[TwinCAT.TypeSystem Namespace](#) [[▶ 2083](#)]

6.11.30.2 IAliasInstance Methods

The [IAliasInstance](#) [[▶ 2433](#)] type exposes the following members.

Extension Methods

	Name	Description
	ReferencesExternalData [▶ 3038]	Indicates, that the Instance value includes process memory data, that cannot be read in one memory block. (Defined by DataTypeExtension [▶ 3021].)

Reference

[IAliasInstance Interface](#) [[▶ 2433](#)]

[TwinCAT.TypeSystem Namespace](#) [[▶ 2083](#)]

6.11.31 IAliasType Interface

Interface representing an Alias Type

Namespace: [TwinCAT.TypeSystem](#) [[▶ 2083](#)]

Assembly: TwinCAT.Ads.Abstractions (in TwinCAT.Ads.Abstractions.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public interface IAliasType : IDataTypeInfo,
    IBitSize
```

The IAliasType type exposes the following members.

Properties

	Name	Description
	Attributes [▶ 2478]	Gets the attributes of the IDataTypeInfo [▶ 2475] (Inherited from IDataTypeInfo [▶ 2475].)
	BaseType [▶ 2439]	Gets the Base Type
	BaseTypeName [▶ 2440]	Gets the BaseType name
	BitSize [▶ 2473]	Gets the size of the IDataTypeInfo [▶ 2475] in bits. (Inherited from IBitSize [▶ 2472].)
	ByteSize [▶ 2474]	Gets the (aligned) size of of the Type/Instance in Bytes (Inherited from IBitSize [▶ 2472].)
	Category [▶ 2478]	Gets the Data Type category (Inherited from IDataTypeInfo [▶ 2475].)
	Comment [▶ 2479]	Gets the comment behind the variable declaration. (Inherited from IDataTypeInfo [▶ 2475].)
	FullName [▶ 2479]	Gets the full name of the IDataTypeInfo [▶ 2475] (Namespace + Name) (Inherited from IDataTypeInfo [▶ 2475].)
	Id [▶ 2480]	Gets the ID of the DataType (Inherited from IDataTypeInfo [▶ 2475].)
	IsBitType [▶ 2474]	Gets a value indicating whether this instance is not basing on a full DataType but instead of some sort of bit mapping (Inherited from IBitSize [▶ 2472].)
	IsByteAligned [▶ 2475]	Indicates that the Size of the Object is Byte aligned (BitSize % 8 == 0) (Inherited from IBitSize [▶ 2472].)
	Name [▶ 2482]	Gets the name of the Data Type (without namespace) (Inherited from IDataTypeInfo [▶ 2475].)
	Namespace [▶ 2482]	Gets the namespace string within the IDataTypeInfo [▶ 2475] exists. (Inherited from IDataTypeInfo [▶ 2475].)
	Size [▶ 2475]	Gets the size of the object in bytes or Bits dependant on IsBitType [▶ 2474] (Inherited from IBitSize [▶ 2472].)

Extension Methods

	Name	Description
	IsArrayOfPrimitives [▶ 3025]	Overloaded. Determines whether the dataType is an array of Primitives. (Defined by DataTypeExtension [▶ 3021].)
	IsArrayOfPrimitives(Boolean) [▶ 3025]	Overloaded. Determines whether the dataType is an array of Primitives. (Defined by DataTypeExtension [▶ 3021].)
	IsContainer [▶ 3027]	Overloaded.

	Name	Description
		Gets a value indicating whether this IDataType [▶ 2475] is a container type (Defined by DataTypeExtension [▶ 3021].)
	IsContainer(Boolean) [▶ 3028]	Overloaded. Gets a value indicating whether this IDataType [▶ 2475] is a container type (Defined by DataTypeExtension [▶ 3021].)
	IsPointer [▶ 3031]	Gets a value indicating whether this IDataType [▶ 2475] is a pointer type (Defined by DataTypeExtension [▶ 3021].)
	IsPrimitive. [▶ 3033]	Overloaded. Gets a value indicating whether this IDataType [▶ 2475] is primitive (Defined by DataTypeExtension [▶ 3021].)
	IsPrimitive(Boolean) [▶ 3034]	Overloaded. Gets a value indicating whether this IDataType [▶ 2475] is primitive (Defined by DataTypeExtension [▶ 3021].)
	IsReference [▶ 3036]	Gets a value indicating whether this IDataType [▶ 2475] is a reference type (Defined by DataTypeExtension [▶ 3021].)
	ReferencesExternalData [▶ 3037]	Indicates, that the Instance value includes process memory data, that cannot be read in one memory block. (Defined by DataTypeExtension [▶ 3021].)
	ResolvableAsPrimitive. [▶ 3039]	Overloaded. Indicates, that this data type can be resolved as primitive or primitive Array. (Defined by DataTypeExtension [▶ 3021].)
	ResolvableAsPrimitive(Boolean) [▶ 3039]	Overloaded. Indicates, that this data type can be resolved as primitive or primitive Array. (Defined by DataTypeExtension [▶ 3021].)
	Resolve. [▶ 3040]	Overloaded. Resolves the specified data type for AliasReference [▶ 3042] (Defined by DataTypeExtension [▶ 3021].)
	Resolve(DataTypeResolveStrategy) [▶ 3041]	Overloaded. Resolves the specified strategy. (Defined by DataTypeExtension [▶ 3021].)

6.11.31.1 IAliasType Properties

The [IAliasType](#) [[▶ 2436](#)] type exposes the following members.

Properties

	Name	Description
	Attributes [▶ 2478]	Gets the attributes of the IDataType [▶ 2475] (Inherited from IDataType [▶ 2475].)
	BaseType [▶ 2439]	Gets the Base Type
	BaseTypeName [▶ 2440]	Gets the BaseType name
	BitSize [▶ 2473]	Gets the size of the IDataType [▶ 2475] in bits. (Inherited from IBitSize [▶ 2472].)
	ByteSize [▶ 2474]	Gets the (aligned) size of of the Type/Instance in Bytes (Inherited from IBitSize [▶ 2472].)
	Category [▶ 2478]	Gets the Data Type category (Inherited from IDataType [▶ 2475].)
	Comment [▶ 2479]	Gets the comment behind the variable declaration. (Inherited from IDataType [▶ 2475].)
	FullName [▶ 2479]	Gets the full name of the IDataType [▶ 2475] (Namespace + Name) (Inherited from IDataType [▶ 2475].)
	Id [▶ 2480]	Gets the ID of the Data Type (Inherited from IDataType [▶ 2475].)
	IsBitType [▶ 2474]	Gets a value indicating whether this instance is not basing on a full Data Type but instead of some sort of bit mapping (Inherited from IBitSize [▶ 2472].)
	IsByteAligned [▶ 2475]	Indicates that the Size of the Object is Byte aligned ($\text{BitSize} \% 8 == 0$) (Inherited from IBitSize [▶ 2472].)
	Name [▶ 2482]	Gets the name of the Data Type (without namespace) (Inherited from IDataType [▶ 2475].)
	Namespace [▶ 2482]	Gets the namespace string within the IDataType [▶ 2475] exists. (Inherited from IDataType [▶ 2475].)
	Size [▶ 2475]	Gets the size of the object in bytes or Bits dependant on IsBitType [▶ 2474] (Inherited from IBitSize [▶ 2472].)

6.11.31.1.1 IAliasType.BaseType Property

Gets the Base Type

Namespace: [TwinCAT.TypeSystem](#) [[▶ 2083](#)]

Assembly: TwinCAT.Ads.Abstractions (in TwinCAT.Ads.Abstractions.dll) Version: 6.0.328+39e3229

Syntax

C#

```
IDataType? BaseType { get; }
```

Property Value

Type: [IDataType](#) [[▸ 2475](#)]

The alias base type or **null** if not resolved.

Reference

6.11.31.2 IAliasType Methods

The [IAliasType](#) [[▸ 2436](#)] type exposes the following members.

Extension Methods

	Name	Description
	IsArrayOfPrimitives [▸ 3025]	Overloaded. Determines whether the dataType is an array of Primitives. (Defined by DataTypeExtension [▸ 3021].)
	IsArrayOfPrimitives(Boolean) [▸ 3025]	Overloaded. Determines whether the dataType is an array of Primitives. (Defined by DataTypeExtension [▸ 3021].)
	IsContainer [▸ 3027]	Overloaded. Gets a value indicating whether this IDataType [▸ 2475] is a container type (Defined by DataTypeExtension [▸ 3021].)
	IsContainer(Boolean) [▸ 3028]	Overloaded. Gets a value indicating whether this IDataType [▸ 2475] is a container type (Defined by DataTypeExtension [▸ 3021].)

	Name	Description
	IsPointer [▶ 3031]	Gets a value indicating whether this IDataType [▶ 2475] is a pointer type (Defined by DataTypeExtension [▶ 3021].)
	IsPrimitive. [▶ 3033]	Overloaded. Gets a value indicating whether this IDataType [▶ 2475] is primitive (Defined by DataTypeExtension [▶ 3021].)
	IsPrimitive(Boolean) [▶ 3034]	Overloaded. Gets a value indicating whether this IDataType [▶ 2475] is primitive (Defined by DataTypeExtension [▶ 3021].)
	IsReference [▶ 3036]	Gets a value indicating whether this IDataType [▶ 2475] is a reference type (Defined by DataTypeExtension [▶ 3021].)
	ReferencesExternalData [▶ 3037]	Indicates, that the Instance value includes process memory data, that cannot be read in one memory block. (Defined by DataTypeExtension [▶ 3021].)
	ResolvableAsPrimitive. [▶ 3039]	Overloaded. Indicates, that this data type can be resolved as primitive or primitive Array. (Defined by DataTypeExtension [▶ 3021].)
	ResolvableAsPrimitive(Boolean) [▶ 3039]	Overloaded. Indicates, that this data type can be resolved as primitive or primitive Array. (Defined by DataTypeExtension [▶ 3021].)
	Resolve. [▶ 3040]	Overloaded. Resolves the specified data type for AliasReference [▶ 3042] (Defined by DataTypeExtension [▶ 3021].)
	Resolve(DataTypeResolveStrategy) [▶ 3041]	Overloaded. Resolves the specified strategy. (Defined by DataTypeExtension [▶ 3021].)

6.11.32 IAnyTypeMarshaler Interface

Interface [IAnyTypeMarshaler](#) Implements the [IGenericTypeMarshaler](#) [[▶ 2542](#)]

Namespace: [TwinCAT.TypeSystem](#) [[▶ 2083](#)]

Assembly: [TwinCAT.Ads.Abstractions](#) (in [TwinCAT.Ads.Abstractions.dll](#)) Version: 6.0.328+39e3229

Syntax

C#

```
public interface IAnyTypeMarshaler : IGenericTypeMarshaler,
    ITypeMarshaler
```

Methods

	Name	Description
	CanMarshal(Type) [▶ 2732]	Determines whether ADS can marshal the specified managed data type. (Inherited from ITypeMarshaler [▶ 2731].)

	Name	Description
	CanMarshal(Type, .Int32, Encoding) [▶ 2446]	Determines whether ADS can marshal the specified managed data type.
	CanMarshalValue(Object) [▶ 2736]	Determines whether ADS can marshal the specified value (Inherited from ITypeMarshaler [▶ 2731].)
	CanMarshalValue(Object, .Int32, Encoding) [▶ 2451]	Determines whether ADS can marshal the specified managed data type.
	Marshal(Object, Encoding, Span.Byte.) [▶ 2734]	Marshals the specified value to the specified destination memory / span. (Inherited from ITypeMarshaler [▶ 2731].)
	Marshal(Object, .Int32, Encoding, Span.Byte.) [▶ 2447]	Marshals the specified value to the specified destination.
	MarshalValueSize(Object, Encoding) [▶ 2736]	Gets the byte size of the value when marshalled. (Inherited from ITypeMarshaler [▶ 2731].)
	MarshalValueSize(Object, .Int32, Encoding) [▶ 2452]	Gets the byte size of the value when marshalled.
	Unmarshal(Type, ReadOnlySpan.Byte, Encoding, Object.) [▶ 2735]	Unmarshals the specified managed type from memory / span (Inherited from ITypeMarshaler [▶ 2731].)
	Unmarshal(Type, .Int32, ReadOnlySpan.Byte, Encoding, Object.) [▶ 2450]	Unmarshals the source data to an managed value of the specified type.
	Unmarshal.T.(ReadOnlySpan.Byte, Encoding, T.) [▶ 2544]	Unmarshals the source data to an managed value of the specified type. (Inherited from IGenericTypeMarshaler [▶ 2542].)

Remarks

The [IAnyTypeMarshaler](#) supports value marshalling / Unmarshalling with the ADS ANY_TYPE concept, what means that the specified managed type is supported by an arguments metadata array (args parameter).

    Type anyType,
    int[] args,
    ReadOnlySpan<byte> source,
    Encoding encoding,
    out Object value
)
```

Parameters

anyType	Type: System.Type The managed type.
args	Type: .System.Int32. The arguments.

source	Type: System.ReadOnlySpan.Byte. The source data.
encoding	Type: System.Text.Encoding The encoding.
value	Type: System.Object. The value.

Return Value

Type: Int32
Number of unmarshaled bytes.

6.11.32.1.5.1 IAnyTypeMarshaler.CanMarshalValue Method (Object, Int32, Encoding)

Determines whether ADS can marshal the specified managed data type.

Namespace: [TwinCAT.TypeSystem \[▶ 2083\]](#)

Assembly: TwinCAT.Ads.Abstractions (in TwinCAT.Ads.Abstractions.dll) Version: 6.0.328+39e3229

Syntax

C#

```
bool CanMarshalValue(
    Object value,
    int[] args,
    Encoding encoding
)
```

Parameters

value	Type: System.Object The managed value.
args	Type: .System.Int32. The arguments.
encoding	Type: System.Text.Encoding The encoding.

Return Value

Type: Boolean

true if this instance can marshal the specified managed type; otherwise, false.

6.11.33 IArrayInstance Interface

Interface representing an array instance

Namespace: [TwinCAT.TypeSystem \[▶ 2083\]](#)
Assembly: TwinCAT.Ads.Abstractions (in TwinCAT.Ads.Abstractions.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public interface IArrayInstance : ISymbol,
    IAttributedInstance, IInstance, IBitSize
```

The IArrayInstance type exposes the following members.

Properties

	Name	Description
	Attributes [▶ 2471]	Gets the Type Attributes. (Inherited from IAttributedInstance [▶ 2469] .)
	BitSize [▶ 2473]	Gets the size of the IDataType [▶ 2475] in bits. (Inherited from IBitSize [▶ 2472] .)
	ByteSize [▶ 2474]	Gets the (aligned) size of of the Type/Instance in Bytes (Inherited from IBitSize [▶ 2472] .)
	Category [▶ 2694]	Gets the Symbol/Datatype Category (Inherited from ISymbol [▶ 2691] .)
	Comment [▶ 2550]	Gets the comment of the IInstance [▶ 2549] (Inherited from IInstance [▶ 2549] .)
	DataType [▶ 2551]	Gets the IDataType [▶ 2475] of the IInstance [▶ 2549] . (Inherited from IInstance [▶ 2549] .)
	Dimensions [▶ 2456]	Gets the dimensions as read only collection.
	Elements [▶ 2456]	Gets the contained Array Elements as read only collection.
	ElementType [▶ 2457]	Gets the type of the contained elements.

	Name	Description
	InstanceName [▶ 2551]	Gets the name of the instance (without periods (.)) (Inherited from IInstance [▶ 2549].)
	InstancePath [▶ 2552]	Gets the relative / absolute access path to the instance (with periods (.)) (Inherited from IInstance [▶ 2549].)
	IsBitType [▶ 2474]	Gets a value indicating whether this instance is not basing on a full DataType but instead of some sort of bit mapping (Inherited from IBitSize [▶ 2472].)
	IsByteAligned [▶ 2475]	Indicates that the Size of the Object is Byte aligned ($\text{BitSize} \% 8 == 0$) (Inherited from IBitSize [▶ 2472].)
	IsContainerType [▶ 2694]	Gets a value indicating whether this Symbol is a container type. (Inherited from ISymbol [▶ 2691].)
	IsPersistent [▶ 2694]	Gets a value indicating whether this ISymbol [▶ 2691] is persistent. (Inherited from ISymbol [▶ 2691].)
	IsPointer [▶ 2552]	Indicates that the IInstance [▶ 2549] represents a Pointer type (Pointer TO) (Inherited from IInstance [▶ 2549].)
	IsPrimitiveType [▶ 2695]	Gets a value indicating whether this instance is a primitive type. (Inherited from ISymbol [▶ 2691].)
	IsReadOnly [▶ 2695]	Indicates that this instance is read only. (Inherited from ISymbol [▶ 2691].)
	IsRecursive [▶ 2696]	Gets a value indicating whether this instance is recursive. (Inherited from ISymbol [▶ 2691].)
	IsReference [▶ 2552]	Indicates that the IInstance [▶ 2549] represents a Reference type (REFERENCE TO) (Inherited from IInstance [▶ 2549].)
	IsStatic [▶ 2553]	Gets a value indicating whether this IInstance [▶ 2549] is static. (Inherited from IInstance [▶ 2549].)
	Item [▶ 2457]	Gets the ISymbol [▶ 2691] with the specified indices.
	Parent [▶ 2696]	Gets the parent Symbol (Inherited from ISymbol [▶ 2691].)
	Size [▶ 2475]	Gets the size of the object in bytes or Bits dependant on IsBitType [▶ 2474] (Inherited from IBitSize [▶ 2472].)
	SubSymbols [▶ 2696]	Gets the SubSymbols of the ISymbol [▶ 2691] (Inherited from ISymbol [▶ 2691].)
	TypeName [▶ 2553]	Gets the name of the DataType [▶ 2475] that is used for this IInstance [▶ 2549]. (Inherited from IInstance [▶ 2549].)
	ValueEncoding [▶ 2472]	Gets the value encoding. (Inherited from IAttributedInstance [▶ 2469].)

Extension Methods

	Name	Description
	ReferencesExternalData [▶ 3038]	Indicates, that the Instance value includes process memory data, that cannot be read in one memory block. (Defined by DataTypeExtension [▶ 3021].)

Reference

6.11.33.1 IArrayInstance Properties

The [IArrayInstance](#) [▶ 2453] type exposes the following members.

Properties

	Name	Description
	Attributes [▶ 2471]	Gets the Type Attributes. (Inherited from IAttributedInstance [▶ 2469].)
	BitSize [▶ 2473]	Gets the size of the IDataType [▶ 2475] in bits. (Inherited from IBitSize [▶ 2472].)
	ByteSize [▶ 2474]	Gets the (aligned) size of of the Type/Instance in Bytes (Inherited from IBitSize [▶ 2472].)
	Category [▶ 2694]	Gets the Symbol/Datatype Category (Inherited from ISymbol [▶ 2691].)
	Comment [▶ 2550]	Gets the comment of the IInstance [▶ 2549] (Inherited from IInstance [▶ 2549].)
	DataType [▶ 2551]	Gets the IDataType [▶ 2475] of the IInstance [▶ 2549]. (Inherited from IInstance [▶ 2549].)
	Dimensions [▶ 2456]	Gets the dimensions as read only collection.
	Elements [▶ 2456]	Gets the contained Array Elements as read only collection.
	ElementType [▶ 2457]	Gets the type of the contained elements.
	InstanceName [▶ 2551]	Gets the name of the instance (without periods (.)) (Inherited from IInstance [▶ 2549].)
	InstancePath [▶ 2552]	Gets the relative / absolute access path to the instance (with periods (.)) (Inherited from IInstance [▶ 2549].)
	IsBitType [▶ 2474]	Gets a value indicating whether this instance is not basing on a full DataType but instead of some sort of bit mapping (Inherited from IBitSize [▶ 2472].)
	IsByteAligned [▶ 2475]	Indicates that the Size of the Object is Byte aligned ($\text{BitSize} \% 8 == 0$) (Inherited from IBitSize [▶ 2472].)
	IsContainerType [▶ 2694]	Gets a value indicating whether this Symbol is acontainer type. (Inherited from ISymbol [▶ 2691].)
	IsPersistent [▶ 2694]	Gets a value indicating whether this ISymbol [▶ 2691] is persistent. (Inherited from ISymbol [▶ 2691].)
	IsPointer [▶ 2552]	Indicates that the IInstance [▶ 2549] represents a Pointer type (Pointer TO) (Inherited from IInstance [▶ 2549].)
	IsPrimitiveType [▶ 2695]	Gets a value indicating whether this instance is a primitive type. (Inherited from ISymbol [▶ 2691].)
	IsReadOnly [▶ 2695]	Indicates that this instance is read only. (Inherited from ISymbol [▶ 2691].)
	IsRecursive [▶ 2696]	Gets a value indicating whether this instance is recursive. (Inherited from ISymbol [▶ 2691].)
	IsReference [▶ 2552]	Indicates that the IInstance [▶ 2549] represents a Reference type (REFERENCE TO) (Inherited from IInstance [▶ 2549].)
	IsStatic [▶ 2553]	Gets a value indicating whether this IInstance [▶ 2549] is static. (Inherited from IInstance [▶ 2549].)
	Item [▶ 2457]	Gets the ISymbol [▶ 2691] with the specified indices.

	Name	Description
	Parent [▸ 2696]	Gets the parent Symbol (Inherited from ISymbol [▸ 2691].)
	Size [▸ 2475]	Gets the size of the object in bytes or Bits dependant on IsBitType [▸ 2474] (Inherited from IBitSize [▸ 2472].)
	SubSymbols [▸ 2696]	Gets the SubSymbols of the ISymbol [▸ 2691] (Inherited from ISymbol [▸ 2691].)

[TwinCAT.TypeSystem Namespace](#) [► 2083]

6.11.34.1.4 IArrayType.IsJagged Property

Gets a value indicating whether this instance is jagged.

Namespace: [TwinCAT.TypeSystem](#) [► 2083]

Assembly: TwinCAT.Ads.Abstractions (in TwinCAT.Ads.Abstractions.dll) Version: 6.0.328+39e3229

Syntax

C#

```
bool IsJagged { get; }
```

Property Value

Type: Boolean
true if this instance is jagged; otherwise, false.

Reference

[IArrayType Interface](#) [► 2459]

[TwinCAT.TypeSystem Namespace](#) [► 2083]

6.11.34.1.5 IArrayType.JaggedLevel Property

Gets the jagged level (Non-Jagged Arrays have level 1)

Namespace: [TwinCAT.TypeSystem](#) [► 2083]

Assembly: TwinCAT.Ads.Abstractions (in TwinCAT.Ads.Abstractions.dll) Version: 6.0.328+39e3229

Syntax

C#

```
int JaggedLevel { get; }
```

Property Value

Type: Int32
The jagged level.

6.11.34.2 IArrayType Methods

The [IArrayType](#) [► 2459] type exposes the following members.

Extension Methods

Name	Description
IsArrayOfPrimitives [▶ 3025]	Overloaded. Determines whether the dataType is an array of Primitives. (Defined by DataTypeExtension [▶ 3021].)
IsArrayOfPrimitives(Boolean) [▶ 3025]	Overloaded. Determines whether the dataType is an array of Primitives. (Defined by DataTypeExtension [▶ 3021].)
IsContainer [▶ 3027]	Overloaded. Gets a value indicating whether this IDataType [▶ 2475] is a container type (Defined by DataTypeExtension [▶ 3021].)
IsContainer(Boolean) [▶ 3028]	Overloaded. Gets a value indicating whether this IDataType [▶ 2475] is a container type (Defined by DataTypeExtension [▶ 3021].)
IsPointer [▶ 3031]	Gets a value indicating whether this IDataType [▶ 2475] is a pointer type (Defined by DataTypeExtension [▶ 3021].)
IsPrimitive [▶ 3033]	Overloaded. Gets a value indicating whether this IDataType [▶ 2475] is primitive (Defined by DataTypeExtension [▶ 3021].)
IsPrimitive(Boolean) [▶ 3034]	Overloaded. Gets a value indicating whether this IDataType [▶ 2475] is primitive (Defined by DataTypeExtension [▶ 3021].)
IsReference [▶ 3036]	Gets a value indicating whether this IDataType [▶ 2475] is a reference type (Defined by DataTypeExtension [▶ 3021].)
ReferencesExternalData [▶ 3037]	Indicates, that the Instance value includes process memory data, that cannot be read in one memory block. (Defined by DataTypeExtension [▶ 3021].)
ResolvableAsPrimitive [▶ 3039]	Overloaded. Indicates, that this data type can be resolved as primitive or primitive Array. (Defined by DataTypeExtension [▶ 3021].)
ResolvableAsPrimitive(Boolean) [▶ 3039]	Overloaded. Indicates, that this data type can be resolved as primitive or primitive Array. (Defined by DataTypeExtension [▶ 3021].)
Resolve [▶ 3040]	Overloaded. Resolves the specified data type for AliasReference [▶ 3042] (Defined by DataTypeExtension [▶ 3021].)
Resolve(DataTypeResolveStrategy) [▶ 3041]	Overloaded. Resolves the specified strategy. (Defined by DataTypeExtension [▶ 3021].)

6.11.35 IArrayValue Interface

Interface [IArrayValue](#)

Namespace: [TwinCAT.TypeSystem \[▸ 2083\]](#)

Assembly: TwinCAT.Ads.Abstractions (in TwinCAT.Ads.Abstractions.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public interface IArrayValue : IValue
```

The IArrayValue type exposes the following members.

Properties

	Name	Description
	Age [▸ 2746]	Gets the age of the value (last successful read of the value) (Inherited from IValue [▸ 2745].)
	CachedRaw [▸ 2746]	Gets the cached Raw internal Data. (Inherited from IValue [▸ 2745].)
	DataType [▸ 2747]	Gets the data type bound to this IValue [▸ 2745] (Inherited from IValue [▸ 2745].)
	IsPrimitive [▸ 2747]	Gets a value indicating whether this IValue [▸ 2745] is a primitive value. (Inherited from IValue [▸ 2745].)
	Symbol [▸ 2748]	Gets the symbol bound to this IValue [▸ 2745] . (Inherited from IValue [▸ 2745].)
	TimeStamp [▸ 2748]	Gets the Time stamp of the last successful read of the Value (local user time, UTC) (Inherited from IValue [▸ 2745].)
	UpdateMode [▸ 2748]	Gets the update mode (not implemented yet) (Inherited from IValue [▸ 2745].)

Methods

	Name	Description
	Read [▸ 2749]	Reads the value (via ADS) (Inherited from IValue [▸ 2745].)
	ReadAsync [▸ 2750]	Reads the value (via ADS) (Inherited from IValue [▸ 2745].)
	ResolveValue [▸ 2750]	Resolves the Value object to its primitive value. (Inherited from IValue [▸ 2745].)
	TryGetArrayElement Values [▸ 2468]	Returns Array Element values.
	TryGetIndexValue [▸ 2468]	Tries to get the specified Array Element
	TryResolveValue [▸ 2751]	Tries to resolves the Value object to its primitive value. (Inherited from IValue [▸ 2745].)
	TrySetIndexValue [▸ 2469]	Tries to set the indexed value on Arrays
	Write [▸ 2751]	Writes the value (via ADS) (Inherited from IValue [▸ 2745].)
	WriteAsync [▸ 2751]	Writes the value (via ADS) (Inherited from IValue [▸ 2745].)

6.11.36 IAttributedInstance Interface

Interface IAttributedInstance

Namespace: [TwinCAT.TypeSystem](#) [► 2083]

Assembly: TwinCAT.Ads.Abstractions (in TwinCAT.Ads.Abstractions.dll) Version: 6.0.328+39e3229

Syntax**C#**

```
public interface IAttributedInstance : IInstance,
    IBitSize
```

The IAttributedInstance type exposes the following members.

Properties

	Name	Description
	Attributes [▶ 2471]	Gets the Type Attributes.
	BitSize [▶ 2473]	Gets the size of the IDataType [▶ 2475] in bits. (Inherited from IBitSize [▶ 2472].)
	ByteSize [▶ 2474]	Gets the (aligned) size of of the Type/Instance in Bytes (Inherited from IBitSize [▶ 2472].)
	Comment [▶ 2550]	Gets the comment of the IInstance [▶ 2549] (Inherited from IInstance [▶ 2549].)
	DataType [▶ 2551]	Gets the IDataType [▶ 2475] of the IInstance [▶ 2549]. (Inherited from IInstance [▶ 2549].)
	InstanceName [▶ 2551]	Gets the name of the instance (without periods (.)) (Inherited from IInstance [▶ 2549].)
	InstancePath [▶ 2552]	Gets the relative / absolute access path to the instance (with periods (.)) (Inherited from IInstance [▶ 2549].)
	IsBitType [▶ 2474]	Gets a value indicating whether this instance is not basing on a full IDataType but instead of some sort of bit mapping (Inherited from IBitSize [▶ 2472].)
	IsByteAligned [▶ 2475]	Indicates that the Size of the Object is Byte aligned ($\text{BitSize} \% 8 == 0$) (Inherited from IBitSize [▶ 2472].)
	IsPointer [▶ 2552]	Indicates that the IInstance [▶ 2549] represents a Pointer type (Pointer TO) (Inherited from IInstance [▶ 2549].)
	IsReference [▶ 2552]	Indicates that the IInstance [▶ 2549] represents a Reference type (REFERENCE TO) (Inherited from IInstance [▶ 2549].)
	IsStatic [▶ 2553]	Gets a value indicating whether this IInstance [▶ 2549] is static. (Inherited from IInstance [▶ 2549].)
	Size [▶ 2475]	Gets the size of the object in bytes or Bits dependant on IsBitType [▶ 2474] (Inherited from IBitSize [▶ 2472].)
	TypeName [▶ 2553]	Gets the name of the IDataType [▶ 2475] that is used for this IInstance [▶ 2549]. (Inherited from IInstance [▶ 2549].)
	ValueEncoding [▶ 2472]	Gets the value encoding.

Extension Methods

	Name	Description
	ReferencesExternalData [▶ 3038]	Indicates, that the Instance value includes process memory data, that cannot be read in one memory block. (Defined by DataTypeExtension [▶ 3021].)

6.11.38 IDataType Interface

Base interface for objects representing data types

Namespace: [TwinCAT.TypeSystem](#) [[▶ 2083](#)]

Assembly: TwinCAT.Ads.Abstractions (in TwinCAT.Ads.Abstractions.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public interface IDataTypeInfo : IBitSize
```

The IDataTypeInfo type exposes the following members.

Properties

	Name	Description
	Attributes [▶ 2478]	Gets the attributes of the IDataTypeInfo
	BitSize [▶ 2473]	Gets the size of the IDataTypeInfo in bits. (Inherited from IBitSize [▶ 2472].)
	ByteSize [▶ 2474]	Gets the (aligned) size of of the Type/Instance in Bytes (Inherited from IBitSize [▶ 2472].)
	Category [▶ 2478]	Gets the Data Type category
	Comment [▶ 2479]	Gets the comment behind the variable declaration.
	FullName [▶ 2479]	Gets the full name of the IDataTypeInfo (Namespace + Name)
	Id [▶ 2480]	Gets the ID of the DataType
	IsBitType [▶ 2474]	Gets a value indicating whether this instance is not basing on a full DataType but instead of some sort of bit mapping (Inherited from IBitSize [▶ 2472].)
	IsByteAligned [▶ 2475]	Indicates that the Size of the Object is Byte aligned ($\text{BitSize} \% 8 == 0$) (Inherited from IBitSize [▶ 2472].)
	Name [▶ 2482]	Gets the name of the Data Type (without namespace)
	Namespace [▶ 2482]	Gets the namespace string within the IDataTypeInfo exists.
	Size [▶ 2475]	Gets the size of the object in bytes or Bits dependant on IsBitType [▶ 2474] (Inherited from IBitSize [▶ 2472].)

Extension Methods

	Name	Description
	IsArrayOfPrimitives [▶ 3025]	Overloaded. Determines whether the dataType is an array of Primitives. (Defined by DataTypeExtension [▶ 3021].)
	IsArrayOfPrimitives(Boolean) [▶ 3025]	Overloaded. Determines whether the dataType is an array of Primitives. (Defined by DataTypeExtension [▶ 3021].)
	IsContainer [▶ 3027]	Overloaded. Gets a value indicating whether this IDataTypeInfo is a container type (Defined by DataTypeExtension [▶ 3021].)
	IsContainer(Boolean) [▶ 3028]	Overloaded. Gets a value indicating whether this IDataTypeInfo is a container type (Defined by DataTypeExtension [▶ 3021].)
	IsPointer [▶ 3031]	Gets a value indicating whether this IDataTypeInfo is a pointer type (Defined by DataTypeExtension [▶ 3021].)
	IsPrimitive [▶ 3033]	Overloaded.

	Name	Description
		Gets a value indicating whether this IDataTyep is primitive (Defined by DataTypeExtension [▶ 3021].)
	IsPrimitive(Boolean) [▶ 3034]	Overloaded. Gets a value indicating whether this IDataTyep is primitive (Defined by DataTypeExtension [▶ 3021].)
	IsReference [▶ 3036]	Gets a value indicating whether this IDataTyep is a reference type (Defined by DataTypeExtension [▶ 3021].)
	ReferencesExternalData [▶ 3037]	Indicates, that the Instance value includes process memory data, that cannot be read in one memory block. (Defined by DataTypeExtension [▶ 3021].)
	ResolvableAsPrimitive [▶ 3039]	Overloaded. Indicates, that this data type can be resolved as primitive or primitive Array. (Defined by DataTypeExtension [▶ 3021].)
	ResolvableAsPrimitive(Boolean) [▶ 3039]	Overloaded. Indicates, that this data type can be resolved as primitive or primitive Array. (Defined by DataTypeExtension [▶ 3021].)
	Resolve [▶ 3040]	Overloaded. Resolves the specified data type for AliasReference [▶ 3042] (Defined by DataTypeExtension [▶ 3021].)
	Resolve(DataTypeResolveStrategy) [▶ 3041]	Overloaded. Resolves the specified strategy. (Defined by DataTypeExtension [▶ 3021].)

6.11.38.1 IDataTyep Properties

The [IDataTyep](#) [▶ 2475] type exposes the following members.

Properties

	Name	Description
	Attributes [▶ 2478]	Gets the attributes of the IDataTyep [▶ 2475]
	BitSize [▶ 2473]	Gets the size of the IDataTyep [▶ 2475] in bits. (Inherited from IBitSize [▶ 2472].)
	ByteSize [▶ 2474]	Gets the (aligned) size of of the Type/Instance in Bytes (Inherited from IBitSize [▶ 2472].)
	Category [▶ 2478]	Gets the Data Type category
	Comment [▶ 2479]	Gets the comment behind the variable declaration.

	Name	Description
	FullName [▶ 2479]	Gets the full name of the IDataType [▶ 2475] (Namespace + Name)
	Id [▶ 2480]	Gets the ID of the DataType
	IsBitType [▶ 2474]	Gets a value indicating whether this instance is not basing on a full DataType but instead of some sort of bit mapping (Inherited from IBitSize [▶ 2472].)
	IsByteAligned [▶ 2475]	Indicates that the Size of the Object is Byte aligned (BitSize % 8 == 0) (Inherited from IBitSize [▶ 2472].)
	Name [▶ 2482]	Gets the name of the Data Type (without namespace)
	Namespace [▶ 2482]	Gets the namespace string within the IDataType [▶ 2475] exists.
	Size [▶ 2475]	Gets the size of the object in bytes or Bits dependant on IsBitType [▶ 2474] (Inherited from IBitSize [▶ 2472].)

6.11.38.1.1 IDatatype.Attributes Property

Gets the attributes of the [IDataType](#) [[▶ 2475](#)]

Namespace: [TwinCAT.TypeSystem](#) [[▶ 2083](#)]

Assembly: TwinCAT.Ads.Abstractions (in TwinCAT.Ads.Abstractions.dll) Version: 6.0.328+39e3229

Syntax

C#

```
ITypeAttributeCollection Attributes { get; }
```

Property Value

Type: [ITypeAttributeCollection](#) [[▶ 2726](#)]

The attributes.

Reference

[IDataType Interface](#) [[▶ 2475](#)]

[TwinCAT.TypeSystem Namespace](#) [[▶ 2083](#)]

6.11.38.1.2 IDatatype.Category Property

Gets the Data Type category

Namespace: [TwinCAT.TypeSystem](#) [► 2083]

Assembly: TwinCAT.Ads.Abstractions (in TwinCAT.Ads.Abstractions.dll) Version: 6.0.328+39e3229

Syntax

C#

```
DataTypeCategory Category { get; }
```

Property Value

Type: [DataTypeCategory](#) [► 2111]

The category.

Reference

[IDataType Interface](#) [► 2475]

[TwinCAT.TypeSystem Namespace](#) [► 2083]

6.11.38.1.3 **IDataType.Comment Property**

Gets the comment behind the variable declaration.

Namespace: [TwinCAT.TypeSystem](#) [► 2083]

Assembly: TwinCAT.Ads.Abstractions (in TwinCAT.Ads.Abstractions.dll) Version: 6.0.328+39e3229

Syntax

C#

```
string Comment { get; }
```

Property Value

Type: String

Comment behind the variable declaration.

Reference

[IDataType Interface](#) [► 2475]

[TwinCAT.TypeSystem Namespace](#) [► 2083]

6.11.38.1.4 **IDataType.FullName Property**

Gets the full name of the [IDataType](#) [► 2475] (Namespace + Name)

Namespace: [TwinCAT.TypeSystem](#) [► 2083]

Assembly: TwinCAT.Ads.Abstractions (in TwinCAT.Ads.Abstractions.dll) Version: 6.0.328+39e3229

Syntax

C#

```
string FullName { get; }
```

Property Value

Type: String

The full name.

Reference

[IDataType Interface](#) [► 2475]

[TwinCAT.TypeSystem Namespace](#) [► 2083]

6.11.38.1.5 IDataTypeId Property

Gets the ID of the DataType

Namespace: [TwinCAT.TypeSystem](#) [► 2083]

Assembly: TwinCAT.Ads.Abstractions (in TwinCAT.Ads.Abstractions.dll) Version: 6.0.328+39e3229

Syntax

C#

```
int Id { get; }
```

Property Value

Type: [Int32](#)
The id.

Reference

[IDataType Interface](#) [► 2475]

[TwinCAT.TypeSystem Namespace](#) [► 2083]

6.11.38.1.6 IDataTypeIdContainer Property

Gets a value indicating whether this [IDataType](#) [► 2475] is a container type

Namespace: [TwinCAT.TypeSystem](#) [► 2083]

Assembly: TwinCAT.Ads.Abstractions (in TwinCAT.Ads.Abstractions.dll) Version: 6.0.116+a71ced3

Syntax

C#

```
bool IsContainer { get; }
```

Property Value

Type: [Boolean](#)
true if this instance is container type; otherwise, false.

Remarks

Container Types are all types that contain SubElements like

- [Array](#) [► 2111]
- [Pointer](#) [► 2111]
- [Union](#) [► 2111]
- [Struct](#) [► 2111]
- [Function](#) [► 2111]
- [FunctionBlock](#) [► 2111]
- [Program](#) [► 2111]

and the [Alias](#) [▸ 2111] and [Reference](#) [▸ 2111] types, if they have a container type as base type.

6.11.38.2 IDataType Methods

The [IDataType \[▸ 2475\]](#) type exposes the following members.

Extension Methods

Name	Description
IsArrayOfPrimitives. [▸ 3025]	Overloaded. Determines whether the dataType is an array of Primitives. (Defined by DataTypeExtension [▸ 3021].)
IsArrayOfPrimitives(Boolean) [▸ 3025]	Overloaded. Determines whether the dataType is an array of Primitives. (Defined by DataTypeExtension [▸ 3021].)
IsContainer. [▸ 3027]	Overloaded. Gets a value indicating whether this IDataType [▸ 2475] is a container type (Defined by DataTypeExtension [▸ 3021].)
IsContainer(Boolean) [▸ 3028]	Overloaded. Gets a value indicating whether this IDataType [▸ 2475] is a container type (Defined by DataTypeExtension [▸ 3021].)
IsPointer [▸ 3031]	Gets a value indicating whether this IDataType [▸ 2475] is a pointer type (Defined by DataTypeExtension [▸ 3021].)
IsPrimitive. [▸ 3033]	Overloaded. Gets a value indicating whether this IDataType [▸ 2475] is primitive (Defined by DataTypeExtension [▸ 3021].)
IsPrimitive(Boolean) [▸ 3034]	Overloaded. Gets a value indicating whether this IDataType [▸ 2475] is primitive (Defined by DataTypeExtension [▸ 3021].)
IsReference [▸ 3036]	Gets a value indicating whether this IDataType [▸ 2475] is a reference type (Defined by DataTypeExtension [▸ 3021].)
ReferencesExternalData [▸ 3037]	Indicates, that the Instance value includes process memory data, that cannot be read in one memory block. (Defined by DataTypeExtension [▸ 3021].)
ResolvableAsPrimitive. [▸ 3039]	Overloaded. Indicates, that this data type can be resolved as primitive or primitive Array. (Defined by DataTypeExtension [▸ 3021].)

	Name	Description
	ResolvableAsPrimitive(Boolean) [▶ 3039]	Overloaded. Indicates, that this data type can be resolved as primitive or primitive Array. (Defined by DataTypeExtension [▶ 3021] .)
	Resolve. [▶ 3040]	Overloaded. Resolves the specified data type for AliasReference [▶ 3042] (Defined by DataTypeExtension [▶ 3021] .)
	Resolve(DataTypeResolveStrategy) [▶ 3041]	Overloaded. Resolves the specified strategy. (Defined by DataTypeExtension [▶ 3021] .)

[TwinCAT.TypeSystem Namespace \[▶ 2083\]](#)

6.11.39 IDataTypeCollection Interface

Interface IDataTypeCollection Implements the ICollection.T.

Namespace: [TwinCAT.TypeSystem \[▶ 2083\]](#)

Assembly: TwinCAT.Ads.Abstractions (in TwinCAT.Ads.Abstractions.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public interface IDataTypeCollection : IDataTypeCollection<IDataType>,
    IList<IDataType>, ICollection<IDataType>, IEnumerable<IDataType>,
    IEnumerable
```

The IDataTypeCollection type exposes the following members.

Properties

	Name	Description
	Count	Gets the number of elements contained in the ICollection.T.. (Inherited from ICollection. IDataType [▶ 2475] ..)
	IsReadOnly	Gets a value indicating whether the ICollection.T. is read-only. (Inherited from ICollection. IDataType [▶ 2475] ..)
	Item.Int32.	Gets or sets the element at the specified index. (Inherited from IList. IDataType [▶ 2475] ..)
	Item.String. [▶ 2488]	Gets the IDataType [▶ 2475] with the specified name. (Inherited from IDataTypeCollection.T. [▶ 2486] .)

Methods

	Name	Description
	Add	Adds an item to the ICollection.T.. (Inherited from ICollection. IDataType [▶ 2475] ..)
	Clear	Removes all items from the ICollection.T.. (Inherited from ICollection. IDataType [▶ 2475] ..)
	Contains	Determines whether the ICollection.T. contains a specific value. (Inherited from ICollection. IDataType [▶ 2475] ..)

	Name	Description
	ContainsType [▶ 2489]	Determines whether the container contains the specified IDataType [▶ 2475]. (Inherited from IDataTypeCollection.T. [▶ 2486].)
	CopyTo	Copies the elements of the ICollection.T. to an Array, starting at a particular Array index. (Inherited from ICollection.IDataType [▶ 2475].)
	GetEnumerator	Returns an enumerator that iterates through the collection. (Inherited from IEnumerable.IDataType [▶ 2475].)
	IndexOf	Determines the index of a specific item in the IList.T. (Inherited from IList.IDataType [▶ 2475].)
	Insert	Inserts an item to the IList.T. at the specified index. (Inherited from IList.IDataType [▶ 2475].)
	Remove	Removes the first occurrence of a specific object from the ICollection.T. (Inherited from ICollection.IDataType [▶ 2475].)
	RemoveAt	Removes the IList.T. item at the specified index. (Inherited from IList.IDataType [▶ 2475].)
	TryGetType [▶ 2490]	Tries to get the specified IDataType [▶ 2475] from the IDataTypeCollection.T. [▶ 2486]. (Inherited from IDataTypeCollection.T. [▶ 2486].)

Assembly: TwinCAT.Ads.Abstractions (in TwinCAT.Ads.Abstractions.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public interface IDatatypeCollection<T> : IList<T>,
    ICollection<T>, IEnumerable<T>, IEnumerable
where T : class, IDataType
```

Type Parameters

T	Data Type type.
---	-----------------

The IDatatypeCollection.T. type exposes the following members.

Properties

	Name	Description
	Count	Gets the number of elements contained in the ICollection.T.. (Inherited from ICollection.T..)
	IsReadOnly	Gets a value indicating whether the ICollection.T. is read-only. (Inherited from ICollection.T..)
	Item.Int32.	Gets or sets the element at the specified index. (Inherited from IList.T..)
	<u>Item.String.</u> ▶ 2488	Gets the IDataType ▶ 2475 with the specified name.

Methods

	Name	Description
	Add	Adds an item to the ICollection.T.. (Inherited from ICollection.T..)
	Clear	Removes all items from the ICollection.T.. (Inherited from ICollection.T..)
	Contains	Determines whether the ICollection.T. contains a specific value. (Inherited from ICollection.T..)
	<u>ContainsType</u> ▶ 2489	Determines whether the container contains the specified IDataType ▶ 2475 .
	CopyTo	Copies the elements of the ICollection.T. to an Array, starting at a particular Array index. (Inherited from ICollection.T..)
	GetEnumerator	Returns an enumerator that iterates through the collection. (Inherited from IEnumerable.T..)
	IndexOf	Determines the index of a specific item in the IList.T.. (Inherited from IList.T..)
	Insert	Inserts an item to the IList.T. at the specified index. (Inherited from IList.T..)
	Remove	Removes the first occurrence of a specific object from the ICollection.T.. (Inherited from ICollection.T..)
	RemoveAt	Removes the IList.T. item at the specified index. (Inherited from IList.T..)
	<u>TryGetType</u> ▶ 2490	Tries to get the specified IDataType ▶ 2475 from the IDataTypeCollection.T.

Interface IDimensionCollection

Namespace: [TwinCAT.TypeSystem \[► 2083\]](#)

Assembly: TwinCAT.Ads.Abstractions (in TwinCAT.Ads.Abstractions.dll) Version: 6.0.328+39e3229

Syntax**C#**

```
public interface IDimensionCollection : IList<IDimension>,
    ICollection<IDimension>, IEnumerable<IDimension>, IEnumerable
```

The IDimensionCollection type exposes the following members.

Properties

	Name	Description
	Count	Gets the number of elements contained in the ICollection.T.. (Inherited from ICollection.IDimension [► 2490].)
	ElementCount [► 2494]	Gets the Number of elements in all Dimensions
	IsNonZeroBased [► 2495]	Gets a value indicating whether this instance is non zero index based.
	IsReadOnly	Gets a value indicating whether the ICollection.T. is read-only. (Inherited from ICollection.IDimension [► 2490].)
	Item	Gets or sets the element at the specified index. (Inherited from IList.IDimension [► 2490].)
	LowerBounds [► 2494]	Gets the lower bounds.
	UpperBounds [► 2494]	Gets the lower bounds.

Methods

	Name	Description
	Add	Adds an item to the ICollection.T.. (Inherited from ICollection.IDimension [► 2490].)
	Clear	Removes all items from the ICollection.T.. (Inherited from ICollection.IDimension [► 2490].)
	Contains	Determines whether the ICollection.T. contains a specific value. (Inherited from ICollection.IDimension [► 2490].)
	CopyTo	Copies the elements of the ICollection.T. to an Array, starting at a particular Array index. (Inherited from ICollection.IDimension [► 2490].)

	Name	Description
	GetDimensionLengths [▶ 2496]	Gets an array the specifies the Lengths of each Array Dimension
	GetEnumerator	Returns an enumerator that iterates through the collection. (Inherited from IEnumerable.IDimension [▶ 2490]..)
	IndexOf	Determines the index of a specific item in the IList.T.. (Inherited from IList.IDimension [▶ 2490]..)
	Insert	Inserts an item to the IList.T. at the specified index. (Inherited from IList.IDimension [▶ 2490]..)
	Remove	Removes the first occurrence of a specific object from the ICollection.T.. (Inherited from ICollection.IDimension [▶ 2490]..)
	RemoveAt	Removes the IList.T. item at the specified index. (Inherited from IList.IDimension [▶ 2490]..)

Extension Methods

	Name	Description
	AddDimension [▶ 2982]	Adds a Dimension (FluentInterface) (Defined by IDimensionCollectionExtension [▶ 2981]..)

Reference

6.11.42.1 IDimensionCollection Properties

The [IDimensionCollection](#) [[▶ 2492](#)] type exposes the following members.

Properties

	Name	Description
	Count	Gets the number of elements contained in the ICollection.T.. (Inherited from ICollection.IDimension [▶ 2490]..)
	ElementCount [▶ 2494]	Gets the Number of elements in all Dimensions
	IsNonZeroBased [▶ 2495]	Gets a value indicating whether this instance is non zero index based.
	IsReadOnly	Gets a value indicating whether the ICollection.T. is read-only. (Inherited from ICollection.IDimension [▶ 2490]..)
	Item	Gets or sets the element at the specified index. (Inherited from IList.IDimension [▶ 2490]..)
	LowerBounds [▶ 2494]	Gets the lower bounds.
	UpperBounds [▶ 2494]	Gets the lower bounds.

6.11.42.1.4 IDimensionCollection.IsNonZeroBased Property

Gets a value indicating whether this instance is non zero index based.

Namespace: [TwinCAT.TypeSystem](#) |> [2083](#)

Assembly: TwinCAT.Ads.Abstractions (in TwinCAT.Ads.Abstractions.dll) Version: 6.0.328+39e3229

Syntax

C#

```
bool IsNonZeroBased { get; }
```

Property Value

Type: Boolean
true if this instance is non zero indexed based; otherwise, false.

6.11.42.2 IDimensionCollection Methods

The [IDimensionCollection](#) |> [2492](#) type exposes the following members.

Methods

	Name	Description
	Add	Adds an item to the ICollection.T.. (Inherited from ICollection.IDimension > 2490)..)
	Clear	Removes all items from the ICollection.T.. (Inherited from ICollection.IDimension > 2490)..)
	Contains	Determines whether the ICollection.T. contains a specific value. (Inherited from ICollection.IDimension > 2490)..)
	CopyTo	Copies the elements of the ICollection.T. to an Array, starting at a particular Array index. (Inherited from ICollection.IDimension > 2490)..)
	GetDimensionLengths > 2496	Gets an array the specifies the Lengths of each Array Dimension
	GetEnumerator	Returns an enumerator that iterates through the collection. (Inherited from IEnumerable.IDimension > 2490)..)
	IndexOf	Determines the index of a specific item in the IList.T.. (Inherited from IList.IDimension > 2490)..)

	Name	Description
	Insert	Inserts an item to the IList.T. at the specified index. (Inherited from IList.IDimension ▶ 2490 ..)
	Remove	Removes the first occurrence of a specific object from the ICollection.T.. (Inherited from ICollection.IDimension ▶ 2490 ..)
	RemoveAt	Removes the IList.T. item at the specified index. (Inherited from IList.IDimension ▶ 2490 ..)

Extension Methods

	Name	Description
	AddDimension ▶ 2982	Adds a Dimension (FluentInterface) (Defined by IDimensionCollectionExtension ▶ 2981 .)

6.11.43 IDynamicSymbol Interface

Interface IDynamicSymbol

Namespace: [TwinCAT.TypeSystem](#) [▶ 2083](#)

Assembly: TwinCAT.Ads.Abstractions (in TwinCAT.Ads.Abstractions.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public interface IDynamicSymbol : ISymbol,
    IAttributedInstance, IInstance, IBitSize
```

The IDynamicSymbol type exposes the following members.

