Gets a value indicating whether this instance is static. (Inherited from DynamicSymbol [▶ 2266].)
	MemberInstances [▶ 3002]	Gets the member instances of the Struct Instance [▶ 2666]. (Inherited from DynamicInterfaceInstance [▶ 2995].)
	NormalizedName [▶ 2285]	Gets the normalized instance name (fixed name for dynamic property access that doesn't contain invalid characters), (Inherited from DynamicSymbol [▶ 2266].)
	NotificationSettings [▶ 2285]	Gets the notification settings. (Inherited from DynamicSymbol [▶ 2266].)
	Parent [▶ 2286]	Gets the parent Symbol (Inherited from DynamicSymbol [▶ 2266].)
	RpcMethods [▶ 3003]	Gets the Method descriptions for the IRpcCallableType [▶ 2624] (Inherited from DynamicInterfaceInstance [▶ 2995].)
	Size [▶ 2286]	Gets the size of the IInstance [▶ 2549] in bytes. (Inherited from DynamicSymbol [▶ 2266].)
	SubSymbols [▶ 2287]	Gets the SubSymbols of the ISymbol [▶ 2691] (Inherited from DynamicSymbol [▶ 2266].)
	TypeName [▶ 2287]	Gets the name of the DataType [▶ 2475] that is used for this IInstance [▶ 2549]. (Inherited from DynamicSymbol [▶ 2266].)
	ValueEncoding [▶ 2288]	Gets the value encoding. (Inherited from DynamicSymbol [▶ 2266].)

Methods

	Name	Description
	AddMember [▶ 2383]	Adds a member instance.
	Equals [▶ 2292]	Equals (Inherited from DynamicSymbol [▶ 2266].)
	GetDynamicMemberNames [▶ 3006]	Returns the enumeration of all dynamic member names. (Inherited from DynamicInterfaceInstance [▶ 2995].)
	GetHashCode [▶ 2293]	Gets the HashCode of the Address (Inherited from DynamicSymbol [▶ 2266].)
	GetMetaObject	Provides a DynamicMetaObject that dispatches to the dynamic virtual methods. The object can be encapsulated inside another DynamicMetaObject to provide custom behavior for individual actions. This method supports the Dynamic Language Runtime infrastructure for language implementers and it is not intended to be used directly from your code. (Inherited from DynamicObject .)
	GetType	Gets the Type of the current instance. (Inherited from Object .)
 	InvokeRpcMethodAsync [▶ 3007]	Invokes the specified RPC Method asynchronously (Inherited from DynamicInterfaceInstance [▶ 2995].)

	Name	Description
	ReadAnyValue [▶ 2300]	Reads the value of this Value [▶ 2775] into a new created instance of the managed type (Inherited from DynamicSymbol [▶ 2266].)
	ReadRawValue. [▶ 2301]	Reads the raw value of the IValueSymbol [▶ 2775] (Ads Read / Write) (Inherited from DynamicSymbol [▶ 2266].)
	ReadRawValue(Int32) [▶ 2302]	Reads the Symbols raw value (Inherited from DynamicSymbol [▶ 2266].)
	ReadRawValueAsync [▶ 2302]	Read raw value as an asynchronous operation. (Inherited from DynamicSymbol [▶ 2266].)
	ReadValue. [▶ 2303]	Reads the value of this DynamicSymbol [▶ 2266]. (Inherited from DynamicSymbol [▶ 2266].)
	ReadValue(Int32) [▶ 2306]	Reads the value of this DynamicSymbol [▶ 2266]. (Inherited from DynamicSymbol [▶ 2266].)
	ReadValueAsync [▶ 2307]	Reads the Value of the IValueSymbol [▶ 2775] asynchronously. (Inherited from DynamicSymbol [▶ 2266].)
	ToString [▶ 2307]	Returns a String that represents this instance. (Inherited from DynamicSymbol [▶ 2266].)
	TryBinaryOperation	Provides implementation for binary operations. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations such as addition and multiplication. (Inherited from DynamicObject .)
	TryConvert	Provides implementation for type conversion operations. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations that convert an object from one type to another. (Inherited from DynamicObject .)
	TryCreateInstance	Provides the implementation for operations that initialize a new instance of a dynamic object. This method is not intended for use in C# or Visual Basic. (Inherited from DynamicObject .)
	TryDeleteIndex	Provides the implementation for operations that delete an object by index. This method is not intended for use in C# or Visual Basic. (Inherited from DynamicObject .)
	TryDeleteMember	Provides the implementation for operations that delete an object member. This method is not intended for use in C# or Visual Basic. (Inherited from DynamicObject .)
	TryGetIndex	Provides the implementation for operations that get a value by index. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for indexing operations. (Inherited from DynamicObject .)
	TryGetMember [▶ 3008]	Provides the implementation for operations that get member values. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations such as getting a value for a property. (Inherited from DynamicInterfaceInstance [▶ 2995].)
	TryInvoke	Provides the implementation for operations that invoke an object. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations such as invoking an object or a delegate. (Inherited from DynamicObject .)
	TryInvokeMember [▶ 3009]	Provides the implementation for operations that invoke a member. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations such as calling a method. (Inherited from DynamicInterfaceInstance [▶ 2995].)

	Name	Description
 	TryInvokeRpcMethod(String, Object, Object.) [▶ 3010]	Invokes the specified RPC Method (Inherited from DynamicInterfaceInstance [▶ 2995].)
 	TryInvokeRpcMethod(String, Object, Object, Object.) [▶ 3012]	Invokes the specified RPC Method (Inherited from DynamicInterfaceInstance [▶ 2995].)
	TryReadValue [▶ 2309]	Reads the Value of the IValueSymbol [▶ 2775] (Inherited from DynamicSymbol [▶ 2266].)
	TrySetIndex	Provides the implementation for operations that set a value by index. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations that access objects by a specified index. (Inherited from DynamicObject .)
	TrySetMember [▶ 3013]	Provides the implementation for operations that set member values. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations such as setting a value for a property. (Inherited from DynamicInterfaceInstance [▶ 2995].)
	TryUnaryOperation	Provides implementation for unary operations. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations such as negation, increment, or decrement. (Inherited from DynamicObject .)
 	TryWriteValue [▶ 2309]	Writes the specified value to the DynamicSymbol [▶ 2266]. (Inherited from DynamicSymbol [▶ 2266].)
	UpdateAnyValue [▶ 2312]	Reads the value of this Value [▶ 2775] into the specified managed value. (Inherited from DynamicSymbol [▶ 2266].)
	WriteAnyValue [▶ 2313]	Writes the value represented by the managed value to this Value [▶ 2775] (Inherited from DynamicSymbol [▶ 2266].)
	WriteRawValue(Byte.) [▶ 2314]	Writes the raw value of the IValueSymbol [▶ 2775] (Ads Read / Write) (Inherited from DynamicSymbol [▶ 2266].)
	WriteRawValue(Byte, Int32) [▶ 2314]	Writes the raw value of the IValueSymbol [▶ 2775] (Ads Read / Write) (Inherited from DynamicSymbol [▶ 2266].)
	WriteRawValueAsync [▶ 2315]	Writes the raw value of the IValueSymbol [▶ 2775] (Ads Read / Write) (Inherited from DynamicSymbol [▶ 2266].)
	WriteValue(Object) [▶ 2316]	Writes the specified value to the DynamicSymbol [▶ 2266]. (Inherited from DynamicSymbol [▶ 2266].)
 	WriteValue(Object, Int32) [▶ 2319]	Writes the specified value to the DynamicSymbol [▶ 2266]. (Inherited from DynamicSymbol [▶ 2266].)
	WriteValueAsync [▶ 2321]	Writes the Value of the IValueSymbol [▶ 2775] (Inherited from DynamicSymbol [▶ 2266].)

Events

	Name	Description
	RawValueChanged [▶ 2323]	Occurs when the RawValue of the IValueSymbol [▶ 2775] has changed. (Inherited from DynamicSymbol [▶ 2266].)
	ValueChanged [▶ 2323]	Occurs when the (Primitive) value of the IValueSymbol [▶ 2775] has changed. (Inherited from DynamicSymbol [▶ 2266].)

Extension Methods

	Name	Description
	ReferencesExternalData [▶ 3038]	Indicates, that the Instance value includes process memory data, that cannot be read in one memory block. (Defined by DataTypeExtension [▶ 3021].)

Reference

[TwinCAT.TypeSystem Namespace](#) [▶ 2083]

6.11.25.1 DynamicVirtualStructInstance Properties

The [DynamicVirtualStructInstance](#) [▶ 2374] type exposes the following members.

Properties

	Name	Description
	InnerSymbol [▶ 2274]	Gets the inner symbol of this DynamicSymbol [▶ 2266] (Inherited from DynamicSymbol [▶ 2266].)
	AccessRights [▶ 2274]	Gets the access rights. (Inherited from DynamicSymbol [▶ 2266].)
	Attributes [▶ 2275]	Gets the Symbol Attributes (Inherited from DynamicSymbol [▶ 2266].)
	BitSize [▶ 2276]	Gets the size of the IDataType [▶ 2475] in bits. (Inherited from DynamicSymbol [▶ 2266].)
	ByteSize [▶ 2276]	Gets the (aligned) size of of the Type/Instance in Bytes (Inherited from DynamicSymbol [▶ 2266].)
	Category [▶ 2277]	Gets the category. (Inherited from DynamicSymbol [▶ 2266].)
	Comment [▶ 2277]	Gets the comment of the IInstance [▶ 2549] (Inherited from DynamicSymbol [▶ 2266].)
	Connection [▶ 2277]	Gets the connection bound to this DynamicSymbol [▶ 2266] (Inherited from DynamicSymbol [▶ 2266].)
	DataType [▶ 2278]	Gets the IDataType [▶ 2475] of the IInstance [▶ 2549]. (Inherited from DynamicSymbol [▶ 2266].)
	HasRpcMethods [▶ 3001]	Gets a value indicating whether this instance has RPC methods (Inherited from DynamicInterfaceInstance [▶ 2995].)
	HasValue [▶ 2278]	Gets a value indicating whether this instance has value (only the non VirtualInstances, what means the Symbols with locations). (Inherited from DynamicSymbol [▶ 2266].)
	InstanceName [▶ 2279]	Gets the name of the instance (without periods (.)) (Inherited from DynamicSymbol [▶ 2266].)
	InstancePath [▶ 2279]	Gets the relative / absolute access path to the instance (with periods (.)) (Inherited from DynamicSymbol [▶ 2266].)

	Name	Description
	IsBitType [▶ 2280]	Gets a value indicating whether this instance is not basing on a full <code>DataType</code> but instead of some sort of bit mapping (Inherited from DynamicSymbol [▶ 2266].)
	IsByteAligned [▶ 2280]	Indicates that the Size of the Object is Byte aligned ($\text{BitSize} \% 8 == 0$) (Inherited from DynamicSymbol [▶ 2266].)
	IsContainerType [▶ 2281]	Gets a value indicating whether this Symbol is a container type. (Inherited from DynamicSymbol [▶ 2266].)
	IsPersistent [▶ 2281]	Gets a value indicating whether this ISymbol [▶ 2691] is persistent. (Inherited from DynamicSymbol [▶ 2266].)
	IsPointer [▶ 2282]	Indicates that the IInstance [▶ 2549] represents a Pointer type (Pointer TO) (Inherited from DynamicSymbol [▶ 2266].)
	IsPrimitiveType [▶ 2282]	Gets a value indicating whether this instance is a primitive type. (Inherited from DynamicSymbol [▶ 2266].)
	IsReadOnly [▶ 2283]	Indicates that this instance is read only. (Inherited from DynamicSymbol [▶ 2266].)
	IsRecursive [▶ 2283]	Gets a value indicating whether this instance is recursive. (Inherited from DynamicSymbol [▶ 2266].)
	IsReference [▶ 2284]	Indicates that the IInstance [▶ 2549] represents a Reference type (REFERENCE TO) (Inherited from DynamicSymbol [▶ 2266].)
	IsStatic [▶ 2284]	Gets a value indicating whether this instance is static. (Inherited from DynamicSymbol [▶ 2266].)
	MemberInstances [▶ 3002]	Gets the member instances of the Struct Instance [▶ 2666]. (Inherited from DynamicInterfaceInstance [▶ 2995].)
	NormalizedName [▶ 2285]	Gets the normalized instance name (fixed name for dynamic property access that doesn't contain invalid characters), (Inherited from DynamicSymbol [▶ 2266].)
	NotificationSettings [▶ 2285]	Gets the notification settings. (Inherited from DynamicSymbol [▶ 2266].)
	Parent [▶ 2286]	Gets the parent Symbol (Inherited from DynamicSymbol [▶ 2266].)
	RpcMethods [▶ 3003]	Gets the Method descriptions for the IRpcCallableType [▶ 2624] (Inherited from DynamicInterfaceInstance [▶ 2995].)
	Size [▶ 2286]	Gets the size of the IInstance [▶ 2549] in bytes. (Inherited from DynamicSymbol [▶ 2266].)
	SubSymbols [▶ 2287]	Gets the SubSymbols of the ISymbol [▶ 2691] (Inherited from DynamicSymbol [▶ 2266].)
	TypeName [▶ 2287]	Gets the name of the DataType [▶ 2475] that is used for this IInstance [▶ 2549]. (Inherited from DynamicSymbol [▶ 2266].)
	ValueEncoding [▶ 2288]	Gets the value encoding. (Inherited from DynamicSymbol [▶ 2266].)

6.11.25.2 DynamicVirtualStructInstance Methods

The [DynamicVirtualStructInstance](#) [[▶ 2374](#)] type exposes the following members.

Methods

	Name	Description
	AddMember [▶ 2383]	Adds an member instance.
	Equals [▶ 2292]	Equals (Inherited from DynamicSymbol [▶ 2266].)
	GetDynamicMemberNames [▶ 3006]	Returns the enumeration of all dynamic member names. (Inherited from DynamicInterfaceInstance [▶ 2995].)
	GetHashCode [▶ 2293]	Gets the HashCode of the Address (Inherited from DynamicSymbol [▶ 2266].)
	GetMetaObject	Provides a DynamicMetaObject that dispatches to the dynamic virtual methods. The object can be encapsulated inside another DynamicMetaObject to provide custom behavior for individual actions. This method supports the Dynamic Language Runtime infrastructure for language implementers and it is not intended to be used directly from your code. (Inherited from DynamicObject .)
	GetType	Gets the Type of the current instance. (Inherited from Object .)
 	InvokeRpcMethodAsync [▶ 3007]	Invokes the specified RPC Method asynchronously (Inherited from DynamicInterfaceInstance [▶ 2995].)
	ReadAnyValue [▶ 2300]	Reads the value of this Value [▶ 2775] into a new created instance of the managed type (Inherited from DynamicSymbol [▶ 2266].)
	ReadRawValue [▶ 2301]	Reads the raw value of the IValueSymbol [▶ 2775] (Ads Read / Write) (Inherited from DynamicSymbol [▶ 2266].)
	ReadRawValue(Int32) [▶ 2302]	Reads the Symbols raw value (Inherited from DynamicSymbol [▶ 2266].)
	ReadRawValueAsync [▶ 2302]	Read raw value as an asynchronous operation. (Inherited from DynamicSymbol [▶ 2266].)
	ReadValue [▶ 2303]	Reads the value of this DynamicSymbol [▶ 2266]. (Inherited from DynamicSymbol [▶ 2266].)
	ReadValue(Int32) [▶ 2306]	Reads the value of this DynamicSymbol [▶ 2266]. (Inherited from DynamicSymbol [▶ 2266].)
	ReadValueAsync [▶ 2307]	Reads the Value of the IValueSymbol [▶ 2775] asynchronously. (Inherited from DynamicSymbol [▶ 2266].)
	ToString [▶ 2307]	Returns a String that represents this instance. (Inherited from DynamicSymbol [▶ 2266].)
	TryBinaryOperation	Provides implementation for binary operations. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations such as addition and multiplication. (Inherited from DynamicObject .)
	TryConvert	Provides implementation for type conversion operations. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations that convert an object from one type to another. (Inherited from DynamicObject .)
	TryCreateInstance	Provides the implementation for operations that initialize a new instance of a dynamic object. This method is not intended for use in C# or Visual Basic. (Inherited from DynamicObject .)
	TryDeleteIndex	Provides the implementation for operations that delete an object by index. This method is not intended for use in C# or Visual Basic. (Inherited from DynamicObject .)