Properties

	Name	Description
	Attributes [▶ 2471]	Gets the Type Attributes. (Inherited from IAttributedInstance [▶ 2469].)
	BitSize [▶ 2473]	Gets the size of the IDataType [▶ 2475] in bits. (Inherited from IBitSize [▶ 2472].)
	ByteSize [▶ 2474]	Gets the (aligned) size of of the Type/Instance in Bytes (Inherited from IBitSize [▶ 2472].)
	Category [▶ 2694]	Gets the Symbol/Datatype Category (Inherited from ISymbol [▶ 2691].)
	Comment [▶ 2550]	Gets the comment of the IInstance [▶ 2549] (Inherited from IInstance [▶ 2549].)
	DataType [▶ 2551]	Gets the IDataType [▶ 2475] of the IInstance [▶ 2549]. (Inherited from IInstance [▶ 2549].)
	InstanceName [▶ 2551]	Gets the name of the instance (without periods (.)) (Inherited from IInstance [▶ 2549].)
	InstancePath [▶ 2552]	Gets the relative / absolute access path to the instance (with periods (.)) (Inherited from IInstance [▶ 2549].)
	IsBitType [▶ 2474]	Gets a value indicating whether this instance is not basing on a full IDataType but instead of some sort of bit mapping (Inherited from IBitSize [▶ 2472].)
	IsByteAligned [▶ 2475]	Indicates that the Size of the Object is Byte aligned ($\text{BitSize} \% 8 == 0$) (Inherited from IBitSize [▶ 2472].)
	IsContainerType [▶ 2694]	Gets a value indicating whether this Symbol is acontainer type. (Inherited from ISymbol [▶ 2691].)
	IsPersistent [▶ 2694]	Gets a value indicating whether this ISymbol [▶ 2691] is persistent. (Inherited from ISymbol [▶ 2691].)
	IsPointer [▶ 2552]	Indicates that the IInstance [▶ 2549] represents a Pointer type (Pointer TO) (Inherited from IInstance [▶ 2549].)
	IsPrimitiveType [▶ 2695]	Gets a value indicating whether this instance is a primitive type. (Inherited from ISymbol [▶ 2691].)
	IsReadOnly [▶ 2695]	Indicates that this instance is read only. (Inherited from ISymbol [▶ 2691].)
	IsRecursive [▶ 2696]	Gets a value indicating whether this instance is recursive. (Inherited from ISymbol [▶ 2691].)
	IsReference [▶ 2552]	Indicates that the IInstance [▶ 2549] represents a Reference type (REFERENCE TO) (Inherited from IInstance [▶ 2549].)
	IsStatic [▶ 2553]	Gets a value indicating whether this IInstance [▶ 2549] is static. (Inherited from IInstance [▶ 2549].)
	NormalizedName [▶ 2499]	Gets the normalized instance name (fixed name for dynamic property access)
	Parent [▶ 2696]	Gets the parent Symbol (Inherited from ISymbol [▶ 2691].)
	Size [▶ 2475]	Gets the size of the object in bytes or Bits dependant on IsBitType [▶ 2474] (Inherited from IBitSize [▶ 2472].)
	SubSymbols [▶ 2696]	Gets the SubSymbols of the ISymbol [▶ 2691] (Inherited from ISymbol [▶ 2691].)
	TypeName [▶ 2553]	Gets the name of the DataType [▶ 2475] that is used for this IInstance [▶ 2549]. (Inherited from IInstance [▶ 2549].)

	Name	Description
	ValueEncoding [▶ 2472]	Gets the value encoding. (Inherited from IAttributedInstance [▶ 2469].)

Extension Methods

	Name	Description
	ReferencesExternalData [▶ 3038]	Indicates, that the Instance value includes process memory data, that cannot be read in one memory block. (Defined by DataTypeExtension [▶ 3021].)

Reference

[TwinCAT.TypeSystem Namespace](#) [▶ 2083]

6.11.43.1 IDynamicSymbol Properties

The [IDynamicSymbol](#) [▶ 2496] type exposes the following members.

Properties

	Name	Description
	Attributes [▶ 2471]	Gets the Type Attributes. (Inherited from IAttributedInstance [▶ 2469].)
	BitSize [▶ 2473]	Gets the size of the IDataType [▶ 2475] in bits. (Inherited from IBitSize [▶ 2472].)
	ByteSize [▶ 2474]	Gets the (aligned) size of of the Type/Instance in Bytes (Inherited from IBitSize [▶ 2472].)
	Category [▶ 2694]	Gets the Symbol/Datatype Category (Inherited from ISymbol [▶ 2691].)
	Comment [▶ 2550]	Gets the comment of the IInstance [▶ 2549] (Inherited from IInstance [▶ 2549].)
	DataType [▶ 2551]	Gets the IDataType [▶ 2475] of the IInstance [▶ 2549]. (Inherited from IInstance [▶ 2549].)
	InstanceName [▶ 2551]	Gets the name of the instance (without periods (.)) (Inherited from IInstance [▶ 2549].)
	InstancePath [▶ 2552]	Gets the relative / absolute access path to the instance (with periods (.)) (Inherited from IInstance [▶ 2549].)
	IsBitType [▶ 2474]	Gets a value indicating whether this instance is not basing on a full DataType but instead of some sort of bit mapping (Inherited from IBitSize [▶ 2472].)
	IsByteAligned [▶ 2475]	Indicates that the Size of the Object is Byte aligned ($\text{BitSize} \% 8 == 0$) (Inherited from IBitSize [▶ 2472].)
	IsContainerType [▶ 2694]	Gets a value indicating whether this Symbol is acontainer type. (Inherited from ISymbol [▶ 2691].)
	IsPersistent [▶ 2694]	Gets a value indicating whether this ISymbol [▶ 2691] is persistent. (Inherited from ISymbol [▶ 2691].)
	IsPointer [▶ 2552]	Indicates that the IInstance [▶ 2549] represents a Pointer type (Pointer TO) (Inherited from IInstance [▶ 2549].)
	IsPrimitiveType [▶ 2695]	Gets a value indicating whether this instance is a primitive type. (Inherited from ISymbol [▶ 2691].)
	IsReadOnly [▶ 2695]	Indicates that this instance is read only. (Inherited from ISymbol [▶ 2691].)

	Name	Description
	IsRecursive [▶ 2696]	Gets a value indicating whether this instance is recursive. (Inherited from ISymbol [▶ 2691].)
	IsReference [▶ 2552]	Indicates that the IInstance [▶ 2549] represents a Reference type (REFERENCE TO) (Inherited from IInstance [▶ 2549].)
	IsStatic [▶ 2553]	Gets a value indicating whether this IInstance [▶ 2549] is static. (Inherited from IInstance [▶ 2549].)
	NormalizedName [▶ 2499]	Gets the normalized instance name (fixed name for dynamic property access)
	Parent [▶ 2696]	Gets the parent Symbol (Inherited from ISymbol [▶ 2691].)
	Size [▶ 2475]	Gets the size of the object in bytes or Bits dependant on IsBitType [▶ 2474] (Inherited from IBitSize [▶ 2472].)
	SubSymbols [▶ 2696]	Gets the SubSymbols of the ISymbol [▶ 2691] (Inherited from ISymbol [▶ 2691].)
	TypeName [▶ 2553]	Gets the name of the DataType [▶ 2475] that is used for this IInstance [▶ 2549]. (Inherited from IInstance [▶ 2549].)
	ValueEncoding [▶ 2472]	Gets the value encoding. (Inherited from IAttributedInstance [▶ 2469].)

6.11.44 IDynamicSymbolLoader Interface

Dynamic symbol loader interface

Namespace: [TwinCAT.TypeSystem](#) [[▶ 2083](#)]

Assembly: TwinCAT.Ads.Abstractions (in TwinCAT.Ads.Abstractions.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public interface IDynamicSymbolLoader : ISymbolLoader,
    ISymbolProvider, ISymbolServer
```

The IDynamicSymbolLoader type exposes the following members.

Properties

	Name	Description
	BuildInTypes [▶ 2716]	Gets the build in types. (Inherited from ISymbolLoader [▶ 2714].)
	DataTypes [▶ 2720]	Gets the data types (Inherited from ISymbolServer [▶ 2719].)
	DefaultValueEncoding [▶ 2721]	Gets the default value encoding. (Inherited from ISymbolServer [▶ 2719].)
	RootNamespaceName [▶ 2718]	Gets the name of the root namespace (Inherited from ISymbolProvider [▶ 2717].)
	Settings [▶ 2716]	Gets or sets the access Method (Inherited from ISymbolLoader [▶ 2714].)
	Symbols [▶ 2721]	Gets the symbols. (Inherited from ISymbolServer [▶ 2719].)
	SymbolsDynamic [▶ 2501]	Gets the symbols (late bound as dynamic objects)

Methods

	Name	Description
	GetDataTypesAsync [▶ 2722]	Gets the data types asynchronously. (Inherited from ISymbolServer [▶ 2719].)
	GetDynamicSymbolsAsync [▶ 2502]	Gets the dynamic symbols asynchronously

	Name	Description
	GetSymbolsAsync [▶ 2723]	Gets the symbols asynchronously (Inherited from ISymbolServer [▶ 2719].)
	ResetCachedSymbolicData [▶ 2724]	Resets the cached symbolic data. (Inherited from ISymbolServer [▶ 2719].)
	TryGetDataTypes [▶ 2723]	Tries to get the symbols from the device target. (Inherited from ISymbolServer [▶ 2719].)
	TryGetSymbols [▶ 2724]	Tries to geth the symbols from the device target. (Inherited from ISymbolServer [▶ 2719].)

Remarks

Dynamic symbols are late bound symbols who are created and will expand during runtime. These symbols can represent complex user defined type instances like PLC Structures and Arrays created during PLC access and assure type safe to their fields and elements.

Interface IDynamicValue Implements the IDynamicMetaObjectProvider Implements the [IValue](#) [▶ 2745]
Implements the [IStructValue](#) [▶ 2678] Implements the [IArrayValue](#) [▶ 2465]

Namespace: [TwinCAT.TypeSystem](#) [▶ 2083]

Assembly: TwinCAT.Ads.Abstractions (in TwinCAT.Ads.Abstractions.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public interface IDynamicValue : IDynamicMetaObjectProvider,
    IValue, IStructValue, IArrayValue
```

The IDynamicValue type exposes the following members.

Properties

	Name	Description
	Age [▶ 2746]	Gets the age of the value (last successful read of the value) (Inherited from IValue [▶ 2745].)
	CachedRaw [▶ 2746]	Gets the cached Raw internal Data. (Inherited from IValue [▶ 2745].)
	DataType [▶ 2747]	Gets the data type bound to this IValue [▶ 2745] (Inherited from IValue [▶ 2745].)
	IsPrimitive [▶ 2747]	Gets a value indicating whether this IValue [▶ 2745] is a primitive value. (Inherited from IValue [▶ 2745].)
	ParentValue [▶ 2506]	Gets the parent value.
	Symbol [▶ 2748]	Gets the symbol bound to this IValue [▶ 2745]. (Inherited from IValue [▶ 2745].)
	TimeStamp [▶ 2748]	Gets the Time stamp of the last successful read of the Value (local user time, UTC) (Inherited from IValue [▶ 2745].)
	UpdateMode [▶ 2748]	Gets the update mode (not implemented yet) (Inherited from IValue [▶ 2745].)
	ValueFactory [▶ 2506]	Gets the value factory.

Methods

	Name	Description
	GetMetaObject	Returns the DynamicMetaObject responsible for binding operations performed on this object. (Inherited from IDynamicMetaObjectProvider.)
	Read [▶ 2749]	Reads the value (via ADS) (Inherited from IValue [▶ 2745].)
	ReadAsync [▶ 2750]	Reads the value (via ADS) (Inherited from IValue [▶ 2745].)
	ResolveValue [▶ 2750]	Resolves the Value object to its primitive value. (Inherited from IValue [▶ 2745].)

	Name	Description
	TryGetArrayElement Values [▶ 2468]	Returns Array Element values. (Inherited from IArrayValue [▶ 2465] .)
	TryGetIndexValue [▶ 2468]	Tries to get the specified Array Element (Inherited from IArrayValue [▶ 2465] .)
	TryGetMemberValue [▶ 2680]	Tries to get a property/Member value. (Inherited from IStructValue [▶ 2678] .)
	TryResolveValue [▶ 2751]	Tries to resolves the Value object to its primitive value. (Inherited from IValue [▶ 2745] .)
	TrySetIndexValue [▶ 2469]	Tries to set the indexed value on Arrays (Inherited from IArrayValue [▶ 2465] .)
	TrySetMemberValue [▶ 2681]	Tries to Set a Member/Property Value (Inherited from IStructValue [▶ 2678] .)
	Write [▶ 2751]	Writes the value (via ADS) (Inherited from IValue [▶ 2745] .)
	WriteAsync [▶ 2751]	Writes the value (via ADS) (Inherited from IValue [▶ 2745] .)

6.11.46.1 IDynamicValue Properties

The [IDynamicValue \[▶ 2504\]](#) type exposes the following members.

Properties

	Name	Description
	Age [▶ 2746]	Gets the age of the value (last successful read of the value) (Inherited from IValue [▶ 2745] .)
	CachedRaw [▶ 2746]	Gets the cached Raw internal Data. (Inherited from IValue [▶ 2745] .)
	DataType [▶ 2747]	Gets the data type bound to this IValue [▶ 2745] (Inherited from IValue [▶ 2745] .)
	IsPrimitive [▶ 2747]	Gets a value indicating whether this IValue [▶ 2745] is a primitive value. (Inherited from IValue [▶ 2745] .)
	ParentValue [▶ 2506]	Gets the parent value.
	Symbol [▶ 2748]	Gets the symbol bound to this IValue [▶ 2745] . (Inherited from IValue [▶ 2745] .)
	TimeStamp [▶ 2748]	Gets the Time stamp of the last successful read of the Value (local user time, UTC) (Inherited from IValue [▶ 2745] .)
	UpdateMode [▶ 2748]	Gets the update mode (not implemented yet) (Inherited from IValue [▶ 2745] .)

	Name	Description
	ValueFactory [▶ 2506]	Gets the value factory.

6.11.46.2 IDynamicValue Methods

The [IDynamicValue](#) [[▶ 2504](#)] type exposes the following members.

Methods

	Name	Description
	GetMetaObject	Returns the DynamicMetaObject responsible for binding operations performed on this object. (Inherited from IDynamicMetaObjectProvider.)
	Read [▶ 2749]	Reads the value (via ADS) (Inherited from IValue [▶ 2745].)
	ReadAsync [▶ 2750]	Reads the value (via ADS) (Inherited from IValue [▶ 2745].)
	ResolveValue [▶ 2750]	Resolves the Value object to its primitive value. (Inherited from IValue [▶ 2745].)
	TryGetArrayElement Values [▶ 2468]	Returns Array Element values. (Inherited from IArrayValue [▶ 2465].)
	TryGetIndexValue [▶ 2468]	Tries to get the specified Array Element (Inherited from IArrayValue [▶ 2465].)
	TryGetMemberValue [▶ 2680]	Tries to get a property/Member value. (Inherited from IStructValue [▶ 2678].)
	TryResolveValue [▶ 2751]	Tries to resolves the Value object to its primitive value. (Inherited from IValue [▶ 2745].)
	TrySetIndexValue [▶ 2469]	Tries to set the indexed value on Arrays (Inherited from IArrayValue [▶ 2465].)
	TrySetMemberValue [▶ 2681]	Tries to Set a Member/Property Value (Inherited from IStructValue [▶ 2678].)
	Write [▶ 2751]	Writes the value (via ADS) (Inherited from IValue [▶ 2745].)
	WriteAsync [▶ 2751]	Writes the value (via ADS) (Inherited from IValue [▶ 2745].)

6.11.47 IEnumType Interface

Common Enum type interface

Namespace: [TwinCAT.TypeSystem \[\[▶ 2083\]\(#\)\]](#)

Assembly: TwinCAT.Ads.Abstractions (in TwinCAT.Ads.Abstractions.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public interface IEnumType : IAliasType,
    IDataType, IBitSize
```

The IEnumType type exposes the following members.

Properties

	Name	Description
	Attributes [▶ 2478]	Gets the attributes of the IDataType [▶ 2475] (Inherited from IDataType [▶ 2475].)
	BaseType [▶ 2439]	Gets the Base Type (Inherited from IAliasType [▶ 2436].)

	Name	Description
	BaseTypeName [▶ 2440]	Gets the BaseType name (Inherited from IAliasType [▶ 2436].)
	BitSize [▶ 2473]	Gets the size of the IDataType [▶ 2475] in bits. (Inherited from IBitSize [▶ 2472].)
	ByteSize [▶ 2474]	Gets the (aligned) size of of the Type/Instance in Bytes (Inherited from IBitSize [▶ 2472].)
	Category [▶ 2478]	Gets the Data Type category (Inherited from IDataType [▶ 2475].)
	Comment [▶ 2479]	Gets the comment behind the variable declaration. (Inherited from IDataType [▶ 2475].)
	EnumValues [▶ 2510]	Enumeration specification (if enum)
	FullName [▶ 2479]	Gets the full name of the IDataType [▶ 2475] (Namespace + Name) (Inherited from IDataType [▶ 2475].)
	Id [▶ 2480]	Gets the ID of the DataType (Inherited from IDataType [▶ 2475].)
	IsBitType [▶ 2474]	Gets a value indicating whether this instance is not basing on a full DataType but instead of some sort of bit mapping (Inherited from IBitSize [▶ 2472].)
	IsByteAligned [▶ 2475]	Indicates that the Size of the Object is Byte aligned ($\text{BitSize} \% 8 == 0$) (Inherited from IBitSize [▶ 2472].)
	Name [▶ 2482]	Gets the name of the Data Type (without namespace) (Inherited from IDataType [▶ 2475].)
	Namespace [▶ 2482]	Gets the namespace string within the IDataType [▶ 2475] exists. (Inherited from IDataType [▶ 2475].)
	Size [▶ 2475]	Gets the size of the object in bytes or Bits dependant on IsBitType [▶ 2474] (Inherited from IBitSize [▶ 2472].)

Methods

	Name	Description
	Contains [▶ 2512]	Determines whether the enum values contains the specified name
	GetNames [▶ 2513]	Gets the filed names of the IEnumType.T. [▶ 2516]
	GetValues [▶ 2513]	Gets the values of the IEnumType.T. [▶ 2516]
	Parse [▶ 2514]	Parses a value name of the IEnumType.T. [▶ 2516] and returns the value (as base type)
	ToString [▶ 2514]	Returns a String that represents the specified value.
	TryParse(String, IConvertible.) [▶ 2515]	Parses the value from value name.
	TryParse(String, IEnumValue.) [▶ 2515]	Parses the value from value name.

Extension Methods

	Name	Description
	IsArrayOfPrimitives. [▶ 3025]	Overloaded.

	Name	Description
		Determines whether the dataType is an array of Primitives. (Defined by DataTypeExtension [▶ 3021].)
	IsArrayOfPrimitives(Boolean) [▶ 3025]	Overloaded. Determines whether the dataType is an array of Primitives. (Defined by DataTypeExtension [▶ 3021].)
	IsContainer. [▶ 3027]	Overloaded. Gets a value indicating whether this IDataType [▶ 2475] is a container type (Defined by DataTypeExtension [▶ 3021].)
	IsContainer(Boolean) [▶ 3028]	Overloaded. Gets a value indicating whether this IDataType [▶ 2475] is a container type (Defined by DataTypeExtension [▶ 3021].)
	IsPointer [▶ 3031]	Gets a value indicating whether this IDataType [▶ 2475] is a pointer type (Defined by DataTypeExtension [▶ 3021].)
	IsPrimitive. [▶ 3033]	Overloaded. Gets a value indicating whether this IDataType [▶ 2475] is primitive (Defined by DataTypeExtension [▶ 3021].)
	IsPrimitive(Boolean) [▶ 3034]	Overloaded. Gets a value indicating whether this IDataType [▶ 2475] is primitive (Defined by DataTypeExtension [▶ 3021].)
	IsReference [▶ 3036]	Gets a value indicating whether this IDataType [▶ 2475] is a reference type (Defined by DataTypeExtension [▶ 3021].)
	ReferencesExternalData [▶ 3037]	Indicates, that the Instance value includes process memory data, that cannot be read in one memory block. (Defined by DataTypeExtension [▶ 3021].)
	ResolvableAsPrimitive. [▶ 3039]	Overloaded. Indicates, that this data type can be resolved as primitive or primitive Array. (Defined by DataTypeExtension [▶ 3021].)
	ResolvableAsPrimitive(Boolean) [▶ 3039]	Overloaded. Indicates, that this data type can be resolved as primitive or primitive Array. (Defined by DataTypeExtension [▶ 3021].)
	Resolve. [▶ 3040]	Overloaded. Resolves the specified data type for AliasReference [▶ 3042] (Defined by DataTypeExtension [▶ 3021].)
	Resolve(DataTypeResolveStrategy) [▶ 3041]	Overloaded. Resolves the specified strategy. (Defined by DataTypeExtension [▶ 3021].)

6.11.47.2 IEnumType Methods

The [IEnumType](#) [[▶ 2507](#)] type exposes the following members.

Methods

	Name	Description
	Contains [▶ 2512]	Determines whether the enum values contains the specified name
	GetNames [▶ 2513]	Gets the filed names of the IEnumType.T. [▶ 2516]
	GetValues [▶ 2513]	Gets the values of the IEnumType.T. [▶ 2516]
	Parse [▶ 2514]	Parses a value name of the IEnumType.T. [▶ 2516] and returns the value (as base type)
	ToString [▶ 2514]	Returns a String that represents the specified value.
	TryParse(String, IConvertible.) [▶ 2515]	Parses the value from value name.
	TryParse(String, IEnumValue.) [▶ 2515]	Parses the value from value name.

Extension Methods

	Name	Description
	IsArrayOfPrimitives. [▶ 3025]	Overloaded. Determines whether the dataType is an array of Primitives. (Defined by DataTypeExtension [▶ 3021].)
	IsArrayOfPrimitives(Boolean) [▶ 3025]	Overloaded. Determines whether the dataType is an array of Primitives. (Defined by DataTypeExtension [▶ 3021].)
	IsContainer. [▶ 3027]	Overloaded. Gets a value indicating whether this IDataType [▶ 2475] is a container type (Defined by DataTypeExtension [▶ 3021].)

	Name	Description
	IsContainer(Boolean) [▶ 3028]	Overloaded. Gets a value indicating whether this IDataType [▶ 2475] is a container type (Defined by DataTypeExtension [▶ 3021] .)
	IsPointer [▶ 3031]	Gets a value indicating whether this IDataType [▶ 2475] is a pointer type (Defined by DataTypeExtension [▶ 3021] .)
	IsPrimitive. [▶ 3033]	Overloaded. Gets a value indicating whether this IDataType [▶ 2475] is primitive (Defined by DataTypeExtension [▶ 3021] .)
	IsPrimitive(Boolean) [▶ 3034]	Overloaded. Gets a value indicating whether this IDataType [▶ 2475] is primitive (Defined by DataTypeExtension [▶ 3021] .)
	IsReference [▶ 3036]	Gets a value indicating whether this IDataType [▶ 2475] is a reference type (Defined by DataTypeExtension [▶ 3021] .)
	ReferencesExternalData [▶ 3037]	Indicates, that the Instance value includes process memory data, that cannot be read in one memory block. (Defined by DataTypeExtension [▶ 3021] .)
	ResolvableAsPrimitive. [▶ 3039]	Overloaded. Indicates, that this data type can be resolved as primitive or primitive Array. (Defined by DataTypeExtension [▶ 3021] .)
	ResolvableAsPrimitive(Boolean) [▶ 3039]	Overloaded. Indicates, that this data type can be resolved as primitive or primitive Array. (Defined by DataTypeExtension [▶ 3021] .)
	Resolve. [▶ 3040]	Overloaded. Resolves the specified data type for AliasReference [▶ 3042] (Defined by DataTypeExtension [▶ 3021] .)
	Resolve(DataTypeResolveStrategy) [▶ 3041]	Overloaded. Resolves the specified strategy. (Defined by DataTypeExtension [▶ 3021] .)

6.11.48 IEnumType.T. Interface

Interface representing an enum type

Namespace: [TwinCAT.TypeSystem \[▸ 2083\]](#)

Assembly: TwinCAT.Ads.Abstractions (in TwinCAT.Ads.Abstractions.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public interface IEnumType<T> : IAliasType,
    IDataType, IBitSize
where T : IConvertible
```

Type Parameters

T	Base type of the Enum
---	-----------------------

The IEnumType.T. type exposes the following members.

Properties

	Name	Description
	Attributes [▸ 2478]	Gets the attributes of the IDataType [▸ 2475] (Inherited from IDataType [▸ 2475] .)
	BaseType [▸ 2439]	Gets the Base Type (Inherited from IAliasType [▸ 2436] .)
	BaseTypeName [▸ 2440]	Gets the BaseType name (Inherited from IAliasType [▸ 2436] .)
	BitSize [▸ 2473]	Gets the size of the IDataType [▸ 2475] in bits. (Inherited from IBitSize [▸ 2472] .)

	Name	Description
	ByteSize [▶ 2474]	Gets the (aligned) size of of the Type/Instance in Bytes (Inherited from IBitSize [▶ 2472].)
	Category [▶ 2478]	Gets the Data Type category (Inherited from IDataType [▶ 2475].)
	Comment [▶ 2479]	Gets the comment behind the variable declaration. (Inherited from IDataType [▶ 2475].)
	EnumValues [▶ 2519]	Enumeration specification (if enum)
	FullName [▶ 2479]	Gets the full name of the IDataType [▶ 2475] (Namespace + Name) (Inherited from IDataType [▶ 2475].)
	Id [▶ 2480]	Gets the ID of the DataType (Inherited from IDataType [▶ 2475].)
	IsBitType [▶ 2474]	Gets a value indicating whether this instance is not basing on a full DataType but instead of some sort of bit mapping (Inherited from IBitSize [▶ 2472].)
	IsByteAligned [▶ 2475]	Indicates that the Size of the Object is Byte aligned ($\text{BitSize} \% 8 == 0$) (Inherited from IBitSize [▶ 2472].)
	Name [▶ 2482]	Gets the name of the Data Type (without namespace) (Inherited from IDataType [▶ 2475].)
	Namespace [▶ 2482]	Gets the namespace string within the IDataType [▶ 2475] exists. (Inherited from IDataType [▶ 2475].)
	Size [▶ 2475]	Gets the size of the object in bytes or Bits dependant on IsBitType [▶ 2474] (Inherited from IBitSize [▶ 2472].)

Methods

	Name	Description
	Contains [▶ 2521]	Determines whether the enum values contains the specified name
	GetNames [▶ 2521]	Gets the filed names of the IEnumType.T.
	GetValues [▶ 2522]	Gets the values of the IEnumType.T.
	Parse [▶ 2522]	Parses a name of the IEnumType.T. and returns the value (as base type)
	ToString [▶ 2523]	Returns a String that represents the specified value.
	TryParse [▶ 2523]	Parses the value from value name.

Extension Methods

	Name	Description
	IsArrayOfPrimitives. [▶ 3025]	Overloaded. Determines whether the dataType is an array of Primitives. (Defined by DataTypeExtension [▶ 3021].)
	IsArrayOfPrimitives(Boolean) [▶ 3025]	Overloaded. Determines whether the dataType is an array of Primitives. (Defined by DataTypeExtension [▶ 3021].)
	IsContainer. [▶ 3027]	Overloaded. Gets a value indicating whether this IDataType [▶ 2475] is a container type (Defined by DataTypeExtension [▶ 3021].)
	IsContainer(Boolean) [▶ 3028]	Overloaded.

	Name	Description
		Gets a value indicating whether this IDataType [▶ 2475] is a container type (Defined by DataTypeExtension [▶ 3021].)
	IsPointer [▶ 3031]	Gets a value indicating whether this IDataType [▶ 2475] is a pointer type (Defined by DataTypeExtension [▶ 3021].)
	IsPrimitive. [▶ 3033]	Overloaded. Gets a value indicating whether this IDataType [▶ 2475] is primitive (Defined by DataTypeExtension [▶ 3021].)
	IsPrimitive(Boolean) [▶ 3034]	Overloaded. Gets a value indicating whether this IDataType [▶ 2475] is primitive (Defined by DataTypeExtension [▶ 3021].)
	IsReference [▶ 3036]	Gets a value indicating whether this IDataType [▶ 2475] is a reference type (Defined by DataTypeExtension [▶ 3021].)
	ReferencesExternalData [▶ 3037]	Indicates, that the Instance value includes process memory data, that cannot be read in one memory block. (Defined by DataTypeExtension [▶ 3021].)
	ResolvableAsPrimitive. [▶ 3039]	Overloaded. Indicates, that this data type can be resolved as primitive or primitive Array. (Defined by DataTypeExtension [▶ 3021].)
	ResolvableAsPrimitive(Boolean) [▶ 3039]	Overloaded. Indicates, that this data type can be resolved as primitive or primitive Array. (Defined by DataTypeExtension [▶ 3021].)
	Resolve. [▶ 3040]	Overloaded. Resolves the specified data type for AliasReference [▶ 3042] (Defined by DataTypeExtension [▶ 3021].)
	Resolve(DataTypeResolveStrategy) [▶ 3041]	Overloaded. Resolves the specified strategy. (Defined by DataTypeExtension [▶ 3021].)

6.11.48.1 IEnumType.T. Properties

The [IEnumType.T.](#) [[▶ 2516](#)] generic type exposes the following members.

Properties

	Name	Description
	Attributes [▶ 2478]	Gets the attributes of the IDataType [▶ 2475] (Inherited from IDataType [▶ 2475].)
	BaseType [▶ 2439]	Gets the Base Type (Inherited from IAliasType [▶ 2436].)

	Name	Description
	BaseTypeName [▶ 2440]	Gets the BaseType name (Inherited from IAliasType [▶ 2436].)
	BitSize [▶ 2473]	Gets the size of the IDataType [▶ 2475] in bits. (Inherited from IBitSize [▶ 2472].)
	ByteSize [▶ 2474]	Gets the (aligned) size of of the Type/Instance in Bytes (Inherited from IBitSize [▶ 2472].)
	Category [▶ 2478]	Gets the Data Type category (Inherited from IDataType [▶ 2475].)
	Comment [▶ 2479]	Gets the comment behind the variable declaration. (Inherited from IDataType [▶ 2475].)
	EnumValues [▶ 2519]	Enumeration specification (if enum)
	FullName [▶ 2479]	Gets the full name of the IDataType [▶ 2475] (Namespace + Name) (Inherited from IDataType [▶ 2475].)
	Id [▶ 2480]	Gets the ID of the DataType (Inherited from IDataType [▶ 2475].)
	IsBitType [▶ 2474]	Gets a value indicating whether this instance is not basing on a full DataType but instead of some sort of bit mapping (Inherited from IBitSize [▶ 2472].)
	IsByteAligned [▶ 2475]	Indicates that the Size of the Object is Byte aligned ($\text{BitSize} \% 8 == 0$) (Inherited from IBitSize [▶ 2472].)
	Name [▶ 2482]	Gets the name of the Data Type (without namespace) (Inherited from IDataType [▶ 2475].)
	Namespace [▶ 2482]	Gets the namespace string within the IDataType [▶ 2475] exists. (Inherited from IDataType [▶ 2475].)
	Size [▶ 2475]	Gets the size of the object in bytes or Bits dependant on IsBitType [▶ 2474] (Inherited from IBitSize [▶ 2472].)

6.11.48.1.1 IEnumType.T..EnumValues Property

Enumeration specification (if enum)

Namespace: [TwinCAT.TypeSystem](#) [▶ 2083]

Assembly: TwinCAT.Ads.Abstractions (in TwinCAT.Ads.Abstractions.dll) Version: 6.0.328+39e3229

Syntax

C#

```
IEnumValueCollection EnumValues { get; }
```

Property Value

Type: [IEnumerable](#) [[2527](#)]

The enum specification.

Reference

[IEnumerable](#). Interface [[2516](#)]

[TwinCAT.TypeSystem](#) Namespace [[2083](#)]

6.11.48.2 IEnumerable.T. Methods

The [IEnumerable.T](#) [[2516](#)] generic type exposes the following members.

Methods

	Name	Description
	Contains [2521]	Determines whether the enum values contains the specified name
	GetNames [2521]	Gets the filed names of the IEnumerable.T [2516]
	GetValues [2522]	Gets the values of the IEnumerable.T [2516]
	Parse [2522]	Parses a name of the IEnumerable.T [2516] and returns the value (as base type)
	ToString [2523]	Returns a String that represents the specified value.
	TryParse [2523]	Parses the value from value name.

Extension Methods

	Name	Description
	IsArrayOfPrimitives [3025]	Overloaded. Determines whether the dataType is an array of Primitives. (Defined by DataTypeExtension [3021].)
	IsArrayOfPrimitives(Boolean) [3025]	Overloaded. Determines whether the dataType is an array of Primitives. (Defined by DataTypeExtension [3021].)
	IsContainer [3027]	Overloaded. Gets a value indicating whether this IDataType [2475] is a container type (Defined by DataTypeExtension [3021].)
	IsContainer(Boolean) [3028]	Overloaded. Gets a value indicating whether this IDataType [2475] is a container type (Defined by DataTypeExtension [3021].)
	IsPointer [3031]	Gets a value indicating whether this IDataType [2475] is a pointer type (Defined by DataTypeExtension [3021].)
	IsPrimitive [3033]	Overloaded. Gets a value indicating whether this IDataType [2475] is primitive (Defined by DataTypeExtension [3021].)
	IsPrimitive(Boolean) [3034]	Overloaded. Gets a value indicating whether this IDataType [2475] is primitive (Defined by DataTypeExtension [3021].)
	IsReference [3036]	Gets a value indicating whether this IDataType [2475] is a reference type (Defined by DataTypeExtension [3021].)

	Name	Description
	ReferencesExternalData [▶ 3037]	Indicates, that the Instance value includes process memory data, that cannot be read in one memory block. (Defined by DataTypeExtension [▶ 3021].)
	ResolvableAsPrimitive [▶ 3039]	Overloaded. Indicates, that this data type can be resolved as primitive or primitive Array. (Defined by DataTypeExtension [▶ 3021].)
	ResolvableAsPrimitive(Boolean) [▶ 3039]	Overloaded. Indicates, that this data type can be resolved as primitive or primitive Array. (Defined by DataTypeExtension [▶ 3021].)
	Resolve . [▶ 3040]	Overloaded. Resolves the specified data type for AliasReference [▶ 3042] (Defined by DataTypeExtension [▶ 3021].)
	Resolve(DataTypeResolveStrategy) [▶ 3041]	Overloaded. Resolves the specified strategy. (Defined by DataTypeExtension [▶ 3021].)

6.11.48.2.1 IEnumType.T..Contains Method

Determines whether the enum values contains the specified name

Namespace: [TwinCAT.TypeSystem](#) [[▶ 2083](#)]

Assembly: TwinCAT.Ads.Abstractions (in TwinCAT.Ads.Abstractions.dll) Version: 6.0.328+39e3229

Syntax

C#

```
bool Contains(
    string name
)
```

Parameters

name	Type: System.String The name.
------	----------------------------------

Return Value

Type: Boolean
true if contains the value, otherwise, false.

Reference

6.11.48.2.3 IEnumType.T..GetValues Method

Gets the values of the [IEnumType.T.](#) [[▶ 2516](#)]

Namespace: [TwinCAT.TypeSystem](#) [[▶ 2083](#)]

Assembly: TwinCAT.Ads.Abstractions (in TwinCAT.Ads.Abstractions.dll) Version: 6.0.328+39e3229

Syntax

C#

```
T[] GetValues()
```

Return Value

Type: [.T](#) [[▶ 2516](#)].
[T\[\]](#).

Reference

[IEnumType.T. Interface](#) [[▶ 2516](#)]

[TwinCAT.TypeSystem Namespace](#) [[▶ 2083](#)]

6.11.48.2.4 IEnumType.T..Parse Method

Parses a name of the [IEnumType.T.](#) [[▶ 2516](#)] and returns the value (as base type)

Namespace: [TwinCAT.TypeSystem](#) [[▶ 2083](#)]

Assembly: TwinCAT.Ads.Abstractions (in TwinCAT.Ads.Abstractions.dll) Version: 6.0.328+39e3229

Syntax

C#

```
T Parse(  
    string name  
)
```

Parameters

name	Type: System.String The name.
------	--

Return Value

Type: [T](#) [[▶ 2516](#)]

T.

Reference

[IEnumerable.T Interface](#) [[▶ 2516](#)]

6.11.48.2.5 IEnumType.T..ToString Method

Returns a String that represents the specified value.

Namespace: [TwinCAT.TypeSystem](#) [[▶ 2083](#)]

Assembly: TwinCAT.Ads.Abstractions (in TwinCAT.Ads.Abstractions.dll) Version: 6.0.328+39e3229

Syntax

C#

```
string ToString(  
    T val  
)
```

Parameters

val	Type: T [▶ 2516] The value.
-----	--

Return Value

Type: String

A String that represents this value.

Reference

[IEnumerable.T Interface](#) [[▶ 2516](#)]

[TwinCAT.TypeSystem Namespace](#) [[▶ 2083](#)]

6.11.48.2.6 IEnumType.T..TryParse Method

Parses the value from value name.

Namespace: [TwinCAT.TypeSystem](#) [[▶ 2083](#)]

Assembly: TwinCAT.Ads.Abstractions (in TwinCAT.Ads.Abstractions.dll) Version: 6.0.328+39e3229

Syntax

C#

```
bool TryParse(  
    string name,  
    out T value  
)
```

Parameters

name	Type: System.String The value name.
------	--

value	Type: T [2516]. The value.
-------	---

Return Value

Type: Boolean
true if value name was found, false otherwise.

Reference

6.11.49 IEnumValue Interface

Generic interface for EnumValues

Namespace: [TwinCAT.TypeSystem](#) [[2083](#)]

Assembly: TwinCAT.Ads.Abstractions (in TwinCAT.Ads.Abstractions.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public interface IEnumValue
```

The IEnumValue type exposes the following members.

Properties

	Name	Description
	ManagedBaseType [2525]	Gets the enumeration base type (sint,byte,short,ushort,int,uint,Int64,UInt64 supported)
	Name [2525]	Gets the name of the Enumeration Value (value as string)
	Primitive [2526]	Gets the (Primitive, BaseType) Value of the enumeration as object
	RawValue [2526]	Gets the raw value of the enumeration (as byte array)
	Size [2526]	Gets the size of the Enum value (in bytes)

Reference

[TwinCAT.TypeSystem Namespace](#) [[2083](#)]

6.11.49.1 IEnumValue Properties

The [IEnumValue](#) [[2524](#)] type exposes the following members.

Properties

	Name	Description
	ManagedBaseType [2525]	Gets the enumeration base type (sint,byte,short,ushort,int,uint,Int64,UInt64 supported)
	Name [2525]	Gets the name of the Enumeration Value (value as string)

	Name	Description
	Primitive [▶ 2526]	Gets the (Primitive, BaseType) Value of the enumeration as object
	RawValue [▶ 2526]	Gets the raw value of the enumeration (as byte array)
	Size [▶ 2526]	Gets the size of the Enum value (in bytes)

Reference

[IEnumValue Interface](#) [[▶ 2524](#)]

6.11.50 IEnumValueCollection Interface

Interface IEnumValueCollection

Namespace: [TwinCAT.TypeSystem |▸ 2083|](#)

Assembly: TwinCAT.Ads.Abstractions (in TwinCAT.Ads.Abstractions.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public interface IEnumValueCollection : IEnumValueCollection<IEnumValue, IConvertible>,
    ICollection<IEnumValue>, IEnumerable<IEnumValue>, IEnumerable
```

The IEnumValueCollection type exposes the following members.

Properties

	Name	Description
	Count	Gets the number of elements contained in the ICollection.T.. (Inherited from ICollection.IEnumValue ▸ 2524 ..)
	IsReadOnly	Gets a value indicating whether the ICollection.T. is read-only. (Inherited from ICollection.IEnumValue ▸ 2524 ..)
	Item ▸ 2530 	Gets or sets the element at the specified index. (Inherited from IEnumValueCollection.TEnumValue, TValue. ▸ 2529 .)

Methods

	Name	Description
	Add	Adds an item to the ICollection.T.. (Inherited from ICollection.IEnumValue ▸ 2524 ..)
	Clear	Removes all items from the ICollection.T.. (Inherited from ICollection.IEnumValue ▸ 2524 ..)
	Contains(T)	Determines whether the ICollection.T. contains a specific value. (Inherited from ICollection.IEnumValue ▸ 2524 ..)
	Contains(String) ▸ 2532 	Determines whether [contains] [the specified name]. (Inherited from IEnumValueCollection.TEnumValue, TValue. ▸ 2529 .)
	CopyTo	Copies the elements of the ICollection.T. to an Array, starting at a particular Array index. (Inherited from ICollection.IEnumValue ▸ 2524 ..)
	GetEnumerator	Returns an enumerator that iterates through the collection. (Inherited from IEnumerable.IEnumValue ▸ 2524 ..)
	GetNames ▸ 2533 	Gets the Value Names. (Inherited from IEnumValueCollection.TEnumValue, TValue. ▸ 2529 .)
	GetValues ▸ 2533 	Gets the values. (Inherited from IEnumValueCollection.TEnumValue, TValue. ▸ 2529 .)

	Name	Description
	Parse [▶ 2533]	Parses the specified name. (Inherited from IEnumValueCollection.TEnumValue, TValue. ▶ 2529 .)
	Remove	Removes the first occurrence of a specific object from the ICollection.T.. (Inherited from ICollection.IEnumValue ▶ 2524 ..)
	TryParse(String, TValue.) [▶ 2535]	Tries to parse the string value of the Enum. (Inherited from IEnumValueCollection.TEnumValue, TValue. ▶ 2529 .)

Interface for collections of [IEnumValues](#) [[▶ 2524](#)]. Implements the [ICollection.T.](#)

Namespace: [TwinCAT.TypeSystem](#) [[▶ 2083](#)]

Assembly: TwinCAT.Ads.Abstractions (in TwinCAT.Ads.Abstractions.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public interface IEnumValueCollection<TEnumValue, TValue> : ICollection<TEnumValue>,
    IEnumerable<TEnumValue>, IEnumerable
where TEnumValue : class, IEnumValue
where TValue : IConvertible
```

Type Parameters

TEnumValue	TValue
------------	--------

The [IEnumValueCollection.TEnumValue, TValue.](#) type exposes the following members.

Properties

	Name	Description
	Count	Gets the number of elements contained in the ICollection.T. (Inherited from ICollection.TEnumValue.)
	IsReadOnly	Gets a value indicating whether the ICollection.T. is read-only. (Inherited from ICollection.TEnumValue.)
	Item [▶ 2530]	Gets or sets the element at the specified index.

Methods

	Name	Description
	Add	Adds an item to the ICollection.T. (Inherited from ICollection.TEnumValue.)
	Clear	Removes all items from the ICollection.T. (Inherited from ICollection.TEnumValue.)
	Contains(T)	Determines whether the ICollection.T. contains a specific value. (Inherited from ICollection.TEnumValue.)

	Name	Description
	Contains(String) [▶ 2532]	Determines whether [contains] [the specified name].
	CopyTo	Copies the elements of the ICollection.T. to an Array, starting at a particular Array index. (Inherited from ICollection.TEnumValue..)
	GetEnumerator	Returns an enumerator that iterates through the collection. (Inherited from IEnumerable.TEnumValue..)
	GetNames [▶ 2533]	Gets the Value Names.
	GetValues [▶ 2533]	Gets the values.
	Parse [▶ 2533]	Parses the specified name.
	Remove	Removes the first occurrence of a specific object from the ICollection.T.. (Inherited from ICollection.TEnumValue..)
	TryParse(String, TEnumValue.) [▶ 2534]	Tries to parse the string value of the Enum.
	TryParse(String, TValue.) [▶ 2535]	Tries to parse the string value of the Enum.

6.11.51.2.1 IEnumerable{T}.TEnumValue, TValue..Contains Method

Overload List

	Name	Description
	<code>Contains(T)</code>	Determines whether the ICollection{T}.T. contains a specific value. (Inherited from ICollection{T}.TEnumValue [▶ 2529].)
	<code>Contains(String)</code> [▶ 2532]	Determines whether [contains] [the specified name].

Reference

[TwinCAT.TypeSystem Namespace \[▶ 2083\]](#)

6.11.51.2.1.1 IEnumerable{T}.TEnumValue, TValue..Contains Method (String)

Determines whether [contains] [the specified name].

Namespace: [TwinCAT.TypeSystem \[▶ 2083\]](#)

Assembly: TwinCAT.Ads.Abstractions (in TwinCAT.Ads.Abstractions.dll) Version: 6.0.328+39e3229

Syntax

C#

```
bool Contains(
    string value
)
```

Parameters

value	Type: System.String Value
-------	------------------------------

Return Value

Type: Boolean
true if [contains] [the specified name]; otherwise, false.

6.11.52 IField Interface

Specifies a single field/member of a [Struct DataType \[▶ 2671\]](#).

Namespace: [TwinCAT.TypeSystem](#) [▶ 2083]

Assembly: TwinCAT.Ads.Abstractions (in TwinCAT.Ads.Abstractions.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public interface IField : IAttributedInstance, IInstance,
    IBitSize
```

The IField type exposes the following members.

Properties

	Name	Description
	Attributes [▶ 2471]	Gets the Type Attributes. (Inherited from IAttributedInstance [▶ 2469].)
	BitSize [▶ 2473]	Gets the size of the IDataType [▶ 2475] in bits. (Inherited from IBitSize [▶ 2472].)
	ByteSize [▶ 2474]	Gets the (aligned) size of of the Type/Instance in Bytes (Inherited from IBitSize [▶ 2472].)
	Comment [▶ 2550]	Gets the comment of the IInstance [▶ 2549] (Inherited from IInstance [▶ 2549].)
	DataType [▶ 2551]	Gets the IDataType [▶ 2475] of the IInstance [▶ 2549]. (Inherited from IInstance [▶ 2549].)
	InstanceName [▶ 2551]	Gets the name of the instance (without periods (.)) (Inherited from IInstance [▶ 2549].)
	InstancePath [▶ 2552]	Gets the relative / absolute access path to the instance (with periods (.)) (Inherited from IInstance [▶ 2549].)
	IsBitType [▶ 2474]	Gets a value indicating whether this instance is not basing on a full IDataType but instead of some sort of bit mapping (Inherited from IBitSize [▶ 2472].)
	IsByteAligned [▶ 2475]	Indicates that the Size of the Object is Byte aligned ($\text{BitSize} \% 8 == 0$) (Inherited from IBitSize [▶ 2472].)
	IsPointer [▶ 2552]	Indicates that the IInstance [▶ 2549] represents a Pointer type (Pointer TO) (Inherited from IInstance [▶ 2549].)
	IsReference [▶ 2552]	Indicates that the IInstance [▶ 2549] represents a Reference type (REFERENCE TO) (Inherited from IInstance [▶ 2549].)
	IsStatic [▶ 2553]	Gets a value indicating whether this IInstance [▶ 2549] is static. (Inherited from IInstance [▶ 2549].)
	ParentType [▶ 2538]	Gets the Parent Struct/Union of this IField.
	Size [▶ 2475]	Gets the size of the object in bytes or Bits dependant on IsBitType [▶ 2474] (Inherited from IBitSize [▶ 2472].)
	TypeName [▶ 2553]	Gets the name of the IDataType [▶ 2475] that is used for this IInstance [▶ 2549]. (Inherited from IInstance [▶ 2549].)
	ValueEncoding [▶ 2472]	Gets the value encoding. (Inherited from IAttributedInstance [▶ 2469].)

Extension Methods

	Name	Description
	ReferencesExternalData [▶ 3038]	Indicates, that the Instance value includes process memory data, that cannot be read in one memory block. (Defined by DataTypeExtension [▶ 3021].)

Reference

```
public interface IFieldCollection : IInstanceCollection<IField>,
    IList<IField>, ICollection<IField>, IEnumerable<IField>,
    IEnumerable
```

The IFieldCollection type exposes the following members.

Properties

	Name	Description
	Count	Gets the number of elements contained in the ICollection.T.. (Inherited from ICollection.IField ▶ 2535 ..)
	IsReadOnly	Gets a value indicating whether the ICollection.T. is read-only. (Inherited from ICollection.IField ▶ 2535 ..)
	Item.Int32.	Gets or sets the element at the specified index. (Inherited from IList.IField ▶ 2535 ..)
	Item.String. ▶ 2556	Gets the Instance ▶ 2549 with the specified instance path. (Inherited from InstanceCollection.T. ▶ 2554 .)
	Mode ▶ 2556	Gets the InstanceCollectionMode ▶ 2573 . (Inherited from InstanceCollection.T. ▶ 2554 .)

Methods

	Name	Description
	Add	Adds an item to the ICollection.T.. (Inherited from ICollection.IField ▶ 2535 ..)
	Clear	Removes all items from the ICollection.T.. (Inherited from ICollection.IField ▶ 2535 ..)
	Contains(T)	Determines whether the ICollection.T. contains a specific value. (Inherited from ICollection.IField ▶ 2535 ..)
	Contains(String) ▶ 2558	Determines whether this collection contains an instance with the specified instance path. (Inherited from InstanceCollection.T. ▶ 2554 .)
	ContainsName ▶ 2558	Determines whether this collection contains an instance with the specified instance name. (Inherited from InstanceCollection.T. ▶ 2554 .)
	CopyTo	Copies the elements of the ICollection.T. to an Array, starting at a particular Array index. (Inherited from ICollection.IField ▶ 2535 ..)
	GetEnumerator	Returns an enumerator that iterates through the collection. (Inherited from IEnumerable.IField ▶ 2535 ..)
	GetInstance ▶ 2559	Gets the Instance ▶ 2549 by instance path. (Inherited from InstanceCollection.T. ▶ 2554 .)
	GetInstanceByName ▶ 2559	Gets the Instance ▶ 2549 by instance name. (Inherited from InstanceCollection.T. ▶ 2554 .)
	IndexOf	Determines the index of a specific item in the IList.T.. (Inherited from IList.IField ▶ 2535 ..)
	Insert	Inserts an item to the IList.T. at the specified index. (Inherited from IList.IField ▶ 2535 ..)
	Remove	Removes the first occurrence of a specific object from the ICollection.T.. (Inherited from ICollection.IField ▶ 2535 ..)
	RemoveAt	Removes the IList.T. item at the specified index. (Inherited from IList.IField ▶ 2535 ..)
	TryGetInstance ▶ 2560	Tries to get the specified instance. (Inherited from InstanceCollection.T. ▶ 2554 .)
	TryGetInstanceByName ▶ 2560	Tries to get the specified instance by name. (Inherited from InstanceCollection.T. ▶ 2554 .)

	Name	Description
	TryGetMember [▶ 2541]	Gets the Field/Member with the specified name from the collection.

6.11.54 IGenericTypeMarshaler Interface

Interface IGenericTypeMarshaler Implements the [ITypeMarshaler](#) [► 2731]

Namespace: [TwinCAT.TypeSystem](#) [► 2083]

Assembly: TwinCAT.Ads.Abstractions (in TwinCAT.Ads.Abstractions.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public interface IGenericTypeMarshaler : ITypeMarshaler
```

The IGenericTypeMarshaler type exposes the following members.

Methods

	Name	Description
	CanMarshal [► 2732]	Determines whether ADS can marshal the specified managed data type. (Inherited from ITypeMarshaler [► 2731].)
	CanMarshalValue [► 2736]	Determines whether ADS can marshal the specified value (Inherited from ITypeMarshaler [► 2731].)
	Marshal [► 2734]	Marshals the specified value to the specified destination memory / span. (Inherited from ITypeMarshaler [► 2731].)
	MarshalValueSize [► 2736]	Gets the byte size of the value when marshalled. (Inherited from ITypeMarshaler [► 2731].)
	Unmarshal(Type, ReadOnlySpan<Byte>, Encoding, Object.) [► 2735]	Unmarshals the specified managed type from memory / span (Inherited from ITypeMarshaler [► 2731].)
	Unmarshal.T.(ReadOnlySpan<Byte>, Encoding, T.) [► 2544]	Unmarshals the source data to an managed value of the specified type.

Remarks

The IGenericTypeMarshaler extends the [ITypeMarshaler](#) [► 2731] by generic methods.

6.11.55 IHierarchicalSymbol Interface

Bindable Symbol interface (for internal use only)

Namespace: [TwinCAT.TypeSystem \[▶ 2083\]](#)

Assembly: TwinCAT.Ads.Abstractions (in TwinCAT.Ads.Abstractions.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public interface IHierarchicalSymbol : ISymbol,
    IAttributedInstance, IInstance, IBitSize
```

The IHierarchicalSymbol type exposes the following members.

Properties

	Name	Description
	Attributes [▶ 2471]	Gets the Type Attributes. (Inherited from IAttributedInstance [▶ 2469] .)
	BitSize [▶ 2473]	Gets the size of the IDataType [▶ 2475] in bits. (Inherited from IBitSize [▶ 2472] .)
	ByteSize [▶ 2474]	Gets the (aligned) size of of the Type/Instance in Bytes (Inherited from IBitSize [▶ 2472] .)
	Category [▶ 2694]	Gets the Symbol/Datatype Category (Inherited from ISymbol [▶ 2691] .)
	Comment [▶ 2550]	Gets the comment of the IInstance [▶ 2549] (Inherited from IInstance [▶ 2549] .)
	DataType [▶ 2551]	Gets the IDataType [▶ 2475] of the IInstance [▶ 2549] . (Inherited from IInstance [▶ 2549] .)
	InstanceName [▶ 2551]	Gets the name of the instance (without periods (.)) (Inherited from IInstance [▶ 2549] .)

	Name	Description
	InstancePath [▶ 2552]	Gets the relative / absolute access path to the instance (with periods (.)) (Inherited from IInstance [▶ 2549].)
	IsBitType [▶ 2474]	Gets a value indicating whether this instance is not basing on a full DataType but instead of some sort of bit mapping (Inherited from IBitSize [▶ 2472].)
	IsByteAligned [▶ 2475]	Indicates that the Size of the Object is Byte aligned ($\text{BitSize} \% 8 == 0$) (Inherited from IBitSize [▶ 2472].)
	IsContainerType [▶ 2694]	Gets a value indicating whether this Symbol is a container type. (Inherited from ISymbol [▶ 2691].)
	IsPersistent [▶ 2694]	Gets a value indicating whether this ISymbol [▶ 2691] is persistent. (Inherited from ISymbol [▶ 2691].)
	IsPointer [▶ 2552]	Indicates that the IInstance [▶ 2549] represents a Pointer type (Pointer TO) (Inherited from IInstance [▶ 2549].)
	IsPrimitiveType [▶ 2695]	Gets a value indicating whether this instance is a primitive type. (Inherited from ISymbol [▶ 2691].)
	IsReadOnly [▶ 2695]	Indicates that this instance is read only. (Inherited from ISymbol [▶ 2691].)
	IsRecursive [▶ 2696]	Gets a value indicating whether this instance is recursive. (Inherited from ISymbol [▶ 2691].)
	IsReference [▶ 2552]	Indicates that the IInstance [▶ 2549] represents a Reference type (REFERENCE TO) (Inherited from IInstance [▶ 2549].)
	IsStatic [▶ 2553]	Gets a value indicating whether this IInstance [▶ 2549] is static. (Inherited from IInstance [▶ 2549].)
	Parent [▶ 2696]	Gets the parent Symbol (Inherited from ISymbol [▶ 2691].)
	Size [▶ 2475]	Gets the size of the object in bytes or Bits dependant on IsBitType [▶ 2474] (Inherited from IBitSize [▶ 2472].)
	SubSymbols [▶ 2696]	Gets the SubSymbols of the ISymbol [▶ 2691] (Inherited from ISymbol [▶ 2691].)
	TypeName [▶ 2553]	Gets the name of the DataType [▶ 2475] that is used for this IInstance [▶ 2549]. (Inherited from IInstance [▶ 2549].)
	ValueEncoding [▶ 2472]	Gets the value encoding. (Inherited from IAttributedInstance [▶ 2469].)

Methods

	Name	Description
	SetParent [▶ 2548]	Sets the parent of the Symbol

Extension Methods

	Name	Description
	ReferencesExternalData [▶ 3038]	Indicates, that the Instance value includes process memory data, that cannot be read in one memory block. (Defined by DataTypeExtension [▶ 3021].)

Reference

6.11.55.1 IHierarchicalSymbol Properties

The [IHierarchicalSymbol](#) [[▶ 2545](#)] type exposes the following members.

Properties

	Name	Description
	Attributes [▶ 2471]	Gets the Type Attributes. (Inherited from IAttributedInstance [▶ 2469].)
	BitSize [▶ 2473]	Gets the size of the IDataType [▶ 2475] in bits. (Inherited from IBitSize [▶ 2472].)
	ByteSize [▶ 2474]	Gets the (aligned) size of of the Type/Instance in Bytes (Inherited from IBitSize [▶ 2472].)
	Category [▶ 2694]	Gets the Symbol/Datatype Category (Inherited from ISymbol [▶ 2691].)
	Comment [▶ 2550]	Gets the comment of the IInstance [▶ 2549] (Inherited from IInstance [▶ 2549].)
	DataType [▶ 2551]	Gets the IDataType [▶ 2475] of the IInstance [▶ 2549]. (Inherited from IInstance [▶ 2549].)
	InstanceName [▶ 2551]	Gets the name of the instance (without periods (.)) (Inherited from IInstance [▶ 2549].)
	InstancePath [▶ 2552]	Gets the relative / absolute access path to the instance (with periods (.)) (Inherited from IInstance [▶ 2549].)
	IsBitType [▶ 2474]	Gets a value indicating whether this instance is not basing on a full DataType but instead of some sort of bit mapping (Inherited from IBitSize [▶ 2472].)
	IsByteAligned [▶ 2475]	Indicates that the Size of the Object is Byte aligned ($\text{BitSize} \% 8 == 0$) (Inherited from IBitSize [▶ 2472].)
	IsContainerType [▶ 2694]	Gets a value indicating whether this Symbol is acontainer type. (Inherited from ISymbol [▶ 2691].)
	IsPersistent [▶ 2694]	Gets a value indicating whether this ISymbol [▶ 2691] is persistent. (Inherited from ISymbol [▶ 2691].)
	IsPointer [▶ 2552]	Indicates that the IInstance [▶ 2549] represents a Pointer type (Pointer TO) (Inherited from IInstance [▶ 2549].)
	IsPrimitiveType [▶ 2695]	Gets a value indicating whether this instance is a primitive type. (Inherited from ISymbol [▶ 2691].)
	IsReadOnly [▶ 2695]	Indicates that this instance is read only. (Inherited from ISymbol [▶ 2691].)
	IsRecursive [▶ 2696]	Gets a value indicating whether this instance is recursive. (Inherited from ISymbol [▶ 2691].)
	IsReference [▶ 2552]	Indicates that the IInstance [▶ 2549] represents a Reference type (REFERENCE TO) (Inherited from IInstance [▶ 2549].)
	IsStatic [▶ 2553]	Gets a value indicating whether this IInstance [▶ 2549] is static. (Inherited from IInstance [▶ 2549].)
	Parent [▶ 2696]	Gets the parent Symbol (Inherited from ISymbol [▶ 2691].)
	Size [▶ 2475]	Gets the size of the object in bytes or Bits dependant on IsBitType [▶ 2474] (Inherited from IBitSize [▶ 2472].)
	SubSymbols [▶ 2696]	Gets the SubSymbols of the ISymbol [▶ 2691] (Inherited from ISymbol [▶ 2691].)
	TypeName [▶ 2553]	Gets the name of the DataType [▶ 2475] that is used for this IInstance [▶ 2549]. (Inherited from IInstance [▶ 2549].)

	Name	Description

6.11.56 Instance Interface

Interface specifying instance objects.

Namespace: [TwinCAT.TypeSystem \[▸ 2083\]](#)

Assembly: TwinCAT.Ads.Abstractions (in TwinCAT.Ads.Abstractions.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public interface IInstance : IBitSize
```

The IInstance type exposes the following members.

Properties

	Name	Description
	BitSize [▸ 2473]	Gets the size of the IDataType [▸ 2475] in bits. (Inherited from IBitSize [▸ 2472].)
	ByteSize [▸ 2474]	Gets the (aligned) size of of the Type/Instance in Bytes (Inherited from IBitSize [▸ 2472].)
	Comment [▸ 2550]	Gets the comment of the IInstance
	DataType [▸ 2551]	Gets the IDataType [▸ 2475] of the IInstance.
	InstanceName [▸ 2551]	Gets the name of the instance (without periods (.))
	InstancePath [▸ 2552]	Gets the relative / absolute access path to the instance (with periods (.))
	IsBitType [▸ 2474]	Gets a value indicating whether this instance is not basing on a full IDataType but instead of some sort of bit mapping (Inherited from IBitSize [▸ 2472].)
	IsByteAligned [▸ 2475]	Indicates that the Size of the Object is Byte aligned ($\text{BitSize} \% 8 == 0$) (Inherited from IBitSize [▸ 2472].)
	IsPointer [▸ 2552]	Indicates that the IInstance represents a Pointer type (Pointer TO)
	IsReference [▸ 2552]	Indicates that the IInstance represents a Reference type (REFERENCE TO)
	IsStatic [▸ 2553]	Gets a value indicating whether this IInstance is static.
	Size [▸ 2475]	Gets the size of the object in bytes or Bits dependant on IsBitType [▸ 2474] (Inherited from IBitSize [▸ 2472].)
	TypeName [▸ 2553]	Gets the name of the IDataType [▸ 2475] that is used for this IInstance.

Extension Methods

	Name	Description
	ReferencesExternalData [▸ 3038]	Indicates, that the Instance value includes process memory data, that cannot be read in one memory block. (Defined by DataTypeExtension [▸ 3021].)

6.11.56.1.1 Instance.Comment Property

Gets the comment of the [IInstance](#) [[▶ 2549](#)]

Namespace: [TwinCAT.TypeSystem](#) [[▶ 2083](#)]

Assembly: TwinCAT.Ads.Abstractions (in TwinCAT.Ads.Abstractions.dll) Version: 6.0.328+39e3229

Syntax

C#

```
string Comment { get; }
```

Property Value

Type: String
The comment.

Reference

[IInstance Interface \[▸ 2549\]](#)

[TwinCAT.TypeSystem Namespace \[▸ 2083\]](#)

6.11.56.1.2 Instance.DataType Property

Gets the [IDataType \[▸ 2475\]](#) of the [IInstance \[▸ 2549\]](#).

Namespace: [TwinCAT.TypeSystem \[▸ 2083\]](#)

Assembly: TwinCAT.Ads.Abstractions (in TwinCAT.Ads.Abstractions.dll) Version: 6.0.328+39e3229

Syntax

C#

```
IDataType? DataType { get; }
```

Property Value

Type: [IDataType \[▸ 2475\]](#)
The type of the data.

Remarks

The DataType can be unresolved in rare circumstances and therefore could have value **null**.

Reference

[IInstance Interface \[▸ 2549\]](#)

[TwinCAT.TypeSystem Namespace \[▸ 2083\]](#)

6.11.56.1.3 Instance.InstanceName Property

Gets the name of the instance (without periods (.))

Namespace: [TwinCAT.TypeSystem \[▸ 2083\]](#)

Assembly: TwinCAT.Ads.Abstractions (in TwinCAT.Ads.Abstractions.dll) Version: 6.0.328+39e3229

Syntax

C#

```
string InstanceName { get; }
```

Property Value

Type: String
The name of the instance.

Reference

6.11.57 InstanceCollection.T. Interface

Generic InstanceCollection interface.

Namespace: [TwinCAT.TypeSystem \[▸ 2083\]](#)

Assembly: TwinCAT.Ads.Abstractions (in TwinCAT.Ads.Abstractions.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public interface IInstanceCollection<T> : IList<T>,
    ICollection<T>, IEnumerable<T>, IEnumerable
where T : class, IInstance
```

Type Parameters

T

The [IInstanceCollection.T.](#) type exposes the following members.

Properties

	Name	Description
	Count	Gets the number of elements contained in the ICollection.T. (Inherited from ICollection.T.)
	IsReadOnly	Gets a value indicating whether the ICollection.T. is read-only. (Inherited from ICollection.T.)
	Item.Int32.	Gets or sets the element at the specified index. (Inherited from IList.T.)
	Item.String. [▸ 2556]	Gets the IInstance [▸ 2549] with the specified instance path.
	Mode [▸ 2556]	Gets the InstanceCollectionMode [▸ 2573] .

Methods

	Name	Description
	Add	Adds an item to the ICollection.T. (Inherited from ICollection.T.)

	Name	Description
	Clear	Removes all items from the ICollection.T.. (Inherited from ICollection.T..)
	Contains(T)	Determines whether the ICollection.T. contains a specific value. (Inherited from ICollection.T..)
	<u>Contains(String)</u> [▶ 2558]	Determines whether this collection contains an instance with the specified instance path.
	<u>ContainsName</u> [▶ 2558]	Determines whether this collection contains an instance with the specified instance name.
	CopyTo	Copies the elements of the ICollection.T. to an Array, starting at a particular Array index. (Inherited from ICollection.T..)
	GetEnumerator	Returns an enumerator that iterates through the collection. (Inherited from IEnumerable.T..)
	<u>GetInstance</u> [▶ 2559]	Gets the <u>Instance</u> [▶ 2549] by instance path.
	<u>GetInstanceByName</u> [▶ 2559]	Gets the <u>Instance</u> [▶ 2549] by instance name.
	IndexOf	Determines the index of a specific item in the IList.T.. (Inherited from IList.T..)
	Insert	Inserts an item to the IList.T. at the specified index. (Inherited from IList.T..)
	Remove	Removes the first occurrence of a specific object from the ICollection.T.. (Inherited from ICollection.T..)
	RemoveAt	Removes the IList.T. item at the specified index. (Inherited from IList.T..)
	<u>TryGetInstance</u> [▶ 2560]	Tries to get the specified instance.
	<u>TryGetInstanceByName</u> [▶ 2560]	Tries to get the specified instance by name.

6.11.57.2.3 IInstanceCollection.T..GetInstance Method

Gets the [IInstance](#) [► 2549] by instance path.

Namespace: [TwinCAT.TypeSystem](#) [► 2083]

Assembly: TwinCAT.Ads.Abstractions (in TwinCAT.Ads.Abstractions.dll) Version: 6.0.328+39e3229

Syntax

C#

```
T GetInstance(  
    string instancePath  
)
```

Parameters

instancePath	Type: System.String The instance path.
--------------	---

Return Value

Type: [T](#) [► 2554]

T.

Reference

6.11.57.2.4 IInstanceCollection.T..GetInstanceByName Method

Gets the [IInstance](#) [► 2549] by instance name.

Namespace: [TwinCAT.TypeSystem](#) [► 2083]

Assembly: TwinCAT.Ads.Abstractions (in TwinCAT.Ads.Abstractions.dll) Version: 6.0.328+39e3229

Syntax

C#

```

IList<T> GetInstanceByName (
    string instanceName
)

```

Parameters

instanceName	Type: System.String Name of the instance.
--------------	--

Return Value

Type: [IList.T](#) [[▶ 2554](#)].
IList<T>.

Reference

6.11.57.2.5 InstanceCollection.T..TryGetInstance Method

Tries to get the specified instance.

Namespace: [TwinCAT.TypeSystem](#) [[▶ 2083](#)]

Assembly: TwinCAT.Ads.Abstractions (in TwinCAT.Ads.Abstractions.dll) Version: 6.0.328+39e3229

Syntax

C#

```

bool TryGetInstance (
    string instancePath,
    out T? symbol
)

```

Parameters

instancePath	Type: System.String The instance path.
symbol	Type: T [▶ 2554]. The symbol.

Return Value

Type: Boolean
true if the [Instance](#) [[▶ 2549](#)] is found; otherwise, false

Reference

6.11.57.2.6 InstanceCollection.T..TryGetInstanceByName Method

Tries to get the specified instance by name.

Namespace: [TwinCAT.TypeSystem](#) [[▶ 2083](#)]

Assembly: TwinCAT.Ads.Abstractions (in TwinCAT.Ads.Abstractions.dll) Version: 6.0.328+39e3229

Syntax

C#

```
bool TryGetInstanceByName(
    string instanceName,
    out IList<T>? symbols
)
```

Parameters

instanceName	Type: System.String Name of the instance.
symbols	Type: System.Collections.Generic.IList.T [▶ 2554]. The found symbols.

Return Value

Type: Boolean

true if the [IInstance](#) [[▶ 2549](#)] is found; otherwise, false

Reference

6.11.58 IMember Interface

Specifies a single field/member of a [Struct DataType](#) [[▶ 2671](#)].

Namespace: [TwinCAT.TypeSystem](#) [[▶ 2083](#)]

Assembly: TwinCAT.Ads.Abstractions (in TwinCAT.Ads.Abstractions.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public interface IMember : IField,
    IAttributedInstance, IInstance, IBitSize
```

The IMember type exposes the following members.

Properties

	Name	Description
	Attributes [▶ 2471]	Gets the Type Attributes. (Inherited from IAttributedInstance [▶ 2469].)
	BitOffset [▶ 2563]	Gets the bit offset.
	BitSize [▶ 2473]	Gets the size of the IDataType [▶ 2475] in bits. (Inherited from IBitSize [▶ 2472].)
	ByteOffset [▶ 2564]	Gets the byte offset.
	ByteSize [▶ 2474]	Gets the (aligned) size of of the Type/Instance in Bytes (Inherited from IBitSize [▶ 2472].)
	Comment [▶ 2550]	Gets the comment of the IInstance [▶ 2549] (Inherited from IInstance [▶ 2549].)

	Name	Description
	DataType [▶ 2551]	Gets the IDataType [▶ 2475] of the IInstance [▶ 2549]. (Inherited from IInstance [▶ 2549].)
	InstanceName [▶ 2551]	Gets the name of the instance (without periods (.)) (Inherited from IInstance [▶ 2549].)
	InstancePath [▶ 2552]	Gets the relative / absolute access path to the instance (with periods (.)) (Inherited from IInstance [▶ 2549].)
	IsBitType [▶ 2474]	Gets a value indicating whether this instance is not basing on a full DataType but instead of some sort of bit mapping (Inherited from IBitSize [▶ 2472].)
	IsByteAligned [▶ 2475]	Indicates that the Size of the Object is Byte aligned ($\text{BitSize} \% 8 == 0$) (Inherited from IBitSize [▶ 2472].)
	IsPointer [▶ 2552]	Indicates that the IInstance [▶ 2549] represents a Pointer type (Pointer TO) (Inherited from IInstance [▶ 2549].)
	IsReference [▶ 2552]	Indicates that the IInstance [▶ 2549] represents a Reference type (REFERENCE TO) (Inherited from IInstance [▶ 2549].)
	IsStatic [▶ 2553]	Gets a value indicating whether this IInstance [▶ 2549] is static. (Inherited from IInstance [▶ 2549].)
	Offset [▶ 2564]	Gets the offset of the IMember within the parent IStructType [▶ 2671] in bits or bytes dependent on IsBitType .
	ParentType [▶ 2538]	Gets the Parent Struct/Union of this IField [▶ 2535]. (Inherited from IField [▶ 2535].)
	Size [▶ 2475]	Gets the size of the object in bytes or Bits dependant on IsBitType [▶ 2474] (Inherited from IBitSize [▶ 2472].)
	TypeName [▶ 2553]	Gets the name of the DataType [▶ 2475] that is used for this IInstance [▶ 2549]. (Inherited from IInstance [▶ 2549].)
	ValueEncoding [▶ 2472]	Gets the value encoding. (Inherited from IAttributedInstance [▶ 2469].)

Extension Methods

	Name	Description
	ReferencesExternalData [▶ 3038]	Indicates, that the Instance value includes process memory data, that cannot be read in one memory block. (Defined by DataTypeExtension [▶ 3021].)

Reference

[TwinCAT.TypeSystem Namespace](#) [[▶ 2083](#)]

6.11.58.1 IMember Properties

The [IMember](#) [[▶ 2561](#)] type exposes the following members.

Properties

	Name	Description
	Attributes [▶ 2471]	Gets the Type Attributes. (Inherited from IAttributedInstance [▶ 2469].)
	BitOffset [▶ 2563]	Gets the bit offset.

	Name	Description
	BitSize [▶ 2473]	Gets the size of the IDataType [▶ 2475] in bits. (Inherited from IBitSize [▶ 2472].)
	ByteOffset [▶ 2564]	Gets the byte offset.
	ByteSize [▶ 2474]	Gets the (aligned) size of of the Type/Instance in Bytes (Inherited from IBitSize [▶ 2472].)
	Comment [▶ 2550]	Gets the comment of the IInstance [▶ 2549] (Inherited from IInstance [▶ 2549].)
	DataType [▶ 2551]	Gets the IDataType [▶ 2475] of the IInstance [▶ 2549] . (Inherited from IInstance [▶ 2549].)
	InstanceName [▶ 2551]	Gets the name of the instance (without periods (.)) (Inherited from IInstance [▶ 2549].)
	InstancePath [▶ 2552]	Gets the relative / absolute access path to the instance (with periods (.)) (Inherited from IInstance [▶ 2549].)
	IsBitType [▶ 2474]	Gets a value indicating whether this instance is not basing on a full IDataType but instead of some sort of bit mapping (Inherited from IBitSize [▶ 2472].)
	IsByteAligned [▶ 2475]	Indicates that the Size of the Object is Byte aligned ($\text{BitSize} \% 8 == 0$) (Inherited from IBitSize [▶ 2472].)
	IsPointer [▶ 2552]	Indicates that the IInstance [▶ 2549] represents a Pointer type (Pointer TO) (Inherited from IInstance [▶ 2549].)
	IsReference [▶ 2552]	Indicates that the IInstance [▶ 2549] represents a Reference type (REFERENCE TO) (Inherited from IInstance [▶ 2549].)
	IsStatic [▶ 2553]	Gets a value indicating whether this IInstance [▶ 2549] is static. (Inherited from IInstance [▶ 2549].)
	Offset [▶ 2564]	Gets the offset of the IMember [▶ 2561] within the parent IStructType [▶ 2671] in bits or bytes dependent on IsBitType .
	ParentType [▶ 2538]	Gets the Parent Struct/Union of this IField [▶ 2535] . (Inherited from IField [▶ 2535].)
	Size [▶ 2475]	Gets the size of the object in bytes or Bits dependant on IsBitType [▶ 2474] (Inherited from IBitSize [▶ 2472].)
	TypeName [▶ 2553]	Gets the name of the DataType [▶ 2475] that is used for this IInstance [▶ 2549] . (Inherited from IInstance [▶ 2549].)
	ValueEncoding [▶ 2472]	Gets the value encoding. (Inherited from IAttributedInstance [▶ 2469].)

Interface [IMemberCollection](#) Implements the [IInstanceCollection.T. \[▶ 2554\]](#)

Namespace: [TwinCAT.TypeSystem \[▶ 2083\]](#)

Assembly: TwinCAT.Ads.Abstractions (in TwinCAT.Ads.Abstractions.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public interface IMemberCollection : IInstanceCollection<IMember>,
    IList<IMember>, ICollection<IMember>, IEnumerable<IMember>,
    IEnumerable
```

The [IMemberCollection](#) type exposes the following members.

Properties

	Name	Description
	Count	Gets the number of elements contained in the ICollection.T.. (Inherited from ICollection.IMember [▶ 2561] ..)
	Instances [▶ 2567]	Gets the Instance members (non static)
	IsReadOnly	Gets a value indicating whether the ICollection.T. is read-only. (Inherited from ICollection.IMember [▶ 2561] ..)
	Item.Int32.	Gets or sets the element at the specified index. (Inherited from IList.IMember [▶ 2561] ..)
	Item.String. [▶ 2556]	Gets the IInstance [▶ 2549] with the specified instance path. (Inherited from IInstanceCollection.T. [▶ 2554] .)
	Mode [▶ 2556]	Gets the InstanceCollectionMode [▶ 2573] . (Inherited from IInstanceCollection.T. [▶ 2554] .)
	Statics [▶ 2567]	Gets the Static Members

Methods

	Name	Description
	Add	Adds an item to the ICollection.T.. (Inherited from ICollection.IMember [▶ 2561]..)
	CalcSize [▶ 2569]	Calculates the Byte Size of the IMemberCollection
	Clear	Removes all items from the ICollection.T.. (Inherited from ICollection.IMember [▶ 2561]..)
	Contains(T)	Determines whether the ICollection.T. contains a specific value. (Inherited from ICollection.IMember [▶ 2561]..)
	Contains(String) [▶ 2558]	Determines whether this collection contains an instance with the specified instance path. (Inherited from InstanceCollection.T. [▶ 2554]..)
	ContainsName [▶ 2558]	Determines whether this collection contains an instance with the specified instance name. (Inherited from InstanceCollection.T. [▶ 2554]..)
	CopyTo	Copies the elements of the ICollection.T. to an Array, starting at a particular Array index. (Inherited from ICollection.IMember [▶ 2561]..)
	GetEnumerator	Returns an enumerator that iterates through the collection. (Inherited from IEnumerable.IMember [▶ 2561]..)

6.11.59.2.1 IMemberCollection.TryGetMember Method

Gets the member with the specified name from the collection.

Namespace: [TwinCAT.TypeSystem \[► 2083\]](#)

Assembly: TwinCAT.Ads.Abstractions (in TwinCAT.Ads.Abstractions.dll) Version: 6.0.328+39e3229

Syntax

C#

```
bool TryGetMember(  
    string memberName,  
    out IMember?? symbol  
)
```

Parameters

memberName	Type: System.String Name of the member.
symbol	Type: TwinCAT.TypeSystem.IMember [► 2561] . The symbol.

Return Value

Type: Boolean
true if found, false otherwise.

Reference

6.11.63 InsufficientAccessRightsException Class

Insufficient rights for access

Inheritance Hierarchy

System.Object
 System.Exception
 TwinCAT.AdsException [[▶ 61](#)]
 TwinCAT.TypeSystem.SymbolException [[▶ 2933](#)]
 TwinCAT.TypeSystem.InsufficientAccessRightsException

Namespace: [TwinCAT.TypeSystem](#) [[▶ 2083](#)]

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
[SerializableAttribute]
public sealed class InsufficientAccessRightsException : SymbolException
```

The InsufficientAccessRightsException type exposes the following members.

Constructors

	Name	Description
	InsufficientAccessRightsException [▶ 2575]	Initializes a new instance of the InsufficientAccessRightsException class.

Properties

	Name	Description
	Data	Gets a collection of key/value pairs that provide additional user-defined information about the exception. (Inherited from Exception.)
	HelpLink	Gets or sets a link to the help file associated with this exception. (Inherited from Exception.)
	HResult	Gets or sets HRESULT, a coded numerical value that is assigned to a specific exception. (Inherited from Exception.)
	InnerException	Gets the Exception instance that caused the current exception. (Inherited from Exception.)
	InstancePath [▶ 2944]	Gets the instance path. (Inherited from SymbolException [▶ 2933].)
	Message	Gets a message that describes the current exception. (Inherited from Exception.)
	Source	Gets or sets the name of the application or the object that causes the error. (Inherited from Exception.)
	StackTrace	Gets a string representation of the immediate frames on the call stack. (Inherited from Exception.)
	Symbol [▶ 2944]	Gets the symbol. (Inherited from SymbolException [▶ 2933].)
	TargetSite	Gets the method that throws the current exception. (Inherited from Exception.)

Methods

	Name	Description
	Equals	Determines whether the specified object is equal to the current object. (Inherited from Object.)
	GetBaseException	When overridden in a derived class, returns the Exception that is the root cause of one or more subsequent exceptions. (Inherited from Exception.)

	Name	Description
	GetHashCode	Serves as the default hash function. (Inherited from Object.)
	GetObjectData [▶ 2945]	When overridden in a derived class, sets the SerializationInfo with information about the exception. (Inherited from SymbolException [▶ 2933] .)
	GetType	Gets the runtime type of the current instance. (Inherited from Exception.)
	ToString	Creates and returns a string representation of the current exception. (Inherited from Exception.)

6.11.64 IOversamplingArrayInstance Interface

Interface [IOversamplingArrayInstance](#)

Namespace: [TwinCAT.TypeSystem](#) [[▶ 2083](#)]

Assembly: [TwinCAT.Ads.Abstractions](#) (in [TwinCAT.Ads.Abstractions.dll](#)) Version: 6.0.328+39e3229

Syntax

C#

```
public interface IOversamplingArrayInstance : IArrayInstance,
    ISymbol, IAttributedInstance, IInstance, IBitSize
```

The IOversamplingArrayInstance type exposes the following members.

Properties

	Name	Description
	Attributes [▶ 2471]	Gets the Type Attributes. (Inherited from IAttributedInstance [▶ 2469].)
	BitSize [▶ 2473]	Gets the size of the IDataType [▶ 2475] in bits. (Inherited from IBitSize [▶ 2472].)
	ByteSize [▶ 2474]	Gets the (aligned) size of of the Type/Instance in Bytes (Inherited from IBitSize [▶ 2472].)
	Category [▶ 2694]	Gets the Symbol/Datatype Category (Inherited from ISymbol [▶ 2691].)
	Comment [▶ 2550]	Gets the comment of the IInstance [▶ 2549] (Inherited from IInstance [▶ 2549].)
	DataType [▶ 2551]	Gets the IDataType [▶ 2475] of the IInstance [▶ 2549]. (Inherited from IInstance [▶ 2549].)
	Dimensions [▶ 2456]	Gets the dimensions as read only collection. (Inherited from IArrayInstance [▶ 2453].)
	Elements [▶ 2456]	Gets the contained Array Elements as read only collection. (Inherited from IArrayInstance [▶ 2453].)
	ElementType [▶ 2457]	Gets the type of the contained elements. (Inherited from IArrayInstance [▶ 2453].)
	InstanceName [▶ 2551]	Gets the name of the instance (without periods (.)) (Inherited from IInstance [▶ 2549].)
	InstancePath [▶ 2552]	Gets the relative / absolute access path to the instance (with periods (.)) (Inherited from IInstance [▶ 2549].)
	IsBitType [▶ 2474]	Gets a value indicating whether this instance is not basing on a full DataType but instead of some sort of bit mapping (Inherited from IBitSize [▶ 2472].)
	IsByteAligned [▶ 2475]	Indicates that the Size of the Object is Byte aligned ($BitSize \% 8 == 0$) (Inherited from IBitSize [▶ 2472].)
	IsContainerType [▶ 2694]	Gets a value indicating whether this Symbol is acontainer type. (Inherited from ISymbol [▶ 2691].)
	IsPersistent [▶ 2694]	Gets a value indicating whether this ISymbol [▶ 2691] is persistent. (Inherited from ISymbol [▶ 2691].)
	IsPointer [▶ 2552]	Indicates that the IInstance [▶ 2549] represents a Pointer type (Pointer TO) (Inherited from IInstance [▶ 2549].)
	IsPrimitiveType [▶ 2695]	Gets a value indicating whether this instance is a primitive type. (Inherited from ISymbol [▶ 2691].)
	IsReadOnly [▶ 2695]	Indicates that this instance is read only. (Inherited from ISymbol [▶ 2691].)
	IsRecursive [▶ 2696]	Gets a value indicating whether this instance is recursive. (Inherited from ISymbol [▶ 2691].)
	IsReference [▶ 2552]	Indicates that the IInstance [▶ 2549] represents a Reference type (REFERENCE TO) (Inherited from IInstance [▶ 2549].)
	IsStatic [▶ 2553]	Gets a value indicating whether this IInstance [▶ 2549] is static. (Inherited from IInstance [▶ 2549].)
	Item [▶ 2457]	Gets the ISymbol [▶ 2691] with the specified indices. (Inherited from IArrayInstance [▶ 2453].)

	Name	Description
	OversamplingElement [▶ 2579]	Gets the oversampling element.
	Parent [▶ 2696]	Gets the parent Symbol (Inherited from ISymbol [▶ 2691].)
	Size [▶ 2475]	Gets the size of the object in bytes or Bits dependant on IsBitType [▶ 2474] (Inherited from IBitSize [▶ 2472].)
	SubSymbols [▶ 2696]	Gets the SubSymbols of the ISymbol [▶ 2691] (Inherited from ISymbol [▶ 2691].)
	TypeName [▶ 2553]	Gets the name of the DataType [▶ 2475] that is used for this Instance [▶ 2549]. (Inherited from Instance [▶ 2549].)
	ValueEncoding [▶ 2472]	Gets the value encoding. (Inherited from AttributedInstance [▶ 2469].)

Extension Methods

	Name	Description
	ReferencesExternalData [▶ 3038]	Indicates, that the Instance value includes process memory data, that cannot be read in one memory block. (Defined by DataTypeExtension [▶ 3021].)

Reference

6.11.64.1 IOversamplingArrayInstance Properties

The [IOversamplingArrayInstance](#) [[▶ 2576](#)] type exposes the following members.

Properties

	Name	Description
	Attributes [▶ 2471]	Gets the Type Attributes. (Inherited from AttributedInstance [▶ 2469].)
	BitSize [▶ 2473]	Gets the size of the IDataType [▶ 2475] in bits. (Inherited from IBitSize [▶ 2472].)
	ByteSize [▶ 2474]	Gets the (aligned) size of of the Type/Instance in Bytes (Inherited from IBitSize [▶ 2472].)
	Category [▶ 2694]	Gets the Symbol/Datatype Category (Inherited from ISymbol [▶ 2691].)
	Comment [▶ 2550]	Gets the comment of the Instance [▶ 2549] (Inherited from Instance [▶ 2549].)
	DataType [▶ 2551]	Gets the IDataType [▶ 2475] of the Instance [▶ 2549]. (Inherited from Instance [▶ 2549].)
	Dimensions [▶ 2456]	Gets the dimensions as read only collection. (Inherited from IArrayInstance [▶ 2453].)
	Elements [▶ 2456]	Gets the contained Array Elements as read only collection. (Inherited from IArrayInstance [▶ 2453].)
	ElementType [▶ 2457]	Gets the type of the contained elements. (Inherited from IArrayInstance [▶ 2453].)

	Name	Description
	InstanceName [▶ 2551]	Gets the name of the instance (without periods (.)) (Inherited from IInstance [▶ 2549].)
	InstancePath [▶ 2552]	Gets the relative / absolute access path to the instance (with periods (.)) (Inherited from IInstance [▶ 2549].)
	IsBitType [▶ 2474]	Gets a value indicating whether this instance is not basing on a full DataType but instead of some sort of bit mapping (Inherited from IBitSize [▶ 2472].)
	IsByteAligned [▶ 2475]	Indicates that the Size of the Object is Byte aligned ($\text{BitSize} \% 8 == 0$) (Inherited from IBitSize [▶ 2472].)
	IsContainerType [▶ 2694]	Gets a value indicating whether this Symbol is a container type. (Inherited from ISymbol [▶ 2691].)
	IsPersistent [▶ 2694]	Gets a value indicating whether this ISymbol [▶ 2691] is persistent. (Inherited from ISymbol [▶ 2691].)
	IsPointer [▶ 2552]	Indicates that the IInstance [▶ 2549] represents a Pointer type (Pointer TO) (Inherited from IInstance [▶ 2549].)
	IsPrimitiveType [▶ 2695]	Gets a value indicating whether this instance is a primitive type. (Inherited from ISymbol [▶ 2691].)
	IsReadOnly [▶ 2695]	Indicates that this instance is read only. (Inherited from ISymbol [▶ 2691].)
	IsRecursive [▶ 2696]	Gets a value indicating whether this instance is recursive. (Inherited from ISymbol [▶ 2691].)
	IsReference [▶ 2552]	Indicates that the IInstance [▶ 2549] represents a Reference type (REFERENCE TO) (Inherited from IInstance [▶ 2549].)
	IsStatic [▶ 2553]	Gets a value indicating whether this IInstance [▶ 2549] is static. (Inherited from IInstance [▶ 2549].)
	Item [▶ 2457]	Gets the ISymbol [▶ 2691] with the specified indices. (Inherited from IArrayInstance [▶ 2453].)
	OversamplingElement [▶ 2579]	Gets the oversampling element.
	Parent [▶ 2696]	Gets the parent Symbol (Inherited from ISymbol [▶ 2691].)
	Size [▶ 2475]	Gets the size of the object in bytes or Bits dependant on IsBitType [▶ 2474] (Inherited from IBitSize [▶ 2472].)
	SubSymbols [▶ 2696]	Gets the SubSymbols of the ISymbol [▶ 2691] (Inherited from ISymbol [▶ 2691].)
	TypeName [▶ 2553]	Gets the name of the DataType [▶ 2475] that is used for this IInstance [▶ 2549]. (Inherited from IInstance [▶ 2549].)
	ValueEncoding [▶ 2472]	Gets the value encoding. (Inherited from AttributedInstance [▶ 2469].)

```

Property Value

Type: [ISymbol](#) [[▶ 2691](#)]

The reference symbol or NULL if PVOID Pointer.

Reference

[IPointerInstance Interface](#) [[▶ 2580](#)]

[TwinCAT.TypeSystem Namespace](#) [[▶ 2083](#)]

6.11.65.2 IPointerInstance Methods

The [IPointerInstance](#) [[▶ 2580](#)] type exposes the following members.

Extension Methods

	Name	Description
	ReferencesExternalData [▶ 3038]	Indicates, that the Instance value includes process memory data, that cannot be read in one memory block. (Defined by DataTypeExtension [▶ 3021].)

Reference

[IPointerInstance Interface \[▶ 2580\]](#)

[TwinCAT.TypeSystem Namespace \[▶ 2083\]](#)

6.11.66 IPointerType Interface

Interface representing a pointer type

Namespace: [TwinCAT.TypeSystem \[▶ 2083\]](#)

Assembly: TwinCAT.Ads.Abstractions (in TwinCAT.Ads.Abstractions.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public interface IPointerType : IDataTypeInfo,
    IBitSize
```

The IPointerType type exposes the following members.

Properties

	Name	Description
	Attributes [▶ 2478]	Gets the attributes of the IDataTypeInfo [▶ 2475] (Inherited from IDataTypeInfo [▶ 2475] .)
	BitSize [▶ 2473]	Gets the size of the IDataTypeInfo [▶ 2475] in bits. (Inherited from IBitSize [▶ 2472] .)
	ByteSize [▶ 2474]	Gets the (aligned) size of of the Type/Instance in Bytes (Inherited from IBitSize [▶ 2472] .)
	Category [▶ 2478]	Gets the Data Type category (Inherited from IDataTypeInfo [▶ 2475] .)
	Comment [▶ 2479]	Gets the comment behind the variable declaration. (Inherited from IDataTypeInfo [▶ 2475] .)
	FullName [▶ 2479]	Gets the full name of the IDataTypeInfo [▶ 2475] (Namespace + Name) (Inherited from IDataTypeInfo [▶ 2475] .)
	Id [▶ 2480]	Gets the ID of the Data Type (Inherited from IDataTypeInfo [▶ 2475] .)
	IsBitType [▶ 2474]	Gets a value indicating whether this instance is not basing on a full IDataTypeInfo but instead of some sort of bit mapping (Inherited from IBitSize [▶ 2472] .)
	IsByteAligned [▶ 2475]	Indicates that the Size of the Object is Byte aligned ($\text{BitSize} \% 8 == 0$) (Inherited from IBitSize [▶ 2472] .)
	Name [▶ 2482]	Gets the name of the Data Type (without namespace) (Inherited from IDataTypeInfo [▶ 2475] .)
	Namespace [▶ 2482]	Gets the namespace string within the IDataTypeInfo [▶ 2475] exists. (Inherited from IDataTypeInfo [▶ 2475] .)
	ReferencedType [▶ 2586]	Gets the the referenced type.
	ReferenceTypeName [▶ 2587]	Gets the name of the referenced datatype
	Size [▶ 2475]	Gets the size of the object in bytes or Bits dependant on IsBitType [▶ 2474] (Inherited from IBitSize [▶ 2472] .)

Extension Methods

Name	Description
IsArrayOfPrimitives [▶ 3025]	Overloaded. Determines whether the dataType is an array of Primitives. (Defined by DataTypeExtension [▶ 3021].)
IsArrayOfPrimitives(Boolean) [▶ 3025]	Overloaded. Determines whether the dataType is an array of Primitives. (Defined by DataTypeExtension [▶ 3021].)
IsContainer [▶ 3027]	Overloaded. Gets a value indicating whether this IDataType [▶ 2475] is a container type (Defined by DataTypeExtension [▶ 3021].)
IsContainer(Boolean) [▶ 3028]	Overloaded. Gets a value indicating whether this IDataType [▶ 2475] is a container type (Defined by DataTypeExtension [▶ 3021].)
IsPointer [▶ 3031]	Gets a value indicating whether this IDataType [▶ 2475] is a pointer type (Defined by DataTypeExtension [▶ 3021].)
IsPrimitive [▶ 3033]	Overloaded. Gets a value indicating whether this IDataType [▶ 2475] is primitive (Defined by DataTypeExtension [▶ 3021].)
IsPrimitive(Boolean) [▶ 3034]	Overloaded. Gets a value indicating whether this IDataType [▶ 2475] is primitive (Defined by DataTypeExtension [▶ 3021].)
IsReference [▶ 3036]	Gets a value indicating whether this IDataType [▶ 2475] is a reference type (Defined by DataTypeExtension [▶ 3021].)
ReferencesExternalData [▶ 3037]	Indicates, that the Instance value includes process memory data, that cannot be read in one memory block. (Defined by DataTypeExtension [▶ 3021].)
ResolvableAsPrimitive [▶ 3039]	Overloaded. Indicates, that this data type can be resolved as primitive or primitive Array. (Defined by DataTypeExtension [▶ 3021].)
ResolvableAsPrimitive(Boolean) [▶ 3039]	Overloaded. Indicates, that this data type can be resolved as primitive or primitive Array. (Defined by DataTypeExtension [▶ 3021].)
Resolve [▶ 3040]	Overloaded. Resolves the specified data type for AliasReference [▶ 3042] (Defined by DataTypeExtension [▶ 3021].)
Resolve(DataTypeResolveStrategy) [▶ 3041]	Overloaded. Resolves the specified strategy. (Defined by DataTypeExtension [▶ 3021].)

6.11.66.1.1 IPointerType.ReferencedType Property

Gets the the referenced type.

Namespace: [TwinCAT.TypeSystem \[▸ 2083\]](#)

Assembly: TwinCAT.Ads.Abstractions (in TwinCAT.Ads.Abstractions.dll) Version: 6.0.328+39e3229

Syntax

C#

```
IDataType? ReferencedType { get; }
```

Property Value

Type: [IDataType \[▸ 2475\]](#)

The datatype of the reference or **null** if not resolved.

Reference

6.11.66.2 IPointerType Methods

The [IPointerType \[▸ 2584\]](#) type exposes the following members.

Extension Methods

	Name	Description
	IsArrayOfPrimitives [▸ 3025]	Overloaded. Determines whether the dataType is an array of Primitives. (Defined by DataTypeExtension [▸ 3021] .)
	IsArrayOfPrimitives(Boolean) [▸ 3025]	Overloaded. Determines whether the dataType is an array of Primitives. (Defined by DataTypeExtension [▸ 3021] .)
	IsContainer [▸ 3027]	Overloaded.

Name	Description
	Gets a value indicating whether this IDataType [▶ 2475] is a container type (Defined by DataTypeExtension [▶ 3021].)
IsContainer(Boolean) [▶ 3028]	Overloaded. Gets a value indicating whether this IDataType [▶ 2475] is a container type (Defined by DataTypeExtension [▶ 3021].)
IsPointer [▶ 3031]	Gets a value indicating whether this IDataType [▶ 2475] is a pointer type (Defined by DataTypeExtension [▶ 3021].)
IsPrimitive. [▶ 3033]	Overloaded. Gets a value indicating whether this IDataType [▶ 2475] is primitive (Defined by DataTypeExtension [▶ 3021].)
IsPrimitive(Boolean) [▶ 3034]	Overloaded. Gets a value indicating whether this IDataType [▶ 2475] is primitive (Defined by DataTypeExtension [▶ 3021].)
IsReference [▶ 3036]	Gets a value indicating whether this IDataType [▶ 2475] is a reference type (Defined by DataTypeExtension [▶ 3021].)
ReferencesExternalData [▶ 3037]	Indicates, that the Instance value includes process memory data, that cannot be read in one memory block. (Defined by DataTypeExtension [▶ 3021].)
ResolvableAsPrimitive. [▶ 3039]	Overloaded. Indicates, that this data type can be resolved as primitive or primitive Array. (Defined by DataTypeExtension [▶ 3021].)
ResolvableAsPrimitive(Boolean) [▶ 3039]	Overloaded. Indicates, that this data type can be resolved as primitive or primitive Array. (Defined by DataTypeExtension [▶ 3021].)
Resolve. [▶ 3040]	Overloaded. Resolves the specified data type for AliasReference [▶ 3042] (Defined by DataTypeExtension [▶ 3021].)
Resolve(DataTypeResolveStrategy) [▶ 3041]	Overloaded. Resolves the specified strategy. (Defined by DataTypeExtension [▶ 3021].)

6.11.67 IPrimitiveType Interface

Interface [IPrimitiveType](#)

Namespace: [TwinCAT.TypeSystem](#) [[▶ 2083](#)]

Assembly: TwinCAT.Ads.Abstractions (in TwinCAT.Ads.Abstractions.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public interface IPrimitiveType : IDataTypeInfo,
    IBitSize
```

The [IPrimitiveType](#) type exposes the following members.