	Name	Description
	TryDeleteMember	Provides the implementation for operations that delete an object member. This method is not intended for use in C# or Visual Basic. (Inherited from DynamicObject.)
	TryGetIndex	Provides the implementation for operations that get a value by index. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for indexing operations. (Inherited from DynamicObject.)
	TryGetMember [▶ 3008]	Provides the implementation for operations that get member values. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations such as getting a value for a property. (Inherited from DynamicInterfaceInstance [▶ 2995].)
	TryInvoke	Provides the implementation for operations that invoke an object. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations such as invoking an object or a delegate. (Inherited from DynamicObject.)
	TryInvokeMember [▶ 3009]	Provides the implementation for operations that invoke a member. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations such as calling a method. (Inherited from DynamicInterfaceInstance [▶ 2995].)
 	TryInvokeRpcMethod(String, Object, Object.) [▶ 3010]	Invokes the specified RPC Method (Inherited from DynamicInterfaceInstance [▶ 2995].)
 	TryInvokeRpcMethod(String, Object, Object, Object.) [▶ 3012]	Invokes the specified RPC Method (Inherited from DynamicInterfaceInstance [▶ 2995].)
	TryReadValue [▶ 2309]	Reads the Value of the IValueSymbol [▶ 2775] (Inherited from DynamicSymbol [▶ 2266].)
	TrySetIndex	Provides the implementation for operations that set a value by index. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations that access objects by a specified index. (Inherited from DynamicObject.)
	TrySetMember [▶ 3013]	Provides the implementation for operations that set member values. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations such as setting a value for a property. (Inherited from DynamicInterfaceInstance [▶ 2995].)
	TryUnaryOperation	Provides implementation for unary operations. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations such as negation, increment, or decrement. (Inherited from DynamicObject.)
 	TryWriteValue [▶ 2309]	Writes the specified value to the DynamicSymbol [▶ 2266]. (Inherited from DynamicSymbol [▶ 2266].)
	UpdateAnyValue [▶ 2312]	Reads the value of this Value [▶ 2775] into the specified managed value. (Inherited from DynamicSymbol [▶ 2266].)
	WriteAnyValue [▶ 2313]	Writes the value represented by the managed value to this Value [▶ 2775] (Inherited from DynamicSymbol [▶ 2266].)
	WriteRawValue(Byte.) [▶ 2314]	Writes the raw value of the IValueSymbol [▶ 2775] (Ads Read / Write) (Inherited from DynamicSymbol [▶ 2266].)

	Name	Description
	WriteRawValue(Byte, Int32) [▶ 2314]	Writes the raw value of the IValueSymbol [▶ 2775] (Ads Read / Write) (Inherited from DynamicSymbol [▶ 2266] .)
	WriteRawValueAsync [▶ 2315]	Writes the raw value of the IValueSymbol [▶ 2775] (Ads Read / Write) (Inherited from DynamicSymbol [▶ 2266] .)
	WriteValue(Object) [▶ 2316]	Writes the specified value to the DynamicSymbol [▶ 2266] . (Inherited from DynamicSymbol [▶ 2266] .)
 	WriteValue(Object, Int32) [▶ 2319]	Writes the specified value to the DynamicSymbol [▶ 2266] . (Inherited from DynamicSymbol [▶ 2266] .)
	WriteValueAsync [▶ 2321]	Writes the Value of the IValueSymbol [▶ 2775] (Inherited from DynamicSymbol [▶ 2266] .)

Extension Methods

	Name	Description
	ReferencesExternalData [▶ 3038]	Indicates, that the Instance value includes process memory data, that cannot be read in one memory block. (Defined by DataTypeExtension [▶ 3021] .)

6.11.25.2.1 DynamicVirtualStructInstance.AddMember Method

Adds an member instance.

Namespace: [TwinCAT.TypeSystem \[▶ 2083\]](#)

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public bool AddMember(
    ISymbol memberInstance,
    IVirtualStructInstance parent
)
```

Parameters

memberInstance	Type: TwinCAT.TypeSystem.ISymbol [▶ 2691] The member instance.
parent	Type: TwinCAT.TypeSystem.IVirtualStructInstance [▶ 2790] The parent struct instance. Usually the this pointer.

Return Value

Type: Boolean

Implements

[IVirtualStructInstance.AddMember\(ISymbol, IVirtualStructInstance\)](#) [[▶ 2794](#)]

Reference

6.11.26 EnumValue.T. Class

Enum Value

Inheritance Hierarchy

System.Object

TwinCAT.TypeSystem.EnumValue.T.

Namespace: [TwinCAT.TypeSystem](#) [[▶ 2083](#)]

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax**C#**

```
public class EnumValue<T> : IEnumValue
where T : IConvertible
```

Type Parameters

T	Enum base type (byte,sbyte,short,ushort,int,uint,long or ulong)
---	---

The EnumValue.T. type exposes the following members.

Constructors

	Name	Description
	EnumValue.T. [▶ 2390]	Initializes a new instance of the EnumValue.T. class.

Properties

	Name	Description
	ManagedBaseType [▶ 2386]	Gets the enumeration base type (sint,byte,short,ushort,int,uint,Int64,UInt64 supported)
	Name [▶ 2386]	Gets the name of the Enum Value
	Primitive [▶ 2387]	Gets the value.
	RawValue [▶ 2387]	Gets the raw value of the enumeration (as byte array)
	Size [▶ 2387]	Gets the size of the Enum value (in bytes)

Methods

	Name	Description
	Equals	Determines whether the specified object is equal to the current object. (Inherited from Object.)
	Finalize	Allows an object to try to free resources and perform other cleanup operations before it is reclaimed by garbage collection. (Inherited from Object.)
	GetHashCode	Serves as the default hash function. (Inherited from Object.)
	GetType	Gets the Type of the current instance. (Inherited from Object.)
	MemberwiseClone	Creates a shallow copy of the current Object. (Inherited from Object.)
	Parse [▶ 2389]	Parse Enum Type string
	ToString [▶ 2389]	Returns a String that represents this instance. (Overrides Object.ToString..)
	TryParse [▶ 2390]	Parse EnumType string

Reference

[TwinCAT.TypeSystem Namespace](#) [[▶ 2083](#)]

6.11.26.1 EnumValue.T. Properties

The [EnumValue.T.](#) [[▶ 2384](#)] generic type exposes the following members.

Properties

	Name	Description
	ManagedBaseType [▶ 2386]	Gets the enumeration base type (sint,byte,short,ushort,int,uint,Int64,UInt64 supported)
	Name [▶ 2386]	Gets the name of the Enum Value
	Primitive [▶ 2387]	Gets the value.
	RawValue [▶ 2387]	Gets the raw value of the enumeration (as byte array)
	Size [▶ 2387]	Gets the size of the Enum value (in bytes)

Reference

6.11.26.2.1 EnumValue.T..Parse Method

Parse Enum Type string

Namespace: [TwinCAT.TypeSystem](#) [[▶ 2083](#)]

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public static EnumValue<T> Parse(  
    IEnumType<T> type,  
    string str  
)
```

Parameters

type	Type: TwinCAT.TypeSystem.IEnumType [▶ 2516]. T [▶ 2384]. The type.
str	Type: System.String The string.