Properties

	Name	Description
	Attributes [▶ 2478]	Gets the attributes of the IDataType [▶ 2475] (Inherited from IDataType [▶ 2475].)
	BitSize [▶ 2473]	Gets the size of the IDataType [▶ 2475] in bits. (Inherited from IBitSize [▶ 2472].)
	ByteSize [▶ 2474]	Gets the (aligned) size of of the Type/Instance in Bytes (Inherited from IBitSize [▶ 2472].)
	Category [▶ 2478]	Gets the Data Type category (Inherited from IDataType [▶ 2475].)
	Comment [▶ 2479]	Gets the comment behind the variable declaration. (Inherited from IDataType [▶ 2475].)
	FullName [▶ 2479]	Gets the full name of the IDataType [▶ 2475] (Namespace + Name) (Inherited from IDataType [▶ 2475].)
	Id [▶ 2480]	Gets the ID of the Data Type (Inherited from IDataType [▶ 2475].)
	IsBitType [▶ 2474]	Gets a value indicating whether this instance is not basing on a full Data Type but instead of some sort of bit mapping (Inherited from IBitSize [▶ 2472].)
	IsByteAligned [▶ 2475]	Indicates that the Size of the Object is Byte aligned ($\text{BitSize} \% 8 == 0$) (Inherited from IBitSize [▶ 2472].)
	Name [▶ 2482]	Gets the name of the Data Type (without namespace) (Inherited from IDataType [▶ 2475].)
	Namespace [▶ 2482]	Gets the namespace string within the IDataType [▶ 2475] exists. (Inherited from IDataType [▶ 2475].)
	PrimitiveFlags [▶ 2591]	Indicates types of different PrimitiveTypes with flags.
	Size [▶ 2475]	Gets the size of the object in bytes or Bits dependant on IsBitType [▶ 2474] (Inherited from IBitSize [▶ 2472].)

Extension Methods

	Name	Description
	IsArrayOfPrimitives [▶ 3025]	Overloaded. Determines whether the dataType is an array of Primitives. (Defined by DataTypeExtension [▶ 3021].)
	IsArrayOfPrimitives(Boolean) [▶ 3025]	Overloaded. Determines whether the dataType is an array of Primitives. (Defined by DataTypeExtension [▶ 3021].)
	IsContainer [▶ 3027]	Overloaded. Gets a value indicating whether this IDataType [▶ 2475] is a container type (Defined by DataTypeExtension [▶ 3021].)
	IsContainer(Boolean) [▶ 3028]	Overloaded. Gets a value indicating whether this IDataType [▶ 2475] is a container type (Defined by DataTypeExtension [▶ 3021].)
	IsPointer [▶ 3031]	Gets a value indicating whether this IDataType [▶ 2475] is a pointer type (Defined by DataTypeExtension [▶ 3021].)
	IsPrimitive [▶ 3033]	Overloaded. Gets a value indicating whether this IDataType [▶ 2475] is primitive (Defined by DataTypeExtension [▶ 3021].)

	Name	Description
	IsPrimitive(Boolean) [▶ 3034]	Overloaded. Gets a value indicating whether this IDataType [▶ 2475] is primitive (Defined by DataTypeExtension [▶ 3021].)
	IsReference [▶ 3036]	Gets a value indicating whether this IDataType [▶ 2475] is a reference type (Defined by DataTypeExtension [▶ 3021].)
	ReferencesExternalData [▶ 3037]	Indicates, that the Instance value includes process memory data, that cannot be read in one memory block. (Defined by DataTypeExtension [▶ 3021].)
	ResolvableAsPrimitive [▶ 3039]	Overloaded. Indicates, that this data type can be resolved as primitive or primitive Array. (Defined by DataTypeExtension [▶ 3021].)
	ResolvableAsPrimitive(Boolean) [▶ 3039]	Overloaded. Indicates, that this data type can be resolved as primitive or primitive Array. (Defined by DataTypeExtension [▶ 3021].)
	Resolve . [▶ 3040]	Overloaded. Resolves the specified data type for AliasReference [▶ 3042] (Defined by DataTypeExtension [▶ 3021].)
	Resolve(DataTypeResolveStrategy) [▶ 3041]	Overloaded. Resolves the specified strategy. (Defined by DataTypeExtension [▶ 3021].)

6.11.68.1.1 IProcessImageAddress.IndexGroup Property

Gets the index group of the Symbol

Namespace: [TwinCAT.TypeSystem](#) [[▶ 2083](#)]

Assembly: TwinCAT.Ads.Abstractions (in TwinCAT.Ads.Abstractions.dll) Version: 6.0.328+39e3229

Syntax

C#

```
uint IndexGroup { get; }
```

Property Value

Type: UInt32
The index group.

Reference

[IProcessImageAddress Interface](#) [[▶ 2593](#)]

[TwinCAT.TypeSystem Namespace](#) [[▶ 2083](#)]

6.11.68.1.2 IProcessImageAddress.IndexOffset Property

Gets the index offset of the Symbol

Namespace: [TwinCAT.TypeSystem](#) [[▶ 2083](#)]

Assembly: TwinCAT.Ads.Abstractions (in TwinCAT.Ads.Abstractions.dll) Version: 6.0.328+39e3229

Syntax

C#

```
uint IndexOffset { get; }
```

Property Value

Type: UInt32
The index offset.

Reference

[IProcessImageAddress Interface \[► 2593\]](#)

[TwinCAT.TypeSystem Namespace \[► 2083\]](#)

6.11.68.1.3 IProcessImageAddress.IsVirtual Property

Gets a value indicating whether this instance is virtual.

Namespace: [TwinCAT.TypeSystem \[► 2083\]](#)

Assembly: TwinCAT.Ads.Abstractions (in TwinCAT.Ads.Abstractions.dll) Version: 6.0.328+39e3229

Syntax

C#

```
bool IsVirtual { get; }
```

Property Value

Type: Boolean

true if this instance is virtual; otherwise, false.

Remarks

Virtual symbols are only organizational elements within the Symbols Hierarchy and cannot be accessed separately by IndexGroup/IndexOffset, Value Read/Writes, notifications or handles.

Assembly: TwinCAT.Ads.Abstractions (in TwinCAT.Ads.Abstractions.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public interface IReferenceInstance : ISymbol,
    IAttributedInstance, IInstance, IBitSize
```

The IReferenceInstance type exposes the following members.

Properties

	Name	Description
	Attributes [► 2471]	Gets the Type Attributes. (Inherited from IAttributedInstance [► 2469] .)
	BitSize [► 2473]	Gets the size of the IDataType [► 2475] in bits. (Inherited from IBitSize [► 2472] .)
	ByteSize [► 2474]	Gets the (aligned) size of of the Type/Instance in Bytes (Inherited from IBitSize [► 2472] .)
	Category [► 2694]	Gets the Symbol/Datatype Category (Inherited from ISymbol [► 2691] .)

	Name	Description
	Comment [▶ 2550]	Gets the comment of the IInstance [▶ 2549] (Inherited from IInstance [▶ 2549].)
	DataType [▶ 2551]	Gets the IDataType [▶ 2475] of the IInstance [▶ 2549]. (Inherited from IInstance [▶ 2549].)
	InstanceName [▶ 2551]	Gets the name of the instance (without periods (.)) (Inherited from IInstance [▶ 2549].)
	InstancePath [▶ 2552]	Gets the relative / absolute access path to the instance (with periods (.)) (Inherited from IInstance [▶ 2549].)
	IsBitType [▶ 2474]	Gets a value indicating whether this instance is not basing on a full DataType but instead of some sort of bit mapping (Inherited from IBitSize [▶ 2472].)
	IsByteAligned [▶ 2475]	Indicates that the Size of the Object is Byte aligned ($\text{BitSize} \% 8 == 0$) (Inherited from IBitSize [▶ 2472].)
	IsContainerType [▶ 2694]	Gets a value indicating whether this Symbol is a container type. (Inherited from ISymbol [▶ 2691].)
	IsPersistent [▶ 2694]	Gets a value indicating whether this ISymbol [▶ 2691] is persistent. (Inherited from ISymbol [▶ 2691].)
	IsPointer [▶ 2552]	Indicates that the IInstance [▶ 2549] represents a Pointer type (Pointer TO) (Inherited from IInstance [▶ 2549].)
	IsPrimitiveType [▶ 2695]	Gets a value indicating whether this instance is a primitive type. (Inherited from ISymbol [▶ 2691].)
	IsReadOnly [▶ 2695]	Indicates that this instance is read only. (Inherited from ISymbol [▶ 2691].)
	IsRecursive [▶ 2696]	Gets a value indicating whether this instance is recursive. (Inherited from ISymbol [▶ 2691].)
	IsReference [▶ 2552]	Indicates that the IInstance [▶ 2549] represents a Reference type (REFERENCE TO) (Inherited from IInstance [▶ 2549].)
	IsStatic [▶ 2553]	Gets a value indicating whether this IInstance [▶ 2549] is static. (Inherited from IInstance [▶ 2549].)
	Parent [▶ 2696]	Gets the parent Symbol (Inherited from ISymbol [▶ 2691].)
	ReferencedType [▶ 2598]	Gets the referenced type
	ResolvedByteSize [▶ 2599]	Get the ByteSize of the (completely) resolved Symbol
	ResolvedCategory [▶ 2599]	Gets the Category of the (completely) resolved Symbol.
	ResolvedType [▶ 2599]	Gets the (completely) resolved type
	Size [▶ 2475]	Gets the size of the object in bytes or Bits dependant on IsBitType [▶ 2474] (Inherited from IBitSize [▶ 2472].)
	SubSymbols [▶ 2696]	Gets the SubSymbols of the ISymbol [▶ 2691] (Inherited from ISymbol [▶ 2691].)
	TypeName [▶ 2553]	Gets the name of the DataType [▶ 2475] that is used for this IInstance [▶ 2549]. (Inherited from IInstance [▶ 2549].)
	ValueEncoding [▶ 2472]	Gets the value encoding. (Inherited from IAttributedInstance [▶ 2469].)

Extension Methods

	Name	Description
	ReferencesExternalData [▶ 3038]	Indicates, that the Instance value includes process memory data, that cannot be read in one memory block. (Defined by DataTypeExtension [▶ 3021].)

Reference

[TwinCAT.TypeSystem Namespace](#) [[▶ 2083](#)]

6.11.69.1 IReferenceInstance Properties

The [IReferenceInstance](#) [[▶ 2595](#)] type exposes the following members.

Properties

	Name	Description
	Attributes [▶ 2471]	Gets the Type Attributes. (Inherited from IAttributedInstance [▶ 2469].)
	BitSize [▶ 2473]	Gets the size of the IDataType [▶ 2475] in bits. (Inherited from IBitSize [▶ 2472].)
	ByteSize [▶ 2474]	Gets the (aligned) size of of the Type/Instance in Bytes (Inherited from IBitSize [▶ 2472].)
	Category [▶ 2694]	Gets the Symbol/Datatype Category (Inherited from ISymbol [▶ 2691].)
	Comment [▶ 2550]	Gets the comment of the IInstance [▶ 2549] (Inherited from IInstance [▶ 2549].)
	DataType [▶ 2551]	Gets the IDataType [▶ 2475] of the IInstance [▶ 2549]. (Inherited from IInstance [▶ 2549].)
	InstanceName [▶ 2551]	Gets the name of the instance (without periods (.)) (Inherited from IInstance [▶ 2549].)
	InstancePath [▶ 2552]	Gets the relative / absolute access path to the instance (with periods (.)) (Inherited from IInstance [▶ 2549].)
	IsBitType [▶ 2474]	Gets a value indicating whether this instance is not basing on a full DataType but instead of some sort of bit mapping (Inherited from IBitSize [▶ 2472].)
	IsByteAligned [▶ 2475]	Indicates that the Size of the Object is Byte aligned ($BitSize \% 8 == 0$) (Inherited from IBitSize [▶ 2472].)
	IsContainerType [▶ 2694]	Gets a value indicating whether this Symbol is acontainer type. (Inherited from ISymbol [▶ 2691].)
	IsPersistent [▶ 2694]	Gets a value indicating whether this ISymbol [▶ 2691] is persistent. (Inherited from ISymbol [▶ 2691].)
	IsPointer [▶ 2552]	Indicates that the IInstance [▶ 2549] represents a Pointer type (Pointer TO) (Inherited from IInstance [▶ 2549].)
	IsPrimitiveType [▶ 2695]	Gets a value indicating whether this instance is a primitive type. (Inherited from ISymbol [▶ 2691].)
	IsReadOnly [▶ 2695]	Indicates that this instance is read only. (Inherited from ISymbol [▶ 2691].)
	IsRecursive [▶ 2696]	Gets a value indicating whether this instance is recursive. (Inherited from ISymbol [▶ 2691].)
	IsReference [▶ 2552]	Indicates that the IInstance [▶ 2549] represents a Reference type (REFERENCE TO) (Inherited from IInstance [▶ 2549].)

	Name	Description
	IsStatic [▶ 2553]	Gets a value indicating whether this IInstance [▶ 2549] is static. (Inherited from IInstance [▶ 2549].)
	Parent [▶ 2696]	Gets the parent Symbol (Inherited from ISymbol [▶ 2691].)
	ReferencedType [▶ 2598]	Gets the referenced type
	ResolvedByteSize [▶ 2599]	Get the ByteSize of the (completely) resolved Symbol
	ResolvedCategory [▶ 2599]	Gets the Category of the (completely) resolved Symbol.
	ResolvedType [▶ 2599]	Gets the (completely) resolved type
	Size [▶ 2475]	Gets the size of the object in bytes or Bits dependant on IsBitType [▶ 2474] (Inherited from IBitSize [▶ 2472].)
	SubSymbols [▶ 2696]	Gets the SubSymbols of the ISymbol [▶ 2691] (Inherited from ISymbol [▶ 2691].)
	TypeName [▶ 2553]	Gets the name of the DataType [▶ 2475] that is used for this IInstance [▶ 2549]. (Inherited from IInstance [▶ 2549].)
	ValueEncoding [▶ 2472]	Gets the value encoding. (Inherited from IAttributedInstance [▶ 2469].)

Reference

[IReferenceInstance Interface](#) [[▶ 2595](#)]

[TwinCAT.TypeSystem Namespace](#) [[▶ 2083](#)]

6.11.69.1.1 IReferenceInstance.ReferencedType Property

Gets the referenced type

Namespace: [TwinCAT.TypeSystem](#) [[▶ 2083](#)]

Assembly: TwinCAT.Ads.Abstractions (in TwinCAT.Ads.Abstractions.dll) Version: 6.0.328+39e3229

Syntax

C#

```
IDataType? ReferencedType { get; }
```

Property Value

Type: [IDataType](#) [[▶ 2475](#)]

The type of the referenced type

Remarks

This is no complete resolvement, only the next level. The referenced type can be a reference again.

Reference

6.11.69.1.2 IReferenceInstance.ResolvedByteSize Property

Get the ByteSize of the (completely) resolved Symbol

Namespace: [TwinCAT.TypeSystem](#) [[▶ 2083](#)]

Assembly: TwinCAT.Ads.Abstractions (in TwinCAT.Ads.Abstractions.dll) Version: 6.0.328+39e3229

Syntax

C#

```
int ResolvedByteSize { get; }
```

Property Value

Type: Int32

The byte size of the resolved type.

Reference

[IReferenceInstance Interface](#) [[▶ 2595](#)]

[TwinCAT.TypeSystem Namespace](#) [[▶ 2083](#)]

6.11.69.1.3 IReferenceInstance.ResolvedCategory Property

Gets the Category of the (completely) resolved Symbol.

Namespace: [TwinCAT.TypeSystem](#) [[▶ 2083](#)]

Assembly: TwinCAT.Ads.Abstractions (in TwinCAT.Ads.Abstractions.dll) Version: 6.0.328+39e3229

Syntax

C#

```
DataTypeCategory ResolvedCategory { get; }
```

Property Value

Type: [DataTypeCategory](#) [[▶ 2111](#)]

The resolved category.

Reference

[IReferenceInstance Interface](#) [[▶ 2595](#)]

[TwinCAT.TypeSystem Namespace](#) [[▶ 2083](#)]

6.11.69.1.4 IReferenceInstance.ResolvedType Property

Gets the (completely) resolved type

Namespace: [TwinCAT.TypeSystem](#) [[▶ 2083](#)]

Assembly: TwinCAT.Ads.Abstractions (in TwinCAT.Ads.Abstractions.dll) Version: 6.0.328+39e3229

Syntax

C#

```
IDataType? ResolvedType { get; }
```

Property ValueType: [IDataType](#) [[▶ 2475](#)]

The type of the resolved symbol

The [IReferenceType](#) type exposes the following members.**Properties**

	Name	Description
	Attributes [▶ 2478]	Gets the attributes of the IDataType [▶ 2475] (Inherited from IDataType [▶ 2475].)
	BitSize [▶ 2473]	Gets the size of the IDataType [▶ 2475] in bits. (Inherited from IBitSize [▶ 2472].)
	ByteSize [▶ 2474]	Gets the (aligned) size of of the Type/Instance in Bytes (Inherited from IBitSize [▶ 2472].)
	Category [▶ 2478]	Gets the Data Type category (Inherited from IDataType [▶ 2475].)
	Comment [▶ 2479]	Gets the comment behind the variable declaration. (Inherited from IDataType [▶ 2475].)
	FullName [▶ 2479]	Gets the full name of the IDataType [▶ 2475] (Namespace + Name) (Inherited from IDataType [▶ 2475].)

	Name	Description
	Id [▶ 2480]	Gets the ID of the DataType (Inherited from IDataType [▶ 2475].)
	IsBitType [▶ 2474]	Gets a value indicating whether this instance is not basing on a full DataType but instead of some sort of bit mapping (Inherited from IBitSize [▶ 2472].)
	IsByteAligned [▶ 2475]	Indicates that the Size of the Object is Byte aligned ($\text{BitSize} \% 8 == 0$) (Inherited from IBitSize [▶ 2472].)
	Name [▶ 2482]	Gets the name of the Data Type (without namespace) (Inherited from IDataType [▶ 2475].)
	Namespace [▶ 2482]	Gets the namespace string within the IDataType [▶ 2475] exists. (Inherited from IDataType [▶ 2475].)
	ReferencedType [▶ 2603]	Gets the the referenced type.
	ReferencedTypeNa me [▶ 2604]	Gets the name of the referenced type.
	ResolvedByteSize [▶ 2604]	Get the ByteSize of the (completely) resolved Symbol
	ResolvedCategory [▶ 2604]	Gets the Category of the (completely) resolved Symbol.
	ResolvedType [▶ 2605]	Gets the (completely) resolved type
	Size [▶ 2475]	Gets the size of the object in bytes or Bits dependant on IsBitType [▶ 2474] (Inherited from IBitSize [▶ 2472].)

Extension Methods

	Name	Description
	IsArrayOfPrimitives. [▶ 3025]	Overloaded. Determines whether the dataType is an array of Primitives. (Defined by DataTypeExtension [▶ 3021].)
	IsArrayOfPrimitives(Boolean) [▶ 3025]	Overloaded. Determines whether the dataType is an array of Primitives. (Defined by DataTypeExtension [▶ 3021].)
	IsContainer. [▶ 3027]	Overloaded. Gets a value indicating whether this IDataType [▶ 2475] is a container type (Defined by DataTypeExtension [▶ 3021].)
	IsContainer(Boolean) [▶ 3028]	Overloaded. Gets a value indicating whether this IDataType [▶ 2475] is a container type (Defined by DataTypeExtension [▶ 3021].)
	IsPointer [▶ 3031]	Gets a value indicating whether this IDataType [▶ 2475] is a pointer type (Defined by DataTypeExtension [▶ 3021].)
	IsPrimitive. [▶ 3033]	Overloaded. Gets a value indicating whether this IDataType [▶ 2475] is primitive (Defined by DataTypeExtension [▶ 3021].)
	IsPrimitive(Boolean) [▶ 3034]	Overloaded. Gets a value indicating whether this IDataType [▶ 2475] is primitive (Defined by DataTypeExtension [▶ 3021].)

	Name	Description
	IsReference [▶ 3036]	Gets a value indicating whether this IDataType [▶ 2475] is a reference type (Defined by DataTypeExtension [▶ 3021].)
	ReferencesExternalData [▶ 3037]	Indicates, that the Instance value includes process memory data, that cannot be read in one memory block. (Defined by DataTypeExtension [▶ 3021].)
	ResolvableAsPrimitive [▶ 3039]	Overloaded. Indicates, that this data type can be resolved as primitive or primitive Array. (Defined by DataTypeExtension [▶ 3021].)
	ResolvableAsPrimitive(Boolean) [▶ 3039]	Overloaded. Indicates, that this data type can be resolved as primitive or primitive Array. (Defined by DataTypeExtension [▶ 3021].)
	Resolve [▶ 3040]	Overloaded. Resolves the specified data type for AliasReference [▶ 3042] (Defined by DataTypeExtension [▶ 3021].)
	Resolve(DataTypeResolveStrategy) [▶ 3041]	Overloaded. Resolves the specified strategy. (Defined by DataTypeExtension [▶ 3021].)

6.11.70.1 IReferenceType Properties

The [IReferenceType](#) [[▶ 2600](#)] type exposes the following members.

Properties

	Name	Description
	Attributes [▶ 2478]	Gets the attributes of the IDataType [▶ 2475] (Inherited from IDataType [▶ 2475].)
	BitSize [▶ 2473]	Gets the size of the IDataType [▶ 2475] in bits. (Inherited from IBitSize [▶ 2472].)
	ByteSize [▶ 2474]	Gets the (aligned) size of of the Type/Instance in Bytes (Inherited from IBitSize [▶ 2472].)
	Category [▶ 2478]	Gets the Data Type category (Inherited from IDataType [▶ 2475].)
	Comment [▶ 2479]	Gets the comment behind the variable declaration. (Inherited from IDataType [▶ 2475].)
	FullName [▶ 2479]	Gets the full name of the IDataType [▶ 2475] (Namespace + Name) (Inherited from IDataType [▶ 2475].)
	Id [▶ 2480]	Gets the ID of the Data Type (Inherited from IDataType [▶ 2475].)

	Name	Description
	IsBitType [▶ 2474]	Gets a value indicating whether this instance is not basing on a full DataType but instead of some sort of bit mapping (Inherited from IBitSize [▶ 2472].)
	IsByteAligned [▶ 2475]	Indicates that the Size of the Object is Byte aligned ($\text{BitSize} \% 8 == 0$) (Inherited from IBitSize [▶ 2472].)
	Name [▶ 2482]	Gets the name of the Data Type (without namespace) (Inherited from IDataType [▶ 2475].)
	Namespace [▶ 2482]	Gets the namespace string within the IDataType [▶ 2475] exists. (Inherited from IDataType [▶ 2475].)
	ReferencedType [▶ 2603]	Gets the the referenced type.
	ReferencedTypeNa me [▶ 2604]	Gets the name of the referenced type.
	ResolvedByteSize [▶ 2604]	Get the ByteSize of the (completely) resolved Symbol
	ResolvedCategory [▶ 2604]	Gets the Category of the (completely) resolved Symbol.
	ResolvedType [▶ 2605]	Gets the (completely) resolved type
	Size [▶ 2475]	Gets the size of the object in bytes or Bits dependant on IsBitType [▶ 2474] (Inherited from IBitSize [▶ 2472].)

[TwinCAT.TypeSystem Namespace \[► 2083\]](#)

6.11.70.1.2 IReferenceType.ReferencedTypeName Property

Gets the name of the referenced type.

Namespace: [TwinCAT.TypeSystem \[► 2083\]](#)

Assembly: TwinCAT.Ads.Abstractions (in TwinCAT.Ads.Abstractions.dll) Version: 6.0.328+39e3229

Syntax

C#

```
string ReferencedTypeName { get; }
```

Property Value

Type: String

The name of the referenced type.

Reference

[IReferenceType Interface \[► 2600\]](#)

[TwinCAT.TypeSystem Namespace \[► 2083\]](#)

6.11.70.1.3 IReferenceType.ResolvedByteSize Property

Get the ByteSize of the (completely) resolved Symbol

Namespace: [TwinCAT.TypeSystem \[► 2083\]](#)

Assembly: TwinCAT.Ads.Abstractions (in TwinCAT.Ads.Abstractions.dll) Version: 6.0.328+39e3229

Syntax

C#

```
int ResolvedByteSize { get; }
```

Property Value

Type: Int32

The size of the resolved byte.

Reference

[IReferenceType Interface \[► 2600\]](#)

[TwinCAT.TypeSystem Namespace \[► 2083\]](#)

6.11.70.1.4 IReferenceType.ResolvedCategory Property

Gets the Category of the (completely) resolved Symbol.

Namespace: [TwinCAT.TypeSystem \[► 2083\]](#)

Assembly: TwinCAT.Ads.Abstractions (in TwinCAT.Ads.Abstractions.dll) Version: 6.0.328+39e3229

Syntax

C#

```
DataTypeCategory ResolvedCategory { get; }
```

Property Value

Type: [DataTypeCategory](#) [▶ 2111]

The resolved category.

Reference

[IReferenceType Interface](#) [▶ 2600]

[TwinCAT.TypeSystem Namespace](#) [▶ 2083]

6.11.70.1.5 IReferenceType.ResolvedType Property

Gets the (completely) resolved type

Namespace: [TwinCAT.TypeSystem](#) [▶ 2083]

Assembly: TwinCAT.Ads.Abstractions (in TwinCAT.Ads.Abstractions.dll) Version: 6.0.328+39e3229

Syntax

C#

```
IDataType? ResolvedType { get; }
```

Property Value

Type: [IDataType](#) [▶ 2475]

The type of the resolved symbol

Reference

Overload List

	Name	Description
	InvokeRpcMethod(String, .Object.) [▶ 2609]	Invokes the specified RPC Method
	InvokeRpcMethod(String, .Object., .Object..) [▶ 2610]	Invokes the specified RPC Method

Reference

[IRpcCallableInstance Interface](#) [[▶ 2606](#)]

[TwinCAT.TypeSystem Namespace](#) [[▶ 2083](#)]

6.11.71.2.1.1 IRpcCallableInstance.InvokeRpcMethod Method (String, .Object.)

Invokes the specified RPC Method

Namespace: [TwinCAT.TypeSystem](#) [[▶ 2083](#)]

Assembly: TwinCAT.Ads.Abstractions (in TwinCAT.Ads.Abstractions.dll) Version: 6.0.328+39e3229

Syntax

C#

```
Object? InvokeRpcMethod(
    string methodName,
    Object[]? inParameters
)
```

Parameters

methodName	Type: System.String The method name.
inParameters	Type: .System.Object. The input parameters or NULL

Return Value

Type: Object
The return value of the Method (as object).

Remarks

This method only supports primitive data types as inParameters. Any available outparameters will be ignored. Complex types will fall back to byte[] arrays.

Examples

The following sample shows how to call (Remote Procedures / Methods) within the PLC.

Dynamic Tree Mode

```
class RpcCallVirtualProgram
{
    /// <summary>
```

```

/// Defines the entry point of the application.
/// </summary>
/// <param name="args">The arguments.</param>
static void Main(string[] args)
{
    // Get the AdsAddress from command-line arguments
    AmsAddress address = ArgParser.Parse(args);

    using (AdsClient client = new AdsClient())
    {
        //client.Synchronize = false;

        // Connect to the target device
        client.Connect(address);

        SymbolLoaderSettings settings = new SymbolLoaderSettings(SymbolLoadMode.VirtualTree);
        ISymbolLoader loader = SymbolLoaderFactory.Create(client, settings);

        // Get the Symbols (Dynamic Symbols)

        IStructInstance main = (IStructInstance)loader.Symbols["MAIN"]; // Gets the MAIN Instance of
the PLC Program

        // Call a Method that has the following signature (within MAIN Program)
        /* {attribute 'TcRpcEnable'}
        METHOD PUBLIC M_Add : INT
        VAR_INPUT
            i1 : INT := 0;
            i2 : INT := 0;
        END_VAR
        */

        short result = (short)main.InvokeRpcMethod("M_Add", new object[] {(short) 3, (short) 4});

        // Call a Method that has no parameter and returns VOID
        main.InvokeRpcMethod("M_Method1", new object[] {});

        //Browsing RpcMethods
        foreach(IRpcMethod method in main.RpcMethods)
        {
            string methodName = method.Name;

            foreach(IRpcMethodParameter parameter in method.Parameters)
            {
                string parameterName = parameter.Name;
                string parameterType = parameter.TypeName;
            }
        }
    }
}

```

6.11.71.2.1.2 IRpcCallableInstance.InvokeRpcMethod Method (String, .Object., .Object.)

Invokes the specified RPC Method

Namespace: [TwinCAT.TypeSystem \[► 2083\]](#)

Assembly: TwinCAT.Ads.Abstractions (in TwinCAT.Ads.Abstractions.dll) Version: 6.0.328+39e3229

Syntax

C#

```
Object? InvokeRpcMethod(
    string methodName,
    Object[]? inParameters,
    out Object[]? outParameters
)
```

Parameters

methodName	Type: System.String The method name.
inParameters	Type: .System.Object. The input parameters or NULL
outParameters	Type: .System.Object.. The output parameters.

Return Value

Type: Object
The return value of the Method (as object).

Remarks

Because this overload doesn't provide any [AnyTypeSpecifier](#) [► 2094] specifications, only primitive datatypes will be correctly marshalled by this method. Complex types will fall back to byte[] arrays.

Examples

The following sample shows how to call (Remote Procedures / Methods) within the PLC.

Dynamic Tree Mode

```
class RpcCallVirtualProgram
{
    /// <summary>
    /// Defines the entry point of the application.
    /// </summary>

6.11.71.2.1.3 IRpcCallableInstance.InvokeRpcMethod Method (String, .Object., .AnyTypeSpecifier., AnyTypeSpecifier, .Object.)

Invokes the specified RPC Method

Namespace: [TwinCAT.TypeSystem](#) [► 2083]

Assembly: TwinCAT.Ads.Abstractions (in TwinCAT.Ads.Abstractions.dll) Version: 5.0.294+Branch.releases-5.0.Sha.90bb9a1b43b6095934fddca3e72bc0ea15da1c14

Syntax

C#

```

Object InvokeRpcMethod(
    string methodName,
    Object[] inParameters,
    AnyTypeSpecifier[] outSpecifiers,
    AnyTypeSpecifier retSpecifier,
    out Object[] outParameters
)

```

Parameters

methodName	Type: System.String The method name.
inParameters	Type: .System.Object. The parameters.
outSpecifiers	Type: .TwinCAT.TypeSystem.AnyTypeSpecifier [► 2094]. The out specifiers (specifying the out types) or NULL.
retSpecifier	Type: TwinCAT.TypeSystem.AnyTypeSpecifier [► 2094] The ret specifier (specifying the return value) or NULL.
outParameters	Type: .System.Object. The out parameters.

Return Value

Type: [Object](#)
The return value of the Method (as object).

Remarks

The RpcMethod optionally support In-Parameters, Out-Parameters and Return values. Therefore the parameters inParameters, outParameters, outSpecifiers, retSpecifier are allowed to be empty or NULL. In case of using primitive datatypes, the type specifier parameters (outSpecifiers and retSpecifier) are not necessary and should not be set.

Examples

The following sample shows how to call (Remote Procedures / Methods) within the PLC.

Dynamic Tree Mode

6.11.71.2.2 IRpcCallableInstance.InvokeRpcMethodAsync Method

Invokes the specified RPC Method asynchronously

Namespace: [TwinCAT.TypeSystem](#) [[▸ 2083](#)]

Assembly: TwinCAT.Ads.Abstractions (in TwinCAT.Ads.Abstractions.dll) Version: 6.0.328+39e3229

Syntax

C#

```
Task<ResultRpcMethodAccess> InvokeRpcMethodAsync (
    string methodName,
    Object[]? inParameters,
    CancellationToken cancel
)
```

Parameters

methodName	Type: System.String The method name.
inParameters	Type: System.Object. The parameters.
cancel	Type: System.Threading.CancellationToken The cancellation token

Return Value

Type: [Task.ResultRpcMethodAccess](#) [[▸ 3213](#)].

A task that represents the asynchronous 'InvokeRpcMethod' operation. The [ResultRpcMethodAccess](#) [[▸ 3213](#)] results contains the return value ([ReturnValue](#) [[▸ 3216](#)]) together with the output parameters. The succeeded communication is indicated by the [ErrorCode](#) property ([ErrorCode](#) [[▸ 3202](#)]) after the communication.

Remarks

Because this overload doesn't provide any [AnyTypeSpecifier](#) [[▸ 2094](#)] specifications, only primitive datatypes will be correctly marshalled by this method. Complex types will fall back to byte[] arrays.

Examples

The following sample shows how to call (Remote Procedures / Methods) within the PLC.

Dynamic Tree Mode

```
class RpcCallVirtualProgram
{
    /// <summary>
    /// Defines the entry point of the application.

            ISymbolLoader loader = SymbolLoaderFactory.Create(client, settings);

            // Get the Symbols (Dynamic Symbols)

            IStructInstance main = (IStructInstance)loader.Symbols["MAIN"]; // Gets the MAIN Instance of
            the PLC Program

            // Call a Method that has the following signature (within MAIN Program)
            /* {attribute 'TcRpcEnable'}
            METHOD PUBLIC M_Add : INT
            VAR_INPUT
                i1 : INT := 0;
                i2 : INT := 0;
            END_VAR
            */

            short result = (short)main.InvokeRpcMethod("M_Add", new object[] { (short) 3, (short) 4 });

            // Call a Method that has no parameter and returns VOID
            main.InvokeRpcMethod("M_Method1", new object[] {});

            //Browsing RpcMethods
            foreach(IRpcMethod method in main.RpcMethods)
            {
                string methodName = method.Name;

                foreach(IRpcMethodParameter parameter in method.Parameters)
                {
                    string parameterName = parameter.Name;
                    string parameterType = parameter.TypeName;
                }
            }
        }
    }
}
```

Reference

[IRpcCallableInstance Interface \[► 2606\]](#)

[TryInvokeRpcMethod Overload \[► 2619\]](#)

[TwinCAT.TypeSystem Namespace \[► 2083\]](#)

6.11.71.2.3.2 IRpcCallableInstance.TryInvokeRpcMethod Method (String, .Object., .Object., Object.)

Invokes the specified RPC Method

Namespace: [TwinCAT.TypeSystem](#) [[▶ 2083](#)]

Assembly: TwinCAT.Ads.Abstractions (in TwinCAT.Ads.Abstractions.dll) Version: 6.0.328+39e3229

Syntax

C#

```
int TryInvokeRpcMethod(
    string methodName,
    Object[]? inParameters,
    out Object[]? outParameters,
    out Object?? retValue
)
```

Parameters

methodName	Type: System.String The method name.
inParameters	Type: .System.Object. The parameters.
outParameters	Type: .System.Object.. The out parameters.
retValue	Type: System.Object. The return value of the RPC method as object.

Return Value

Type: Int32
The result value of the call (ErrorCode). 0 means Succeeded.

Remarks

Because this overload doesn't provide any [AnyTypeSpecifier](#) [[▶ 2094](#)] specifications, only primitive datatypes will be correctly marshalled by this method. Complex types will fall back to byte[] arrays.

Examples

The following sample shows how to call (Remote Procedures / Methods) within the PLC.

Dynamic Tree Mode

```
class RpcCallVirtualProgram
{
    /// <summary>
    /// Defines the entry point of the application.
    /// </summary>
    /// <param name="args">The arguments.</param>
    static void Main(string[] args)
    {
        // Get the AdsAddress from command-line arguments
        AmsAddress address = ArgParser.Parse(args);

        using (AdsClient client = new AdsClient())
        {
            //client.Synchronize = false;

            // Connect to the target device
            client.Connect(address);

            SymbolLoaderSettings settings = new SymbolLoaderSettings(SymbolsLoadMode.VirtualTree);
            ISymbolLoader loader = SymbolLoaderFactory.Create(client, settings);

            // Get the Symbols (Dynamic Symbols)

            IStructInstance main = (IStructInstance)loader.Symbols["MAIN"]; // Gets the MAIN Instance of
            the PLC Program

            // Call a Method that has the following signature (within MAIN Program)
            /* {attribute 'TcRpcEnable'}
            METHOD PUBLIC M_Add : INT
```

outParameters Type: System.Object.
The out parameters.

retValue Type: System.Object.
The return value of the RPC method./>

Return Value

Type: Int32
AdsErrorCode.

Remarks

The RpcMethod optionally support In-Parameters, Out-Parameters and Return values. Therefore the parameters inParameters, outParameters, outSpecifiers, retSpecifier are allowed to be empty or NULL. In case of using primitive datatypes, the type specifier parameters (outSpecifiers and retSpecifier) are not necessary and should not be set.

Examples

The following sample shows how to call (Remote Procedures / Methods) within the PLC.

Dynamic Tree Mode

```
class RpcCallVirtualProgram
{
    /// <summary>
    /// Defines the entry point of the application.
    /// </summary>
    /// <param name="args">The arguments.</param>
    static void Main(string[] args)
    {
        // Get the AdsAddress from command-line arguments
        AmsAddress address = ArgParser.Parse(args);

        using (AdsClient client = new AdsClient())
        {
            //client.Synchronize = false;

            // Connect to the target device
            client.Connect(address);

            SymbolLoaderSettings settings = new SymbolLoaderSettings(SymbolsLoadMode.VirtualTree);
            ISymbolLoader loader = SymbolLoaderFactory.Create(client, settings);

            // Get the Symbols (Dynamic Symbols)

            IRpcStructInstance main = (IRpcStructInstance)loader.Symbols["MAIN"]; // Gets the MAIN Instance of the PLC Program

            // Call a Method that has the following signature (within MAIN Program)
            /* {attribute 'TcRpcEnable'}
            METHOD PUBLIC M_Add : INT
            VAR_INPUT
                i1 : INT := 0;
                i2 : INT := 0;
            END_VAR
            */

            short result = (short)main.InvokeRpcMethod("M_Add", new object[] {(short) 3, (short) 4});

            // Call a Method that has no parameter and returns VOID
            main.InvokeRpcMethod("M_Method1", new object[] {});

            //Browsing RpcMethods
            foreach(IRpcMethod method in main.RpcMethods)
            {
                string methodName = method.Name;

                foreach(IRpcMethodParameter parameter in method.Parameters)
                {
                    string parameterName = parameter.Name;
                    string parameterType = parameter.TypeName;
                }
            }
        }
    }
}
```

Syntax

C#

```
IRpcMethodCollection RpcMethods { get; }
```

Property Value

Type: [IRpcMethodCollection](#) [[▶ 2629](#)]
 The RPC methods.

Remarks

The DataType (Structure) must be marked with the PlcAttribute 'TcRpcEnable' to enable RpcMethods, otherwise RpcMethods are not passed through to the ADS symbolic information.

Interface for RPC Method collections.

Namespace: [TwinCAT.TypeSystem](#) [[▶ 2083](#)]

Assembly: TwinCAT.Ads.Abstractions (in TwinCAT.Ads.Abstractions.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public interface IRpcMethodCollection : IList<IRpcMethod>,  
    ICollection<IRpcMethod>, IEnumerable<IRpcMethod>, IEnumerable
```

The IRpcMethodCollection type exposes the following members.

Properties

	Name	Description
	Count	Gets the number of elements contained in the ICollection.T.. (Inherited from ICollection.IRpcMethod [▶ 2625]..)
	IsReadOnly	Gets a value indicating whether the ICollection.T. is read-only. (Inherited from ICollection.IRpcMethod [▶ 2625]..)
	Item.Int32.	Gets or sets the element at the specified index. (Inherited from IList.IRpcMethod [▶ 2625]..)
	Item.String. [▶ 2631]	Gets the IRpcMethod [▶ 2625] with the specified method name.

Methods

	Name	Description
	Add	Adds an item to the ICollection.T.. (Inherited from ICollection.IRpcMethod [▶ 2625]..)
	Clear	Removes all items from the ICollection.T.. (Inherited from ICollection.IRpcMethod [▶ 2625]..)
	Contains(T)	Determines whether the ICollection.T. contains a specific value. (Inherited from ICollection.IRpcMethod [▶ 2625]..)
	Contains(String) [▶ 2633]	Determines whether this collection contains the specified method name.
	CopyTo	Copies the elements of the ICollection.T. to an Array, starting at a particular Array index. (Inherited from ICollection.IRpcMethod [▶ 2625]..)
	GetEnumerator	Returns an enumerator that iterates through the collection. (Inherited from IEnumerable.IRpcMethod [▶ 2625]..)
	IndexOf	Determines the index of a specific item in the IList.T.. (Inherited from IList.IRpcMethod [▶ 2625]..)
	Insert	Inserts an item to the IList.T. at the specified index. (Inherited from IList.IRpcMethod [▶ 2625]..)
	Remove	Removes the first occurrence of a specific object from the ICollection.T.. (Inherited from ICollection.IRpcMethod [▶ 2625]..)
	RemoveAt	Removes the IList.T. item at the specified index. (Inherited from IList.IRpcMethod [▶ 2625]..)
	TryGetMethod(Int32, IRpcMethod.) [▶ 2634]	Tries to get the specified method.
	TryGetMethod(String, IRpcMethod.) [▶ 2634]	Tries to get the specified method.

	Name	Description
	HasLengthIsParameter [▸ 2636]	Gets a value indicating whether this instance has a related Lengths Parameter.
	IsInput [▸ 2639]	Gets a value indicating whether this instance is input.
	IsOutput [▸ 2639]	Gets a value indicating whether this instance is output.
	LengthsParameterIndex [▸ 2637]	Gets the index of the Lengths parameter (within the MethodParameter List)
	Name [▸ 2637]	Gets the Parameter Name
	ParameterFlags [▸ 2637]	Gets the parameter flags.
	Size [▸ 2638]	Gets the size of the IRpcMethodParameter [▸ 2635]
	TypeName [▸ 2638]	Gets the Data type of the Parameter

Reference

[TwinCAT.TypeSystem Namespace \[▸ 2083\]](#)

6.11.75.1.1 IRpcMethodParameter.HasLengthIsParameter Property

Gets a value indicating whether this instance has a related Lengths Parameter.

Namespace: [TwinCAT.TypeSystem \[▸ 2083\]](#)

Assembly: TwinCAT.Ads.Abstractions (in TwinCAT.Ads.Abstractions.dll) Version: 6.0.328+39e3229

Syntax

C#

```
bool HasLengthIsParameter { get; }
```

Property Value

Type: Boolean

true if this instance has a Lengths parameter; otherwise, false.

Reference

[IRpcMethodParameter Interface](#) [► 2635]

[TwinCAT.TypeSystem Namespace](#) [► 2083]

6.11.75.1.2 IRpcMethodParameter.LengthIsParameterIndex Property

Gets the index of the LengthIs parameter (within the MethodParameter List)

Namespace: [TwinCAT.TypeSystem](#) [► 2083]

Assembly: TwinCAT.Ads.Abstractions (in TwinCAT.Ads.Abstractions.dll) Version: 6.0.328+39e3229

Syntax

C#

```
int LengthIsParameterIndex { get; }
```

Property Value

Type: Int32

The index of the length is parameter.

Remarks

This field references to the Parameter that defines the length for this generic one. Equally to the marshalling attributes of COM (sizeof, length) this enables to transport parameter of type (PVOID)

6.11.76 IRpcMethodParameterCollection Interface

Interface IRpcMethodParameterCollection

Namespace: [TwinCAT.TypeSystem](#) [► 2083]

Assembly: TwinCAT.Ads.Abstractions (in TwinCAT.Ads.Abstractions.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public interface IRpcMethodParameterCollection : IList<IRpcMethodParameter>,
    ICollection<IRpcMethodParameter>, IEnumerable<IRpcMethodParameter>, IEnumerable
```

The IRpcMethodParameterCollection type exposes the following members.

Properties

	Name	Description
	Count	Gets the number of elements contained in the ICollection.T.. (Inherited from ICollection.IRpcMethodParameter [▶ 2635]..)
	IsReadOnly	Gets a value indicating whether the ICollection.T. is read-only. (Inherited from ICollection.IRpcMethodParameter [▶ 2635]..)
	Item	Gets or sets the element at the specified index. (Inherited from IList.IRpcMethodParameter [▶ 2635]..)

Methods

	Name	Description
	Add	Adds an item to the ICollection.T.. (Inherited from ICollection.IRpcMethodParameter [▶ 2635]..)
	Clear	Removes all items from the ICollection.T.. (Inherited from ICollection.IRpcMethodParameter [▶ 2635]..)
	Contains	Determines whether the ICollection.T. contains a specific value. (Inherited from ICollection.IRpcMethodParameter [▶ 2635]..)
	CopyTo	Copies the elements of the ICollection.T. to an Array, starting at a particular Array index. (Inherited from ICollection.IRpcMethodParameter [▶ 2635]..)
	GetEnumerator	Returns an enumerator that iterates through the collection. (Inherited from IEnumerable.IRpcMethodParameter [▶ 2635]..)
	GetLengthIsParameter [▶ 2641]	Gets the corresponding LengthIs parameter.
	IndexOf	Determines the index of a specific item in the IList.T.. (Inherited from IList.IRpcMethodParameter [▶ 2635]..)
	Insert	Inserts an item to the IList.T. at the specified index. (Inherited from IList.IRpcMethodParameter [▶ 2635]..)
	Remove	Removes the first occurrence of a specific object from the ICollection.T.. (Inherited from ICollection.IRpcMethodParameter [▶ 2635]..)
	RemoveAt	Removes the IList.T. item at the specified index. (Inherited from IList.IRpcMethodParameter [▶ 2635]..)

6.11.77 IRpcStructInstance Interface

Note: This API is now obsolete.

Interface IRpcStructInstance

Namespace: [TwinCAT.TypeSystem](#) [► 2083]

Assembly: TwinCAT.Ads.Abstractions (in TwinCAT.Ads.Abstractions.dll) Version: 6.0.328+39e3229

Syntax

C#

```
[ObsoleteAttribute("Use IStructInstance instead!")]
public interface IRpcStructInstance : IStructInstance,
    IInterfaceInstance, ISymbol, IAttributedInstance, IInstance, IBitSize,
    IRpcCallableInstance
```

The IRpcStructInstance type exposes the following members.

Properties

	Name	Description
	Attributes [► 2471]	Gets the Type Attributes. (Inherited from IAttributedInstance [► 2469].)
	BitSize [► 2473]	Gets the size of the IDataType [► 2475] in bits. (Inherited from IBitSize [► 2472].)
	ByteSize [► 2474]	Gets the (aligned) size of of the Type/Instance in Bytes (Inherited from IBitSize [► 2472].)
	Category [► 2694]	Gets the Symbol/Datatype Category (Inherited from ISymbol [► 2691].)

	Name	Description
	Comment [▶ 2550]	Gets the comment of the Instance [▶ 2549] (Inherited from Instance [▶ 2549] .)
	DataType [▶ 2551]	Gets the IDataType [▶ 2475] of the Instance [▶ 2549] . (Inherited from Instance [▶ 2549] .)
	HasRpcMethods [▶ 3018]	Gets a value indicating whether this instance has RPC methods (Inherited from InterfaceInstance [▶ 3014] .)
	InstanceName [▶ 2551]	Gets the name of the instance (without periods (.)) (Inherited from Instance [▶ 2549] .)
	InstancePath [▶ 2552]	Gets the relative / absolute access path to the instance (with periods (.)) (Inherited from Instance [▶ 2549] .)
	IsBitType [▶ 2474]	Gets a value indicating whether this instance is not basing on a full DataType but instead of some sort of bit mapping (Inherited from IBitSize [▶ 2472] .)
	IsByteAligned [▶ 2475]	Indicates that the Size of the Object is Byte aligned ($\text{BitSize} \% 8 == 0$) (Inherited from IBitSize [▶ 2472] .)
	IsContainerType [▶ 2694]	Gets a value indicating whether this Symbol is a container type. (Inherited from ISymbol [▶ 2691] .)
	IsPersistent [▶ 2694]	Gets a value indicating whether this ISymbol [▶ 2691] is persistent. (Inherited from ISymbol [▶ 2691] .)
	IsPointer [▶ 2552]	Indicates that the Instance [▶ 2549] represents a Pointer type (Pointer TO) (Inherited from Instance [▶ 2549] .)
	IsPrimitiveType [▶ 2695]	Gets a value indicating whether this instance is a primitive type. (Inherited from ISymbol [▶ 2691] .)
	IsReadOnly [▶ 2695]	Indicates that this instance is read only. (Inherited from ISymbol [▶ 2691] .)
	IsRecursive [▶ 2696]	Gets a value indicating whether this instance is recursive. (Inherited from ISymbol [▶ 2691] .)
	IsReference [▶ 2552]	Indicates that the Instance [▶ 2549] represents a Reference type (REFERENCE TO) (Inherited from Instance [▶ 2549] .)
	IsStatic [▶ 2553]	Gets a value indicating whether this Instance [▶ 2549] is static. (Inherited from Instance [▶ 2549] .)
	MemberInstances [▶ 3018]	Gets the member instances of the Struct Instance [▶ 3014] . (Inherited from InterfaceInstance [▶ 3014] .)
	Parent [▶ 2696]	Gets the parent Symbol (Inherited from ISymbol [▶ 2691] .)
	RpcMethods [▶ 2607]	Gets the Method descriptions for the IRpcCallableType [▶ 2624] (Inherited from IRpcCallableInstance [▶ 2606] .)
	Size [▶ 2475]	Gets the size of the object in bytes or Bits dependant on IsBitType [▶ 2474] (Inherited from IBitSize [▶ 2472] .)
	SubSymbols [▶ 2696]	Gets the SubSymbols of the ISymbol [▶ 2691] (Inherited from ISymbol [▶ 2691] .)
	TypeName [▶ 2553]	Gets the name of the DataType [▶ 2475] that is used for this Instance [▶ 2549] . (Inherited from Instance [▶ 2549] .)
	ValueEncoding [▶ 2472]	Gets the value encoding. (Inherited from AttributedInstance [▶ 2469] .)

Methods

	Name	Description
	InvokeRpcMethod(String, .Object.) [▶ 2609]	Invokes the specified RPC Method (Inherited from IRpcCallableInstance [▶ 2606].)
	InvokeRpcMethod(String, .Object., .Object.) [▶ 2610]	Invokes the specified RPC Method (Inherited from IRpcCallableInstance [▶ 2606].)
	InvokeRpcMethodAsync [▶ 2614]	Invokes the specified RPC Method asynchronously (Inherited from IRpcCallableInstance [▶ 2606].)
	TryInvokeRpcMethod(String, .Object., Object.) [▶ 2619]	Invokes the specified RPC Method (Inherited from IRpcCallableInstance [▶ 2606].)
	TryInvokeRpcMethod(String, .Object., .Object., Object.) [▶ 2620]	Invokes the specified RPC Method (Inherited from IRpcCallableInstance [▶ 2606].)

Extension Methods

	Name	Description
	ReferencesExternalData [▶ 3038]	Indicates, that the Instance value includes process memory data, that cannot be read in one memory block. (Defined by DataTypeExtension [▶ 3021].)

Syntax

C#

```
public interface IStringInstance : ISymbol,
    IAttributedInstance, IInstance, IBitSize
```

The IStringInstance type exposes the following members.

Properties

	Name	Description
	Attributes [▶ 2471]	Gets the Type Attributes. (Inherited from IAttributedInstance [▶ 2469].)
	BitSize [▶ 2473]	Gets the size of the IDataType [▶ 2475] in bits. (Inherited from IBitSize [▶ 2472].)
	ByteSize [▶ 2474]	Gets the (aligned) size of of the Type/Instance in Bytes (Inherited from IBitSize [▶ 2472].)
	Category [▶ 2694]	Gets the Symbol/Datatype Category (Inherited from ISymbol [▶ 2691].)
	Comment [▶ 2550]	Gets the comment of the IInstance [▶ 2549] (Inherited from IInstance [▶ 2549].)
	DataType [▶ 2551]	Gets the IDataType [▶ 2475] of the IInstance [▶ 2549]. (Inherited from IInstance [▶ 2549].)
	InstanceName [▶ 2551]	Gets the name of the instance (without periods (.)) (Inherited from IInstance [▶ 2549].)
	InstancePath [▶ 2552]	Gets the relative / absolute access path to the instance (with periods (.)) (Inherited from IInstance [▶ 2549].)
	IsBitType [▶ 2474]	Gets a value indicating whether this instance is not basing on a full IDataType but instead of some sort of bit mapping (Inherited from IBitSize [▶ 2472].)
	IsByteAligned [▶ 2475]	Indicates that the Size of the Object is Byte aligned ($\text{BitSize} \% 8 == 0$) (Inherited from IBitSize [▶ 2472].)
	IsContainerType [▶ 2694]	Gets a value indicating whether this Symbol is acontainer type. (Inherited from ISymbol [▶ 2691].)
	IsFixedLength [▶ 2649]	Gets a value indicating whether this instance is a string of static length
	IsPersistent [▶ 2694]	Gets a value indicating whether this ISymbol [▶ 2691] is persistent. (Inherited from ISymbol [▶ 2691].)
	IsPointer [▶ 2552]	Indicates that the IInstance [▶ 2549] represents a Pointer type (Pointer TO) (Inherited from IInstance [▶ 2549].)
	IsPrimitiveType [▶ 2695]	Gets a value indicating whether this instance is a primitive type. (Inherited from ISymbol [▶ 2691].)
	IsReadOnly [▶ 2695]	Indicates that this instance is read only. (Inherited from ISymbol [▶ 2691].)
	IsRecursive [▶ 2696]	Gets a value indicating whether this instance is recursive. (Inherited from ISymbol [▶ 2691].)
	IsReference [▶ 2552]	Indicates that the IInstance [▶ 2549] represents a Reference type (REFERENCE TO) (Inherited from IInstance [▶ 2549].)
	IsStatic [▶ 2553]	Gets a value indicating whether this IInstance [▶ 2549] is static. (Inherited from IInstance [▶ 2549].)
	Parent [▶ 2696]	Gets the parent Symbol (Inherited from ISymbol [▶ 2691].)
	Size [▶ 2475]	Gets the size of the object in bytes or Bits dependant on IsBitType [▶ 2474] (Inherited from IBitSize [▶ 2472].)
	SubSymbols [▶ 2696]	Gets the SubSymbols of the ISymbol [▶ 2691] (Inherited from ISymbol [▶ 2691].)

	Name	Description
	TypeName [▶ 2553]	Gets the name of the DataType [▶ 2475] that is used for this Instance [▶ 2549]. (Inherited from Instance [▶ 2549].)
	ValueEncoding [▶ 2472]	Gets the value encoding. (Inherited from AttributedInstance [▶ 2469].)

Extension Methods

	Name	Description

	BitSize [▶ 2473]	Gets the size of the IDataType [▶ 2475] in bits. (Inherited from IBitSize [▶ 2472].)
	ByteSize [▶ 2474]	Gets the (aligned) size of of the Type/Instance in Bytes (Inherited from IBitSize [▶ 2472].)
	Category [▶ 2694]	Gets the Symbol/Datatype Category (Inherited from ISymbol [▶ 2691].)
	Comment [▶ 2550]	Gets the comment of the Instance [▶ 2549] (Inherited from Instance [▶ 2549].)
	DataType [▶ 2551]	Gets the IDataType [▶ 2475] of the Instance [▶ 2549]. (Inherited from Instance [▶ 2549].)
	InstanceName [▶ 2551]	Gets the name of the instance (without periods (.)) (Inherited from Instance [▶ 2549].)
	InstancePath [▶ 2552]	Gets the relative / absolute access path to the instance (with periods (.)) (Inherited from Instance [▶ 2549].)
	IsBitType [▶ 2474]	Gets a value indicating whether this instance is not basing on a full DataType but instead of some sort of bit mapping (Inherited from IBitSize [▶ 2472].)
	IsByteAligned [▶ 2475]	Indicates that the Size of the Object is Byte aligned ($\text{BitSize} \% 8 == 0$) (Inherited from IBitSize [▶ 2472].)
	IsContainerType [▶ 2694]	Gets a value indicating whether this Symbol is acontainer type. (Inherited from ISymbol [▶ 2691].)
	IsFixedLength [▶ 2649]	Gets a value indicating whether this instance is a string of static length

	Name	Description
	IsPersistent [▶ 2694]	Gets a value indicating whether this ISymbol [▶ 2691] is persistent. (Inherited from ISymbol [▶ 2691].)
	IsPointer [▶ 2552]	Indicates that the IInstance [▶ 2549] represents a Pointer type (Pointer TO) (Inherited from IInstance [▶ 2549].)
	IsPrimitiveType [▶ 2695]	Gets a value indicating whether this instance is a primitive type. (Inherited from ISymbol [▶ 2691].)
	IsReadOnly [▶ 2695]	Indicates that this instance is read only. (Inherited from ISymbol [▶ 2691].)
	IsRecursive [▶ 2696]	Gets a value indicating whether this instance is recursive. (Inherited from ISymbol [▶ 2691].)
	IsReference [▶ 2552]	Indicates that the IInstance [▶ 2549] represents a Reference type (REFERENCE TO) (Inherited from IInstance [▶ 2549].)
	IsStatic [▶ 2553]	Gets a value indicating whether this IInstance [▶ 2549] is static. (Inherited from IInstance [▶ 2549].)
	Parent [▶ 2696]	Gets the parent Symbol (Inherited from ISymbol [▶ 2691].)
	Size [▶ 2475]	Gets the size of the object in bytes or Bits dependant on IsBitType [▶ 2474] (Inherited from IBitSize [▶ 2472].)
	SubSymbols [▶ 2696]	Gets the SubSymbols of the ISymbol [▶ 2691] (Inherited from ISymbol [▶ 2691].)
	TypeName [▶ 2553]	Gets the name of the DataType [▶ 2475] that is used for this IInstance [▶ 2549]. (Inherited from IInstance [▶ 2549].)
	ValueEncoding [▶ 2472]	Gets the value encoding. (Inherited from IAttributedInstance [▶ 2469].)

6.11.78.1.1 IStringInstance.IsFixedLength Property

Gets a value indicating whether this instance is a string of static length

Namespace: [TwinCAT.TypeSystem](#) [[▶ 2083](#)]

Assembly: TwinCAT.Ads.Abstractions (in TwinCAT.Ads.Abstractions.dll) Version: 6.0.328+39e3229

Syntax

C#

```
bool IsFixedLength { get; }
```

Property Value

Type: Boolean
true if this instance is of static length; otherwise, false.

Reference

6.11.79 IStringMarshaler Interface

Common interface for marshalling ADS string values.

Namespace: [TwinCAT.TypeSystem](#) [▸ 2083]

Assembly: TwinCAT.Ads.Abstractions (in TwinCAT.Ads.Abstractions.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public interface IStringMarshaler
```

The [IStringMarshaler](#) type exposes the following members.

Properties

	Name	Description
	Encoding [▸ 2660]	The encoding used by this marshaler.
	StringTerminatorSize [▸ 2661]	Gets the size of the string terminator '\0'

Methods

	Name	Description
	Marshal(String, Span.Byte.) [▸ 2653]	Marshals the specified string value.
	Marshal(IStringType, String, Span.Byte.) [▸ 2654]	Marshals the specified string value.
	MarshalSize(IStringType) [▸ 2655]	Gets the marshal size of the specified string type.
	MarshalSize(String) [▸ 2655]	Gets the marshal size of the string.
	MarshalSize(Encoding, Int32) [▸ 2656]	Gets the marshal size of the string given by its length.

	Name	Description
	Unmarshal(ReadOnlySpan.Byte., String.) [▶ 2658]	Unmarshals a string from memory/span.
	Unmarshal(IStringType, ReadOnlySpan.Byte., String.) [▶ 2659]	Unmarshals the specified string type.
	Unmarshal(ReadOnlySpan.Byte., Encoding, String.) [▶ 2659]	Unmarshals a string from memory/span.

6.11.80 IStringType Interface

Interface representing a string [IDataType](#) [► 2475]

Namespace: [TwinCAT.TypeSystem](#) [► 2083]

Assembly: TwinCAT.Ads.Abstractions (in TwinCAT.Ads.Abstractions.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public interface IStringType : IDataType,
    IBitSize
```

The IStringType type exposes the following members.

Properties

	Name	Description
	Attributes [► 2478]	Gets the attributes of the IDataType [► 2475] (Inherited from IDataType [► 2475].)

	Name	Description
	BitSize [▶ 2473]	Gets the size of the IDataType [▶ 2475] in bits. (Inherited from IBitSize [▶ 2472] .)
	ByteSize [▶ 2474]	Gets the (aligned) size of of the Type/Instance in Bytes (Inherited from IBitSize [▶ 2472] .)
	Category [▶ 2478]	Gets the Data Type category (Inherited from IDataType [▶ 2475] .)
	Comment [▶ 2479]	Gets the comment behind the variable declaration. (Inherited from IDataType [▶ 2475] .)
	Encoding [▶ 2664]	Gets the encoding of the String (Encoding.Default (STRING) or Encoding.UNICODE (WSTRING))
	FullName [▶ 2479]	Gets the full name of the IDataType [▶ 2475] (Namespace + Name) (Inherited from IDataType [▶ 2475] .)
	Id [▶ 2480]	Gets the ID of the Data Type (Inherited from IDataType [▶ 2475] .)
	IsBitType [▶ 2474]	Gets a value indicating whether this instance is not basing on a full Data Type but instead of some sort of bit mapping (Inherited from IBitSize [▶ 2472] .)
	IsByteAligned [▶ 2475]	Indicates that the Size of the Object is Byte aligned ($\text{BitSize} \% 8 == 0$) (Inherited from IBitSize [▶ 2472] .)
	IsFixedLength [▶ 2665]	Gets a value indicating whether the string is of fixed length.
	Length [▶ 2665]	Gets the number of characters within the string (when fixed length).
	Name [▶ 2482]	Gets the name of the Data Type (without namespace) (Inherited from IDataType [▶ 2475] .)
	Namespace [▶ 2482]	Gets the namespace string within the IDataType [▶ 2475] exists. (Inherited from IDataType [▶ 2475] .)
	Size [▶ 2475]	Gets the size of the object in bytes or Bits dependant on IsBitType [▶ 2474] (Inherited from IBitSize [▶ 2472] .)

Extension Methods

	Name	Description
	IsArrayOfPrimitives. [▶ 3025]	Overloaded. Determines whether the dataType is an array of Primitives. (Defined by DataTypeExtension [▶ 3021] .)
	IsArrayOfPrimitives(Boolean) [▶ 3025]	Overloaded. Determines whether the dataType is an array of Primitives. (Defined by DataTypeExtension [▶ 3021] .)
	IsContainer. [▶ 3027]	Overloaded. Gets a value indicating whether this IDataType [▶ 2475] is a container type (Defined by DataTypeExtension [▶ 3021] .)
	IsContainer(Boolean) [▶ 3028]	Overloaded. Gets a value indicating whether this IDataType [▶ 2475] is a container type (Defined by DataTypeExtension [▶ 3021] .)
	IsPointer [▶ 3031]	Gets a value indicating whether this IDataType [▶ 2475] is a pointer type (Defined by DataTypeExtension [▶ 3021] .)
	IsPrimitive. [▶ 3033]	Overloaded. Gets a value indicating whether this IDataType [▶ 2475] is primitive (Defined by DataTypeExtension [▶ 3021] .)

	Name	Description
	IsPrimitive(Boolean) [▶ 3034]	Overloaded. Gets a value indicating whether this IDataType [▶ 2475] is primitive (Defined by DataTypeExtension [▶ 3021].)
	IsReference [▶ 3036]	Gets a value indicating whether this IDataType [▶ 2475] is a reference type (Defined by DataTypeExtension [▶ 3021].)
	ReferencesExternalData [▶ 3037]	Indicates, that the Instance value includes process memory data, that cannot be read in one memory block. (Defined by DataTypeExtension [▶ 3021].)
	ResolvableAsPrimitive [▶ 3039]	Overloaded. Indicates, that this data type can be resolved as primitive or primitive Array. (Defined by DataTypeExtension [▶ 3021].)
	ResolvableAsPrimitive(Boolean) [▶ 3039]	Overloaded. Indicates, that this data type can be resolved as primitive or primitive Array. (Defined by DataTypeExtension [▶ 3021].)
	Resolve . [▶ 3040]	Overloaded. Resolves the specified data type for AliasReference [▶ 3042] (Defined by DataTypeExtension [▶ 3021].)
	Resolve(DataTypeResolveStrategy) [▶ 3041]	Overloaded. Resolves the specified strategy. (Defined by DataTypeExtension [▶ 3021].)

	Comment [▶ 2479]	Gets the comment behind the variable declaration. (Inherited from IDataType [▶ 2475].)
	Encoding [▶ 2664]	Gets the encoding of the String (Encoding.Default (STRING) or Encoding.UNICODE (WSTRING))

	Name	Description
	FullName [▶ 2479]	Gets the full name of the IDataType [▶ 2475] (Namespace + Name) (Inherited from IDataType [▶ 2475].)
	Id [▶ 2480]	Gets the ID of the Data Type (Inherited from IDataType [▶ 2475].)
	IsBitType [▶ 2474]	Gets a value indicating whether this instance is not basing on a full Data Type but instead of some sort of bit mapping (Inherited from IBitSize [▶ 2472].)
	IsByteAligned [▶ 2475]	Indicates that the Size of the Object is Byte aligned ($\text{BitSize} \% 8 == 0$) (Inherited from IBitSize [▶ 2472].)
	IsFixedLength [▶ 2665]	Gets a value indicating whether the string is of fixed length.
	Length [▶ 2665]	Gets the number of characters within the string (when fixed length).
	Name [▶ 2482]	Gets the name of the Data Type (without namespace) (Inherited from IDataType [▶ 2475].)
	Namespace [▶ 2482]	Gets the namespace string within the IDataType [▶ 2475] exists. (Inherited from IDataType [▶ 2475].)
	Size [▶ 2475]	Gets the size of the object in bytes or Bits dependant on IsBitType [▶ 2474] (Inherited from IBitSize [▶ 2472].)

6.11.80.1.1 IStringType.Encoding Property

Gets the encoding of the String (Encoding.Default (STRING) or Encoding.UNICODE (WSTRING))

Namespace: [TwinCAT.TypeSystem](#) [[▶ 2083](#)]

Assembly: TwinCAT.Ads.Abstractions (in TwinCAT.Ads.Abstractions.dll) Version: 6.0.328+39e3229

Syntax

C#

```
Encoding Encoding { get; }
```

Property Value

Type: Encoding
The encoding.

Reference

6.11.80.1.2 IStringType.IsFixedLength Property

Gets a value indicating whether the string is of fixed length.

Namespace: [TwinCAT.TypeSystem](#) [[▶ 2083](#)]

Assembly: TwinCAT.Ads.Abstractions (in TwinCAT.Ads.Abstractions.dll) Version: 6.0.328+39e3229

Syntax

C#

```
bool IsFixedLength { get; }
```

Property Value

Type: Boolean

true if this instance is fixed length; otherwise, false.

Reference

6.11.80.2 IStringType Methods

The [IStringType](#) [[▶ 2661](#)] type exposes the following members.

Extension Methods

	Name	Description
	IsArrayOfPrimitives [▶ 3025]	Overloaded. Determines whether the dataType is an array of Primitives. (Defined by DataTypeExtension [▶ 3021].)
	IsArrayOfPrimitives(Boolean) [▶ 3025]	Overloaded. Determines whether the dataType is an array of Primitives. (Defined by DataTypeExtension [▶ 3021].)

Name	Description
IsContainer. [▶ 3027]	Overloaded. Gets a value indicating whether this IDataType [▶ 2475] is a container type (Defined by DataTypeExtension [▶ 3021].)
IsContainer(Boolean) [▶ 3028]	Overloaded. Gets a value indicating whether this IDataType [▶ 2475] is a container type (Defined by DataTypeExtension [▶ 3021].)
IsPointer [▶ 3031]	Gets a value indicating whether this IDataType [▶ 2475] is a pointer type (Defined by DataTypeExtension [▶ 3021].)
IsPrimitive. [▶ 3033]	Overloaded. Gets a value indicating whether this IDataType [▶ 2475] is primitive (Defined by DataTypeExtension [▶ 3021].)
IsPrimitive(Boolean) [▶ 3034]	Overloaded. Gets a value indicating whether this IDataType [▶ 2475] is primitive (Defined by DataTypeExtension [▶ 3021].)
IsReference [▶ 3036]	Gets a value indicating whether this IDataType [▶ 2475] is a reference type (Defined by DataTypeExtension [▶ 3021].)
ReferencesExternalData [▶ 3037]	Indicates, that the Instance value includes process memory data, that cannot be read in one memory block. (Defined by DataTypeExtension [▶ 3021].)
ResolvableAsPrimitive. [▶ 3039]	Overloaded. Indicates, that this data type can be resolved as primitive or primitive Array. (Defined by DataTypeExtension [▶ 3021].)
ResolvableAsPrimitive(Boolean) [▶ 3039]	Overloaded. Indicates, that this data type can be resolved as primitive or primitive Array. (Defined by DataTypeExtension [▶ 3021].)
Resolve. [▶ 3040]	Overloaded. Resolves the specified data type for AliasReference [▶ 3042] (Defined by DataTypeExtension [▶ 3021].)
Resolve(DataTypeResolveStrategy) [▶ 3041]	Overloaded. Resolves the specified strategy. (Defined by DataTypeExtension [▶ 3021].)

Reference

6.11.81 IStructInstance Interface

Interface representing an instance of a [IStructType](#) [[▶ 2671](#)]

Namespace: [TwinCAT.TypeSystem](#) [[▶ 2083](#)]

Assembly: TwinCAT.Ads.Abstractions (in TwinCAT.Ads.Abstractions.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public interface IStructInstance : IInterfaceInstance,
    ISymbol, IAttributedInstance, IInstance, IBitSize, IRpcCallableInstance
```

The IStructInstance type exposes the following members.

Properties

	Name	Description
	Attributes [▶ 2471]	Gets the Type Attributes. (Inherited from IAttributedInstance [▶ 2469].)
	BitSize [▶ 2473]	Gets the size of the IDataType [▶ 2475] in bits. (Inherited from IBitSize [▶ 2472].)
	ByteSize [▶ 2474]	Gets the (aligned) size of of the Type/Instance in Bytes (Inherited from IBitSize [▶ 2472].)
	Category [▶ 2694]	Gets the Symbol/Datatype Category (Inherited from ISymbol [▶ 2691].)
	Comment [▶ 2550]	Gets the comment of the IInstance [▶ 2549] (Inherited from IInstance [▶ 2549].)
	DataType [▶ 2551]	Gets the IDataType [▶ 2475] of the IInstance [▶ 2549]. (Inherited from IInstance [▶ 2549].)
	HasRpcMethods [▶ 3018]	Gets a value indicating whether this instance has RPC methods (Inherited from IInterfaceInstance [▶ 3014].)
	InstanceName [▶ 2551]	Gets the name of the instance (without periods (.)) (Inherited from IInstance [▶ 2549].)
	InstancePath [▶ 2552]	Gets the relative / absolute access path to the instance (with periods (.)) (Inherited from IInstance [▶ 2549].)
	IsBitType [▶ 2474]	Gets a value indicating whether this instance is not basing on a full DataType but instead of some sort of bit mapping (Inherited from IBitSize [▶ 2472].)
	IsByteAligned [▶ 2475]	Indicates that the Size of the Object is Byte aligned ($BitSize \% 8 == 0$) (Inherited from IBitSize [▶ 2472].)
	IsContainerType [▶ 2694]	Gets a value indicating whether this Symbol is acontainer type. (Inherited from ISymbol [▶ 2691].)
	IsPersistent [▶ 2694]	Gets a value indicating whether this ISymbol [▶ 2691] is persistent. (Inherited from ISymbol [▶ 2691].)
	IsPointer [▶ 2552]	Indicates that the IInstance [▶ 2549] represents a Pointer type (Pointer TO) (Inherited from IInstance [▶ 2549].)
	IsPrimitiveType [▶ 2695]	Gets a value indicating whether this instance is a primitive type. (Inherited from ISymbol [▶ 2691].)
	IsReadOnly [▶ 2695]	Indicates that this instance is read only. (Inherited from ISymbol [▶ 2691].)
	IsRecursive [▶ 2696]	Gets a value indicating whether this instance is recursive. (Inherited from ISymbol [▶ 2691].)
	IsReference [▶ 2552]	Indicates that the IInstance [▶ 2549] represents a Reference type (REFERENCE TO) (Inherited from IInstance [▶ 2549].)
	IsStatic [▶ 2553]	Gets a value indicating whether this IInstance [▶ 2549] is static. (Inherited from IInstance [▶ 2549].)
	MemberInstances [▶ 3018]	Gets the member instances of the Struct Instance [▶ 3014]. (Inherited from IInterfaceInstance [▶ 3014].)
	Parent [▶ 2696]	Gets the parent Symbol (Inherited from ISymbol [▶ 2691].)
	RpcMethods [▶ 2607]	Gets the Method descriptions for the IRpcCallableType [▶ 2624] (Inherited from IRpcCallableInstance [▶ 2606].)

	Name	Description
	Size [▶ 2475]	Gets the size of the object in bytes or Bits dependant on IsBitType [▶ 2474] (Inherited from IBitSize [▶ 2472].)
	SubSymbols [▶ 2696]	Gets the SubSymbols of the ISymbol [▶ 2691] (Inherited from ISymbol [▶ 2691].)
	TypeName [▶ 2553]	Gets the name of the DataType [▶ 2475] that is used for this Instance [▶ 2549]. (Inherited from Instance [▶ 2549].)
	ValueEncoding [▶ 2472]	Gets the value encoding. (Inherited from AttributedInstance [▶ 2469].)

Methods

	Name	Description
	InvokeRpcMethod (String, .Object.) [▶ 2609]	Invokes the specified RPC Method (Inherited from IRpcCallableInstance [▶ 2606].)
	InvokeRpcMethod (String, .Object., .Object.) [▶ 2610]	Invokes the specified RPC Method (Inherited from IRpcCallableInstance [▶ 2606].)
	InvokeRpcMethodAsync [▶ 2614]	Invokes the specified RPC Method asynchronously (Inherited from IRpcCallableInstance [▶ 2606].)
	TryInvokeRpcMethod (String, .Object., Object.) [▶ 2619]	Invokes the specified RPC Method (Inherited from IRpcCallableInstance [▶ 2606].)
	TryInvokeRpcMethod (String, .Object., Object., Object.) [▶ 2620]	Invokes the specified RPC Method (Inherited from IRpcCallableInstance [▶ 2606].)

Extension Methods

	Name	Description
	ReferencesExternalData [▶ 3038]	Indicates, that the Instance value includes process memory data, that cannot be read in one memory block. (Defined by DataTypeExtension [▶ 3021].)

6.11.81.1 IStructInstance Properties

The [IStructInstance](#) [[▶ 2666](#)] type exposes the following members.

Properties

	Name	Description
	Attributes [▶ 2471]	Gets the Type Attributes. (Inherited from AttributedInstance [▶ 2469].)

	Name	Description
	BitSize [▶ 2473]	Gets the size of the IDataType [▶ 2475] in bits. (Inherited from IBitSize [▶ 2472] .)
	ByteSize [▶ 2474]	Gets the (aligned) size of of the Type/Instance in Bytes (Inherited from IBitSize [▶ 2472] .)
	Category [▶ 2694]	Gets the Symbol/Datatype Category (Inherited from ISymbol [▶ 2691] .)
	Comment [▶ 2550]	Gets the comment of the IInstance [▶ 2549] (Inherited from IInstance [▶ 2549] .)
	DataType [▶ 2551]	Gets the IDataType [▶ 2475] of the IInstance [▶ 2549] . (Inherited from IInstance [▶ 2549] .)
	HasRpcMethods [▶ 3018]	Gets a value indicating whether this instance has RPC methods (Inherited from IInterfaceInstance [▶ 3014] .)
	InstanceName [▶ 2551]	Gets the name of the instance (without periods (.)) (Inherited from IInstance [▶ 2549] .)
	InstancePath [▶ 2552]	Gets the relative / absolute access path to the instance (with periods (.)) (Inherited from IInstance [▶ 2549] .)
	IsBitType [▶ 2474]	Gets a value indicating whether this instance is not basing on a full IDataType but instead of some sort of bit mapping (Inherited from IBitSize [▶ 2472] .)
	IsByteAligned [▶ 2475]	Indicates that the Size of the Object is Byte aligned ($\text{BitSize} \% 8 == 0$) (Inherited from IBitSize [▶ 2472] .)
	IsContainerType [▶ 2694]	Gets a value indicating whether this Symbol is acontainer type. (Inherited from ISymbol [▶ 2691] .)
	IsPersistent [▶ 2694]	Gets a value indicating whether this ISymbol [▶ 2691] is persistent. (Inherited from ISymbol [▶ 2691] .)
	IsPointer [▶ 2552]	Indicates that the IInstance [▶ 2549] represents a Pointer type (Pointer TO) (Inherited from IInstance [▶ 2549] .)
	IsPrimitiveType [▶ 2695]	Gets a value indicating whether this instance is a primitive type. (Inherited from ISymbol [▶ 2691] .)
	IsReadOnly [▶ 2695]	Indicates that this instance is read only. (Inherited from ISymbol [▶ 2691] .)
	IsRecursive [▶ 2696]	Gets a value indicating whether this instance is recursive. (Inherited from ISymbol [▶ 2691] .)
	IsReference [▶ 2552]	Indicates that the IInstance [▶ 2549] represents a Reference type (REFERENCE TO) (Inherited from IInstance [▶ 2549] .)
	IsStatic [▶ 2553]	Gets a value indicating whether this IInstance [▶ 2549] is static. (Inherited from IInstance [▶ 2549] .)
	MemberInstances [▶ 3018]	Gets the member instances of the Struct Instance [▶ 3014] . (Inherited from IInterfaceInstance [▶ 3014] .)
	Parent [▶ 2696]	Gets the parent Symbol (Inherited from ISymbol [▶ 2691] .)
	RpcMethods [▶ 2607]	Gets the Method descriptions for the IRpcCallableType [▶ 2624] (Inherited from IRpcCallableInstance [▶ 2606] .)
	Size [▶ 2475]	Gets the size of the object in bytes or Bits dependant on IsBitType [▶ 2474] (Inherited from IBitSize [▶ 2472] .)
	SubSymbols [▶ 2696]	Gets the SubSymbols of the ISymbol [▶ 2691] (Inherited from ISymbol [▶ 2691] .)
	TypeName [▶ 2553]	Gets the name of the DataType [▶ 2475] that is used for this IInstance [▶ 2549] . (Inherited from IInstance [▶ 2549] .)

	Name	Description
	ValueEncoding [▶ 2472]	Gets the value encoding. (Inherited from IAttributedInstance [▶ 2469].)

[TwinCAT.TypeSystem Namespace](#) [▶ [2083](#)]

6.11.81.1.1 IStructInstance.HasRpcMethods Property

Gets a value indicating whether this instance has RPC methods

Namespace: [TwinCAT.TypeSystem](#) [▶ [2083](#)]

Assembly: TwinCAT.Ads.Abstractions (in TwinCAT.Ads.Abstractions.dll) Version: 6.0.95+cf8c3f5

Syntax

C#

```
bool HasRpcMethods { get; }
```

Property Value

Type: [Boolean](#)

true if this instance has RPC methods; otherwise, false.

Remarks

If the struct instance supports RPC Methods, then the instance class is also supporting [IRpcStructInstance](#) [▶ [2642](#)]:

Reference

6.11.82 IStructType Interface

Interface representing Struct data types

Namespace: [TwinCAT.TypeSystem](#) [▶ 2083]

Assembly: TwinCAT.Ads.Abstractions (in TwinCAT.Ads.Abstractions.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public interface IStructType : IInterfaceType,
    IDataTypes, IBitSize, IRpcCallableType
```

The IStructType type exposes the following members.

Properties

	Name	Description
	AllMembers [▶ 2987]	Gets all members (down the derivation hierarchy) (Inherited from IInterfaceType [▶ 2983].)
	Attributes [▶ 2478]	Gets the attributes of the IDataType [▶ 2475] (Inherited from IDataType [▶ 2475].)
	BaseType [▶ 2988]	Gets the structs Base Type (Null if not derived). (Inherited from IInterfaceType [▶ 2983].)
	BaseTypeName [▶ 2988]	Gets the the Name of the Base class (if derived) (Inherited from IInterfaceType [▶ 2983].)
	BitSize [▶ 2473]	Gets the size of the IDataType [▶ 2475] in bits. (Inherited from IBitSize [▶ 2472].)
	ByteSize [▶ 2474]	Gets the (aligned) size of of the Type/Instance in Bytes (Inherited from IBitSize [▶ 2472].)
	Category [▶ 2478]	Gets the Data Type category (Inherited from IDataType [▶ 2475].)
	Comment [▶ 2479]	Gets the comment behind the variable declaration. (Inherited from IDataType [▶ 2475].)
	FullName [▶ 2479]	Gets the full name of the IDataType [▶ 2475] (Namespace + Name) (Inherited from IDataType [▶ 2475].)
	HasRpcMethods [▶ 2986]	Gets a value indicating whether this instance has RPC methods (Struct types only) (Inherited from IInterfaceType [▶ 2983].)
	Id [▶ 2480]	Gets the ID of the Data Type (Inherited from IDataType [▶ 2475].)
	InterfaceImplementationNames [▶ 2987]	Gets the names of the interfaces, this IDataType [▶ 2475] implements. (Inherited from IInterfaceType [▶ 2983].)
	InterfaceImplementations [▶ 2987]	Gets the resolved interface types, this IDataType [▶ 2475] implements. (Inherited from IInterfaceType [▶ 2983].)
	IsBitType [▶ 2474]	Gets a value indicating whether this instance is not basing on a full Data Type but instead of some sort of bit mapping (Inherited from IBitSize [▶ 2472].)
	IsByteAligned [▶ 2475]	Indicates that the Size of the Object is Byte aligned ($\text{BitSize} \% 8 == 0$) (Inherited from IBitSize [▶ 2472].)
	Members [▶ 2988]	Gets a readonly collection of the Members [▶ 2561] of the IInterfaceType [▶ 2983]. (Inherited from IInterfaceType [▶ 2983].)
	Name [▶ 2482]	Gets the name of the Data Type (without namespace) (Inherited from IDataType [▶ 2475].)
	Namespace [▶ 2482]	Gets the namespace string within the IDataType [▶ 2475] exists. (Inherited from IDataType [▶ 2475].)

	Name	Description
	RpcMethods [▶ 2624]	Gets the Method descriptions for the IRpcCallableType [▶ 2624] (Inherited from IRpcCallableType [▶ 2624].)
	Size [▶ 2475]	Gets the size of the object in bytes or Bits dependant on IsBitType [▶ 2474] (Inherited from IBitSize [▶ 2472].)

Extension Methods

	Name	Description
	IsArrayOfPrimitives [▶ 3025]	Overloaded. Determines whether the dataType is an array of Primitives. (Defined by DataTypeExtension [▶ 3021].)
	IsArrayOfPrimitives(Boolean) [▶ 3025]	Overloaded. Determines whether the dataType is an array of Primitives. (Defined by DataTypeExtension [▶ 3021].)
	IsContainer . [▶ 3027]	Overloaded. Gets a value indicating whether this IDataType [▶ 2475] is a container type (Defined by DataTypeExtension [▶ 3021].)
	IsContainer(Boolean) [▶ 3028]	Overloaded. Gets a value indicating whether this IDataType [▶ 2475] is a container type (Defined by DataTypeExtension [▶ 3021].)
	IsPointer [▶ 3031]	Gets a value indicating whether this IDataType [▶ 2475] is a pointer type (Defined by DataTypeExtension [▶ 3021].)
	IsPrimitive . [▶ 3033]	Overloaded. Gets a value indicating whether this IDataType [▶ 2475] is primitive (Defined by DataTypeExtension [▶ 3021].)
	IsPrimitive(Boolean) [▶ 3034]	Overloaded. Gets a value indicating whether this IDataType [▶ 2475] is primitive (Defined by DataTypeExtension [▶ 3021].)
	IsReference [▶ 3036]	Gets a value indicating whether this IDataType [▶ 2475] is a reference type (Defined by DataTypeExtension [▶ 3021].)
	ReferencesExternalData [▶ 3037]	Indicates, that the Instance value includes process memory data, that cannot be read in one memory block. (Defined by DataTypeExtension [▶ 3021].)
	ResolvableAsPrimitive ve. [▶ 3039]	Overloaded. Indicates, that this data type can be resolved as primitive or primitive Array. (Defined by DataTypeExtension [▶ 3021].)
	ResolvableAsPrimitive(Boolean) [▶ 3039]	Overloaded. Indicates, that this data type can be resolved as primitive or primitive Array. (Defined by DataTypeExtension [▶ 3021].)
	Resolve . [▶ 3040]	Overloaded. Resolves the specified data type for AliasReference [▶ 3042] (Defined by DataTypeExtension [▶ 3021].)
	Resolve(DataTypeResolveStrategy) [▶ 3041]	Overloaded. Resolves the specified strategy. (Defined by DataTypeExtension [▶ 3021].)

6.11.82.1.1 IStructType.AllMembers Property

Gets all members (down the derivation hierarchy)

Namespace: [TwinCAT.TypeSystem](#) [▶ 2083]

Assembly: TwinCAT.Ads.Abstractions (in TwinCAT.Ads.Abstractions.dll) Version: 6.0.95+cf8c3f5

Syntax

C#

```
IMemberCollection AllMembers { get; }
```

Property Value

Type: [IMemberCollection](#) [▶ 2565]

All members.

Reference

[IStructType Interface](#) [▶ 2671]

[TwinCAT.TypeSystem Namespace](#) [▶ 2083]

6.11.82.1.2 IStructType.BaseType Property

Gets the structs Base Type (Null if not derived).

Namespace: [TwinCAT.TypeSystem](#) [▶ 2083]

Assembly: TwinCAT.Ads.Abstractions (in TwinCAT.Ads.Abstractions.dll) Version: 6.0.95+cf8c3f5

Syntax

C#

```
IDataType? BaseType { get; }
```

Property Value

Type: [IDataType](#) [▶ 2475]

Reference

[IStructType Interface \[► 2671\]](#)

[TwinCAT.TypeSystem Namespace \[► 2083\]](#)

6.11.82.1.3 IStructType.BaseTypeName Property

Gets the the Name of the Base class (if derived)

Namespace: [TwinCAT.TypeSystem \[► 2083\]](#)

Assembly: TwinCAT.Ads.Abstractions (in TwinCAT.Ads.Abstractions.dll) Version: 6.0.95+cf8c3f5

Syntax

C#

```
string BaseTypeName { get; }
```

Property Value

Type: [String](#)

Empty if not derived.

Reference

[IStructType Interface \[► 2671\]](#)

[TwinCAT.TypeSystem Namespace \[► 2083\]](#)

6.11.82.1.4 IStructType.HasRpcMethods Property

Gets a value indicating whether this instance has RPC methods (Struct types only)

Namespace: [TwinCAT.TypeSystem \[► 2083\]](#)

Assembly: TwinCAT.Ads.Abstractions (in TwinCAT.Ads.Abstractions.dll) Version: 5.0.294+Branch.releases-5.0.Sha.90bb9a1b43b6095934fddca3e72bc0ea15da1c14

Syntax

C#

```
bool HasRpcMethods { get; }
```

Property Value

Type: [Boolean](#)

true if this instance has RPC methods; otherwise, false.

Remarks

The DataType (Structure) must be marked with the PlcAttribute 'TcRpcEnable' to enable RpcMethods, otherwise RpcMethods are not passed through to the ADS symbolic information.

Reference

6.11.82.2 IStructType Methods

The [IStructType](#) [▶ 2671] type exposes the following members.

Extension Methods

Name	Description
IsArrayOfPrimitives [▶ 3025]	Overloaded. Determines whether the dataType is an array of Primitives. (Defined by DataTypeExtension [▶ 3021].)
IsArrayOfPrimitives(Boolean) [▶ 3025]	Overloaded. Determines whether the dataType is an array of Primitives. (Defined by DataTypeExtension [▶ 3021].)
IsContainer [▶ 3027]	Overloaded. Gets a value indicating whether this IDataType [▶ 2475] is a container type (Defined by DataTypeExtension [▶ 3021].)
IsContainer(Boolean) [▶ 3028]	Overloaded. Gets a value indicating whether this IDataType [▶ 2475] is a container type (Defined by DataTypeExtension [▶ 3021].)
IsPointer [▶ 3031]	Gets a value indicating whether this IDataType [▶ 2475] is a pointer type (Defined by DataTypeExtension [▶ 3021].)
IsPrimitive [▶ 3033]	Overloaded. Gets a value indicating whether this IDataType [▶ 2475] is primitive (Defined by DataTypeExtension [▶ 3021].)
IsPrimitive(Boolean) [▶ 3034]	Overloaded. Gets a value indicating whether this IDataType [▶ 2475] is primitive (Defined by DataTypeExtension [▶ 3021].)

	Name	Description
	IsReference [▶ 3036]	Gets a value indicating whether this IDataType [▶ 2475] is a reference type (Defined by DataTypeExtension [▶ 3021].)
	ReferencesExternalData [▶ 3037]	Indicates, that the Instance value includes process memory data, that cannot be read in one memory block. (Defined by DataTypeExtension [▶ 3021].)
	ResolvableAsPrimitive [▶ 3039]	Overloaded. Indicates, that this data type can be resolved as primitive or primitive Array. (Defined by DataTypeExtension [▶ 3021].)
	ResolvableAsPrimitive(Boolean) [▶ 3039]	Overloaded. Indicates, that this data type can be resolved as primitive or primitive Array. (Defined by DataTypeExtension [▶ 3021].)
	Resolve [▶ 3040]	Overloaded. Resolves the specified data type for AliasReference [▶ 3042] (Defined by DataTypeExtension [▶ 3021].)
	Resolve(DataTypeResolveStrategy) [▶ 3041]	Overloaded. Resolves the specified strategy. (Defined by DataTypeExtension [▶ 3021].)

6.11.83 IStructValue Interface

Interface [IStructValue](#)

Namespace: [TwinCAT.TypeSystem](#) [[▶ 2083](#)]

Assembly: TwinCAT.Ads.Abstractions (in TwinCAT.Ads.Abstractions.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public interface IStructValue : IValue
```

The [IStructValue](#) type exposes the following members.

Properties

	Name	Description
	Age [▶ 2746]	Gets the age of the value (last successful read of the value) (Inherited from IValue [▶ 2745].)
	CachedRaw [▶ 2746]	Gets the cached Raw internal Data. (Inherited from IValue [▶ 2745].)
	DataType [▶ 2747]	Gets the data type bound to this IValue [▶ 2745] (Inherited from IValue [▶ 2745].)
	IsPrimitive [▶ 2747]	Gets a value indicating whether this IValue [▶ 2745] is a primitive value. (Inherited from IValue [▶ 2745].)
	Symbol [▶ 2748]	Gets the symbol bound to this IValue [▶ 2745]. (Inherited from IValue [▶ 2745].)

	Name	Description
	TimeStamp [▶ 2748]	Gets the Time stamp of the last successful read of the Value (local user time, UTC) (Inherited from IValue [▶ 2745].)
	UpdateMode [▶ 2748]	Gets the update mode (not implemented yet) (Inherited from IValue [▶ 2745].)

Methods

	Name	Description
	Read [▶ 2749]	Reads the value (via ADS) (Inherited from IValue [▶ 2745].)
	ReadAsync [▶ 2750]	Reads the value (via ADS) (Inherited from IValue [▶ 2745].)
	ResolveValue [▶ 2750]	Resolves the Value object to its primitive value. (Inherited from IValue [▶ 2745].)
	TryGetMemberValue [▶ 2680]	Tries to get a property/Member value.
	TryResolveValue [▶ 2751]	Tries to resolves the Value object to its primitive value. (Inherited from IValue [▶ 2745].)
	TrySetMemberValue [▶ 2681]	Tries to Set a Member/Property Value
	Write [▶ 2751]	Writes the value (via ADS) (Inherited from IValue [▶ 2745].)
	WriteAsync [▶ 2751]	Writes the value (via ADS) (Inherited from IValue [▶ 2745].)

6.11.83.2.1 IStructValue.TryGetMemberValue Method

Tries to get a property/Member value.

Namespace: [TwinCAT.TypeSystem \[▸ 2083\]](#)

Assembly: TwinCAT.Ads.Abstractions (in TwinCAT.Ads.Abstractions.dll) Version: 6.0.328+39e3229

Syntax

C#

```
bool TryGetMemberValue(
    string name,
    out Object?? value
)
```

Parameters

name	Type: System.String The name of the member
value	Type: System.Object. The value.

Return Value

Type: Boolean
true if succeeded, otherwise false otherwise.

Reference

6.11.84 ISubRangeType Interface

Interface representing a SubRange type

Namespace: [TwinCAT.TypeSystem \[▸ 2083\]](#)

Assembly: TwinCAT.Ads.Abstractions (in TwinCAT.Ads.Abstractions.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public interface ISubRangeType : IDataTypes,  
    IBitSize
```

The ISubRangeType type exposes the following members.

Properties

	Name	Description
	Attributes [▶ 2478]	Gets the attributes of the IDataType [▶ 2475] (Inherited from IDataType [▶ 2475].)
	BaseType [▶ 2684]	Gets the the base type of the ISubRangeType
	BaseTypeName [▶ 2685]	Gets the name of the base type.
	BitSize [▶ 2473]	Gets the size of the IDataType [▶ 2475] in bits. (Inherited from IBitSize [▶ 2472].)
	ByteSize [▶ 2474]	Gets the (aligned) size of of the Type/Instance in Bytes (Inherited from IBitSize [▶ 2472].)
	Category [▶ 2478]	Gets the Data Type category (Inherited from IDataType [▶ 2475].)
	Comment [▶ 2479]	Gets the comment behind the variable declaration. (Inherited from IDataType [▶ 2475].)
	FullName [▶ 2479]	Gets the full name of the IDataType [▶ 2475] (Namespace + Name) (Inherited from IDataType [▶ 2475].)
	Id [▶ 2480]	Gets the ID of the Data Type (Inherited from IDataType [▶ 2475].)
	IsBitType [▶ 2474]	Gets a value indicating whether this instance is not basing on a full Data Type but instead of some sort of bit mapping (Inherited from IBitSize [▶ 2472].)
	IsByteAligned [▶ 2475]	Indicates that the Size of the Object is Byte aligned ($\text{BitSize} \% 8 == 0$) (Inherited from IBitSize [▶ 2472].)
	Name [▶ 2482]	Gets the name of the Data Type (without namespace) (Inherited from IDataType [▶ 2475].)
	Namespace [▶ 2482]	Gets the namespace string within the IDataType [▶ 2475] exists. (Inherited from IDataType [▶ 2475].)
	Size [▶ 2475]	Gets the size of the object in bytes or Bits dependant on IsBitType [▶ 2474] (Inherited from IBitSize [▶ 2472].)

Extension Methods

	Name	Description
	IsArrayOfPrimitives [▶ 3025]	Overloaded. Determines whether the dataType is an array of Primitives. (Defined by DataTypeExtension [▶ 3021].)
	IsArrayOfPrimitives(Boolean) [▶ 3025]	Overloaded. Determines whether the dataType is an array of Primitives. (Defined by DataTypeExtension [▶ 3021].)
	IsContainer [▶ 3027]	Overloaded. Gets a value indicating whether this IDataType [▶ 2475] is a container type (Defined by DataTypeExtension [▶ 3021].)
	IsContainer(Boolean) [▶ 3028]	Overloaded. Gets a value indicating whether this IDataType [▶ 2475] is a container type (Defined by DataTypeExtension [▶ 3021].)
	IsPointer [▶ 3031]	Gets a value indicating whether this IDataType [▶ 2475] is a pointer type (Defined by DataTypeExtension [▶ 3021].)
	IsPrimitive [▶ 3033]	Overloaded.

	Name	Description
		Gets a value indicating whether this IDataType [▶ 2475] is primitive (Defined by DataTypeExtension [▶ 3021].)
	IsPrimitive(Boolean) [▶ 3034]	Overloaded. Gets a value indicating whether this IDataType [▶ 2475] is primitive (Defined by DataTypeExtension [▶ 3021].)
	IsReference [▶ 3036]	Gets a value indicating whether this IDataType [▶ 2475] is a reference type (Defined by DataTypeExtension [▶ 3021].)
	ReferencesExternalData [▶ 3037]	Indicates, that the Instance value includes process memory data, that cannot be read in one memory block. (Defined by DataTypeExtension [▶ 3021].)
	ResolvableAsPrimitive [▶ 3039]	Overloaded. Indicates, that this data type can be resolved as primitive or primitive Array. (Defined by DataTypeExtension [▶ 3021].)
	ResolvableAsPrimitive(Boolean) [▶ 3039]	Overloaded. Indicates, that this data type can be resolved as primitive or primitive Array. (Defined by DataTypeExtension [▶ 3021].)
	Resolve [▶ 3040]	Overloaded. Resolves the specified data type for AliasReference [▶ 3042] (Defined by DataTypeExtension [▶ 3021].)
	Resolve(DataTypeResolveStrategy) [▶ 3041]	Overloaded. Resolves the specified strategy. (Defined by DataTypeExtension [▶ 3021].)