Return Value

Type: [EnumValue](#) [[▶ 2384](#)].[T](#) [[▶ 2384](#)].

EnumValue<T>.

Exceptions

Exception	Condition
FormatException	

Reference

[EnumValue.T. Class](#) [[▶ 2384](#)]

6.11.26.2.2 EnumValue.T..ToString Method

Returns a String that represents this instance.

Namespace: [TwinCAT.TypeSystem](#) [[▶ 2083](#)]

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public override string? ToString()
```

Return Value

Type: String

A String that represents this instance.

Reference

[EnumValue.T. Class](#) [[▶ 2384](#)]

[TwinCAT.TypeSystem Namespace](#) [[▶ 2083](#)]

6.11.26.2.3 EnumValue.T..TryParse Method

Parse EnumType string

Namespace: [TwinCAT.TypeSystem](#) [[▶ 2083](#)]

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public static bool TryParse(
    IEnumType<T> type,
    string str,
    out EnumValue<T>? value
)
```

Parameters

type	Type: TwinCAT.TypeSystem.IEnumType [▶ 2516]. T [▶ 2384]. The type.
str	Type: System.String The string.
value	Type: TwinCAT.TypeSystem.EnumValue [▶ 2384]. T [▶ 2384]. The value.

Return Value

Type: Boolean

true if the [EnumValue.T.](#) [[▶ 2384](#)] could be parsed, false otherwise.

Reference

[EnumValue.T. Class](#) [[▶ 2384](#)]

[TwinCAT.TypeSystem Namespace](#) [[▶ 2083](#)]

6.11.26.3 EnumValue.T. Constructor

Initializes a new instance of the [EnumValue.T.](#) [[▶ 2384](#)] class.

Namespace: [TwinCAT.TypeSystem](#) [[▶ 2083](#)]

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public EnumValue(
    string name,
    T value,
    int valueSize
)
```

Parameters

name	Type: System.String The name.
value	Type: T [▶ 2384] The value.
valueSize	Type: System.Int32 Value size in bytes.

Reference

[EnumValue.T. Class \[▸ 2384\]](#)

[TwinCAT.TypeSystem Namespace \[▸ 2083\]](#)

6.11.27 EnumValueCollection Class

Class EnumValueCollection.

Inheritance Hierarchy

System.Object
 TwinCAT.TypeSystem.EnumValueCollection

Namespace: [TwinCAT.TypeSystem \[▸ 2083\]](#)

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public class EnumValueCollection : IList<IEnumValue>,
    ICollection<IEnumValue>, IEnumerable<IEnumValue>, IEnumerable,
    IEnumValueCollection, IEnumValueCollection<IEnumValue, IConvertible>
```

The EnumValueCollection type exposes the following members.

Properties

	Name	Description
	Count [▸ 2393]	Gets the number of elements contained in the ICollection.T..
	IsReadOnly [▸ 2393]	Gets a value indicating whether the ICollection.T. is read-only.
	Item.Int32. [▸ 2394]	Gets or sets the element at the specified index.
	Item.String. [▸ 2395]	Gets or sets the element at the specified index.

Methods

	Name	Description
	Add [▸ 2396]	Adds an item to the ICollection.T..
	AsReadOnly [▸ 2397]	Gets as read only.
	Clear [▸ 2397]	Removes all items from the ICollection.T..
	Contains(IEnumValue) [▸ 2399]	Determines whether the ICollection.T. contains a specific value.
	Contains(Object) [▸ 2398]	Determines whether [contains] [the specified value].
	Contains(String) [▸ 2399]	Determines whether [contains] [the specified name].
	CopyTo [▸ 2400]	Copies the entire list.
	Equals	Determines whether the specified object is equal to the current object. (Inherited from Object.)

	Name	Description
	Finalize	Allows an object to try to free resources and perform other cleanup operations before it is reclaimed by garbage collection. (Inherited from Object.)
	GetEnumerator [▶ 2400]	Returns an enumerator that iterates through the collection.
	GetHashCode	Serves as the default hash function. (Inherited from Object.)
	GetNames [▶ 2401]	Gets the names.
	GetType	Gets the Type of the current instance. (Inherited from Object.)
	GetValues [▶ 2401]	Gets the values.
	IndexOf [▶ 2402]	Determines the index of a specific item in the IList.T..
	Insert [▶ 2402]	Inserts an item to the IList.T. at the specified index.
	MemberwiseClone	Creates a shallow copy of the current Object. (Inherited from Object.)
	Parse [▶ 2403]	Parses the specified string to the Enum value.
	Remove [▶ 2404]	Removes the first occurrence of a specific object from the ICollection.T..
	RemoveAt [▶ 2404]	Removes the IList.T. item at the specified index.
	ToString	Returns a string that represents the current object. (Inherited from Object.)
	TryGetInfo [▶ 2405]	Tries the get information.
	TryParse(String, IConvertible.) [▶ 2406]	Parse the specified string to the enum value.
	TryParse(String, IEnumValue.) [▶ 2407]	Parse the specified string to the enum value.

6.11.27.2 EnumValueCollection Methods

The [EnumValueCollection](#) [[▶ 2391](#)] type exposes the following members.

Methods

	Name	Description
	Add [▶ 2396]	Adds an item to the ICollection.T..
	AsReadOnly [▶ 2397]	Gets as read only.
	Clear [▶ 2397]	Removes all items from the ICollection.T..
	Contains(IEnumValu e) [▶ 2399]	Determines whether the ICollection.T. contains a specific value.

	Name	Description
	Contains(Object) [▶ 2398]	Determines whether [contains] [the specified value].
	Contains(String) [▶ 2399]	Determines whether [contains] [the specified name].
	CopyTo [▶ 2400]	Copies the entire list.
	Equals	Determines whether the specified object is equal to the current object. (Inherited from Object.)
	Finalize	Allows an object to try to free resources and perform other cleanup operations before it is reclaimed by garbage collection. (Inherited from Object.)
	GetEnumerator [▶ 2400]	Returns an enumerator that iterates through the collection.
	GetHashCode	Serves as the default hash function. (Inherited from Object.)
	GetNames [▶ 2401]	Gets the names.
	GetType	Gets the Type of the current instance. (Inherited from Object.)
	GetValues [▶ 2401]	Gets the values.
	IndexOf [▶ 2402]	Determines the index of a specific item in the IList.T..
	Insert [▶ 2402]	Inserts an item to the IList.T. at the specified index.
	MemberwiseClone	Creates a shallow copy of the current Object. (Inherited from Object.)
	Parse [▶ 2403]	Parses the specified string to the Enum value.
	Remove [▶ 2404]	Removes the first occurrence of a specific object from the ICollection.T..
	RemoveAt [▶ 2404]	Removes the IList.T. item at the specified index.
	ToString	Returns a string that represents the current object. (Inherited from Object.)
	TryGetInfo [▶ 2405]	Tries the get information.
	TryParse(String, IConvertible.) [▶ 2406]	Parse the specified string to the enum value.
	TryParse(String, IEnumValue.) [▶ 2407]	Parse the specified string to the enum value.

6.11.27.2.8 EnumValueCollection.GetValues Method

Gets the values.

Namespace: [TwinCAT.TypeSystem](#) [► 2083]

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public IConvertible[] GetValues()
```

Return Value

Type: `IConvertible`.

`T[]`.

Implements

[IEnumerable<TEnumValue, TValue>.GetValues.](#) [[▶ 2533](#)]

Reference

[EnumValueCollection Class](#) [[▶ 2391](#)]

[TwinCAT.TypeSystem Namespace](#) [[▶ 2083](#)]

6.11.27.2.9 EnumValueCollection.IndexOf Method

Determines the index of a specific item in the `IList.T`.

Namespace: [TwinCAT.TypeSystem](#) [[▶ 2083](#)]

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public int IndexOf(
    IEnumValue item
)
```

Parameters

item	Type: TwinCAT.TypeSystem.IEnumValue [▶ 2524] The object to locate in the <code>IList.T</code> .
------	--

Return Value

Type: `Int32`

The index of item if found in the list; otherwise, -1.

Implements

`IList.T.IndexOf(T)`

Reference

[EnumValueCollection Class](#) [[▶ 2391](#)]

[TwinCAT.TypeSystem Namespace](#) [[▶ 2083](#)]

6.11.27.2.10 EnumValueCollection.Insert Method

Inserts an item to the `IList.T` at the specified index.

Namespace: [TwinCAT.TypeSystem](#) [[▸ 2083](#)]

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public void Insert(  
    int index,  
    IEnumValue item  
)
```

Parameters

index	Type: System.Int32 The zero-based index at which item should be inserted.
item	Type: TwinCAT.TypeSystem.IEnumValue [▸ 2524] The object to insert into the IList.T..

Implements

IList.T..Insert(Int32, T)

Reference

[EnumValueCollection Class](#) [[▸ 2391](#)]

[TwinCAT.TypeSystem Namespace](#) [[▸ 2083](#)]

6.11.27.2.11 EnumValueCollection.Parse Method

Parses the specified string to the Enum value.

Namespace: [TwinCAT.TypeSystem](#) [[▸ 2083](#)]

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public IConvertible Parse(  
    string name  
)
```

Parameters

name	Type: System.String The name.
------	----------------------------------

Return Value

Type: IConvertible

T.

Implements

[IEnumValueCollection.TEnumValue, TValue..Parse\(String\)](#) [[▸ 2533](#)]

Exceptions

Exception	Condition
ArgumentOutOfRangeException	name

Reference

[EnumValueCollection Class \[▸ 2391\]](#)

6.11.27.2.12 EnumValueCollection.Remove Method

Removes the first occurrence of a specific object from the ICollection.T..

Namespace: [TwinCAT.TypeSystem \[▸ 2083\]](#)

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax**C#**

```
public bool Remove(
    IEnumValue item
)
```

Parameters

item	Type: TwinCAT.TypeSystem.IEnumValue [▸ 2524] The object to remove from the ICollection.T..
------	---

Return Value

Type: Boolean

true if item was successfully removed from the ICollection.T.; otherwise, false. This method also returns false if item is not found in the original ICollection.T..

Implements

ICollection.T..Remove(T)

Exceptions

Exception	Condition
NotImplementedException	

Reference

6.11.28 EnumValueCollection.T. Class

Collection of [EnumValues](#) [[▶ 2384](#)]

Inheritance Hierarchy

System.Object

 TwinCAT.TypeSystem.EnumValueCollection.T.

Namespace: [TwinCAT.TypeSystem](#) [[▶ 2083](#)]

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public class EnumValueCollection<T> : IList<EnumValue<T>>,  
    ICollection<EnumValue<T>>, IEnumerable<EnumValue<T>>, IEnumerable<T>,  
    IEnumValueCollection<EnumValue<T>, T>  
where T : struct, new(), IConvertible
```

Type Parameters

T	Base type of enum
---	-------------------

The EnumValueCollection.T. type exposes the following members.

Constructors

	Name	Description
	EnumValueCollection.T. [▶ 2427]	Initializes a new instance of the EnumValueCollection.T. class.

Properties

	Name	Description
	Count [▶ 2410]	Gets the number of elements contained in the ICollection.T..
	Empty [▶ 2412]	Return an Empty Collection.
	IsReadOnly [▶ 2410]	Gets a value indicating whether the ICollection.T. is read-only.
	Item.Int32. [▶ 2411]	Gets or sets the element at the specified index.
	Item.String. [▶ 2412]	Gets the enumeration value str from the string representation.

Methods

	Name	Description
	Add [▶ 2414]	Adds an item to the ICollection.T..
	AddValue [▶ 2425]	Adds the value.
	AsReadOnly [▶ 2414]	Gets as read only.
	Clear [▶ 2415]	Removes all items from the ICollection.T..
	Contains(EnumValue.T.) [▶ 2417]	Determines whether the ICollection.T. contains a specific value.
	Contains(T) [▶ 2416]	Determines whether [contains] [the specified value].
	Contains(String) [▶ 2416]	Determines whether [contains] [the specified name].
	CopyTo [▶ 2417]	Copies the entire list.
	Equals	Determines whether the specified object is equal to the current object. (Inherited from Object.)
	Finalize	Allows an object to try to free resources and perform other cleanup operations before it is reclaimed by garbage collection. (Inherited from Object.)
	GetEnumerator [▶ 2418]	Returns an enumerator that iterates through the collection.
	GetHashCode	Serves as the default hash function. (Inherited from Object.)
	GetNames [▶ 2419]	Gets the names.

	Name	Description
	GetType	Gets the Type of the current instance. (Inherited from Object.)
	GetValues [▶ 2419]	Gets the values.
	IndexOf [▶ 2420]	Determines the index of a specific item in the IList.T..
	Insert [▶ 2420]	Inserts an item to the IList.T. at the specified index.
	MemberwiseClone	Creates a shallow copy of the current Object. (Inherited from Object.)
	Parse [▶ 2421]	Parses the specified string to the Enum value.
	Remove [▶ 2422]	Removes the first occurrence of a specific object from the ICollection.T..
	RemoveAt [▶ 2422]	Removes the IList.T. item at the specified index.
	ToString	Returns a string that represents the current object. (Inherited from Object.)
	TryGetValue [▶ 2425]	Tries to get the value
	TryParse(String, T.) [▶ 2424]	Parse the specified string to the enum value.
	TryParse(String, EnumValue.T..) [▶ 2424]	Parse the specified string to the enum value.

Operators

	Name	Description
	(EnumValueCollection.T. to EnumValueCollection) [▶ 2426]	Performs an explicit conversion from EnumValueCollection.T. to EnumValueCollection [▶ 2391].

Reference

6.11.28.1 EnumValueCollection.T. Properties

The [EnumValueCollection.T.](#) [[▶ 2407](#)] generic type exposes the following members.

Properties

	Name	Description
	Count [▶ 2410]	Gets the number of elements contained in the ICollection.T..
	Empty [▶ 2412]	Return an Empty Collection.
	IsReadOnly [▶ 2410]	Gets a value indicating whether the ICollection.T. is read-only.
	Item.Int32. [▶ 2411]	Gets or sets the element at the specified index.

	Name	Description
	Item.String. ▶ 2412	Gets the enumeration value str from the string representation.

6.11.28.1.1 EnumValueCollection.T..Count Property

Gets the number of elements contained in the ICollection.T..

Namespace: [TwinCAT.TypeSystem](#) [▶ 2083](#)

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public int Count { get; }
```

Property Value

Type: Int32
The count.