6.11.85 ISubRangeType.T. Interface

Interface representing a SubRange type

Namespace: [TwinCAT.TypeSystem](#) [[▶ 2083](#)]

Assembly: TwinCAT.Ads.Abstractions (in TwinCAT.Ads.Abstractions.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public interface ISubRangeType<T> : ISubRangeType,
    IDataType, IBitSize
where T : struct, new()
```

Type Parameters

T

The ISubRangeType.T. type exposes the following members.

Properties

	Name	Description
	Attributes [▶ 2478]	Gets the attributes of the IDataType [▶ 2475] (Inherited from IDataType [▶ 2475].)
	BaseType [▶ 2684]	Gets the the base type of the ISubRangeType [▶ 2681] (Inherited from ISubRangeType [▶ 2681].)
	BaseTypeName [▶ 2685]	Gets the name of the base type. (Inherited from ISubRangeType [▶ 2681].)
	BitSize [▶ 2473]	Gets the size of the IDataType [▶ 2475] in bits. (Inherited from IBitSize [▶ 2472].)

	Name	Description
	ByteSize [▶ 2474]	Gets the (aligned) size of of the Type/Instance in Bytes (Inherited from IBitSize [▶ 2472].)
	Category [▶ 2478]	Gets the Data Type category (Inherited from IDataType [▶ 2475].)
	Comment [▶ 2479]	Gets the comment behind the variable declaration. (Inherited from IDataType [▶ 2475].)
	FullName [▶ 2479]	Gets the full name of the IDataType [▶ 2475] (Namespace + Name) (Inherited from IDataType [▶ 2475].)
	Id [▶ 2480]	Gets the ID of the DataType (Inherited from IDataType [▶ 2475].)
	IsBitType [▶ 2474]	Gets a value indicating whether this instance is not basing on a full DataType but instead of some sort of bit mapping (Inherited from IBitSize [▶ 2472].)
	IsByteAligned [▶ 2475]	Indicates that the Size of the Object is Byte aligned ($\text{BitSize} \% 8 == 0$) (Inherited from IBitSize [▶ 2472].)
	LowerBound [▶ 2689]	Gets the lower bound.
	Name [▶ 2482]	Gets the name of the Data Type (without namespace) (Inherited from IDataType [▶ 2475].)
	Namespace [▶ 2482]	Gets the namespace string within the IDataType [▶ 2475] exists. (Inherited from IDataType [▶ 2475].)
	Size [▶ 2475]	Gets the size of the object in bytes or Bits dependant on IsBitType [▶ 2474] (Inherited from IBitSize [▶ 2472].)
	UpperBound [▶ 2690]	Gets the upper bound.

Extension Methods

	Name	Description
	IsArrayOfPrimitives. [▶ 3025]	Overloaded. Determines whether the dataType is an array of Primitives. (Defined by DataTypeExtension [▶ 3021].)
	IsArrayOfPrimitives(Boolean) [▶ 3025]	Overloaded. Determines whether the dataType is an array of Primitives. (Defined by DataTypeExtension [▶ 3021].)
	IsContainer. [▶ 3027]	Overloaded. Gets a value indicating whether this IDataType [▶ 2475] is a container type (Defined by DataTypeExtension [▶ 3021].)
	IsContainer(Boolean) [▶ 3028]	Overloaded. Gets a value indicating whether this IDataType [▶ 2475] is a container type (Defined by DataTypeExtension [▶ 3021].)
	IsPointer [▶ 3031]	Gets a value indicating whether this IDataType [▶ 2475] is a pointer type (Defined by DataTypeExtension [▶ 3021].)
	IsPrimitive. [▶ 3033]	Overloaded. Gets a value indicating whether this IDataType [▶ 2475] is primitive (Defined by DataTypeExtension [▶ 3021].)
	IsPrimitive(Boolean) [▶ 3034]	Overloaded. Gets a value indicating whether this IDataType [▶ 2475] is primitive (Defined by DataTypeExtension [▶ 3021].)

	Name	Description
	IsReference [▶ 3036]	Gets a value indicating whether this IDataType [▶ 2475] is a reference type (Defined by DataTypeExtension [▶ 3021].)
	ReferencesExternalData [▶ 3037]	Indicates, that the Instance value includes process memory data, that cannot be read in one memory block. (Defined by DataTypeExtension [▶ 3021].)
	ResolvableAsPrimitive [▶ 3039]	Overloaded. Indicates, that this data type can be resolved as primitive or primitive Array. (Defined by DataTypeExtension [▶ 3021].)
	ResolvableAsPrimitive(Boolean) [▶ 3039]	Overloaded. Indicates, that this data type can be resolved as primitive or primitive Array. (Defined by DataTypeExtension [▶ 3021].)
	Resolve [▶ 3040]	Overloaded. Resolves the specified data type for AliasReference [▶ 3042] (Defined by DataTypeExtension [▶ 3021].)
	Resolve(DataTypeResolveStrategy) [▶ 3041]	Overloaded. Resolves the specified strategy. (Defined by DataTypeExtension [▶ 3021].)

6.11.85.1 ISubRangeType.T. Properties

The [ISubRangeType.T](#) [[▶ 2686](#)] generic type exposes the following members.

Properties

	Name	Description
	Attributes [▶ 2478]	Gets the attributes of the IDataType [▶ 2475] (Inherited from IDataType [▶ 2475].)
	BaseType [▶ 2684]	Gets the the base type of the ISubRangeType [▶ 2681] (Inherited from ISubRangeType [▶ 2681].)
	BaseTypeName [▶ 2685]	Gets the name of the base type. (Inherited from ISubRangeType [▶ 2681].)
	BitSize [▶ 2473]	Gets the size of the IDataType [▶ 2475] in bits. (Inherited from IBitSize [▶ 2472].)
	ByteSize [▶ 2474]	Gets the (aligned) size of of the Type/Instance in Bytes (Inherited from IBitSize [▶ 2472].)
	Category [▶ 2478]	Gets the Data Type category (Inherited from IDataType [▶ 2475].)
	Comment [▶ 2479]	Gets the comment behind the variable declaration. (Inherited from IDataType [▶ 2475].)

	Name	Description
	FullName [▸ 2479]	Gets the full name of the IDataType [▸ 2475] (Namespace + Name) (Inherited from IDataType [▸ 2475] .)
	Id [▸ 2480]	Gets the ID of the Data Type (Inherited from IDataType [▸ 2475] .)
	IsBitType [▸ 2474]	Gets a value indicating whether this instance is not basing on a full Data Type but instead of some sort of bit mapping (Inherited from IBitSize [▸ 2472] .)
	IsByteAligned [▸ 2475]	Indicates that the Size of the Object is Byte aligned (BitSize % 8 == 0) (Inherited from IBitSize [▸ 2472] .)
	LowerBound [▸ 2689]	Gets the lower bound.
	Name [▸ 2482]	Gets the name of the Data Type (without namespace) (Inherited from IDataType [▸ 2475] .)
	Namespace [▸ 2482]	Gets the namespace string within the IDataType [▸ 2475] exists. (Inherited from IDataType [▸ 2475] .)
	Size [▸ 2475]	Gets the size of the object in bytes or Bits dependant on IsBitType [▸ 2474] (Inherited from IBitSize [▸ 2472] .)
	UpperBound [▸ 2690]	Gets the upper bound.

6.11.85.2 ISubRangeType.T. Methods

The [ISubRangeType.T.](#) [[▸ 2686](#)] generic type exposes the following members.

Extension Methods

	Name	Description
	IsArrayOfPrimitives. [▸ 3025]	Overloaded. Determines whether the dataType is an array of Primitives. (Defined by DataTypeExtension [▸ 3021].)
	IsArrayOfPrimitives(Boolean) [▸ 3025]	Overloaded. Determines whether the dataType is an array of Primitives. (Defined by DataTypeExtension [▸ 3021].)
	IsContainer. [▸ 3027]	Overloaded. Gets a value indicating whether this IDataType [▸ 2475] is a container type (Defined by DataTypeExtension [▸ 3021].)
	IsContainer(Boolean) [▸ 3028]	Overloaded. Gets a value indicating whether this IDataType [▸ 2475] is a container type (Defined by DataTypeExtension [▸ 3021].)
	IsPointer [▸ 3031]	Gets a value indicating whether this IDataType [▸ 2475] is a pointer type (Defined by DataTypeExtension [▸ 3021].)
	IsPrimitive. [▸ 3033]	Overloaded. Gets a value indicating whether this IDataType [▸ 2475] is primitive (Defined by DataTypeExtension [▸ 3021].)
	IsPrimitive(Boolean) [▸ 3034]	Overloaded. Gets a value indicating whether this IDataType [▸ 2475] is primitive (Defined by DataTypeExtension [▸ 3021].)
	IsReference [▸ 3036]	Gets a value indicating whether this IDataType [▸ 2475] is a reference type (Defined by DataTypeExtension [▸ 3021].)

	Name	Description
	ReferencesExternalData [▶ 3037]	Indicates, that the Instance value includes process memory data, that cannot be read in one memory block. (Defined by DataTypeExtension [▶ 3021].)
	ResolvableAsPrimitive [▶ 3039]	Overloaded. Indicates, that this data type can be resolved as primitive or primitive Array. (Defined by DataTypeExtension [▶ 3021].)
	ResolvableAsPrimitive(Boolean) [▶ 3039]	Overloaded. Indicates, that this data type can be resolved as primitive or primitive Array. (Defined by DataTypeExtension [▶ 3021].)
	Resolve [▶ 3040]	Overloaded. Resolves the specified data type for AliasReference [▶ 3042] (Defined by DataTypeExtension [▶ 3021].)
	Resolve(DataTypeResolveStrategy) [▶ 3041]	Overloaded. Resolves the specified strategy. (Defined by DataTypeExtension [▶ 3021].)

6.11.86 ISymbol Interface

Interface specifying Symbols (

Namespace: [TwinCAT.TypeSystem](#) [[▶ 2083](#)]

Assembly: TwinCAT.Ads.Abstractions (in TwinCAT.Ads.Abstractions.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public interface ISymbol : IAttributedInstance,
    IInstance, IBitSize
```

The ISymbol type exposes the following members.

Properties

	Name	Description
	Attributes [▶ 2471]	Gets the Type Attributes. (Inherited from IAttributedInstance [▶ 2469].)
	BitSize [▶ 2473]	Gets the size of the IDataType [▶ 2475] in bits. (Inherited from IBitSize [▶ 2472].)
	ByteSize [▶ 2474]	Gets the (aligned) size of of the Type/Instance in Bytes (Inherited from IBitSize [▶ 2472].)
	Category [▶ 2694]	Gets the Symbol/Datatype Category
	Comment [▶ 2550]	Gets the comment of the IInstance [▶ 2549] (Inherited from IInstance [▶ 2549].)
	DataType [▶ 2551]	Gets the IDataType [▶ 2475] of the IInstance [▶ 2549]. (Inherited from IInstance [▶ 2549].)

	Name	Description
	InstanceName [▶ 2551]	Gets the name of the instance (without periods (.)) (Inherited from IInstance [▶ 2549].)
	InstancePath [▶ 2552]	Gets the relative / absolute access path to the instance (with periods (.)) (Inherited from IInstance [▶ 2549].)
	IsBitType [▶ 2474]	Gets a value indicating whether this instance is not basing on a full DataType but instead of some sort of bit mapping (Inherited from IBitSize [▶ 2472].)
	IsByteAligned [▶ 2475]	Indicates that the Size of the Object is Byte aligned ($\text{BitSize} \% 8 == 0$) (Inherited from IBitSize [▶ 2472].)
	IsContainerType [▶ 2694]	Gets a value indicating whether this Symbol is a container type.
	IsPersistent [▶ 2694]	Gets a value indicating whether this ISymbol is persistent.
	IsPointer [▶ 2552]	Indicates that the IInstance [▶ 2549] represents a Pointer type (Pointer TO) (Inherited from IInstance [▶ 2549].)
	IsPrimitiveType [▶ 2695]	Gets a value indicating whether this instance is a primitive type.
	IsReadOnly [▶ 2695]	Indicates that this instance is read only.
	IsRecursive [▶ 2696]	Gets a value indicating whether this instance is recursive.
	IsReference [▶ 2552]	Indicates that the IInstance [▶ 2549] represents a Reference type (REFERENCE TO) (Inherited from IInstance [▶ 2549].)
	IsStatic [▶ 2553]	Gets a value indicating whether this IInstance [▶ 2549] is static. (Inherited from IInstance [▶ 2549].)
	Parent [▶ 2696]	Gets the parent Symbol
	Size [▶ 2475]	Gets the size of the object in bytes or Bits dependant on IsBitType [▶ 2474] (Inherited from IBitSize [▶ 2472].)
	SubSymbols [▶ 2696]	Gets the SubSymbols of the ISymbol
	TypeName [▶ 2553]	Gets the name of the DataType [▶ 2475] that is used for this IInstance [▶ 2549]. (Inherited from IInstance [▶ 2549].)
	ValueEncoding [▶ 2472]	Gets the value encoding. (Inherited from IAttributedInstance [▶ 2469].)

Extension Methods

	Name	Description
	ReferencesExternalData [▶ 3038]	Indicates, that the Instance value includes process memory data, that cannot be read in one memory block. (Defined by DataTypeExtension [▶ 3021].)

6.11.86.1 ISymbol Properties

The [ISymbol](#) [▶ 2691] type exposes the following members.

Properties

	Name	Description
	Attributes [▶ 2471]	Gets the Type Attributes. (Inherited from IAttributedInstance [▶ 2469].)
	BitSize [▶ 2473]	Gets the size of the IDataType [▶ 2475] in bits. (Inherited from IBitSize [▶ 2472].)
	ByteSize [▶ 2474]	Gets the (aligned) size of of the Type/Instance in Bytes (Inherited from IBitSize [▶ 2472].)
	Category [▶ 2694]	Gets the Symbol/Datatype Category
	Comment [▶ 2550]	Gets the comment of the IInstance [▶ 2549] (Inherited from IInstance [▶ 2549].)
	DataType [▶ 2551]	Gets the IDataType [▶ 2475] of the IInstance [▶ 2549]. (Inherited from IInstance [▶ 2549].)
	InstanceName [▶ 2551]	Gets the name of the instance (without periods (.)) (Inherited from IInstance [▶ 2549].)
	InstancePath [▶ 2552]	Gets the relative / absolute access path to the instance (with periods (.)) (Inherited from IInstance [▶ 2549].)
	IsBitType [▶ 2474]	Gets a value indicating whether this instance is not basing on a full DataType but instead of some sort of bit mapping (Inherited from IBitSize [▶ 2472].)
	IsByteAligned [▶ 2475]	Indicates that the Size of the Object is Byte aligned ($\text{BitSize} \% 8 == 0$) (Inherited from IBitSize [▶ 2472].)
	IsContainerType [▶ 2694]	Gets a value indicating whether this Symbol is acontainer type.
	IsPersistent [▶ 2694]	Gets a value indicating whether this ISymbol [▶ 2691] is persistent.
	IsPointer [▶ 2552]	Indicates that the IInstance [▶ 2549] represents a Pointer type (Pointer TO) (Inherited from IInstance [▶ 2549].)
	IsPrimitiveType [▶ 2695]	Gets a value indicating whether this instance is a primitive type.
	IsReadOnly [▶ 2695]	Indicates that this instance is read only.
	IsRecursive [▶ 2696]	Gets a value indicating whether this instance is recursive.
	IsReference [▶ 2552]	Indicates that the IInstance [▶ 2549] represents a Reference type (REFERENCE TO) (Inherited from IInstance [▶ 2549].)
	IsStatic [▶ 2553]	Gets a value indicating whether this IInstance [▶ 2549] is static. (Inherited from IInstance [▶ 2549].)
	Parent [▶ 2696]	Gets the parent Symbol
	Size [▶ 2475]	Gets the size of the object in bytes or Bits dependant on IsBitType [▶ 2474] (Inherited from IBitSize [▶ 2472].)
	SubSymbols [▶ 2696]	Gets the SubSymbols of the ISymbol [▶ 2691]
	TypeName [▶ 2553]	Gets the name of the DataType [▶ 2475] that is used for this IInstance [▶ 2549]. (Inherited from IInstance [▶ 2549].)
	ValueEncoding [▶ 2472]	Gets the value encoding. (Inherited from IAttributedInstance [▶ 2469].)

6.11.86.1.2 ISymbol.IsContainerType Property

Gets a value indicating whether this Symbol is acontainer type.

Namespace: [TwinCAT.TypeSystem](#) [► 2083]

Assembly: TwinCAT.Ads.Abstractions (in TwinCAT.Ads.Abstractions.dll) Version: 6.0.328+39e3229

Syntax

C#

```
bool IsContainerType { get; }
```

Property Value

Type: Boolean

true if this instance is container type; otherwise, false.

Reference

[ISymbol Interface](#) [► 2691]

[TwinCAT.TypeSystem Namespace](#) [► 2083]

6.11.86.1.3 ISymbol.IsPersistent Property

Gets a value indicating whether this [ISymbol](#) [► 2691] is persistent.

Namespace: [TwinCAT.TypeSystem](#) [► 2083]

Assembly: TwinCAT.Ads.Abstractions (in TwinCAT.Ads.Abstractions.dll) Version: 6.0.328+39e3229

Syntax

C#

```
bool IsPersistent { get; }
```

Property Value

Type: Boolean
true if this instance is persistent; otherwise, false.

Reference

[ISymbol Interface](#) [► 2691]

[TwinCAT.TypeSystem Namespace](#) [► 2083]

6.11.86.1.4 ISymbol.IsPrimitiveType Property

Gets a value indicating whether this instance is a primitive type.

Namespace: [TwinCAT.TypeSystem](#) [► 2083]

Assembly: TwinCAT.Ads.Abstractions (in TwinCAT.Ads.Abstractions.dll) Version: 6.0.328+39e3229

Syntax

C#

```
bool IsPrimitiveType { get; }
```

Property Value

Type: Boolean
true if this instance is primitive type; otherwise, false.

Reference

[ISymbol Interface](#) [► 2691]

[TwinCAT.TypeSystem Namespace](#) [► 2083]

6.11.86.1.5 ISymbol.IsReadOnly Property

Indicates that this instance is read only.

Namespace: [TwinCAT.TypeSystem](#) [► 2083]

Assembly: TwinCAT.Ads.Abstractions (in TwinCAT.Ads.Abstractions.dll) Version: 6.0.328+39e3229

Syntax

C#

```
bool IsReadOnly { get; }
```

Property Value

Type: Boolean

Remarks

Actually, this Flag is restricted to TcCOM-Objects readonly Parameters. Within the PLC this is used for the ApplicationName and ProjectName of PLC instances. Write-Access on these Modules will create an [DeviceAccessDenied](#) [► 664] error.

6.11.87 ISymbolCollection Interface

Interface [ISymbolCollection](#) Implements the [IInstanceCollection.T.](#) [[▶ 2554](#)]

Namespace: [TwinCAT.TypeSystem](#) [[▶ 2083](#)]

Assembly: [TwinCAT.Ads.Abstractions](#) (in [TwinCAT.Ads.Abstractions.dll](#)) Version: 6.0.328+39e3229

Syntax

C#

```
public interface ISymbolCollection : ISymbolCollection<ISymbol>,
    IInstanceCollection<ISymbol>, IList<ISymbol>, ICollection<ISymbol>,
    IEnumerable<ISymbol>, IEnumerable
```

The [ISymbolCollection](#) type exposes the following members.

Properties

	Name	Description
	Count	Gets the number of elements contained in the ICollection.T. (Inherited from ICollection.ISymbol [▶ 2691].)
	IsReadOnly	Gets a value indicating whether the ICollection.T. is read-only. (Inherited from ICollection.ISymbol [▶ 2691].)

	Name	Description
	Item.Int32.	Gets or sets the element at the specified index. (Inherited from IList.ISymbol [▶ 2691]..)
	Item.String. [▶ 2556]	Gets the Instance [▶ 2549] with the specified instance path. (Inherited from InstanceCollection.T. [▶ 2554].)
	Mode [▶ 2556]	Gets the InstanceCollectionMode [▶ 2573]. (Inherited from InstanceCollection.T. [▶ 2554].)

Methods

	Name	Description
	Add	Adds an item to the ICollection.T.. (Inherited from ICollection.ISymbol [▶ 2691]..)
	Clear	Removes all items from the ICollection.T.. (Inherited from ICollection.ISymbol [▶ 2691]..)
	Contains(T)	Determines whether the ICollection.T. contains a specific value. (Inherited from ICollection.ISymbol [▶ 2691]..)
	Contains(String) [▶ 2558]	Determines whether this collection contains an instance with the specified instance path. (Inherited from InstanceCollection.T. [▶ 2554].)
	ContainsName [▶ 2558]	Determines whether this collection contains an instance with the specified instance name. (Inherited from InstanceCollection.T. [▶ 2554].)
	CopyTo	Copies the elements of the ICollection.T. to an Array, starting at a particular Array index. (Inherited from ICollection.ISymbol [▶ 2691]..)
	GetEnumerator	Returns an enumerator that iterates through the collection. (Inherited from IEnumerable.ISymbol [▶ 2691]..)
	GetInstance [▶ 2559]	Gets the Instance [▶ 2549] by instance path. (Inherited from InstanceCollection.T. [▶ 2554].)
	GetInstanceByName [▶ 2559]	Gets the Instance [▶ 2549] by instance name. (Inherited from InstanceCollection.T. [▶ 2554].)
	IndexOf	Determines the index of a specific item in the IList.T.. (Inherited from IList.ISymbol [▶ 2691]..)
	Insert	Inserts an item to the IList.T. at the specified index. (Inherited from IList.ISymbol [▶ 2691]..)
	Remove	Removes the first occurrence of a specific object from the ICollection.T.. (Inherited from ICollection.ISymbol [▶ 2691]..)
	RemoveAt	Removes the IList.T. item at the specified index. (Inherited from IList.ISymbol [▶ 2691]..)
	TryGetInstance [▶ 2560]	Tries to get the specified instance. (Inherited from InstanceCollection.T. [▶ 2554].)
	TryGetInstanceByName [▶ 2560]	Tries to get the specified instance by name. (Inherited from InstanceCollection.T. [▶ 2554].)

[TwinCAT.TypeSystem Namespace](#) [▶ 2083]

6.11.88 ISymbolCollection.T. Interface

Interface ISymbolCollection

Namespace: [TwinCAT.TypeSystem](#) [▶ 2083]

Assembly: TwinCAT.Ads.Abstractions (in TwinCAT.Ads.Abstractions.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public interface ISymbolCollection<T> : IInstanceCollection<T>,
    IList<T>, ICollection<T>, IEnumerable<T>, IEnumerable
where T : class, ISymbol
```

Type Parameters

T

The ISymbolCollection.T. type exposes the following members.

Properties

	Name	Description
	Count	Gets the number of elements contained in the ICollection.T. (Inherited from ICollection.T.)
	IsReadOnly	Gets a value indicating whether the ICollection.T. is read-only. (Inherited from ICollection.T.)
	Item.Int32.	Gets or sets the element at the specified index. (Inherited from IList.T.)
	Item.String. [▶ 2556]	Gets the IInstance [▶ 2549] with the specified instance path. (Inherited from IInstanceCollection.T. [▶ 2554].)
	Mode [▶ 2556]	Gets the InstanceCollectionMode [▶ 2573]. (Inherited from IInstanceCollection.T. [▶ 2554].)

Methods

	Name	Description
	Add	Adds an item to the ICollection.T. (Inherited from ICollection.T.)
	Clear	Removes all items from the ICollection.T. (Inherited from ICollection.T.)
	Contains(T)	Determines whether the ICollection.T. contains a specific value. (Inherited from ICollection.T.)
	Contains(String) [▶ 2558]	Determines whether this collection contains an instance with the specified instance path. (Inherited from IInstanceCollection.T. [▶ 2554].)

	Name	Description
	ContainsName [▶ 2558]	Determines whether this collection contains an instance with the specified instance name. (Inherited from IInstanceCollection.T. [▶ 2554].)
	CopyTo	Copies the elements of the ICollection.T. to an Array, starting at a particular Array index. (Inherited from ICollection.T.)
	GetEnumerator	Returns an enumerator that iterates through the collection. (Inherited from IEnumerable.T.)
	GetInstance [▶ 2559]	Gets the IInstance [▶ 2549] by instance path. (Inherited from IInstanceCollection.T. [▶ 2554].)
	GetInstanceByName [▶ 2559]	Gets the IInstance [▶ 2549] by instance name. (Inherited from IInstanceCollection.T. [▶ 2554].)
	IndexOf	Determines the index of a specific item in the IList.T. . (Inherited from IList.T.)
	Insert	Inserts an item to the IList.T. at the specified index. (Inherited from IList.T.)
	Remove	Removes the first occurrence of a specific object from the ICollection.T. . (Inherited from ICollection.T.)
	RemoveAt	Removes the IList.T. item at the specified index. (Inherited from IList.T.)
	TryGetInstance [▶ 2560]	Tries to get the specified instance. (Inherited from IInstanceCollection.T. [▶ 2554].)
	TryGetInstanceByName [▶ 2560]	Tries to get the specified instance by name. (Inherited from IInstanceCollection.T. [▶ 2554].)

6.11.89 ISymbolFactory Interface

Symbol Factory Interface

Namespace: [TwinCAT.TypeSystem](#) [▶ 2083]

Assembly: TwinCAT.Ads.Abstractions (in TwinCAT.Ads.Abstractions.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public interface ISymbolFactory
```

The ISymbolFactory type exposes the following members.

Properties

	Name	Description
	FactoryServices [▶ 2704]	Gets the factory services.
	HasInvalidCharacters [▶ 2704]	Gets a value indicating whether ISymbol [▶ 2691]s have invalid characters
	InvalidCharacters [▶ 2705]	Gets the invalid characters that are not allowed to appear within the Instance Name

Methods

	Name	Description
	CreateArrayElement [▶ 2706]	Creates a single Array Element
	CreateArrayElementInstances [▶ 2706]	Creates all Element Instances of the specified array parent symbol.
	CreateFieldInstance [▶ 2707]	Creates a single Instance member on a struct parent
	CreateFieldInstances [▶ 2708]	Creates the Member Instances collection for the specified parent instance
	CreateInstance [▶ 2708]	Creates the Symbol with the specified resolver
	CreateInstanceAsync [▶ 2709]	Creates the Symbol with the specified resolver
	CreateReferenceInstance [▶ 2709]	Creates the dereferenced Pointer instance
	CreateVirtualStruct [▶ 2710]	Creates the virtual structure.
	Initialize [▶ 2710]	Initializes the the ISymbolFactory.
	SetInvalidCharacters [▶ 2711]	Sets the invalid characters.

6.11.89.2.1 ISymbolFactory.CreateArrayElement Method

Creates a single Array Element

Namespace: [TwinCAT.TypeSystem](#) [[▶ 2083](#)]

Assembly: TwinCAT.Ads.Abstractions (in TwinCAT.Ads.Abstractions.dll) Version: 6.0.328+39e3229

Syntax

C#

```
ISymbol CreateArrayElement(
    IArrayType arrayType,
    int[] currentIndex,
    ISymbol parent
)
```

Parameters

arrayType	Type: TwinCAT.TypeSystem.IArrayType [▶ 2459] Resolved Array type.
currentIndex	Type: <code>.System.Int32</code> . Array Index of the Element
parent	Type: TwinCAT.TypeSystem.ISymbol [▶ 2691] Array Instance

Return Value

Type: [ISymbol](#) [[▶ 2691](#)]

Array element

Reference

[ISymbolFactory Interface](#) [[▶ 2702](#)]

[TwinCAT.TypeSystem Namespace](#) [[▶ 2083](#)]

6.11.89.2.2 ISymbolFactory.CreateArrayElementInstances Method

Creates all Element Instances of the specified array parent symbol.

Namespace: [TwinCAT.TypeSystem](#) [[▶ 2083](#)]

Assembly: TwinCAT.Ads.Abstractions (in TwinCAT.Ads.Abstractions.dll) Version: 6.0.328+39e3229

Syntax

C#

```
ISymbolCollection<ISymbol> CreateArrayElementInstances (
    ISymbol parentInstance,
    IArrayType arrayType
)
```

Parameters

parentInstance	Type: TwinCAT.TypeSystem.ISymbol [▶ 2691] The parent instance.
arrayType	Type: TwinCAT.TypeSystem.IArrayType [▶ 2459] Resolved array type.

Return Value

Type: [ISymbolCollection](#) [▶ 2700].[ISymbol](#) [▶ 2691].
SymbolCollection.

Reference

[ISymbolFactory Interface](#) [▶ 2702]

[TwinCAT.TypeSystem Namespace](#) [▶ 2083]

6.11.89.2.3 ISymbolFactory.CreateFieldInstance Method

Creates a single Instance member on a struct parent

Namespace: [TwinCAT.TypeSystem](#) [▶ 2083]

Assembly: TwinCAT.Ads.Abstractions (in TwinCAT.Ads.Abstractions.dll) Version: 6.0.328+39e3229

Syntax

C#

```
ISymbol CreateFieldInstance (
    IField field,
    ISymbol parent
)
```

Parameters

field	Type: TwinCAT.TypeSystem.IField [▶ 2535] Field
parent	Type: TwinCAT.TypeSystem.ISymbol [▶ 2691] Parent Struct/Alias/Union

Return Value

Type: [ISymbol](#) [▶ 2691]
Instance member

Remarks

Because the Alias type can act like a struct, the parent can be an [IAliasInstance](#) also.

Reference

6.11.89.2.6 ISymbolFactory.CreateInstanceAsync Method

Creates the Symbol with the specified resolver

Namespace: [TwinCAT.TypeSystem](#) [[▶ 2083](#)]

Assembly: TwinCAT.Ads.Abstractions (in TwinCAT.Ads.Abstractions.dll) Version: 6.0.328+39e3229

Syntax**C#**

```
Task<ResultValue<ISymbol>> CreateInstanceAsync (
    ISymbolInfo entry,
    ISymbol? parent,
    CancellationToken cancel
)
```

Parameters

entry	Type: TwinCAT.TypeSystem.ISymbolInfo [▶ 2712] Symbol Entry.
parent	Type: TwinCAT.TypeSystem.ISymbol [▶ 2691] The parent.
cancel	Type: System.Threading.CancellationToken The cancellation token.

Return Value

Type: [Task.ResultValue](#) [[▶ 1181](#)].[ISymbol](#) [[▶ 2691](#)].
[Task<ResultValue<ISymbol>>](#).

Namespace: [TwinCAT.TypeSystem](#) [▶ 2083]

Assembly: TwinCAT.Ads.Abstractions (in TwinCAT.Ads.Abstractions.dll) Version: 6.0.328+39e3229

Syntax**C#**

```
ISymbol CreateVirtualStruct(
    string instanceName,
    string instancePath,
    ISymbol? parent
)
```

Parameters

instanceName	Type: System.String Name of the instance.
instancePath	Type: System.String The instance path.
parent	Type: TwinCAT.TypeSystem.ISymbol [▶ 2691] The parent.

Return Value

Type: [ISymbol](#) [▶ 2691]
Virtual struct instance

Reference

Namespace: [TwinCAT.TypeSystem](#) [[▶ 2083](#)]

Assembly: TwinCAT.Ads.Abstractions (in TwinCAT.Ads.Abstractions.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public interface ISymbolLoader : ISymbolProvider,  
    ISymbolServer
```

The ISymbolLoader type exposes the following members.

Properties

	Name	Description
	BuildInTypes [▶ 2716]	Gets the build in types.
	DataTypes [▶ 2720]	Gets the data types (Inherited from ISymbolServer [▶ 2719].)
	DefaultValueEncoding [▶ 2721]	Gets the default value encoding. (Inherited from ISymbolServer [▶ 2719].)
	RootNamespaceName [▶ 2718]	Gets the name of the root namespace (Inherited from ISymbolProvider [▶ 2717].)
	Settings [▶ 2716]	Gets or sets the access Method
	Symbols [▶ 2721]	Gets the symbols. (Inherited from ISymbolServer [▶ 2719].)

Methods

	Name	Description
	GetDataTypesAsync [▶ 2722]	Gets the data types asynchronously. (Inherited from ISymbolServer [▶ 2719].)
	GetSymbolsAsync [▶ 2723]	Gets the symbols asynchronously (Inherited from ISymbolServer [▶ 2719].)
	ResetCachedSymbolicData [▶ 2724]	Resets the cached symbolic data. (Inherited from ISymbolServer [▶ 2719].)
	TryGetDataTypes [▶ 2723]	Tries to get the symbols from the device target. (Inherited from ISymbolServer [▶ 2719].)
	TryGetSymbols [▶ 2724]	Tries to geth the symbols from the device target. (Inherited from ISymbolServer [▶ 2719].)

Symbol Provider interface.

Namespace: [TwinCAT.TypeSystem](#) [▶ 2083]

Assembly: TwinCAT.Ads.Abstractions (in TwinCAT.Ads.Abstractions.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public interface ISymbolProvider : ISymbolServer
```

The [ISymbolProvider](#) type exposes the following members.

Properties

	Name	Description
	DataTypes [▶ 2720]	Gets the data types (Inherited from ISymbolServer [▶ 2719].)
	DefaultValueEncoding [▶ 2721]	Gets the default value encoding. (Inherited from ISymbolServer [▶ 2719].)
	RootNamespaceName [▶ 2718]	Gets the name of the root namespace
	Symbols [▶ 2721]	Gets the symbols. (Inherited from ISymbolServer [▶ 2719].)

Methods

	Name	Description
	GetDataTypesAsync [▶ 2722]	Gets the data types asynchronously. (Inherited from ISymbolServer [▶ 2719].)
	GetSymbolsAsync [▶ 2723]	Gets the symbols asynchronously (Inherited from ISymbolServer [▶ 2719].)
	ResetCachedSymbolicData [▶ 2724]	Resets the cached symbolic data. (Inherited from ISymbolServer [▶ 2719].)
	TryGetDataTypes [▶ 2723]	Tries to get the symbols from the device target. (Inherited from ISymbolServer [▶ 2719].)

6.11.94.1.1 ISymbolServer.DataTypes Property

Gets the data types

Namespace: [TwinCAT.TypeSystem](#) [[▸ 2083](#)]

Assembly: [TwinCAT.Ads.Abstractions](#) (in [TwinCAT.Ads.Abstractions.dll](#)) Version: 6.0.328+39e3229

Syntax

C#

```
IDataValueCollection<IDataType> DataTypes { get; }
```

Property Value

Type: [IDataValueCollection](#) [[▶ 2486](#)].[IDataType](#) [[▶ 2475](#)].

The data types.

Remarks

This property reads the `DataTypes` synchronously, if the data is not available yet. For performance reasons, the asynchronous counterpart [GetDataTypesAsync\(CancellationToken\)](#) [[▶ 2722](#)] should be preferred for the first call.

Reference

6.11.94.1.2 ISymbolServer.DefaultValueEncoding Property

Gets the default value encoding.

Namespace: [TwinCAT.TypeSystem](#) [[▶ 2083](#)]

Assembly: TwinCAT.Ads.Abstractions (in TwinCAT.Ads.Abstractions.dll) Version: 6.0.328+39e3229

Syntax

C#

```
Encoding DefaultValueEncoding { get; }
```

Property Value

Type: `Encoding`

The default value encoding.

Reference

[ISymbolServer Interface](#) [[▶ 2719](#)]

[TwinCAT.TypeSystem Namespace](#) [[▶ 2083](#)]

6.11.94.1.3 ISymbolServer.Symbols Property

Gets the symbols.

Namespace: [TwinCAT.TypeSystem](#) [[▶ 2083](#)]

Assembly: TwinCAT.Ads.Abstractions (in TwinCAT.Ads.Abstractions.dll) Version: 6.0.328+39e3229

Syntax

C#

```
ISymbolCollection<ISymbol> Symbols { get; }
```

Property Value

Type: [ISymbolCollection](#) [[▸ 2700](#)].[ISymbol](#) [[▸ 2691](#)].
The symbols.

Remarks

This property reads the Symbol information synchronously, if the data is not available yet. For performance reasons, the asynchronous counterpart [GetSymbolsAsync\(CancellationTokentoken\)](#) [[▸ 2723](#)] should be preferred for the first call.

Reference

[ISymbolServer Interface](#) [[▸ 2719](#)]

6.11.94.2.1 ISymbolServer.GetDataTypesAsync Method

Gets the data types asynchronously.

Namespace: [TwinCAT.TypeSystem](#) [[▸ 2083](#)]

Assembly: TwinCAT.Ads.Abstractions (in TwinCAT.Ads.Abstractions.dll) Version: 6.0.328+39e3229

Syntax

C#

```
Task<ResultDataTypes> GetDataTypesAsync(
    CancellationToken cancel
)
```

Parameters

cancel	Type: System.Threading.CancellationToken The cancellation token.
--------	---

Return Value

Type: [Task.ResultDataTypes](#) [[▸ 2872](#)].

A task that represents the asynchronous 'GetDataTypes' operation. The [ResultDataTypes](#) [[▸ 2872](#)] parameter contains the data types ([DataTypes](#) [[▸ 2874](#)]) and the [ErrorCode](#) [[▸ 1120](#)] after execution.

6.11.96 ITypeAttributeCollection Interface

Interface ITypeAttributeCollection

Namespace: [TwinCAT.TypeSystem](#) [▸ 2083]

Assembly: TwinCAT.Ads.Abstractions (in TwinCAT.Ads.Abstractions.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public interface ITypeAttributeCollection : IList<ITypeAttribute>,  
    ICollection<ITypeAttribute>, IEnumerable<ITypeAttribute>, IEnumerable
```

The ITypeAttributeCollection type exposes the following members.

Properties

	Name	Description
	Count	Gets the number of elements contained in the ICollection.T.. (Inherited from ICollection.ITypeAttribute [▶ 2725]..)
	IsReadOnly	Gets a value indicating whether the ICollection.T. is read-only. (Inherited from ICollection.ITypeAttribute [▶ 2725]..)
	Item.Int32.	Gets or sets the element at the specified index. (Inherited from IList.ITypeAttribute [▶ 2725]..)
	Item.String. [▶ 2728]	Gets the String with the specified name.

Methods

	Name	Description
	Add	Adds an item to the ICollection.T.. (Inherited from ICollection.ITypeAttribute [▶ 2725]..)
	Clear	Removes all items from the ICollection.T.. (Inherited from ICollection.ITypeAttribute [▶ 2725]..)
	Contains(T)	Determines whether the ICollection.T. contains a specific value. (Inherited from ICollection.ITypeAttribute [▶ 2725]..)
	Contains(String) [▶ 2730]	Determines whether this ITypeAttributeCollection contains the specified attribute.
	CopyTo	Copies the elements of the ICollection.T. to an Array, starting at a particular Array index. (Inherited from ICollection.ITypeAttribute [▶ 2725]..)
	GetEnumerator	Returns an enumerator that iterates through the collection. (Inherited from IEnumerable.ITypeAttribute [▶ 2725]..)
	IndexOf	Determines the index of a specific item in the IList.T.. (Inherited from IList.ITypeAttribute [▶ 2725]..)
	Insert	Inserts an item to the IList.T. at the specified index. (Inherited from IList.ITypeAttribute [▶ 2725]..)
	Remove	Removes the first occurrence of a specific object from the ICollection.T.. (Inherited from ICollection.ITypeAttribute [▶ 2725]..)
	RemoveAt	Removes the IList.T. item at the specified index. (Inherited from IList.ITypeAttribute [▶ 2725]..)
	TryGetAttribute [▶ 2730]	Tries to get the specified ITypeAttribute [▶ 2725]
	TryGetValue [▶ 2731]	Tries to get the specified Attribute value.

Tries to get the specified Attribute value.

Namespace: [TwinCAT.TypeSystem \[▶ 2083\]](#)

Assembly: TwinCAT.Ads.Abstractions (in TwinCAT.Ads.Abstractions.dll) Version: 6.0.328+39e3229

Syntax

C#

```
bool TryGetValue(
    string name,
    out string?? value
)
```

Parameters

name	Type: System.String The name.
value	Type: System.String. The value.

Return Value

Type: Boolean
true if the value is found, false otherwise.

Reference

[ITypeAttributeCollection Interface \[▶ 2726\]](#)

[TwinCAT.TypeSystem Namespace \[▶ 2083\]](#)

6.11.97 ITypeMarshaler Interface

Interface ITypeMarshaler

Namespace: [TwinCAT.TypeSystem \[▶ 2083\]](#)

Assembly: TwinCAT.Ads.Abstractions (in TwinCAT.Ads.Abstractions.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public interface ITypeMarshaler
```

The ITypeMarshaler type exposes the following members.

Methods

	Name	Description
	CanMarshal [▶ 2732]	Determines whether ADS can marshal the specified managed data type.
	CanMarshalValue [▶ 2736]	Determines whether ADS can marshal the specified value

	Name	Description
	Marshal [▶ 2734]	Marshals the specified value to the specified destination memory / span.
	MarshalValueSize [▶ 2736]	Gets the byte size of the value when marshalled.
	Unmarshal [▶ 2735]	Unmarshals the specified managed type from memory / span

Remarks

The `ITypeMarshaler` is the common base interface for marshalling classes. It support marshalling / unmarshalling of primitive managed values.

6.11.97.1.1 ITypeMarshaler.CanMarshal Method

Determines whether ADS can marshal the specified managed data type.

Namespace: [TwinCAT.TypeSystem](#) [[▶ 2083](#)]

Assembly: [TwinCAT.Ads.Abstractions](#) (in [TwinCAT.Ads.Abstractions.dll](#)) Version: 6.0.328+39e3229

Syntax

C#

```
bool CanMarshal(  
    Type type  
)
```

Parameters

type	Type: System.Type The Managed data type.
------	---

Return Value

Type: Boolean

true if this instance can marshal the specified managed type; otherwise, false.

Reference

6.11.97.1.4 ITypeMarshaler.Unmarshal Method

Unmarshals the specified managed type from memory / span

Namespace: [TwinCAT.TypeSystem](#) [[▶ 2083](#)]

Assembly: TwinCAT.Ads.Abstractions (in TwinCAT.Ads.Abstractions.dll) Version: 6.0.328+39e3229

Syntax

C#

```
int Unmarshal(
    Type type,
    ReadOnlySpan<byte> source,
    Encoding encoding,
    out Object value
)
```

Parameters

type	Type: System.Type The type.
source	Type: System.ReadOnlySpan.Byte . The source memory/span
encoding	Type: System.Text.Encoding The encoding.
value	Type: System.Object . The created value.

Return Value

Type: Int32
Number of unmarshaled bytes.

6.11.98 IUnionInstance Interface

Interface for an Instance of the [IUnionType](#) [[▶ 2740](#)].

Namespace: [TwinCAT.TypeSystem](#) [[▶ 2083](#)]

Assembly: TwinCAT.Ads.Abstractions (in TwinCAT.Ads.Abstractions.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public interface IUnionInstance : ISymbol,
    IAttributedInstance, IInstance, IBitSize
```

The IUnionInstance type exposes the following members.

Properties

	Name	Description
	Attributes [▶ 2471]	Gets the Type Attributes. (Inherited from IAttributedInstance [▶ 2469].)
	BitSize [▶ 2473]	Gets the size of the IDataType [▶ 2475] in bits. (Inherited from IBitSize [▶ 2472].)
	ByteSize [▶ 2474]	Gets the (aligned) size of of the Type/Instance in Bytes (Inherited from IBitSize [▶ 2472].)
	Category [▶ 2694]	Gets the Symbol/Datatype Category (Inherited from ISymbol [▶ 2691].)
	Comment [▶ 2550]	Gets the comment of the IInstance [▶ 2549] (Inherited from IInstance [▶ 2549].)
	DataType [▶ 2551]	Gets the IDataType [▶ 2475] of the IInstance [▶ 2549]. (Inherited from IInstance [▶ 2549].)
	FieldInstances [▶ 2740]	Gets the field instances of the Union
	InstanceName [▶ 2551]	Gets the name of the instance (without periods (.)) (Inherited from IInstance [▶ 2549].)
	InstancePath [▶ 2552]	Gets the relative / absolute access path to the instance (with periods (.)) (Inherited from IInstance [▶ 2549].)
	IsBitType [▶ 2474]	Gets a value indicating whether this instance is not basing on a full DataType but instead of some sort of bit mapping (Inherited from IBitSize [▶ 2472].)
	IsByteAligned [▶ 2475]	Indicates that the Size of the Object is Byte aligned (BitSize % 8 == 0) (Inherited from IBitSize [▶ 2472].)

	Name	Description
	IsContainerType [▶ 2694]	Gets a value indicating whether this Symbol is a container type. (Inherited from ISymbol [▶ 2691].)
	IsPersistent [▶ 2694]	Gets a value indicating whether this ISymbol [▶ 2691] is persistent. (Inherited from ISymbol [▶ 2691].)
	IsPointer [▶ 2552]	Indicates that the IInstance [▶ 2549] represents a Pointer type (Pointer TO) (Inherited from IInstance [▶ 2549].)
	IsPrimitiveType [▶ 2695]	Gets a value indicating whether this instance is a primitive type. (Inherited from ISymbol [▶ 2691].)
	IsReadOnly [▶ 2695]	Indicates that this instance is read only. (Inherited from ISymbol [▶ 2691].)
	IsRecursive [▶ 2696]	Gets a value indicating whether this instance is recursive. (Inherited from ISymbol [▶ 2691].)
	IsReference [▶ 2552]	Indicates that the IInstance [▶ 2549] represents a Reference type (REFERENCE TO) (Inherited from IInstance [▶ 2549].)
	IsStatic [▶ 2553]	Gets a value indicating whether this IInstance [▶ 2549] is static. (Inherited from IInstance [▶ 2549].)
	Parent [▶ 2696]	Gets the parent Symbol (Inherited from ISymbol [▶ 2691].)
	Size [▶ 2475]	Gets the size of the object in bytes or Bits dependant on IsBitType [▶ 2474] (Inherited from IBitSize [▶ 2472].)
	SubSymbols [▶ 2696]	Gets the SubSymbols of the ISymbol [▶ 2691] (Inherited from ISymbol [▶ 2691].)
	TypeName [▶ 2553]	Gets the name of the DataType [▶ 2475] that is used for this IInstance [▶ 2549]. (Inherited from IInstance [▶ 2549].)
	ValueEncoding [▶ 2472]	Gets the value encoding. (Inherited from IAttributedInstance [▶ 2469].)

Extension Methods

	Name	Description
	ReferencesExternalData [▶ 3038]	Indicates, that the Instance value includes process memory data, that cannot be read in one memory block. (Defined by DataTypeExtension [▶ 3021].)

Reference

6.11.98.1 UnionInstance Properties

The [IUnionInstance](#) [▶ 2737] type exposes the following members.

Properties

	Name	Description
	Attributes [▶ 2471]	Gets the Type Attributes. (Inherited from IAttributedInstance [▶ 2469].)
	BitSize [▶ 2473]	Gets the size of the IDataType [▶ 2475] in bits. (Inherited from IBitSize [▶ 2472].)

	Name	Description
	ByteSize [▶ 2474]	Gets the (aligned) size of of the Type/Instance in Bytes (Inherited from IBitSize [▶ 2472].)
	Category [▶ 2694]	Gets the Symbol/Datatype Category (Inherited from ISymbol [▶ 2691].)
	Comment [▶ 2550]	Gets the comment of the Instance [▶ 2549] (Inherited from Instance [▶ 2549].)
	DataType [▶ 2551]	Gets the IDataType [▶ 2475] of the Instance [▶ 2549] . (Inherited from Instance [▶ 2549].)
	FieldInstances [▶ 2740]	Gets the field instances of the Union
	InstanceName [▶ 2551]	Gets the name of the instance (without periods (.)) (Inherited from Instance [▶ 2549].)
	InstancePath [▶ 2552]	Gets the relative / absolute access path to the instance (with periods (.)) (Inherited from Instance [▶ 2549].)
	IsBitType [▶ 2474]	Gets a value indicating whether this instance is not basing on a full DataType but instead of some sort of bit mapping (Inherited from IBitSize [▶ 2472].)
	IsByteAligned [▶ 2475]	Indicates that the Size of the Object is Byte aligned ($\text{BitSize} \% 8 == 0$) (Inherited from IBitSize [▶ 2472].)
	IsContainerType [▶ 2694]	Gets a value indicating whether this Symbol is acontainer type. (Inherited from ISymbol [▶ 2691].)
	IsPersistent [▶ 2694]	Gets a value indicating whether this ISymbol [▶ 2691] is persistent. (Inherited from ISymbol [▶ 2691].)
	IsPointer [▶ 2552]	Indicates that the Instance [▶ 2549] represents a Pointer type (Pointer TO) (Inherited from Instance [▶ 2549].)
	IsPrimitiveType [▶ 2695]	Gets a value indicating whether this instance is a primitive type. (Inherited from ISymbol [▶ 2691].)
	IsReadOnly [▶ 2695]	Indicates that this instance is read only. (Inherited from ISymbol [▶ 2691].)
	IsRecursive [▶ 2696]	Gets a value indicating whether this instance is recursive. (Inherited from ISymbol [▶ 2691].)
	IsReference [▶ 2552]	Indicates that the Instance [▶ 2549] represents a Reference type (REFERENCE TO) (Inherited from Instance [▶ 2549].)
	IsStatic [▶ 2553]	Gets a value indicating whether this Instance [▶ 2549] is static. (Inherited from Instance [▶ 2549].)
	Parent [▶ 2696]	Gets the parent Symbol (Inherited from ISymbol [▶ 2691].)
	Size [▶ 2475]	Gets the size of the object in bytes or Bits dependant on IsBitType [▶ 2474] (Inherited from IBitSize [▶ 2472].)
	SubSymbols [▶ 2696]	Gets the SubSymbols of the ISymbol [▶ 2691] (Inherited from ISymbol [▶ 2691].)
	TypeName [▶ 2553]	Gets the name of the DataType [▶ 2475] that is used for this Instance [▶ 2549] . (Inherited from Instance [▶ 2549].)
	ValueEncoding [▶ 2472]	Gets the value encoding. (Inherited from IAttributedInstance [▶ 2469].)

Name	Description
IsArrayOfPrimitives. [► 3025]	Overloaded. Determines whether the dataType is an array of Primitives. (Defined by DataTypeExtension [► 3021].)
IsArrayOfPrimitives(Boolean) [► 3025]	Overloaded. Determines whether the dataType is an array of Primitives. (Defined by DataTypeExtension [► 3021].)
IsContainer. [► 3027]	Overloaded. Gets a value indicating whether this IDataType [► 2475] is a container type (Defined by DataTypeExtension [► 3021].)
IsContainer(Boolean) [► 3028]	Overloaded. Gets a value indicating whether this IDataType [► 2475] is a container type (Defined by DataTypeExtension [► 3021].)
IsPointer [► 3031]	Gets a value indicating whether this IDataType [► 2475] is a pointer type (Defined by DataTypeExtension [► 3021].)
IsPrimitive. [► 3033]	Overloaded. Gets a value indicating whether this IDataType [► 2475] is primitive (Defined by DataTypeExtension [► 3021].)
IsPrimitive(Boolean) [► 3034]	Overloaded. Gets a value indicating whether this IDataType [► 2475] is primitive (Defined by DataTypeExtension [► 3021].)
IsReference [► 3036]	Gets a value indicating whether this IDataType [► 2475] is a reference type (Defined by DataTypeExtension [► 3021].)
ReferencesExternalD ata [► 3037]	Indicates, that the Instance value includes process memory data, that cannot be read in one memory block. (Defined by DataTypeExtension [► 3021].)
ResolvableAsPrimiti ve. [► 3039]	Overloaded. Indicates, that this data type can be resolved as primitive or primitive Array. (Defined by DataTypeExtension [► 3021].)
ResolvableAsPrimiti ve(Boolean) [► 3039]	Overloaded. Indicates, that this data type can be resolved as primitive or primitive Array. (Defined by DataTypeExtension [► 3021].)
Resolve. [► 3040]	Overloaded. Resolves the specified data type for AliasReference [► 3042] (Defined by DataTypeExtension [► 3021].)
Resolve(DataTypeRe solveStrategy) [► 3041]	Overloaded. Resolves the specified strategy. (Defined by DataTypeExtension [► 3021].)

6.11.100 IValue Interface

Symbol Value Interface

Namespace: [TwinCAT.TypeSystem \[▶ 2083\]](#)

Assembly: TwinCAT.Ads.Abstractions (in TwinCAT.Ads.Abstractions.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public interface IValue
```

The IValue type exposes the following members.