Implements

ICollection.T..Count

Reference

[EnumValueCollection.T. Class](#) [▶ 2407](#)

[TwinCAT.TypeSystem Namespace](#) [▶ 2083](#)

6.11.28.1.2 EnumValueCollection.T..IsReadOnly Property

Gets a value indicating whether the ICollection.T. is read-only.

Namespace: [TwinCAT.TypeSystem](#) [▶ 2083](#)

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public bool IsReadOnly { get; }
```

Property Value

Type: Boolean
true if this instance is read only; otherwise, false.

Implements

ICollection.T..IsReadOnly

Reference

6.11.28.1.3 EnumValueCollection.T..Item Property

Overload List

	Name	Description
	Item.Int32. [▸ 2411]	Gets or sets the element at the specified index.
	Item.String. [▸ 2412]	Gets the enumeration value str from the string representation.

Reference

[EnumValueCollection.T. Class \[▸ 2407\]](#)

[TwinCAT.TypeSystem Namespace \[▸ 2083\]](#)

6.11.28.1.3.1 EnumValueCollection.T..Item Property (Int32)

Gets or sets the element at the specified index.

Namespace: [TwinCAT.TypeSystem \[▸ 2083\]](#)

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public EnumValue<T> this[
    int index
] { get; set; }
```

Parameters

index	Type: System.Int32 The index.
-------	----------------------------------

Return Value

Type: [EnumValue \[▸ 2384\].T \[▸ 2407\]](#).

EnumValue<T>.

Implements

IList.T..Item.Int32.

Exceptions

Exception	Condition
NotImplementedException	

Reference

6.11.28.2 EnumValueCollection.T. Methods

The [EnumValueCollection.T.](#) [[▶ 2407](#)] generic type exposes the following members.

Methods

	Name	Description
	Add [▶ 2414]	Adds an item to the ICollection.T..
	AddValue [▶ 2425]	Adds the value.
	AsReadOnly [▶ 2414]	Gets as read only.
	Clear [▶ 2415]	Removes all items from the ICollection.T..
	Contains(EnumValue.T.) [▶ 2417]	Determines whether the ICollection.T. contains a specific value.
	Contains(T) [▶ 2416]	Determines whether [contains] [the specified value].
	Contains(String) [▶ 2416]	Determines whether [contains] [the specified name].
	CopyTo [▶ 2417]	Copies the entire list.
	Equals	Determines whether the specified object is equal to the current object. (Inherited from Object.)
	Finalize	Allows an object to try to free resources and perform other cleanup operations before it is reclaimed by garbage collection. (Inherited from Object.)
	GetEnumerator [▶ 2418]	Returns an enumerator that iterates through the collection.
	GetHashCode	Serves as the default hash function. (Inherited from Object.)
	GetNames [▶ 2419]	Gets the names.
	GetType	Gets the Type of the current instance. (Inherited from Object.)
	GetValues [▶ 2419]	Gets the values.
	IndexOf [▶ 2420]	Determines the index of a specific item in the IList.T..
	Insert [▶ 2420]	Inserts an item to the IList.T. at the specified index.
	MemberwiseClone	Creates a shallow copy of the current Object. (Inherited from Object.)
	Parse [▶ 2421]	Parses the specified string to the Enum value.
	Remove [▶ 2422]	Removes the first occurrence of a specific object from the ICollection.T..
	RemoveAt [▶ 2422]	Removes the IList.T. item at the specified index.

	Name	Description
	ToString	Returns a string that represents the current object. (Inherited from Object.)
	TryGetValue [▶ 2425]	Tries to get the value
	TryParse(String, T.) [▶ 2424]	Parse the specified string to the enum value.
	TryParse(String, EnumValue.T.) [▶ 2424]	Parse the specified string to the enum value.

Determines the index of a specific item in the [IList.T..](#)

Namespace: [TwinCAT.TypeSystem](#) [[▶ 2083](#)]

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax**C#**

```
public int IndexOf(
    EnumValue<T> item
)
```

Parameters

item	Type: TwinCAT.TypeSystem.EnumValue [▶ 2384]. T [▶ 2407]. The object to locate in the IList.T..
------	---

Return Value

Type: [Int32](#)
The index of item if found in the list; otherwise, -1.

Implements

[IList.T..IndexOf\(T\)](#)

Reference

[EnumValueCollection.T. Class](#) [[▶ 2407](#)]

[TwinCAT.TypeSystem Namespace](#) [[▶ 2083](#)]

6.11.28.2.11 EnumValueCollection.T..Insert Method

Inserts an item to the [IList.T.](#) at the specified index.

Namespace: [TwinCAT.TypeSystem](#) [[▶ 2083](#)]

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public void Insert(
    int index,
    EnumValue<T> item
)
```

Parameters

index	Type: System.Int32 The zero-based index at which item should be inserted.
item	Type: TwinCAT.TypeSystem.EnumValue [▶ 2384]. T [▶ 2407]. The object to insert into the IList.T..

Implements

[IList.T..Insert\(Int32, T\)](#)

Reference

[EnumValueCollection.T. Class](#) [[▶ 2407](#)]

[TwinCAT.TypeSystem Namespace](#) [[▶ 2083](#)]

6.11.28.2.12 EnumValueCollection.T..Parse Method

Parses the specified string to the Enum value.

Namespace: [TwinCAT.TypeSystem](#) [[▶ 2083](#)]

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public T Parse(
    string name
)
```

Parameters

name	Type: System.String The name.
------	----------------------------------

Return Value

Type: [T](#) [[▶ 2407](#)]
T.

Implements

[IEnumValueCollection.TEnumValue, TValue..Parse\(String\)](#) [[▶ 2533](#)]

Exceptions

```

The FieldCollection type exposes the following members.

Constructors

	Name	Description
	FieldCollection. [▶ 2430]	Initializes a new instance of the FieldCollection class.
	FieldCollection(IEnumerable.IField.) [▶ 2430]	Initializes a new instance of the FieldCollection class (copy constructor)

Properties

	Name	Description
	Count [▶ 3107]	Gets the collection count. (Inherited from InstanceCollection.T. [▶ 3104].)
	InnerList [▶ 3108]	Gets the List of instances. (Inherited from InstanceCollection.T. [▶ 3104].)
	InnerPathDict [▶ 3108]	The Path dictionary (Inherited from InstanceCollection.T. [▶ 3104].)
	IsReadOnly [▶ 3109]	Gets a value indicating whether this instance is read only. (Inherited from InstanceCollection.T. [▶ 3104].)
	Item.Int32. [▶ 3109]	Gets or sets the Instance [▶ 2549] at the specified index. (Inherited from InstanceCollection.T. [▶ 3104].)
	Item.String. [▶ 3110]	Gets the Instance [▶ 2549] with the specified instance path. (Inherited from InstanceCollection.T. [▶ 3104].)
	Mode [▶ 3111]	The mode this InstanceCollection.T. [▶ 3104] is working in. (Inherited from InstanceCollection.T. [▶ 3104].)

Methods

	Name	Description
	Add [▶ 3112]	Adds the specified item. (Inherited from InstanceCollection.T. [▶ 3104].)
	AddRange [▶ 3113]	Adds the specified items to this collection. (Inherited from InstanceCollection.T. [▶ 3104].)
	AsReadOnly [▶ 2432]	Returns a read only copy of this collection (shallow copy)
	Clear [▶ 3114]	Clears this instance. (Inherited from InstanceCollection.T. [▶ 3104].)
	Clone [▶ 2432]	Clones this FieldCollection.
	Contains(T) [▶ 3115]	Determines whether this collection contains the specified Instance [▶ 2549] (Inherited from InstanceCollection.T. [▶ 3104].)
	Contains(String) [▶ 3114]	Determines whether this collection contains an Instance [▶ 2549] with the specified InstanceName / InstancePath (Inherited from InstanceCollection.T. [▶ 3104].)
	ContainsName [▶ 3116]	Determines whether the specified instance name contains name. (Inherited from InstanceCollection.T. [▶ 3104].)
	CopyTo [▶ 3116]	Copies this InstanceCollection.T. [▶ 3104] to the specified array. (Inherited from InstanceCollection.T. [▶ 3104].)
	Equals	Determines whether the specified object is equal to the current object. (Inherited from Object.)

	Name	Description
	Finalize	Allows an object to try to free resources and perform other cleanup operations before it is reclaimed by garbage collection. (Inherited from Object.)
	GetEnumerator [▶ 3117]	Gets the enumerator. (Inherited from InstanceCollection.T. [▶ 3104].)
	GetHashCode	Serves as the default hash function. (Inherited from Object.)
	GetInstance [▶ 3117]	Gets the Instance [▶ 2549] by instance path. (Inherited from InstanceCollection.T. [▶ 3104].)
	GetInstanceByName [▶ 3118]	Gets the name of the instance by. (Inherited from InstanceCollection.T. [▶ 3104].)
	GetType	Gets the Type of the current instance. (Inherited from Object.)
	IndexOf [▶ 3119]	Determines the index of the specified Instance [▶ 2549]. (Inherited from InstanceCollection.T. [▶ 3104].)
	Insert [▶ 3119]	Inserts the specified Instance [▶ 2549] at the specified index. (Inherited from InstanceCollection.T. [▶ 3104].)
	MemberwiseClone	Creates a shallow copy of the current Object. (Inherited from Object.)
	Remove [▶ 3120]	Removes the specified item. (Inherited from InstanceCollection.T. [▶ 3104].)
	RemoveAt [▶ 3121]	Removes the Instance [▶ 2549] at the specified index. (Inherited from InstanceCollection.T. [▶ 3104].)
	ToString	Returns a string that represents the current object. (Inherited from Object.)
	TryGetInstance [▶ 3121]	Tries to get the Instance [▶ 2549]. of the specified path. (Inherited from InstanceCollection.T. [▶ 3104].)
	TryGetInstanceByName [▶ 3122]	Tries to get Instances by name. (Inherited from InstanceCollection.T. [▶ 3104].)
	TryGetMember [▶ 2433]	Tries to get the specified member

6.11.29.2 FieldCollection Properties

The [FieldCollection](#) [▶ 2427] type exposes the following members.

Properties

	Name	Description
	Count [▶ 3107]	Gets the collection count. (Inherited from InstanceCollection.T. [▶ 3104].)
	InnerList [▶ 3108]	Gets the Llist of instances. (Inherited from InstanceCollection.T. [▶ 3104].)

	Name	Description
	InnerPathDict [▶ 3108]	The Path dictionary (Inherited from InstanceCollection.T. [▶ 3104].)
	IsReadOnly [▶ 3109]	Gets a value indicating whether this instance is read only. (Inherited from InstanceCollection.T. [▶ 3104].)
	Item.Int32. [▶ 3109]	Gets or sets the Instance [▶ 2549] at the specified index. (Inherited from InstanceCollection.T. [▶ 3104].)
	Item.String. [▶ 3110]	Gets the Instance [▶ 2549] with the specified instance path. (Inherited from InstanceCollection.T. [▶ 3104].)
	Mode [▶ 3111]	The mode this InstanceCollection.T. [▶ 3104] is working in. (Inherited from InstanceCollection.T. [▶ 3104].)

6.11.29.3 FieldCollection Methods

The [FieldCollection \[▶ 2427\]](#) type exposes the following members.

Methods

	Name	Description
	Add [▶ 3112]	Adds the specified item. (Inherited from InstanceCollection.T. [▶ 3104].)
	AddRange [▶ 3113]	Adds the specified items to this collection. (Inherited from InstanceCollection.T. [▶ 3104].)
	AsReadOnly [▶ 2432]	Returns a read only copy of this collection (shallow copy)
	Clear [▶ 3114]	Clears this instance. (Inherited from InstanceCollection.T. [▶ 3104].)
	Clone [▶ 2432]	Clones this FieldCollection [▶ 2427] .
	Contains(T) [▶ 3115]	Determines whether this collection contains the specified Instance [▶ 2549] (Inherited from InstanceCollection.T. [▶ 3104].)
	Contains(String) [▶ 3114]	Determines whether this collection contains an Instance [▶ 2549] with the specified InstanceName / InstancePath (Inherited from InstanceCollection.T. [▶ 3104].)
	ContainsName [▶ 3116]	Determines whether the specified instance name contains name. (Inherited from InstanceCollection.T. [▶ 3104].)
	CopyTo [▶ 3116]	Copies this InstanceCollection.T. [▶ 3104] to the specified array. (Inherited from InstanceCollection.T. [▶ 3104].)
	Equals	Determines whether the specified object is equal to the current object. (Inherited from Object.)
	Finalize	Allows an object to try to free resources and perform other cleanup operations before it is reclaimed by garbage collection. (Inherited from Object.)
	GetEnumerator [▶ 3117]	Gets the enumerator. (Inherited from InstanceCollection.T. [▶ 3104].)
	GetHashCode	Serves as the default hash function. (Inherited from Object.)
	GetInstance [▶ 3117]	Gets the Instance [▶ 2549] by instance path. (Inherited from InstanceCollection.T. [▶ 3104].)

	Name	Description
	GetInstanceByName [▶ 3118]	Gets the name of the instance by. (Inherited from InstanceCollection.T. [▶ 3104].)
	GetType	Gets the Type of the current instance. (Inherited from Object.)
	IndexOf [▶ 3119]	Determines the index of the specified IInstance [▶ 2549]. (Inherited from InstanceCollection.T. [▶ 3104].)
	Insert [▶ 3119]	Inserts the specified IInstance [▶ 2549] at the specified index. (Inherited from InstanceCollection.T. [▶ 3104].)
	MemberwiseClone	Creates a shallow copy of the current Object. (Inherited from Object.)
	Remove [▶ 3120]	Removes the specified item. (Inherited from InstanceCollection.T. [▶ 3104].)
	RemoveAt [▶ 3121]	Removes the IInstance [▶ 2549] at the specified index. (Inherited from InstanceCollection.T. [▶ 3104].)
	ToString	Returns a string that represents the current object. (Inherited from Object.)
	TryGetInstance [▶ 3121]	Tries to get the IInstance [▶ 2549]. of the specified path. (Inherited from InstanceCollection.T. [▶ 3104].)
	TryGetInstanceByName [▶ 3122]	Tries to get Instances by name. (Inherited from InstanceCollection.T. [▶ 3104].)
	TryGetMember [▶ 2433]	Tries to get the specified member

6.11.29.3.1 FieldCollection.AsReadOnly Method

Returns a read only copy of this collection (shallow copy)

Namespace: [TwinCAT.TypeSystem](#) [[▶ 2083](#)]

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public ReadOnlyFieldCollection AsReadOnly()
```

Return Value

Type: [ReadOnlyFieldCollection](#) [[▶ 2841](#)]

The readonly copy.

6.11.29.3.3 FieldCollection.TryGetMember Method

Tries to get the specified member

Namespace: [TwinCAT.TypeSystem](#) [▸ 2083]

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public bool TryGetMember(  
    string fieldName,  
    out IField?? symbol  
)
```

Parameters

fieldName	Type: System.String Name of the member.
symbol	Type: TwinCAT.TypeSystem.IField [▸ 2535]. The symbol.

Return Value

Type: Boolean

true if found, false otherwise.

Implements

[IFieldCollection.TryGetMember\(String, IField.\)](#) [▸ 2541]

6.11.30 IAliasInstance Interface

Interface representing an instance of an [IAliasType](#) [▸ 2436].

Namespace: [TwinCAT.TypeSystem](#) [▶ 2083]

Assembly: TwinCAT.Ads.Abstractions (in TwinCAT.Ads.Abstractions.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public interface IAliasInstance : ISymbol,
    IAttributedInstance, IInstance, IBitSize
```

The IAliasInstance type exposes the following members.