Properties

	Name	Description
	Age [▶ 2746]	Gets the age of the value (last successful read of the value)
	CachedRaw [▶ 2746]	Gets the cached Raw internal Data.
	DataType [▶ 2747]	Gets the data type bound to this IValue
	IsPrimitive [▶ 2747]	Gets a value indicating whether this IValue is a primitive value.
	Symbol [▶ 2748]	Gets the symbol bound to this IValue.
	TimeStamp [▶ 2748]	Gets the Time stamp of the last successful read of the Value (local user time, UTC)
	UpdateMode [▶ 2748]	Gets the update mode (not implemented yet)

Methods

	Name	Description
	Read [▶ 2749]	Reads the value (via ADS)
	ReadAsync [▶ 2750]	Reads the value (via ADS)
	ResolveValue [▶ 2750]	Resolves the Value object to its primitive value.
	TryResolveValue [▶ 2751]	Tries to resolves the Value object to its primitive value.
	Write [▶ 2751]	Writes the value (via ADS)
	WriteAsync [▶ 2751]	Writes the value (via ADS)

6.11.100.2.3 IValue.ResolveValue Method

Resolves the Value object to its primitive value.

Namespace: [TwinCAT.TypeSystem](#) [[▶ 2083](#)]

Assembly: TwinCAT.Ads.Abstractions (in TwinCAT.Ads.Abstractions.dll) Version: 6.0.328+39e3229

Syntax

C#

```
Object ResolveValue(
    bool resolveEnumToPrimitive
)
```

Parameters

resolveEnumToPrimitive	Type: System.Boolean if set to true EnumValue [▶ 2524]s are resolved to their primitives also.
------------------------	---

Return Value

Type: Object
System.Object.

Remarks

If the value is not primitive, this method returns the [IValue](#) [[▶ 2745](#)] itself.

Reference

6.11.102 IValueAnySymbol Interface

Interface IValueAnySymbol

Namespace: [TwinCAT.TypeSystem \[▶ 2083\]](#)

Assembly: TwinCAT.Ads.Abstractions (in TwinCAT.Ads.Abstractions.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public interface IValueAnySymbol : ISymbol,
    IAttributedInstance, IInstance, IBitSize
```

The IValueAnySymbol type exposes the following members.

Properties

	Name	Description
	Attributes [▶ 2471]	Gets the Type Attributes. (Inherited from IAttributedInstance [▶ 2469] .)
	BitSize [▶ 2473]	Gets the size of the IDataType [▶ 2475] in bits. (Inherited from IBitSize [▶ 2472] .)
	ByteSize [▶ 2474]	Gets the (aligned) size of of the Type/Instance in Bytes (Inherited from IBitSize [▶ 2472] .)
	Category [▶ 2694]	Gets the Symbol/Datatype Category (Inherited from ISymbol [▶ 2691] .)
	Comment [▶ 2550]	Gets the comment of the IInstance [▶ 2549] (Inherited from IInstance [▶ 2549] .)

	Name	Description
	DataType [▶ 2551]	Gets the IDataType [▶ 2475] of the IInstance [▶ 2549]. (Inherited from IInstance [▶ 2549].)
	InstanceName [▶ 2551]	Gets the name of the instance (without periods (.)) (Inherited from IInstance [▶ 2549].)
	InstancePath [▶ 2552]	Gets the relative / absolute access path to the instance (with periods (.)) (Inherited from IInstance [▶ 2549].)
	IsBitType [▶ 2474]	Gets a value indicating whether this instance is not basing on a full DataType but instead of some sort of bit mapping (Inherited from IBitSize [▶ 2472].)
	IsByteAligned [▶ 2475]	Indicates that the Size of the Object is Byte aligned ($\text{BitSize} \% 8 == 0$) (Inherited from IBitSize [▶ 2472].)
	IsContainerType [▶ 2694]	Gets a value indicating whether this Symbol is acontainer type. (Inherited from ISymbol [▶ 2691].)
	IsPersistent [▶ 2694]	Gets a value indicating whether this ISymbol [▶ 2691] is persistent. (Inherited from ISymbol [▶ 2691].)
	IsPointer [▶ 2552]	Indicates that the IInstance [▶ 2549] represents a Pointer type (Pointer TO) (Inherited from IInstance [▶ 2549].)
	IsPrimitiveType [▶ 2695]	Gets a value indicating whether this instance is a primitive type. (Inherited from ISymbol [▶ 2691].)
	IsReadOnly [▶ 2695]	Indicates that this instance is read only. (Inherited from ISymbol [▶ 2691].)
	IsRecursive [▶ 2696]	Gets a value indicating whether this instance is recursive. (Inherited from ISymbol [▶ 2691].)
	IsReference [▶ 2552]	Indicates that the IInstance [▶ 2549] represents a Reference type (REFERENCE TO) (Inherited from IInstance [▶ 2549].)
	IsStatic [▶ 2553]	Gets a value indicating whether this IInstance [▶ 2549] is static. (Inherited from IInstance [▶ 2549].)
	Parent [▶ 2696]	Gets the parent Symbol (Inherited from ISymbol [▶ 2691].)
	Size [▶ 2475]	Gets the size of the object in bytes or Bits dependant on IsBitType [▶ 2474] (Inherited from IBitSize [▶ 2472].)
	SubSymbols [▶ 2696]	Gets the SubSymbols of the ISymbol [▶ 2691] (Inherited from ISymbol [▶ 2691].)
	TypeName [▶ 2553]	Gets the name of the DataType [▶ 2475] that is used for this IInstance [▶ 2549]. (Inherited from IInstance [▶ 2549].)
	ValueEncoding [▶ 2472]	Gets the value encoding. (Inherited from IAttributedInstance [▶ 2469].)

Methods

	Name	Description
	ReadAnyValue(Type) [▶ 2758]	Reads the value of this Value into a new created instance of the managed type
	ReadAnyValue(Type, Int32) [▶ 2759]	Reads the value of this Value [▶ 2775] into a new created instance of the managed type
	ReadAnyValue.T.. [▶ 2759]	Reads the value of this Value into a new created instance of the managed type

	Name	Description
	ReadAnyValue.T. (Int32) [▶ 2760]	Reads the value of this Value [▶ 2775] into a new created instance of the managed type
	ReadAnyValueAsync (Type, CancellationToken) [▶ 2761]	Reads the (AnyType) value asynchronously.
	ReadAnyValueAsync .T. (CancellationToken) [▶ 2761]	Reads the (AnyType) value asynchronously.
	UpdateAnyValue(O bject.) [▶ 2762]	Reads the value of this Value [▶ 2775] into the specified managed value.
	UpdateAnyValue(O bject., Int32) [▶ 2763]	Reads the value of this Value [▶ 2775] into the specified managed value.
	WriteAnyValue(Obj ect) [▶ 2764]	Writes the value represented by the managed value to this Value [▶ 2775]
	WriteAnyValue(Obj ect, Int32) [▶ 2764]	Writes the value represented by the managed value to this Value [▶ 2775]

Extension Methods

	Name	Description
	ReferencesExternalD ata [▶ 3038]	Indicates, that the Instance value includes process memory data, that cannot be read in one memory block. (Defined by DataTypeExtension [▶ 3021] .)

6.11.103 IValueRawSymbol Interface

Interface IValueRawSymbol

Namespace: [TwinCAT.TypeSystem](#) [[▶ 2083](#)]

Assembly: TwinCAT.Ads.Abstractions (in TwinCAT.Ads.Abstractions.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public interface IValueRawSymbol : IHierarchicalSymbol,
    ISymbol, IAttributedInstance, IInstance, IBitSize
```

The IValueRawSymbol type exposes the following members.

Properties

	Name	Description
	Attributes [▶ 2471]	Gets the Type Attributes. (Inherited from IAttributedInstance [▶ 2469].)
	BitSize [▶ 2473]	Gets the size of the IDataType [▶ 2475] in bits. (Inherited from IBitSize [▶ 2472].)
	ByteSize [▶ 2474]	Gets the (aligned) size of of the Type/Instance in Bytes (Inherited from IBitSize [▶ 2472].)
	Category [▶ 2694]	Gets the Symbol/Datatype Category (Inherited from ISymbol [▶ 2691].)
	Comment [▶ 2550]	Gets the comment of the IInstance [▶ 2549] (Inherited from IInstance [▶ 2549].)

	Name	Description
	DataType [▶ 2551]	Gets the IDataType [▶ 2475] of the IInstance [▶ 2549]. (Inherited from IInstance [▶ 2549].)
	HasValue [▶ 2768]	Gets a value indicating whether this IValueSymbol [▶ 2775] has a value.
	InstanceName [▶ 2551]	Gets the name of the instance (without periods (.)) (Inherited from IInstance [▶ 2549].)
	InstancePath [▶ 2552]	Gets the relative / absolute access path to the instance (with periods (.)) (Inherited from IInstance [▶ 2549].)
	IsBitType [▶ 2474]	Gets a value indicating whether this instance is not basing on a full DataType but instead of some sort of bit mapping (Inherited from IBitSize [▶ 2472].)
	IsByteAligned [▶ 2475]	Indicates that the Size of the Object is Byte aligned ($\text{BitSize} \% 8 == 0$) (Inherited from IBitSize [▶ 2472].)
	IsContainerType [▶ 2694]	Gets a value indicating whether this Symbol is a container type. (Inherited from ISymbol [▶ 2691].)
	IsPersistent [▶ 2694]	Gets a value indicating whether this ISymbol [▶ 2691] is persistent. (Inherited from ISymbol [▶ 2691].)
	IsPointer [▶ 2552]	Indicates that the IInstance [▶ 2549] represents a Pointer type (Pointer TO) (Inherited from IInstance [▶ 2549].)
	IsPrimitiveType [▶ 2695]	Gets a value indicating whether this instance is a primitive type. (Inherited from ISymbol [▶ 2691].)
	IsReadOnly [▶ 2695]	Indicates that this instance is read only. (Inherited from ISymbol [▶ 2691].)
	IsRecursive [▶ 2696]	Gets a value indicating whether this instance is recursive. (Inherited from ISymbol [▶ 2691].)
	IsReference [▶ 2552]	Indicates that the IInstance [▶ 2549] represents a Reference type (REFERENCE TO) (Inherited from IInstance [▶ 2549].)
	IsStatic [▶ 2553]	Gets a value indicating whether this IInstance [▶ 2549] is static. (Inherited from IInstance [▶ 2549].)
	Parent [▶ 2696]	Gets the parent Symbol (Inherited from ISymbol [▶ 2691].)
	Size [▶ 2475]	Gets the size of the object in bytes or Bits dependant on IsBitType [▶ 2474] (Inherited from IBitSize [▶ 2472].)
	SubSymbols [▶ 2696]	Gets the SubSymbols of the ISymbol [▶ 2691] (Inherited from ISymbol [▶ 2691].)
	TypeName [▶ 2553]	Gets the name of the DataType [▶ 2475] that is used for this IInstance [▶ 2549]. (Inherited from IInstance [▶ 2549].)
	ValueAccessor [▶ 2769]	Gets the value accessor.
	ValueEncoding [▶ 2472]	Gets the value encoding. (Inherited from IAttributedInstance [▶ 2469].)

Methods

	Name	Description
	ReadRawValue [▶ 2770]	Reads the raw value of the IValueSymbol [▶ 2775] (Ads Read / Write)
	ReadRawValue(Int32) [▶ 2771]	Reads the raw value of the IValueSymbol [▶ 2775] (Ads Read / Write)

	Name	Description
	ReadRawValueAsynchronous [2772]	Reads the raw value of the IValueSymbol [2775] (Ads Read / Write) asynchronously.
	SetParent [2548]	Sets the parent of the Symbol (Inherited from IHierarchicalSymbol [2545].)
	WriteRawValue(Byte) [2772]	Writes the raw value of the IValueSymbol [2775] (Ads Read / Write)
	WriteRawValue(Byte, Int32) [2773]	Writes the raw value of the IValueSymbol [2775] (Ads Read / Write)
	WriteRawValueAsynchronous [2774]	Writes the raw value of the IValueSymbol [2775] (Ads Read / Write)

Events

	Name	Description
	RawValueChanged [2774]	Occurs when the RawValue of the IValueSymbol [2775] has changed.

Extension Methods

	Name	Description
	ReferencesExternalData [3038]	Indicates, that the Instance value includes process memory data, that cannot be read in one memory block. (Defined by DataTypeExtension [3021].)

Reference

6.11.103.1 IValueRawSymbol Properties

The [IValueRawSymbol](#) [[2765](#)] type exposes the following members.

Properties

	Name	Description
	Attributes [2471]	Gets the Type Attributes. (Inherited from IAttributedInstance [2469].)
	BitSize [2473]	Gets the size of the IDataType [2475] in bits. (Inherited from IBitSize [2472].)
	ByteSize [2474]	Gets the (aligned) size of of the Type/Instance in Bytes (Inherited from IBitSize [2472].)
	Category [2694]	Gets the Symbol/Datatype Category (Inherited from ISymbol [2691].)
	Comment [2550]	Gets the comment of the IInstance [2549] (Inherited from IInstance [2549].)
	DataType [2551]	Gets the IDataType [2475] of the IInstance [2549]. (Inherited from IInstance [2549].)

	Name	Description
	HasValue [▶ 2768]	Gets a value indicating whether this IValueSymbol [▶ 2775] has a value.
	InstanceName [▶ 2551]	Gets the name of the instance (without periods (.)) (Inherited from IInstance [▶ 2549] .)
	InstancePath [▶ 2552]	Gets the relative / absolute access path to the instance (with periods (.)) (Inherited from IInstance [▶ 2549] .)
	IsBitType [▶ 2474]	Gets a value indicating whether this instance is not basing on a full DataType but instead of some sort of bit mapping (Inherited from IBitSize [▶ 2472] .)
	IsByteAligned [▶ 2475]	Indicates that the Size of the Object is Byte aligned ($\text{BitSize} \% 8 == 0$) (Inherited from IBitSize [▶ 2472] .)
	IsContainerType [▶ 2694]	Gets a value indicating whether this Symbol is a container type. (Inherited from ISymbol [▶ 2691] .)
	IsPersistent [▶ 2694]	Gets a value indicating whether this ISymbol [▶ 2691] is persistent. (Inherited from ISymbol [▶ 2691] .)
	IsPointer [▶ 2552]	Indicates that the IInstance [▶ 2549] represents a Pointer type (Pointer TO) (Inherited from IInstance [▶ 2549] .)
	IsPrimitiveType [▶ 2695]	Gets a value indicating whether this instance is a primitive type. (Inherited from ISymbol [▶ 2691] .)
	IsReadOnly [▶ 2695]	Indicates that this instance is read only. (Inherited from ISymbol [▶ 2691] .)
	IsRecursive [▶ 2696]	Gets a value indicating whether this instance is recursive. (Inherited from ISymbol [▶ 2691] .)
	IsReference [▶ 2552]	Indicates that the IInstance [▶ 2549] represents a Reference type (REFERENCE TO) (Inherited from IInstance [▶ 2549] .)
	IsStatic [▶ 2553]	Gets a value indicating whether this IInstance [▶ 2549] is static. (Inherited from IInstance [▶ 2549] .)
	Parent [▶ 2696]	Gets the parent Symbol (Inherited from ISymbol [▶ 2691] .)
	Size [▶ 2475]	Gets the size of the object in bytes or Bits dependant on IsBitType [▶ 2474] (Inherited from IBitSize [▶ 2472] .)
	SubSymbols [▶ 2696]	Gets the SubSymbols of the ISymbol [▶ 2691] (Inherited from ISymbol [▶ 2691] .)
	TypeName [▶ 2553]	Gets the name of the DataType [▶ 2475] that is used for this IInstance [▶ 2549] . (Inherited from IInstance [▶ 2549] .)
	ValueAccessor [▶ 2769]	Gets the value accessor.
	ValueEncoding [▶ 2472]	Gets the value encoding. (Inherited from IAttributedInstance [▶ 2469] .)

[TwinCAT.TypeSystem Namespace \[► 2083\]](#)

6.11.103.2.1.2 IValueRawSymbol.ReadRawValue Method (Int32)

Reads the raw value of the [IValueSymbol \[► 2775\]](#) (Ads Read / Write)

Namespace: [TwinCAT.TypeSystem \[► 2083\]](#)

Assembly: TwinCAT.Ads.Abstractions (in TwinCAT.Ads.Abstractions.dll) Version: 6.0.328+39e3229

Syntax

C#

```
byte[] ReadRawValue(  
    int timeout  
)
```

Parameters

timeout	Type: System.Int32 The timeout in ms.
---------	--

Field Value

Type: .Byte.
The raw value.

Return Value

Type: .Byte.
System.Byte[].

Remarks

A negative timeout indicates that the Default Timeout for the communication will be used. 0 means timeout is switched off.

Assembly: TwinCAT.Ads.Abstractions (in TwinCAT.Ads.Abstractions.dll) Version: 6.0.328+39e3229

Syntax

C#

```
Task<ResultReadRawAccess> ReadRawValueAsync (
    CancellationToken cancel
)
```

Parameters

cancel	Type: System.Threading.CancellationToken The cancellation token.
--------	---

Field Value

Type: [Task.ResultReadRawAccess \[► 3206\]](#).

The raw value.

Return Value

Type: [Task.ResultReadRawAccess \[► 3206\]](#).

System.Byte[].

Reference

[IValueRawSymbol Interface \[► 2765\]](#)

[TwinCAT.TypeSystem Namespace \[► 2083\]](#)

6.11.103.2.3 IValueRawSymbol.WriteRawValue Method

Overload List

	Name	Description
	WriteRawValue(Byte e.) [► 2772]	Writes the raw value of the IValueSymbol [► 2775] (Ads Read / Write)
	WriteRawValue(Byte e., Int32) [► 2773]	Writes the raw value of the IValueSymbol [► 2775] (Ads Read / Write)

Reference

[IValueRawSymbol Interface \[► 2765\]](#)

[TwinCAT.TypeSystem Namespace \[► 2083\]](#)

6.11.103.2.3.1 IValueRawSymbol.WriteRawValue Method (.Byte.)

Writes the raw value of the [IValueSymbol \[► 2775\]](#) (Ads Read / Write)

Namespace: [TwinCAT.TypeSystem](#) [[▶ 2083](#)]

Assembly: TwinCAT.Ads.Abstractions (in TwinCAT.Ads.Abstractions.dll) Version: 6.0.328+39e3229

Syntax

C#

```
void WriteRawValue(  
    byte[] rawValue  
)
```

Parameters

rawValue	Type: <code>.System.Byte</code> . The value as byte array.
----------	---

Reference

[IValueRawSymbol Interface](#) [[▶ 2765](#)]

[WriteRawValue Overload](#) [[▶ 2772](#)]

[TwinCAT.TypeSystem Namespace](#) [[▶ 2083](#)]

6.11.103.2.3.2 IValueRawSymbol.WriteRawValue Method (.Byte., Int32)

Writes the raw value of the [IValueSymbol](#) [[▶ 2775](#)] (Ads Read / Write)

Namespace: [TwinCAT.TypeSystem](#) [[▶ 2083](#)]

Assembly: TwinCAT.Ads.Abstractions (in TwinCAT.Ads.Abstractions.dll) Version: 6.0.328+39e3229

Syntax

C#

```
void WriteRawValue(  
    byte[] rawValue,  
    int timeout  
)
```

Parameters

rawValue	Type: <code>.System.Byte</code> . The value as byte array.
timeout	Type: <code>System.Int32</code> The timeout.

Field Value

Type:
The value.

Remarks

A negative timeout indicates that the Default Timeout for the communication will be used. 0 means timeout is switched off.

6.11.103.2.4 IValueRawSymbol.WriteRawValueAsync Method

Writes the raw value of the [IValueSymbol \[▶ 2775\]](#) (Ads Read / Write)

Namespace: [TwinCAT.TypeSystem \[▶ 2083\]](#)

Assembly: TwinCAT.Ads.Abstractions (in TwinCAT.Ads.Abstractions.dll) Version: 6.0.328+39e3229

Syntax

C#

```
Task<ResultWriteAccess> WriteRawValueAsync (
    byte[] rawValue,
    CancellationToken cancel
)
```

Parameters

rawValue	Type: .System.Byte. The value as byte array.
cancel	Type: System.Threading.CancellationToken The cancellation token.

Return Value

Type: [Task.ResultWriteAccess \[▶ 3217\]](#).

A task that represents the asynchronous read operation. The [ResultRead \[▶ 1143\]](#) parameter contains the total number of bytes read into the buffer ([ReadBytes \[▶ 1145\]](#)) and the [ErrorCode \[▶ 1120\]](#) after execution..

6.11.104 IValueSymbol Interface

Interface for a [ISymbol \[▶ 2691\]](#) that supports values.

Namespace: [TwinCAT.TypeSystem \[▶ 2083\]](#)

Assembly: TwinCAT.Ads.Abstractions (in TwinCAT.Ads.Abstractions.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public interface IValueSymbol : IValueRawSymbol,
    IHierarchicalSymbol, ISymbol, IAttributedInstance, IInstance, IBitSize
```

The IValueSymbol type exposes the following members.

Properties

	Name	Description
	AccessRights [▶ 2780]	Gets the access rights.
	Attributes [▶ 2471]	Gets the Type Attributes. (Inherited from IAttributedInstance [▶ 2469] .)
	BitSize [▶ 2473]	Gets the size of the IDataType [▶ 2475] in bits. (Inherited from IBitSize [▶ 2472] .)
	ByteSize [▶ 2474]	Gets the (aligned) size of of the Type/Instance in Bytes (Inherited from IBitSize [▶ 2472] .)
	Category [▶ 2694]	Gets the Symbol/Datatype Category (Inherited from ISymbol [▶ 2691] .)
	Comment [▶ 2550]	Gets the comment of the IInstance [▶ 2549] (Inherited from IInstance [▶ 2549] .)
	Connection [▶ 2781]	Gets the connection that produces values for this IValueSymbol
	DataType [▶ 2551]	Gets the IDataType [▶ 2475] of the IInstance [▶ 2549] . (Inherited from IInstance [▶ 2549] .)
	HasValue [▶ 2768]	Gets a value indicating whether this IValueSymbol has a value. (Inherited from IValueRawSymbol [▶ 2765] .)
	InstanceName [▶ 2551]	Gets the name of the instance (without periods (.)) (Inherited from IInstance [▶ 2549] .)
	InstancePath [▶ 2552]	Gets the relative / absolute access path to the instance (with periods (.)) (Inherited from IInstance [▶ 2549] .)

	Name	Description
	IsBitType [▶ 2474]	Gets a value indicating whether this instance is not basing on a full DataType but instead of some sort of bit mapping (Inherited from IBitSize [▶ 2472].)
	IsByteAligned [▶ 2475]	Indicates that the Size of the Object is Byte aligned (BitSize % 8 == 0) (Inherited from IBitSize [▶ 2472].)
	IsContainerType [▶ 2694]	Gets a value indicating whether this Symbol is acontainer type. (Inherited from ISymbol [▶ 2691].)
	IsPersistent [▶ 2694]	Gets a value indicating whether this ISymbol [▶ 2691] is persistent. (Inherited from ISymbol [▶ 2691].)
	IsPointer [▶ 2552]	Indicates that the IInstance [▶ 2549] represents a Pointer type (Pointer TO) (Inherited from IInstance [▶ 2549].)
	IsPrimitiveType [▶ 2695]	Gets a value indicating whether this instance is a primitive type. (Inherited from ISymbol [▶ 2691].)
	IsReadOnly [▶ 2695]	Indicates that this instance is read only. (Inherited from ISymbol [▶ 2691].)
	IsRecursive [▶ 2696]	Gets a value indicating whether this instance is recursive. (Inherited from ISymbol [▶ 2691].)
	IsReference [▶ 2552]	Indicates that the IInstance [▶ 2549] represents a Reference type (REFERENCE TO) (Inherited from IInstance [▶ 2549].)
	IsStatic [▶ 2553]	Gets a value indicating whether this IInstance [▶ 2549] is static. (Inherited from IInstance [▶ 2549].)
	NotificationSettings [▶ 2781]	Gets or sets the notification settings.
	Parent [▶ 2696]	Gets the parent Symbol (Inherited from ISymbol [▶ 2691].)
	Size [▶ 2475]	Gets the size of the object in bytes or Bits dependant on IsBitType [▶ 2474] (Inherited from IBitSize [▶ 2472].)
	SubSymbols [▶ 2696]	Gets the SubSymbols of the ISymbol [▶ 2691] (Inherited from ISymbol [▶ 2691].)
	TypeName [▶ 2553]	Gets the name of the DataType [▶ 2475] that is used for this IInstance [▶ 2549]. (Inherited from IInstance [▶ 2549].)
	ValueAccessor [▶ 2769]	Gets the value accessor. (Inherited from IValueRawSymbol [▶ 2765].)
	ValueEncoding [▶ 2472]	Gets the value encoding. (Inherited from IAttributedInstance [▶ 2469].)

Methods

	Name	Description
	ReadRawValue . [▶ 2770]	Reads the raw value of the IValueSymbol (Ads Read / Write) (Inherited from IValueRawSymbol [▶ 2765].)
	ReadRawValue (Int32) [▶ 2771]	Reads the raw value of the IValueSymbol (Ads Read / Write) (Inherited from IValueRawSymbol [▶ 2765].)
	ReadRawValue Asyn c [▶ 2772]	Reads the raw value of the IValueSymbol (Ads Read / Write) asynchronously. (Inherited from IValueRawSymbol [▶ 2765].)
	ReadValue . [▶ 2784]	Reads the Value of the IValueSymbol

	Name	Description
	ReadValue(Int32) [▶ 2785]	Reads the Value of the IValueSymbol
	ReadValueAsync [▶ 2785]	Reads the Value of the IValueSymbol asynchronously.
	SetParent [▶ 2548]	Sets the parent of the Symbol (Inherited from IHierarchicalSymbol [▶ 2545].)
	TryReadValue [▶ 2786]	Reads the Value of the IValueSymbol
	TryWriteValue [▶ 2787]	Writes the Value of the IValueSymbol
	WriteRawValue(Byte) [▶ 2772]	Writes the raw value of the IValueSymbol (Ads Read / Write) (Inherited from IValueRawSymbol [▶ 2765].)
	WriteRawValue(Byte, Int32) [▶ 2773]	Writes the raw value of the IValueSymbol (Ads Read / Write) (Inherited from IValueRawSymbol [▶ 2765].)
	WriteRawValueAsync [▶ 2774]	Writes the raw value of the IValueSymbol (Ads Read / Write) (Inherited from IValueRawSymbol [▶ 2765].)
	WriteValue(Object) [▶ 2788]	Writes the Value of the IValueSymbol
	WriteValue(Object, Int32) [▶ 2788]	Writes the Value of the IValueSymbol
	WriteValueAsync [▶ 2789]	Writes the Value of the IValueSymbol

Events

	Name	Description
	RawValueChanged [▶ 2774]	Occurs when the RawValue of the IValueSymbol has changed. (Inherited from IValueRawSymbol [▶ 2765].)
	ValueChanged [▶ 2790]	Occurs when the (Primitive) value of the IValueSymbol has changed.

Extension Methods

	Name	Description
	PollValues(IObservable<Unit>) [▶ 1355]	Overloaded. Poll symbol values on trigger signals. (Defined by ValueSymbolExtensions [▶ 1333].)
	PollValues(TimeSpan) [▶ 1356]	Overloaded. Polls the symbol as value sequence of object values with a specified period time. (Defined by ValueSymbolExtensions [▶ 1333].)
	PollValues(IObservable<Unit>, Boolean) [▶ 1357]	Overloaded. Polls symbol values on trigger signals. (Defined by ValueSymbolExtensions [▶ 1333].)
	PollValues(TimeSpan, Boolean) [▶ 1358]	Overloaded. Polls the symbol as value sequence of object values with a specified period time. (Defined by ValueSymbolExtensions [▶ 1333].)

	Name	Description
	PollValues.T. (IObservable.Unit.) [▶ 1362]	Overloaded. Poll symbol values as a value sequence on trigger signals (typed) (Defined by ValueSymbolExtensions [▶ 1333].)
 	PollValues.T. (TimeSpan) [▶ 1363]	Overloaded. Polls the symbol as value sequence of object values with a specified period time (typed) (Defined by ValueSymbolExtensions [▶ 1333].)
 	PollValues.T. (IObservable.Unit. , Func.ResultReadValueAccess2.IValueSymbol , Object , T .) [▶ 1365]	Overloaded. Poll symbol values on trigger signals (typed) (Defined by ValueSymbolExtensions [▶ 1333].)
	PollValues.T. (IObservable.Unit. , Boolean) [▶ 1364]	Overloaded. Poll symbol values on trigger signals (typed) (Defined by ValueSymbolExtensions [▶ 1333].)
	PollValues.T. (TimeSpan , Boolean) [▶ 1367]	Overloaded. Polls the symbol as value sequence of object values with a specified period time (typed) (Defined by ValueSymbolExtensions [▶ 1333].)
	PollValues2(IObservable.Unit.) [▶ 1368]	Overloaded. Poll symbol values as a sequence of annotated results (Value + ErrorCode) (Defined by ValueSymbolExtensions [▶ 1333].)
	PollValues2(TimeSpan) [▶ 1369]	Overloaded. Poll symbol values with communication return codes. (Defined by ValueSymbolExtensions [▶ 1333].)
	ReferencesExternalData [▶ 3038]	Indicates, that the Instance value includes process memory data, that cannot be read in one memory block. (Defined by DataTypeExtension [▶ 3021].)
 	WhenValueChanged [▶ 1344]	Gets an observable sequence when the value of the IValueSymbol has changed. (Defined by ValueSymbolExtensions [▶ 1333].)
 	WriteValues(IObservable.Object.) [▶ 1347]	Overloaded. Subscribes the IValueSymbol to an observable sequence of values and writes them to the IValueSymbol . (Defined by ValueSymbolExtensions [▶ 1333].)
	WriteValues(IObservable.Object., Action.Exception.) [▶ 1348]	Overloaded. Subscribes the IValueSymbol to an observable sequence of values and writes them to the IValueSymbol . (Defined by ValueSymbolExtensions [▶ 1333].)
	WriteValues(IObservable.Object., CancellationToken) [▶ 1349]	Overloaded. Subscribes the IValueSymbol to an observable sequence of values and writes them to the IValueSymbol . (Defined by ValueSymbolExtensions [▶ 1333].)
	WriteValues(IObservable.Object.,	Overloaded.

	Name	Description
	Action.Exception, CancellationToken [▶ 1350]	Subscribes the IValueSymbol to an observable sequence of values and writes them to the IValueSymbol. (Defined by ValueSymbolExtensions [▶ 1333].)

6.11.104.1 IValueSymbol Properties

The [IValueSymbol](#) [▶ 2775] type exposes the following members.

Properties

	Name	Description
	AccessRights [▶ 2780]	Gets the access rights.
	Attributes [▶ 2471]	Gets the Type Attributes. (Inherited from IAttributedInstance [▶ 2469].)
	BitSize [▶ 2473]	Gets the size of the IDataType [▶ 2475] in bits. (Inherited from IBitSize [▶ 2472].)
	ByteSize [▶ 2474]	Gets the (aligned) size of of the Type/Instance in Bytes (Inherited from IBitSize [▶ 2472].)
	Category [▶ 2694]	Gets the Symbol/Datatype Category (Inherited from ISymbol [▶ 2691].)
	Comment [▶ 2550]	Gets the comment of the IInstance [▶ 2549] (Inherited from IInstance [▶ 2549].)
	Connection [▶ 2781]	Gets the connection that produces values for this IValueSymbol [▶ 2775]
	DataType [▶ 2551]	Gets the IDataType [▶ 2475] of the IInstance [▶ 2549]. (Inherited from IInstance [▶ 2549].)
	HasValue [▶ 2768]	Gets a value indicating whether this IValueSymbol [▶ 2775] has a value. (Inherited from IValueRawSymbol [▶ 2765].)
	InstanceName [▶ 2551]	Gets the name of the instance (without periods (.)) (Inherited from IInstance [▶ 2549].)
	InstancePath [▶ 2552]	Gets the relative / absolute access path to the instance (with periods (.)) (Inherited from IInstance [▶ 2549].)
	IsBitType [▶ 2474]	Gets a value indicating whether this instance is not basing on a full DataType but instead of some sort of bit mapping (Inherited from IBitSize [▶ 2472].)
	IsByteAligned [▶ 2475]	Indicates that the Size of the Object is Byte aligned (BitSize % 8 == 0) (Inherited from IBitSize [▶ 2472].)
	IsContainerType [▶ 2694]	Gets a value indicating whether this Symbol is acontainer type. (Inherited from ISymbol [▶ 2691].)
	IsPersistent [▶ 2694]	Gets a value indicating whether this ISymbol [▶ 2691] is persistent. (Inherited from ISymbol [▶ 2691].)
	IsPointer [▶ 2552]	Indicates that the IInstance [▶ 2549] represents a Pointer type (Pointer TO) (Inherited from IInstance [▶ 2549].)
	IsPrimitiveType [▶ 2695]	Gets a value indicating whether this instance is a primitive type. (Inherited from ISymbol [▶ 2691].)

	Name	Description
	IsReadOnly [▶ 2695]	Indicates that this instance is read only. (Inherited from ISymbol [▶ 2691].)
	IsRecursive [▶ 2696]	Gets a value indicating whether this instance is recursive. (Inherited from ISymbol [▶ 2691].)
	IsReference [▶ 2552]	Indicates that the Instance [▶ 2549] represents a Reference type (REFERENCE TO) (Inherited from Instance [▶ 2549].)
	IsStatic [▶ 2553]	Gets a value indicating whether this Instance [▶ 2549] is static. (Inherited from Instance [▶ 2549].)
	NotificationSettings [▶ 2781]	Gets or sets the notification settings.
	Parent [▶ 2696]	Gets the parent Symbol (Inherited from ISymbol [▶ 2691].)
	Size [▶ 2475]	Gets the size of the object in bytes or Bits dependant on IsBitType [▶ 2474] (Inherited from BitSize [▶ 2472].)
	SubSymbols [▶ 2696]	Gets the SubSymbols of the ISymbol [▶ 2691] (Inherited from ISymbol [▶ 2691].)
	TypeName [▶ 2553]	Gets the name of the DataType [▶ 2475] that is used for this Instance [▶ 2549]. (Inherited from Instance [▶ 2549].)
	ValueAccessor [▶ 2769]	Gets the value accessor. (Inherited from IValueRawSymbol [▶ 2765].)
	ValueEncoding [▶ 2472]	Gets the value encoding. (Inherited from IAttributedInstance [▶ 2469].)

6.11.104.2 IValueSymbol Methods

The [IValueSymbol](#) [[▶ 2775](#)] type exposes the following members.

Methods

	Name	Description
	ReadRawValue . [▶ 2770]	Reads the raw value of the IValueSymbol [▶ 2775] (Ads Read / Write) (Inherited from IValueRawSymbol [▶ 2765].)

	Name	Description
	ReadRawValue(Int32) [▶ 2771]	Reads the raw value of the IValueSymbol [▶ 2775] (Ads Read / Write) (Inherited from IValueRawSymbol [▶ 2765].)
	ReadRawValueAsync [▶ 2772]	Reads the raw value of the IValueSymbol [▶ 2775] (Ads Read / Write) asynchronously. (Inherited from IValueRawSymbol [▶ 2765].)
	ReadValue. [▶ 2784]	Reads the Value of the IValueSymbol [▶ 2775]
	ReadValue(Int32) [▶ 2785]	Reads the Value of the IValueSymbol [▶ 2775]
	ReadValueAsync [▶ 2785]	Reads the Value of the IValueSymbol [▶ 2775] asynchronously.
	SetParent [▶ 2548]	Sets the parent of the Symbol (Inherited from IHierarchicalSymbol [▶ 2545].)
	TryReadValue [▶ 2786]	Reads the Value of the IValueSymbol [▶ 2775]
	TryWriteValue [▶ 2787]	Writes the Value of the IValueSymbol [▶ 2775]
	WriteRawValue(Byte) [▶ 2772]	Writes the raw value of the IValueSymbol [▶ 2775] (Ads Read / Write) (Inherited from IValueRawSymbol [▶ 2765].)
	WriteRawValue(Byte, Int32) [▶ 2773]	Writes the raw value of the IValueSymbol [▶ 2775] (Ads Read / Write) (Inherited from IValueRawSymbol [▶ 2765].)
	WriteRawValueAsync [▶ 2774]	Writes the raw value of the IValueSymbol [▶ 2775] (Ads Read / Write) (Inherited from IValueRawSymbol [▶ 2765].)
	WriteValue(Object) [▶ 2788]	Writes the Value of the IValueSymbol [▶ 2775]
	WriteValue(Object, Int32) [▶ 2788]	Writes the Value of the IValueSymbol [▶ 2775]
	WriteValueAsync [▶ 2789]	Writes the Value of the IValueSymbol [▶ 2775]

Extension Methods

	Name	Description
	PollValues(IObservableUnit) [▶ 1355]	Overloaded. Poll symbol values on trigger signals. (Defined by ValueSymbolExtensions [▶ 1333].)
	PollValues(TimeSpan) [▶ 1356]	Overloaded. Polls the symbol as value sequence of object values with a specified period time. (Defined by ValueSymbolExtensions [▶ 1333].)
	PollValues(IObservableUnit, Boolean) [▶ 1357]	Overloaded. Polls symbol values on trigger signals. (Defined by ValueSymbolExtensions [▶ 1333].)
	PollValues(TimeSpan, Boolean) [▶ 1358]	Overloaded. Polls the symbol as value sequence of object values with a specified period time. (Defined by ValueSymbolExtensions [▶ 1333].)

	Name	Description
	PollValues.T. (IObservable.Unit.) [▶ 1362]	Overloaded. Poll symbol values as a value sequence on trigger signals (typed) (Defined by ValueSymbolExtensions [▶ 1333].)
 	PollValues.T. (TimeSpan) [▶ 1363]	Overloaded. Polls the symbol as value sequence of object values with a specified period time (typed) (Defined by ValueSymbolExtensions [▶ 1333].)
 	PollValues.T. (IObservable.Unit. , Func.ResultReadValueAccess2.IValueSymbol, Object., T.) [▶ 1365]	Overloaded. Poll symbol values on trigger signals (typed) (Defined by ValueSymbolExtensions [▶ 1333].)
	PollValues.T. (IObservable.Unit. , Boolean) [▶ 1364]	Overloaded. Poll symbol values on trigger signals (typed) (Defined by ValueSymbolExtensions [▶ 1333].)
	PollValues.T. (TimeSpan , Boolean) [▶ 1367]	Overloaded. Polls the symbol as value sequence of object values with a specified period time (typed) (Defined by ValueSymbolExtensions [▶ 1333].)
	PollValues2(IObservable.Unit.) [▶ 1368]	Overloaded. Poll symbol values as a sequence of annotated results (Value + ErrorCode) (Defined by ValueSymbolExtensions [▶ 1333].)
	PollValues2(TimeSpan) [▶ 1369]	Overloaded. Poll symbol values with communication return codes. (Defined by ValueSymbolExtensions [▶ 1333].)
	ReferencesExternalData [▶ 3038]	Indicates, that the Instance value includes process memory data, that cannot be read in one memory block. (Defined by DataTypeExtension [▶ 3021].)
 	WhenValueChanged [▶ 1344]	Gets an observable sequence when the value of the IValueSymbol [▶ 2775] has changed. (Defined by ValueSymbolExtensions [▶ 1333].)
 	WriteValues(IObservable.Object.) [▶ 1347]	Overloaded. Subscribes the IValueSymbol [▶ 2775] to an observable sequence of values and writes them to the IValueSymbol [▶ 2775]. (Defined by ValueSymbolExtensions [▶ 1333].)
	WriteValues(IObservable.Object., Action.Exception.) [▶ 1348]	Overloaded. Subscribes the IValueSymbol [▶ 2775] to an observable sequence of values and writes them to the IValueSymbol [▶ 2775]. (Defined by ValueSymbolExtensions [▶ 1333].)
	WriteValues(IObservable.Object., Cancellation.Token) [▶ 1349]	Overloaded. Subscribes the IValueSymbol [▶ 2775] to an observable sequence of values and writes them to the IValueSymbol [▶ 2775]. (Defined by ValueSymbolExtensions [▶ 1333].)
	WriteValues(IObservable.Object.,	Overloaded. Subscribes the IValueSymbol [▶ 2775] to an observable sequence of values and writes them to the IValueSymbol [▶ 2775]. (Defined by ValueSymbolExtensions [▶ 1333].)

	Name	Description
	Action.Exception, CancellationToken [▶ 1350]

6.11.104.2.1 IValueSymbol.ReadValue Method

Overload List

	Name	Description
	ReadValue. [▶ 2784]	Reads the Value of the IValueSymbol [▶ 2775]
	ReadValue(Int32) [▶ 2785]	Reads the Value of the IValueSymbol [▶ 2775]

Reference

[IValueSymbol Interface](#) [▶ 2775]

[TwinCAT.TypeSystem Namespace](#) [▶ 2083]

6.11.104.2.1.1 IValueSymbol.ReadValue Method

Reads the Value of the [IValueSymbol](#) [▶ 2775]

Namespace: [TwinCAT.TypeSystem](#) [▶ 2083]

Assembly: TwinCAT.Ads.Abstractions (in TwinCAT.Ads.Abstractions.dll) Version: 6.0.328+39e3229

Syntax

C#

```
Object ReadValue ()
```

Field Value

Type: Object
The value.

Return Value

Type: Object
System.Object.

Remarks

Calling on primitive types, a call of this method will return the primitive value. On complex types (structures and arrays) it depends on the [ISymbolLoader](#) [▶ 2714] settings what will happen. In non dynamic modes: the raw byte Array will be returned, in dynamic mode: A Value will be created on the fly.

Reference

[TwinCAT.TypeSystem Namespace \[▶ 2083\]](#)

6.11.104.2.1.2 IValueSymbol.ReadValue Method (Int32)

Reads the Value of the [IValueSymbol \[▶ 2775\]](#)

Namespace: [TwinCAT.TypeSystem \[▶ 2083\]](#)

Assembly: TwinCAT.Ads.Abstractions (in TwinCAT.Ads.Abstractions.dll) Version: 6.0.328+39e3229

Syntax

C#

```
Object ReadValue(  
    int timeout  
)
```

Parameters

timeout	Type: System.Int32 The timeout in ms.
---------	--

Field Value

Type: Object
The value.

Return Value

Type: Object
System.Object.

Remarks

Calling on primitive types, a call of this method will return the primitive value. On complex types (structures and arrays) it depends on the [ISymbolLoader \[▶ 2714\]](#) settings what will happen. In non dynamic modes: the raw byte Array will be returned, in dynamic mode: A Value will be created on the fly. A negative timeout indicates that the Default Timeout for the communication will be used. 0 means timeout is switched off.

6.11.104.2.2 IValueSymbol.ReadValueAsync Method

Reads the Value of the [IValueSymbol \[▶ 2775\]](#) asynchronously.

Namespace: [TwinCAT.TypeSystem \[▶ 2083\]](#)

Assembly: TwinCAT.Ads.Abstractions (in TwinCAT.Ads.Abstractions.dll) Version: 6.0.328+39e3229

Syntax

C#

```
Task<ResultReadValueAccess> ReadValueAsync(  
    CancellationToken cancel  
)
```

Parameters

cancel	Type: System.Threading.CancellationToken The cancellation token.
--------	---

Return Value

Type: [Task.ResultReadValueAccess](#) [[▸ 3209](#)].

A tasks that represents the asynchronous 'ReadValue' operation. The read result is stored in the [ResultReadValueAccess](#) [[▸ 3209](#)] return value and contains the [Value](#) [[▸ 3213](#)] and the [ErrorCode](#) [[▸ 3202](#)].

Remarks

Calling on primitive types, a call of this method will return the primitive value. On complex types (structures and arrays) it depends on the [ISymbolLoader](#) [[▸ 2714](#)] settings what will happen. In non dynamic modes: the raw byte Array will be returned, in dynamic mode: A Value will be created on the fly.

6.11.104.2.3 IValueSymbol.TryReadValue Method

Reads the Value of the [IValueSymbol](#) [[▸ 2775](#)]

Namespace: [TwinCAT.TypeSystem](#) [[▸ 2083](#)]

Assembly: TwinCAT.Ads.Abstractions (in TwinCAT.Ads.Abstractions.dll) Version: 6.0.328+39e3229

Syntax**C#**

```
int TryReadValue(
    int timeout,
    out Object?? value
)
```

Parameters

timeout	Type: System.Int32 The timeout in ms.
value	Type: System.Object. The symbol value.

Return Value

Type: Int32
The error code.

Remarks

Calling on primitive types, a call of this method will return the primitive value. On complex types (structures and arrays) it depends on the [ISymbolLoader](#) [[▸ 2714](#)] settings what will happen. In non dynamic modes: the raw byte Array will be returned, in dynamic mode: A Value will be created on the fly. A negative timeout indicates that the Default Timeout for the communication will be used. 0 means timeout is switched off.

6.11.104.2.4 IValueSymbol.TryWriteValue Method

Writes the Value of the [IValueSymbol \[▶ 2775\]](#)

Namespace: [TwinCAT.TypeSystem \[▶ 2083\]](#)

Assembly: TwinCAT.Ads.Abstractions (in TwinCAT.Ads.Abstractions.dll) Version: 6.0.328+39e3229

Syntax

C#

```
int TryWriteValue(
    Object value,
    int timeout
)
```

Parameters

value	Type: System.Object The value.
timeout	Type: System.Int32 The timeout in ms.

Return Value

Type: Int32
The error code.

Remarks

Calling on primitive types, a call of this method will directly write this Value. On complex types (structs and arrays) it depends on the [ISymbolLoader \[▶ 2714\]](#) settings what will happen. In non dynamic modes: Only byte Arrays (of correct size) can be written) in dynamic mode: A Value that represents the value will be accepted also. A negative timeout indicates that the Default Timeout for the communication will be used. 0 means timeout is switched off.

6.11.105 IVirtualStructInstance Interface

Virtual Struct instance interface.

Namespace: [TwinCAT.TypeSystem](#) [\[▶ 2083\]](#)

Assembly: TwinCAT.Ads.Abstractions (in TwinCAT.Ads.Abstractions.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public interface IVirtualStructInstance : IStructInstance,
    IInterfaceInstance, ISymbol, IAttributedInstance, IInstance, IBitSize,
    IRpcCallableInstance
```

The IVirtualStructInstance type exposes the following members.