Properties

	Name	Description
	Attributes [▶ 2471]	Gets the Type Attributes. (Inherited from IAttributedInstance [▶ 2469].)
	BitSize [▶ 2473]	Gets the size of the IDataType [▶ 2475] in bits. (Inherited from IBitSize [▶ 2472].)
	ByteSize [▶ 2474]	Gets the (aligned) size of of the Type/Instance in Bytes (Inherited from IBitSize [▶ 2472].)
	Category [▶ 2694]	Gets the Symbol/Datatype Category (Inherited from ISymbol [▶ 2691].)
	Comment [▶ 2550]	Gets the comment of the IInstance [▶ 2549] (Inherited from IInstance [▶ 2549].)
	DataType [▶ 2551]	Gets the IDataType [▶ 2475] of the IInstance [▶ 2549]. (Inherited from IInstance [▶ 2549].)
	InstanceName [▶ 2551]	Gets the name of the instance (without periods (.)) (Inherited from IInstance [▶ 2549].)
	InstancePath [▶ 2552]	Gets the relative / absolute access path to the instance (with periods (.)) (Inherited from IInstance [▶ 2549].)
	IsBitType [▶ 2474]	Gets a value indicating whether this instance is not basing on a full DataType but instead of some sort of bit mapping (Inherited from IBitSize [▶ 2472].)
	IsByteAligned [▶ 2475]	Indicates that the Size of the Object is Byte aligned ($\text{BitSize} \% 8 == 0$) (Inherited from IBitSize [▶ 2472].)
	IsContainerType [▶ 2694]	Gets a value indicating whether this Symbol is acontainer type. (Inherited from ISymbol [▶ 2691].)
	IsPersistent [▶ 2694]	Gets a value indicating whether this ISymbol [▶ 2691] is persistent. (Inherited from ISymbol [▶ 2691].)
	IsPointer [▶ 2552]	Indicates that the IInstance [▶ 2549] represents a Pointer type (Pointer TO) (Inherited from IInstance [▶ 2549].)
	IsPrimitiveType [▶ 2695]	Gets a value indicating whether this instance is a primitive type. (Inherited from ISymbol [▶ 2691].)
	IsReadOnly [▶ 2695]	Indicates that this instance is read only. (Inherited from ISymbol [▶ 2691].)
	IsRecursive [▶ 2696]	Gets a value indicating whether this instance is recursive. (Inherited from ISymbol [▶ 2691].)
	IsReference [▶ 2552]	Indicates that the IInstance [▶ 2549] represents a Reference type (REFERENCE TO) (Inherited from IInstance [▶ 2549].)
	IsStatic [▶ 2553]	Gets a value indicating whether this IInstance [▶ 2549] is static. (Inherited from IInstance [▶ 2549].)
	Parent [▶ 2696]	Gets the parent Symbol (Inherited from ISymbol [▶ 2691].)

	Name	Description
	Size [▶ 2475]	Gets the size of the object in bytes or Bits dependant on IsBitType [▶ 2474] (Inherited from IBitSize [▶ 2472] .)
	SubSymbols [▶ 2696]	Gets the SubSymbols of the ISymbol [▶ 2691] (Inherited from ISymbol [▶ 2691] .)
	TypeName [▶ 2553]	Gets the name of the DataType [▶ 2475] that is used for this Instance [▶ 2549] . (Inherited from Instance [▶ 2549] .)
	ValueEncoding [▶ 2472]	Gets the value encoding. (Inherited from AttributedInstance [▶ 2469] .)

Extension Methods

	Name	Description
	ReferencesExternalData [▶ 3038]	Indicates, that the Instance value includes process memory data, that cannot be read in one memory block. (Defined by DataTypeExtension [▶ 3021] .)

Reference

6.11.30.1 IAliasInstance Properties

The [IAliasInstance \[▶ 2433\]](#) type exposes the following members.

Properties

	Name	Description
	Attributes [▶ 2471]	Gets the Type Attributes. (Inherited from AttributedInstance [▶ 2469] .)
	BitSize [▶ 2473]	Gets the size of the IDataType [▶ 2475] in bits. (Inherited from IBitSize [▶ 2472] .)
	ByteSize [▶ 2474]	Gets the (aligned) size of of the Type/Instance in Bytes (Inherited from IBitSize [▶ 2472] .)
	Category [▶ 2694]	Gets the Symbol/Datatype Category (Inherited from ISymbol [▶ 2691] .)
	Comment [▶ 2550]	Gets the comment of the Instance [▶ 2549] (Inherited from Instance [▶ 2549] .)
	DataType [▶ 2551]	Gets the IDataType [▶ 2475] of the Instance [▶ 2549] . (Inherited from Instance [▶ 2549] .)
	InstanceName [▶ 2551]	Gets the name of the instance (without periods (.)) (Inherited from Instance [▶ 2549] .)
	InstancePath [▶ 2552]	Gets the relative / absolute access path to the instance (with periods (.)) (Inherited from Instance [▶ 2549] .)
	IsBitType [▶ 2474]	Gets a value indicating whether this instance is not basing on a full DataType but instead of some sort of bit mapping (Inherited from IBitSize [▶ 2472] .)
	IsByteAligned [▶ 2475]	Indicates that the Size of the Object is Byte aligned ($BitSize \% 8 == 0$) (Inherited from IBitSize [▶ 2472] .)
	IsContainerType [▶ 2694]	Gets a value indicating whether this Symbol is acontainer type. (Inherited from ISymbol [▶ 2691] .)

	Name	Description
	IsPersistent [▶ 2694]	Gets a value indicating whether this ISymbol [▶ 2691] is persistent. (Inherited from ISymbol [▶ 2691].)
	IsPointer [▶ 2552]	Indicates that the IInstance [▶ 2549] represents a Pointer type (Pointer TO) (Inherited from IInstance [▶ 2549].)
	IsPrimitiveType [▶ 2695]	Gets a value indicating whether this instance is a primitive type. (Inherited from ISymbol [▶ 2691].)
	IsReadOnly [▶ 2695]	Indicates that this instance is read only. (Inherited from ISymbol [▶ 2691].)
	IsRecursive [▶ 2696]	Gets a value indicating whether this instance is recursive. (Inherited from ISymbol [▶ 2691].)
	IsReference [▶ 2552]	Indicates that the IInstance [▶ 2549] represents a Reference type (REFERENCE TO) (Inherited from IInstance [▶ 2549].)
	IsStatic [▶ 2553]	Gets a value indicating whether this IInstance [▶ 2549] is static. (Inherited from IInstance [▶ 2549].)
	Parent [▶ 2696]	Gets the parent Symbol (Inherited from ISymbol [▶ 2691].)
	Size [▶ 2475]	Gets the size of the object in bytes or Bits dependant on IsBitType [▶ 2474] (Inherited from IBitSize [▶ 2472].)
	SubSymbols [▶ 2696]	Gets the SubSymbols of the ISymbol [▶ 2691] (Inherited from ISymbol [▶ 2691].)
	TypeName [▶ 2553]	Gets the name of the DataType [▶ 2475] that is used for this IInstance [▶ 2549]. (Inherited from IInstance [▶ 2549].)
	ValueEncoding [▶ 2472]	Gets the value encoding. (Inherited from IAttributedInstance [▶ 2469].)