Properties

	Name	Description
	Attributes [▶ 2471]	Gets the Type Attributes. (Inherited from IAttributedInstance [▶ 2469] .)
	BitSize [▶ 2473]	Gets the size of the IDataType [▶ 2475] in bits. (Inherited from IBitSize [▶ 2472] .)

	Name	Description
	ByteSize [▶ 2474]	Gets the (aligned) size of of the Type/Instance in Bytes (Inherited from IBitSize [▶ 2472].)
	Category [▶ 2694]	Gets the Symbol/Datatype Category (Inherited from ISymbol [▶ 2691].)
	Comment [▶ 2550]	Gets the comment of the Instance [▶ 2549] (Inherited from Instance [▶ 2549].)
	DataType [▶ 2551]	Gets the IDataType [▶ 2475] of the Instance [▶ 2549] . (Inherited from Instance [▶ 2549].)
	HasRpcMethods [▶ 3018]	Gets a value indicating whether this instance has RPC methods (Inherited from InterfaceInstance [▶ 3014].)
	InstanceName [▶ 2551]	Gets the name of the instance (without periods (.)) (Inherited from Instance [▶ 2549].)
	InstancePath [▶ 2552]	Gets the relative / absolute access path to the instance (with periods (.)) (Inherited from Instance [▶ 2549].)
	IsBitType [▶ 2474]	Gets a value indicating whether this instance is not basing on a full DataType but instead of some sort of bit mapping (Inherited from IBitSize [▶ 2472].)
	IsByteAligned [▶ 2475]	Indicates that the Size of the Object is Byte aligned ($\text{BitSize} \% 8 == 0$) (Inherited from IBitSize [▶ 2472].)
	IsContainerType [▶ 2694]	Gets a value indicating whether this Symbol is acontainer type. (Inherited from ISymbol [▶ 2691].)
	IsPersistent [▶ 2694]	Gets a value indicating whether this ISymbol [▶ 2691] is persistent. (Inherited from ISymbol [▶ 2691].)
	IsPointer [▶ 2552]	Indicates that the Instance [▶ 2549] represents a Pointer type (Pointer TO) (Inherited from Instance [▶ 2549].)
	IsPrimitiveType [▶ 2695]	Gets a value indicating whether this instance is a primitive type. (Inherited from ISymbol [▶ 2691].)
	IsReadOnly [▶ 2695]	Indicates that this instance is read only. (Inherited from ISymbol [▶ 2691].)
	IsRecursive [▶ 2696]	Gets a value indicating whether this instance is recursive. (Inherited from ISymbol [▶ 2691].)
	IsReference [▶ 2552]	Indicates that the Instance [▶ 2549] represents a Reference type (REFERENCE TO) (Inherited from Instance [▶ 2549].)
	IsStatic [▶ 2553]	Gets a value indicating whether this Instance [▶ 2549] is static. (Inherited from Instance [▶ 2549].)
	MemberInstances [▶ 3018]	Gets the member instances of the Struct Instance [▶ 3014] . (Inherited from InterfaceInstance [▶ 3014].)
	Parent [▶ 2696]	Gets the parent Symbol (Inherited from ISymbol [▶ 2691].)
	RpcMethods [▶ 2607]	Gets the Method descriptions for the IRpcCallableType [▶ 2624] (Inherited from IRpcCallableInstance [▶ 2606].)
	Size [▶ 2475]	Gets the size of the object in bytes or Bits dependant on IsBitType [▶ 2474] (Inherited from IBitSize [▶ 2472].)
	SubSymbols [▶ 2696]	Gets the SubSymbols of the ISymbol [▶ 2691] (Inherited from ISymbol [▶ 2691].)
	TypeName [▶ 2553]	Gets the name of the DataType [▶ 2475] that is used for this Instance [▶ 2549] . (Inherited from Instance [▶ 2549].)
	ValueEncoding [▶ 2472]	Gets the value encoding. (Inherited from AttributedInstance [▶ 2469].)

Methods

	Name	Description
	AddMember [▶ 2794]	Adds the member.
	InvokeRpcMethod(String, Object.) [▶ 2609]	Invokes the specified RPC Method (Inherited from IRpcCallableInstance [▶ 2606].)
	InvokeRpcMethod(String, Object., Object.) [▶ 2610]	Invokes the specified RPC Method (Inherited from IRpcCallableInstance [▶ 2606].)
	InvokeRpcMethodAsync [▶ 2614]	Invokes the specified RPC Method asynchronously (Inherited from IRpcCallableInstance [▶ 2606].)
	TryInvokeRpcMethod(String, Object., Object.) [▶ 2619]	Invokes the specified RPC Method (Inherited from IRpcCallableInstance [▶ 2606].)
	TryInvokeRpcMethod(String, Object., Object., Object.) [▶ 2620]	Invokes the specified RPC Method (Inherited from IRpcCallableInstance [▶ 2606].)

Extension Methods

	Name	Description
	ReferencesExternalData [▶ 3038]	Indicates, that the Instance value includes process memory data, that cannot be read in one memory block. (Defined by DataTypeExtension [▶ 3021].)

Remarks

Virtual struct instance are used to create a TreeView from the flat list of symbols.

6.11.105.1 IVirtualStructInstance Properties

The [IVirtualStructInstance](#) [[▶ 2790](#)] type exposes the following members.

Properties

	Name	Description
	Attributes [▶ 2471]	Gets the Type Attributes. (Inherited from IAttributedInstance [▶ 2469].)
	BitSize [▶ 2473]	Gets the size of the IDataType [▶ 2475] in bits. (Inherited from IBitSize [▶ 2472].)
	ByteSize [▶ 2474]	Gets the (aligned) size of of the Type/Instance in Bytes (Inherited from IBitSize [▶ 2472].)

	Name	Description
	Category [▶ 2694]	Gets the Symbol/Datatype Category (Inherited from ISymbol [▶ 2691] .)
	Comment [▶ 2550]	Gets the comment of the IInstance [▶ 2549] (Inherited from IInstance [▶ 2549] .)
	DataType [▶ 2551]	Gets the IDataType [▶ 2475] of the IInstance [▶ 2549] . (Inherited from IInstance [▶ 2549] .)
	HasRpcMethods [▶ 3018]	Gets a value indicating whether this instance has RPC methods (Inherited from IInterfaceInstance [▶ 3014] .)
	InstanceName [▶ 2551]	Gets the name of the instance (without periods (.)) (Inherited from IInstance [▶ 2549] .)
	InstancePath [▶ 2552]	Gets the relative / absolute access path to the instance (with periods (.)) (Inherited from IInstance [▶ 2549] .)
	IsBitType [▶ 2474]	Gets a value indicating whether this instance is not basing on a full DataType but instead of some sort of bit mapping (Inherited from IBitSize [▶ 2472] .)
	IsByteAligned [▶ 2475]	Indicates that the Size of the Object is Byte aligned ($\text{BitSize} \% 8 == 0$) (Inherited from IBitSize [▶ 2472] .)
	IsContainerType [▶ 2694]	Gets a value indicating whether this Symbol is acontainer type. (Inherited from ISymbol [▶ 2691] .)
	IsPersistent [▶ 2694]	Gets a value indicating whether this ISymbol [▶ 2691] is persistent. (Inherited from ISymbol [▶ 2691] .)
	IsPointer [▶ 2552]	Indicates that the IInstance [▶ 2549] represents a Pointer type (Pointer TO) (Inherited from IInstance [▶ 2549] .)
	IsPrimitiveType [▶ 2695]	Gets a value indicating whether this instance is a primitive type. (Inherited from ISymbol [▶ 2691] .)
	IsReadOnly [▶ 2695]	Indicates that this instance is read only. (Inherited from ISymbol [▶ 2691] .)
	IsRecursive [▶ 2696]	Gets a value indicating whether this instance is recursive. (Inherited from ISymbol [▶ 2691] .)
	IsReference [▶ 2552]	Indicates that the IInstance [▶ 2549] represents a Reference type (REFERENCE TO) (Inherited from IInstance [▶ 2549] .)
	IsStatic [▶ 2553]	Gets a value indicating whether this IInstance [▶ 2549] is static. (Inherited from IInstance [▶ 2549] .)
	MemberInstances [▶ 3018]	Gets the member instances of the Struct Instance [▶ 3014] . (Inherited from IInterfaceInstance [▶ 3014] .)
	Parent [▶ 2696]	Gets the parent Symbol (Inherited from ISymbol [▶ 2691] .)
	RpcMethods [▶ 2607]	Gets the Method descriptions for the IRpcCallableType [▶ 2624] (Inherited from IRpcCallableInstance [▶ 2606] .)
	Size [▶ 2475]	Gets the size of the object in bytes or Bits dependant on IsBitType [▶ 2474] (Inherited from IBitSize [▶ 2472] .)
	SubSymbols [▶ 2696]	Gets the SubSymbols of the ISymbol [▶ 2691] (Inherited from ISymbol [▶ 2691] .)
	TypeName [▶ 2553]	Gets the name of the DataType [▶ 2475] that is used for this IInstance [▶ 2549] . (Inherited from IInstance [▶ 2549] .)
	ValueEncoding [▶ 2472]	Gets the value encoding. (Inherited from IAttributedInstance [▶ 2469] .)

6.11.105.2.1 IVirtualStructInstance.AddMember Method

Adds the member.

Namespace: [TwinCAT.TypeSystem](#) [▸ 2083]

Assembly: TwinCAT.Ads.Abstractions (in TwinCAT.Ads.Abstractions.dll) Version: 6.0.328+39e3229

Syntax

C#

```
bool AddMember(
    ISymbol memberInstance,
    IVirtualStructInstance parent
)
```

Parameters

memberInstance	Type: TwinCAT.TypeSystem.ISymbol [▶ 2691] The member instance.
parent	Type: TwinCAT.TypeSystem.IVirtualStructInstance [▶ 2790] The parent struct instance. Usually the this pointer.

Return Value

Type: Boolean

6.11.106 MarshalException Class

Common Marshalling Exception

Inheritance Hierarchy

System.Object
 System.Exception
 [TwinCAT.AdsException](#) [[▶ 61](#)]
 TwinCAT.TypeSystem.MarshalException

Namespace: [TwinCAT.TypeSystem](#) [[▶ 2083](#)]

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
[SerializableAttribute]
public sealed class MarshalException : AdsException
```

The MarshalException type exposes the following members.

Constructors

	Name	Description
	MarshalException . [▶ 2797]	Initializes a new instance of the MarshalException class.
	MarshalException (DataType) [▶ 2798]	Initializes a new instance of the MarshalException class.
	MarshalException (String) [▶ 2798]	Initializes a new instance of the MarshalException class.

	Name	Description
	MarshalException(I DataType, Object) [▶ 2799]	Initializes a new instance of the MarshalException class.
	MarshalException(I DataType, Type) [▶ 2800]	Initializes a new instance of the MarshalException class.
	MarshalException(Str ing, Exception) [▶ 2799]	Initializes a new Instance of the AdsException class.
	MarshalException(I DataType, Type, String) [▶ 2800]	Initializes a new instance of the MarshalException class.
	MarshalException(I nstance, Type, MemberInfo) [▶ 2801]	Initializes a new instance of the MarshalException class.

Properties

	Name	Description
	Data	Gets a collection of key/value pairs that provide additional user-defined information about the exception. (Inherited from Exception.)
	HelpLink	Gets or sets a link to the help file associated with this exception. (Inherited from Exception.)
	HResult	Gets or sets HRESULT, a coded numerical value that is assigned to a specific exception. (Inherited from Exception.)
	InnerException	Gets the Exception instance that caused the current exception. (Inherited from Exception.)
	Message	Gets a message that describes the current exception. (Inherited from Exception.)
	Source	Gets or sets the name of the application or the object that causes the error. (Inherited from Exception.)
	StackTrace	Gets a string representation of the immediate frames on the call stack. (Inherited from Exception.)
	TargetSite	Gets the method that throws the current exception. (Inherited from Exception.)

Methods

	Name	Description
	Equals	Determines whether the specified object is equal to the current object. (Inherited from Object.)
	GetBaseException	When overridden in a derived class, returns the Exception that is the root cause of one or more subsequent exceptions. (Inherited from Exception.)
	GetHashCode	Serves as the default hash function. (Inherited from Object.)
	GetObjectData	When overridden in a derived class, sets the SerializationInfo with information about the exception. (Inherited from Exception.)
	GetType	Gets the runtime type of the current instance. (Inherited from Exception.)

	Name	Description
	ToString	Creates and returns a string representation of the current exception. (Inherited from Exception.)

[TwinCAT.TypeSystem Namespace \[▶ 2083\]](#)

6.11.106.1.1 MarshalException Constructor

Initializes a new instance of the [MarshalException \[▶ 2795\]](#) class.

Namespace: [TwinCAT.TypeSystem \[▶ 2083\]](#)

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public MarshalException()
```

Reference

6.11.106.2 MarshalException Properties

The [MarshalException \[▶ 2795\]](#) type exposes the following members.

Properties

	Name	Description
	Data	Gets a collection of key/value pairs that provide additional user-defined information about the exception. (Inherited from Exception.)
	HelpLink	Gets or sets a link to the help file associated with this exception. (Inherited from Exception.)
	HResult	Gets or sets HRESULT, a coded numerical value that is assigned to a specific exception. (Inherited from Exception.)
	InnerException	Gets the Exception instance that caused the current exception. (Inherited from Exception.)

	Name	Description
	Message	Gets a message that describes the current exception. (Inherited from Exception.)
	Source	Gets or sets the name of the application or the object that causes the error. (Inherited from Exception.)
	StackTrace	Gets a string representation of the immediate frames on the call stack. (Inherited from Exception.)
	TargetSite	Gets the method that throws the current exception. (Inherited from Exception.)

Reference

[TwinCAT.TypeSystem Namespace \[► 2083\]](#)

6.11.106.3 MarshalException Methods

The [MarshalException \[► 2795\]](#) type exposes the following members.

Methods

	Name	Description
	Equals	Determines whether the specified object is equal to the current object. (Inherited from Object.)
	GetBaseException	When overridden in a derived class, returns the Exception that is the root cause of one or more subsequent exceptions. (Inherited from Exception.)
	GetHashCode	Serves as the default hash function. (Inherited from Object.)
	GetObjectData	When overridden in a derived class, sets the SerializationInfo with information about the exception. (Inherited from Exception.)
	GetType	Gets the runtime type of the current instance. (Inherited from Exception.)
	ToString	Creates and returns a string representation of the current exception. (Inherited from Exception.)

Namespace: [TwinCAT.TypeSystem \[► 2083\]](#)

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public class MemberCollection : InstanceCollection<IMember>,
    IMemberCollection, IInstanceCollection<IMember>, IList<IMember>,
    ICollection<IMember>, IEnumerable<IMember>, IEnumerable
```

The MemberCollection type exposes the following members.

Constructors

	Name	Description
	MemberCollection [▶ 2805]	Initializes a new instance of the MemberCollection class.
	MemberCollection(IEnumerable.IMember) [▶ 2805]	Initializes a new instance of the MemberCollection class (copy constructor)

Properties

	Name	Description
	Count [▶ 3107]	Gets the collection count. (Inherited from InstanceCollection.T. [▶ 3104].)
	Empty [▶ 2806]	Returns an Empty Member Collection.
	InnerList [▶ 3108]	Gets the IList of instances. (Inherited from InstanceCollection.T. [▶ 3104].)
	InnerPathDict [▶ 3108]	The Path dictionary (Inherited from InstanceCollection.T. [▶ 3104].)
	Instances [▶ 2807]	Gets the Instance members (non static)
	IsReadOnly [▶ 3109]	Gets a value indicating whether this instance is read only. (Inherited from InstanceCollection.T. [▶ 3104].)
	Item.Int32. [▶ 3109]	Gets or sets the Instance [▶ 2549] at the specified index. (Inherited from InstanceCollection.T. [▶ 3104].)
	Item.String. [▶ 3110]	Gets the Instance [▶ 2549] with the specified instance path. (Inherited from InstanceCollection.T. [▶ 3104].)
	Mode [▶ 3111]	The mode this InstanceCollection.T. [▶ 3104] is working in. (Inherited from InstanceCollection.T. [▶ 3104].)
	Statics [▶ 2807]	Gets the Static Members

Methods

	Name	Description
	Add [▶ 2811]	Adds the specified item. (Overrides InstanceCollection.T..Add(T) [▶ 3112].)
	AddRange [▶ 3113]	Adds the specified items to this collection. (Inherited from InstanceCollection.T. [▶ 3104].)
	AsReadOnly [▶ 2809]	Returns a read only copy of this collection (shallow copy)
	CalcSize [▶ 2811]	Calculates the Byte Size of the IMemberCollection [▶ 2565]
	Clear [▶ 3114]	Clears this instance. (Inherited from InstanceCollection.T. [▶ 3104].)

	Name	Description
	Clone [▶ 2809]	Clones this MemberCollection.
	Contains(T) [▶ 3115]	Determines whether this collection contains the specified Instance [▶ 2549] (Inherited from InstanceCollection.T. [▶ 3104].)
	Contains(String) [▶ 3114]	Determines whether this collection contains an Instance [▶ 2549] with the specified InstanceName / InstancePath (Inherited from InstanceCollection.T. [▶ 3104].)
	ContainsName [▶ 3116]	Determines whether the specified instance name contains name. (Inherited from InstanceCollection.T. [▶ 3104].)
	CopyTo [▶ 3116]	Copies this InstanceCollection.T. [▶ 3104] to the specified array. (Inherited from InstanceCollection.T. [▶ 3104].)
	Equals	Determines whether the specified object is equal to the current object. (Inherited from Object.)
	Finalize	Allows an object to try to free resources and perform other cleanup operations before it is reclaimed by garbage collection. (Inherited from Object.)
	GetEnumerator [▶ 3117]	Gets the enumerator. (Inherited from InstanceCollection.T. [▶ 3104].)
	GetHashCode	Serves as the default hash function. (Inherited from Object.)
	GetInstance [▶ 3117]	Gets the Instance [▶ 2549] by instance path. (Inherited from InstanceCollection.T. [▶ 3104].)
	GetInstanceByName [▶ 3118]	Gets the name of the instance by. (Inherited from InstanceCollection.T. [▶ 3104].)
	GetType	Gets the Type of the current instance. (Inherited from Object.)
	IndexOf [▶ 3119]	Determines the index of the specified Instance [▶ 2549]. (Inherited from InstanceCollection.T. [▶ 3104].)
	Insert [▶ 3119]	Inserts the specified Instance [▶ 2549] at the specified index. (Inherited from InstanceCollection.T. [▶ 3104].)
	MemberwiseClone	Creates a shallow copy of the current Object. (Inherited from Object.)
	Remove [▶ 3120]	Removes the specified item. (Inherited from InstanceCollection.T. [▶ 3104].)
	RemoveAt [▶ 3121]	Removes the Instance [▶ 2549] at the specified index. (Inherited from InstanceCollection.T. [▶ 3104].)
	ToString	Returns a string that represents the current object. (Inherited from Object.)
	TryGetInstance [▶ 3121]	Tries to get the Instance [▶ 2549] of the specified path. (Inherited from InstanceCollection.T. [▶ 3104].)
	TryGetInstanceByName [▶ 3122]	Tries to get Instances by name. (Inherited from InstanceCollection.T. [▶ 3104].)
	TryGetMember [▶ 2810]	Tries to get the specified member

6.11.107.3 MemberCollection Methods

The [MemberCollection \[▶ 2802\]](#) type exposes the following members.

Methods

	Name	Description
	Add [▶ 2811]	Adds the specified item. (Overrides InstanceCollection.T..Add(T) [▶ 3112].)
	AddRange [▶ 3113]	Adds the specified items to this collection. (Inherited from InstanceCollection.T. [▶ 3104].)
	AsReadOnly [▶ 2809]	Returns a read only copy of this collection (shallow copy)
	CalcSize [▶ 2811]	Calculates the Byte Size of the IMemberCollection [▶ 2565]
	Clear [▶ 3114]	Clears this instance. (Inherited from InstanceCollection.T. [▶ 3104].)
	Clone [▶ 2809]	Clones this MemberCollection [▶ 2802] .
	Contains(T) [▶ 3115]	Determines whether this collection contains the specified Instance [▶ 2549] (Inherited from InstanceCollection.T. [▶ 3104].)
	Contains(String) [▶ 3114]	Determines whether this collection contains an Instance [▶ 2549] with the specified InstanceName / InstancePath (Inherited from InstanceCollection.T. [▶ 3104].)
	ContainsName [▶ 3116]	Determines whether the specified instance name contains name. (Inherited from InstanceCollection.T. [▶ 3104].)
	CopyTo [▶ 3116]	Copies this InstanceCollection.T. [▶ 3104] to the specified array. (Inherited from InstanceCollection.T. [▶ 3104].)
	Equals	Determines whether the specified object is equal to the current object. (Inherited from Object.)
	Finalize	Allows an object to try to free resources and perform other cleanup operations before it is reclaimed by garbage collection. (Inherited from Object.)
	GetEnumerator [▶ 3117]	Gets the enumerator. (Inherited from InstanceCollection.T. [▶ 3104].)
	GetHashCode	Serves as the default hash function. (Inherited from Object.)
	GetInstance [▶ 3117]	Gets the Instance [▶ 2549] by instance path. (Inherited from InstanceCollection.T. [▶ 3104].)
	GetInstanceByName [▶ 3118]	Gets the name of the instance by. (Inherited from InstanceCollection.T. [▶ 3104].)
	GetType	Gets the Type of the current instance. (Inherited from Object.)
	IndexOf [▶ 3119]	Determines the index of the specified Instance [▶ 2549] . (Inherited from InstanceCollection.T. [▶ 3104].)
	Insert [▶ 3119]	Inserts the specified Instance [▶ 2549] at the specified index. (Inherited from InstanceCollection.T. [▶ 3104].)
	MemberwiseClone	Creates a shallow copy of the current Object. (Inherited from Object.)
	Remove [▶ 3120]	Removes the specified item. (Inherited from InstanceCollection.T. [▶ 3104].)

	Name	Description
	RemoveAt [▶ 3121]	Removes the Instance [▶ 2549] at the specified index. (Inherited from InstanceCollection.T. [▶ 3104].)
	ToString	Returns a string that represents the current object. (Inherited from Object.)
	TryGetInstance [▶ 3121]	Tries to get the Instance [▶ 2549] . of the specified path. (Inherited from InstanceCollection.T. [▶ 3104].)
	TryGetInstanceByName [▶ 3122]	Tries to get Instances by name. (Inherited from InstanceCollection.T. [▶ 3104].)
	TryGetMember [▶ 2810]	Tries to get the specified member

	Member name	Value	Description
	None	0	None / Uninitialized
	System	1	System Type like Byte / Word / DWORD
	Unsigned	2	Primitive Type is Unsigned

	Member name	Value	Description
	Bool	4	Boolean Value (maps to true and false)
	Float	8	Floating Point
	Date	16	Type represents a Date
	Time	32	Type represents a Time
	Numeric	64	Numeric value
	Bitset	128	Bitset
	MaskNumericUnsigned	66	Numeric / Unsigned Mask
	MaskDateTime	48	Date / Time Mask
	MaskSpecialType	67	Special type Mask

Reference

 System.EventArgs
 [TwinCAT.TypeSystem.ValueChangedBaseEventArgs \[▶ 2968\]](#)
 TwinCAT.TypeSystem.RawValueChangedEventArgs

Namespace: [TwinCAT.TypeSystem \[▶ 2083\]](#)

Assembly: TwinCAT.Ads.Abstractions (in TwinCAT.Ads.Abstractions.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public class RawValueChangedEventArgs : ValueChangedBaseEventArgs
```

The RawValueChangedEventArgs type exposes the following members.

Properties

	Name	Description
	DateTime [▶ 2970]	Notification timestamp (Inherited from ValueChangedBaseEventArgs [▶ 2968] .)
	Symbol [▶ 2970]	Gets the symbol. (Inherited from ValueChangedBaseEventArgs [▶ 2968] .)
	Value [▶ 2814]	New Value (byte[])

Methods

	Name	Description
	Equals	Determines whether the specified object is equal to the current object. (Inherited from Object.)
	Finalize	Allows an object to try to free resources and perform other cleanup operations before it is reclaimed by garbage collection. (Inherited from Object.)
	GetHashCode	Serves as the default hash function. (Inherited from Object.)

	Name	Description
	GetType	Gets the Type of the current instance. (Inherited from Object.)
	MemberwiseClone	Creates a shallow copy of the current Object. (Inherited from Object.)
	ToString	Returns a string that represents the current object. (Inherited from Object.)

Namespace: [TwinCAT.TypeSystem \[▶ 2083\]](#)

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public class ReadOnlyDataTypeCollection : ReadOnlyDataTypeCollection<IDataType>,
    IDataValueCollection, IDataValueCollection<IDataType>, IList<IDataType>,
    ICollection<IDataType>, IEnumerable<IDataType>, IEnumerable
```

The ReadOnlyDataTypeCollection type exposes the following members.

Constructors

	Name	Description
	ReadOnlyDataTypeCollection [▶ 2816]	Initializes a new instance of the ReadOnlyDataTypeCollection class.

Properties

	Name	Description
	Count	Gets the number of elements contained in the ReadOnlyCollection.T. instance. (Inherited from ReadOnlyCollection.IDataType [▶ 2475] ..)
	Empty [▶ 2817]	Gets the empty collection.

	Name	Description
	Item.Int32.	Gets the element at the specified index. (Inherited from ReadOnlyCollection.IDataType [▸ 2475]..)
	Item.String. [▸ 3143]	Gets the element with the specified type name. (Inherited from ReadOnlyDataTypeCollection.T. [▸ 3139]..)
	Items	Returns the IList.T. that the ReadOnlyCollection.T. wraps. (Inherited from ReadOnlyCollection.IDataType [▸ 2475]..)

Methods

	Name	Description
	Contains	Determines whether an element is in the ReadOnlyCollection.T.. (Inherited from ReadOnlyCollection.IDataType [▸ 2475]..)
	ContainsType [▸ 3144]	Determines whether the specified name contains type. (Inherited from ReadOnlyDataTypeCollection.T. [▸ 3139]..)
	CopyTo	Copies the entire ReadOnlyCollection.T. to a compatible one-dimensional Array, starting at the specified index of the target array. (Inherited from ReadOnlyCollection.IDataType [▸ 2475]..)
	Equals	Determines whether the specified object is equal to the current object. (Inherited from Object.)
	Finalize	Allows an object to try to free resources and perform other cleanup operations before it is reclaimed by garbage collection. (Inherited from Object.)
	GetEnumerator	Returns an enumerator that iterates through the ReadOnlyCollection.T.. (Inherited from ReadOnlyCollection.IDataType [▸ 2475]..)
	GetHashCode	Serves as the default hash function. (Inherited from Object.)
	GetType	Gets the Type of the current instance. (Inherited from Object.)
	IndexOf	Searches for the specified object and returns the zero-based index of the first occurrence within the entire ReadOnlyCollection.T.. (Inherited from ReadOnlyCollection.IDataType [▸ 2475]..)
	MemberwiseClone	Creates a shallow copy of the current Object. (Inherited from Object.)
	ToString	Returns a string that represents the current object. (Inherited from Object.)
	TryGetType [▸ 3145]	Tries to get the Type with the specified name out of the collection. (Inherited from ReadOnlyDataTypeCollection.T. [▸ 3139]..)

Namespace: [TwinCAT.TypeSystem \[► 2083\]](#)

Assembly: TwinCAT.Ads.Abstractions (in TwinCAT.Ads.Abstractions.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public class ReadOnlyDimensionCollection : ReadOnlyCollection<IDimension>,
    IDimensionCollection, IList<IDimension>, ICollection<IDimension>,
    IEnumerable<IDimension>, IEnumerable
```

The ReadOnlyDimensionCollection type exposes the following members.

Properties

	Name	Description
	Count	Gets the number of elements contained in the ReadOnlyCollection.T. instance. (Inherited from ReadOnlyCollection.IDimension [▶ 2490]..)
	ElementCount [▶ 2820]	Gets the Number of elements in all Dimensions
	Empty [▶ 2822]	Returns an empty ReadOnlyDimensionCollection
	IsNonZeroBased [▶ 2822]	Gets a value indicating whether this instance is non zero index based.
	Item	Gets the element at the specified index. (Inherited from ReadOnlyCollection.IDimension [▶ 2490]..)
	Items	Returns the IList.T. that the ReadOnlyCollection.T. wraps. (Inherited from ReadOnlyCollection.IDimension [▶ 2490]..)
	LowerBounds [▶ 2821]	Gets the lower bounds.
	UpperBounds [▶ 2821]	Gets the upper bounds.

Methods

	Name	Description
	Contains	Determines whether an element is in the ReadOnlyCollection.T.. (Inherited from ReadOnlyCollection.IDimension [▶ 2490]..)
	CopyTo	Copies the entire ReadOnlyCollection.T. to a compatible one-dimensional Array, starting at the specified index of the target array. (Inherited from ReadOnlyCollection.IDimension [▶ 2490]..)
	Equals	Determines whether the specified object is equal to the current object. (Inherited from Object.)
	Finalize	Allows an object to try to free resources and perform other cleanup operations before it is reclaimed by garbage collection. (Inherited from Object.)
	GetDimensionLengths [▶ 2824]	Gets an array the specifies the Lengths of each Array Dimension
	GetEnumerator	Returns an enumerator that iterates through the ReadOnlyCollection.T.. (Inherited from ReadOnlyCollection.IDimension [▶ 2490]..)
	GetHashCode	Serves as the default hash function. (Inherited from Object.)
	GetType	Gets the Type of the current instance. (Inherited from Object.)
	IndexOf	Searches for the specified object and returns the zero-based index of the first occurrence within the entire ReadOnlyCollection.T.. (Inherited from ReadOnlyCollection.IDimension [▶ 2490]..)

	Name	Description
	MemberwiseClone	Creates a shallow copy of the current Object. (Inherited from Object.)
	ToString	Returns a string that represents the current object. (Inherited from Object.)

Extension Methods

Inheritance Hierarchy

System.Object

System.Collections.ObjectModel.ReadOnlyCollection.[IEnumValue](#) [[▶ 2524](#)].

TwinCAT.TypeSystem.ReadOnlyEnumValueCollection

Namespace: [TwinCAT.TypeSystem](#) [[▶ 2083](#)]

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public class ReadOnlyEnumValueCollection : ReadOnlyCollection<IEnumValue>,
    IEnumValueCollection, IEnumValueCollection<IEnumValue, IConvertible>, ICollection<IEnumValue>,
    IEnumerable<IEnumValue>, IEnumerable
```

The ReadOnlyEnumValueCollection type exposes the following members.

Constructors

	Name	Description
	ReadOnlyEnumValueCollection [▶ 2826]	Initializes a new instance of the ReadOnlyEnumValueCollection.T. [▶ 2833] class.

Properties

	Name	Description
	Count	Gets the number of elements contained in the ReadOnlyCollection.T. instance. (Inherited from ReadOnlyCollection.IEnumValue [▶ 2524]..)
	Item.Int32.	Gets the element at the specified index. (Inherited from ReadOnlyCollection.IEnumValue [▶ 2524]..)
	Item.String. [▶ 2827]	Gets or sets the element at the specified index.
	Items	Returns the IList.T. that the ReadOnlyCollection.T. wraps. (Inherited from ReadOnlyCollection.IEnumValue [▶ 2524]..)

Methods

	Name	Description
	Contains(T)	Determines whether an element is in the ReadOnlyCollection.T.. (Inherited from ReadOnlyCollection.IEnumValue [▶ 2524]..)
	Contains(String) [▶ 2829]	Determines whether [contains] [the specified name].
	CopyTo	Copies the entire ReadOnlyCollection.T. to a compatible one-dimensional Array, starting at the specified index of the target array. (Inherited from ReadOnlyCollection.IEnumValue [▶ 2524]..)
	Equals	Determines whether the specified object is equal to the current object. (Inherited from Object.)
	Finalize	Allows an object to try to free resources and perform other cleanup operations before it is reclaimed by garbage collection. (Inherited from Object.)
	GetEnumerator	Returns an enumerator that iterates through the ReadOnlyCollection.T.. (Inherited from ReadOnlyCollection.IEnumValue [▶ 2524]..)
	GetHashCode	Serves as the default hash function. (Inherited from Object.)
	GetNames [▶ 2829]	Gets the Value Names.
	GetType	Gets the Type of the current instance. (Inherited from Object.)
	GetValues [▶ 2830]	Gets the values.
	IndexOf	Searches for the specified object and returns the zero-based index of the first occurrence within the entire ReadOnlyCollection.T.. (Inherited from ReadOnlyCollection.IEnumValue [▶ 2524]..)
	MemberwiseClone	Creates a shallow copy of the current Object. (Inherited from Object.)

	Name	Description
	Parse [▸ 2830]	Parses the specified name.
	ToString	Returns a string that represents the current object. (Inherited from Object.)
	TryParse(String, IConvertible.) [▸ 2831]	Tries to pars the string value of the Enum.
	TryParse(String, EnumValue.) [▸ 2832]	Tries to pars the string value of the Enum.

6.11.113.3 ReadOnlyEnumValueCollection Methods

The [ReadOnlyEnumValueCollection \[▶ 2824\]](#) type exposes the following members.

Methods

	Name	Description
	Contains(T)	Determines whether an element is in the ReadOnlyCollection.T.. (Inherited from ReadOnlyCollection.IEnumValue [▶ 2524].)
	Contains(String) [▶ 2829]	Determines whether [contains] [the specified name].
	CopyTo	Copies the entire ReadOnlyCollection.T. to a compatible one-dimensional Array, starting at the specified index of the target array. (Inherited from ReadOnlyCollection.IEnumValue [▶ 2524].)
	Equals	Determines whether the specified object is equal to the current object. (Inherited from Object.)
	Finalize	Allows an object to try to free resources and perform other cleanup operations before it is reclaimed by garbage collection. (Inherited from Object.)
	GetEnumerator	Returns an enumerator that iterates through the ReadOnlyCollection.T.. (Inherited from ReadOnlyCollection.IEnumValue [▶ 2524].)
	GetHashCode	Serves as the default hash function. (Inherited from Object.)
	GetNames [▶ 2829]	Gets the Value Names.
	GetType	Gets the Type of the current instance. (Inherited from Object.)
	GetValues [▶ 2830]	Gets the values.
	IndexOf	Searches for the specified object and returns the zero-based index of the first occurrence within the entire ReadOnlyCollection.T.. (Inherited from ReadOnlyCollection.IEnumValue [▶ 2524].)
	MemberwiseClone	Creates a shallow copy of the current Object. (Inherited from Object.)
	Parse [▶ 2830]	Parses the specified name.
	ToString	Returns a string that represents the current object. (Inherited from Object.)
	TryParse(String, IConvertible.) [▶ 2831]	Tries to pars the string value of the Enum.
	TryParse(String, IEnumValue.) [▶ 2832]	Tries to pars the string value of the Enum.

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public class ReadOnlyEnumValueCollection<T> : ReadOnlyCollection<EnumValue<T>>,
    IEnumerable<EnumValue<T>, T>, ICollection<EnumValue<T>>, IEnumerable<EnumValue<T>>,
    IEnumerable
where T : struct, new(), IConvertible
```

Type Parameters

T

The ReadOnlyEnumValueCollection.T. type exposes the following members.

Constructors

	Name	Description
	ReadOnlyEnumValueCollection.T. [▶ 2834]	Initializes a new instance of the ReadOnlyEnumValueCollection.T. class.

Properties

	Name	Description
	Count	Gets the number of elements contained in the ReadOnlyCollection.T. instance. (Inherited from ReadOnlyCollection.EnumValue [▶ 2384].T...)
	Item.Int32.	Gets the element at the specified index. (Inherited from ReadOnlyCollection.EnumValue [▶ 2384].T...)
	Item.String. [▶ 2835]	Gets the enumeration value T from its string representation.
	Items	Returns the IList.T. that the ReadOnlyCollection.T. wraps. (Inherited from ReadOnlyCollection.EnumValue [▶ 2384].T...)

Methods

	Name	Description
	Contains(T)	Determines whether an element is in the ReadOnlyCollection.T.. (Inherited from ReadOnlyCollection.EnumValue [▶ 2384].T...)
	Contains(String) [▶ 2837]	Determines whether [contains] [the specified name].
	CopyTo	Copies the entire ReadOnlyCollection.T. to a compatible one-dimensional Array, starting at the specified index of the target array. (Inherited from ReadOnlyCollection.EnumValue [▶ 2384].T...)
	Equals	Determines whether the specified object is equal to the current object. (Inherited from Object.)
	Finalize	Allows an object to try to free resources and perform other cleanup operations before it is reclaimed by garbage collection. (Inherited from Object.)
	GetEnumerator	Returns an enumerator that iterates through the ReadOnlyCollection.T.. (Inherited from ReadOnlyCollection.EnumValue [▶ 2384].T...)
	GetHashCode	Serves as the default hash function. (Inherited from Object.)
	GetNames [▶ 2838]	Gets the Value Names.
	GetType	Gets the Type of the current instance. (Inherited from Object.)
	GetValues [▶ 2838]	Gets the values.
	IndexOf	Searches for the specified object and returns the zero-based index of the first occurrence within the entire ReadOnlyCollection.T.. (Inherited from ReadOnlyCollection.EnumValue [▶ 2384].T...)
	MemberwiseClone	Creates a shallow copy of the current Object. (Inherited from Object.)
	Parse [▶ 2839]	Parses the specified name.
	ToString	Returns a string that represents the current object. (Inherited from Object.)
	TryParse(String, T.) [▶ 2840]	Tries to parse the string value of the Enum.
	TryParse(String, EnumValue.T.) [▶ 2840]	Tries to parse the string value of the Enum.

6.11.115.3 ReadOnlyFieldCollection Methods

The [ReadOnlyFieldCollection](#) [[▶ 2841](#)] type exposes the following members.

Methods

	Name	Description
	Contains(T)	Determines whether an element is in the ReadOnlyCollection.T.. (Inherited from ReadOnlyCollection.IField [▶ 2535]..)
	Contains(String) [▶ 3150]	Determines whether the ReadOnlyInstanceCollection.T. [▶ 3145] contains an instance with the specified instance path. (Inherited from ReadOnlyInstanceCollection.T. [▶ 3145].)
	ContainsName [▶ 3151]	Determines whether the specified instance is contained. (Inherited from ReadOnlyInstanceCollection.T. [▶ 3145].)
	CopyTo	Copies the entire ReadOnlyCollection.T. to a compatible one-dimensional Array, starting at the specified index of the target array. (Inherited from ReadOnlyCollection.IField [▶ 2535]..)
	Equals	Determines whether the specified object is equal to the current object. (Inherited from Object.)
	Finalize	Allows an object to try to free resources and perform other cleanup operations before it is reclaimed by garbage collection. (Inherited from Object.)
	GetEnumerator	Returns an enumerator that iterates through the ReadOnlyCollection.T.. (Inherited from ReadOnlyCollection.IField [▶ 2535]..)
	GetHashCode	Serves as the default hash function. (Inherited from Object.)
	GetInstance [▶ 3152]	Gets the Instance [▶ 2549] by instance path. (Inherited from ReadOnlyInstanceCollection.T. [▶ 3145].)
	GetInstanceByName [▶ 3152]	Gets the Instance [▶ 2549] by instance name. (Inherited from ReadOnlyInstanceCollection.T. [▶ 3145].)
	GetType	Gets the Type of the current instance. (Inherited from Object.)
	IndexOf	Searches for the specified object and returns the zero-based index of the first occurrence within the entire ReadOnlyCollection.T.. (Inherited from ReadOnlyCollection.IField [▶ 2535]..)
	MemberwiseClone	Creates a shallow copy of the current Object. (Inherited from Object.)
	ToString	Returns a string that represents the current object. (Inherited from Object.)
	TryGetInstance [▶ 3153]	Tries to get the instance with the specified instance path. (Inherited from ReadOnlyInstanceCollection.T. [▶ 3145].)
	TryGetInstanceByName [▶ 3153]	Tries to get the instance by name. (Inherited from ReadOnlyInstanceCollection.T. [▶ 3145].)

	Name	Description
	TryGetMember [▶ 2845]	Tries to get the specified member

6.11.115.3.1 ReadOnlyFieldCollection.TryGetMember Method

Tries to get the specified member

Namespace: [TwinCAT.TypeSystem](#) [▶ 2083]

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public bool TryGetMember(
    string fieldName,
    out IField?? symbol
)
```

Parameters

fieldName	Type: System.String Name of the member.
symbol	Type: TwinCAT.TypeSystem.IField [▶ 2535]. The symbol.

Return Value

Type: Boolean
true if found, false otherwise.

Implements

[IFieldCollection.TryGetMember\(String, IField.\)](#) [▶ 2541]

Reference

TwinCAT.TypeSystem.ReadOnlyMemberCollection

Namespace: [TwinCAT.TypeSystem](#) [▶ 2083]**Assembly:** TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public class ReadOnlyMemberCollection : ReadOnlyInstanceCollection<IMember>,
    IMemberCollection, IInstanceCollection<IMember>, IList<IMember>,
    ICollection<IMember>, IEnumerable<IMember>, IEnumerable
```

The `ReadOnlyMemberCollection` type exposes the following members.

Constructors

	Name	Description
	ReadOnlyMemberCollection [▶ 2847]	Initializes a new instance of the <code>ReadOnlyMemberCollection</code> class.

Properties

	Name	Description
	Count	Gets the number of elements contained in the <code>ReadOnlyCollection.T.</code> instance. (Inherited from ReadOnlyCollection.IMember [▶ 2561]..)
	Empty [▶ 2848]	Returns an Empty <code>ReadOnlyMemberCollection</code>
	Instances [▶ 2849]	Gets the Instance members (non static)
	Item.Int32.	Gets the element at the specified index. (Inherited from ReadOnlyCollection.IMember [▶ 2561]..)
	Item.String. [▶ 3148]	Gets the element with the specified instance path. (Inherited from ReadOnlyInstanceCollection.T. [▶ 3145].)
	Items	Returns the <code>IList.T.</code> that the <code>ReadOnlyCollection.T.</code> wraps. (Inherited from ReadOnlyCollection.IMember [▶ 2561]..)
	Mode [▶ 3149]	Gets the InstanceCollectionMode [▶ 2573]. (Inherited from ReadOnlyInstanceCollection.T. [▶ 3145].)
	Statics [▶ 2849]	Gets the Static Members

Methods

	Name	Description
	CalcSize [▶ 2852]	Calculates the Byte Size of the IMemberCollection [▶ 2565]
	Contains(T)	Determines whether an element is in the <code>ReadOnlyCollection.T.</code> (Inherited from ReadOnlyCollection.IMember [▶ 2561]..)
	Contains(String) [▶ 3150]	Determines whether the ReadOnlyInstanceCollection.T. [▶ 3145] contains an instance with the specified instance path. (Inherited from ReadOnlyInstanceCollection.T. [▶ 3145].)
	ContainsName [▶ 3151]	Determines whether the specified instance is contained. (Inherited from ReadOnlyInstanceCollection.T. [▶ 3145].)
	CopyTo	Copies the entire <code>ReadOnlyCollection.T.</code> to a compatible one-dimensional Array, starting at the specified index of the target array. (Inherited from ReadOnlyCollection.IMember [▶ 2561]..)

	Name	Description
	Equals	Determines whether the specified object is equal to the current object. (Inherited from Object.)
	Finalize	Allows an object to try to free resources and perform other cleanup operations before it is reclaimed by garbage collection. (Inherited from Object.)
	GetEnumerator	Returns an enumerator that iterates through the ReadOnlyCollection.T.. (Inherited from ReadOnlyCollection.IMember [▶ 2561].)
	GetHashCode	Serves as the default hash function. (Inherited from Object.)
	GetInstance [▶ 3152]	Gets the Instance [▶ 2549] by instance path. (Inherited from ReadOnlyInstanceCollection.T. [▶ 3145] .)
	GetInstanceByName [▶ 3152]	Gets the Instance [▶ 2549] by instance name. (Inherited from ReadOnlyInstanceCollection.T. [▶ 3145] .)
	GetType	Gets the Type of the current instance. (Inherited from Object.)
	IndexOf	Searches for the specified object and returns the zero-based index of the first occurrence within the entire ReadOnlyCollection.T.. (Inherited from ReadOnlyCollection.IMember [▶ 2561] ..)
	MemberwiseClone	Creates a shallow copy of the current Object. (Inherited from Object.)
	ToString	Returns a string that represents the current object. (Inherited from Object.)
	TryGetInstance [▶ 3153]	Tries to get the instance with the specified instance path. (Inherited from ReadOnlyInstanceCollection.T. [▶ 3145] .)
	TryGetInstanceByName [▶ 3153]	Tries to get the instance by name. (Inherited from ReadOnlyInstanceCollection.T. [▶ 3145] .)
	TryGetMember [▶ 2851]	Tries to get the specified member

6.11.118.1.1.1 ReadOnlyRpcMethodCollection.Item Property (String)

Gets the [IRpcMethod \[▸ 2625\]](#) with the specified method name.

Namespace: [TwinCAT.TypeSystem \[▸ 2083\]](#)

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public IRpcMethod this[
    string methodName
] { get; }
```

Parameters

methodName	Type: System.String Name of the method.
------------	--

Return Value

Type: [IRpcMethod \[▸ 2625\]](#)
RpcMethod.

Implements

[IRpcMethodCollection.Item.String. \[▸ 2631\]](#)

Exceptions

Exception	Condition
KeyNotFoundException

6.11.118.2 ReadOnlyRpcMethodCollection Methods

The [ReadOnlyRpcMethodCollection \[► 2855\]](#) type exposes the following members.

Methods

	Name	Description
	Contains(T)	Determines whether an element is in the ReadOnlyCollection.T.. (Inherited from ReadOnlyCollection.IRpcMethod [► 2625].)
	Contains(String) [► 2859]	Determines whether this collection contains the specified method name.
	CopyTo	Copies the entire ReadOnlyCollection.T. to a compatible one-dimensional Array, starting at the specified index of the target array. (Inherited from ReadOnlyCollection.IRpcMethod [► 2625].)
	Equals	Determines whether the specified object is equal to the current object. (Inherited from Object.)
	Finalize	Allows an object to try to free resources and perform other cleanup operations before it is reclaimed by garbage collection. (Inherited from Object.)
	GetEnumerator	Returns an enumerator that iterates through the ReadOnlyCollection.T.. (Inherited from ReadOnlyCollection.IRpcMethod [► 2625].)
	GetHashCode	Serves as the default hash function. (Inherited from Object.)
	GetType	Gets the Type of the current instance. (Inherited from Object.)
	IndexOf	Searches for the specified object and returns the zero-based index of the first occurrence within the entire ReadOnlyCollection.T.. (Inherited from ReadOnlyCollection.IRpcMethod [► 2625].)
	MemberwiseClone	Creates a shallow copy of the current Object. (Inherited from Object.)
	ToString	Returns a string that represents the current object. (Inherited from Object.)
	TryGetMethod(Int32, IRpcMethod.) [► 2860]	Tries to get the specified method.
	TryGetMethod(String, IRpcMethod.) [► 2861]	Tries to get the specified method.

ReadOnly collection containing [ISymbol](#) [[▶ 2691](#)] objects.

Inheritance Hierarchy

System.Object

System.Collections.ObjectModel.ReadOnlyCollection.[ISymbol](#) [[▶ 2691](#)].

[TwinCAT.TypeSystem.Generic.ReadOnlyInstanceCollection](#) [[▶ 3145](#)].[ISymbol](#) [[▶ 2691](#)].

[TwinCAT.TypeSystem.Generic.ReadOnlySymbolCollection](#) [[▶ 3161](#)].[ISymbol](#) [[▶ 2691](#)].

[TwinCAT.TypeSystem.ReadOnlySymbolCollection](#)

Namespace: [TwinCAT.TypeSystem](#) [[▶ 2083](#)]

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public class ReadOnlySymbolCollection : ReadOnlySymbolCollection<ISymbol>,
    ISymbolCollection, ISymbolCollection<ISymbol>, IInstanceCollection<ISymbol>,
    IList<ISymbol>, ICollection<ISymbol>, IEnumerable<ISymbol>,
    IEnumerable
```

The ReadOnlySymbolCollection type exposes the following members.

Constructors

	Name	Description
	ReadOnlySymbolCollection [▶ 2863]	Initializes a new instance of the ReadOnlySymbolCollection class.

Properties

	Name	Description
	Count	Gets the number of elements contained in the ReadOnlyCollection.T. instance. (Inherited from ReadOnlyCollection.ISymbol [▶ 2691].)
	Empty [▶ 2864]	Returns an Empty collection.
	Item.Int32.	Gets the element at the specified index. (Inherited from ReadOnlyCollection.ISymbol [▶ 2691].)
	Item.String. [▶ 3148]	Gets the element with the specified instance path. (Inherited from ReadOnlyInstanceCollection.T. [▶ 3145].)
	Items	Returns the IList.T. that the ReadOnlyCollection.T. wraps. (Inherited from ReadOnlyCollection.ISymbol [▶ 2691].)
	Mode [▶ 3149]	Gets the InstanceCollectionMode [▶ 2573]. (Inherited from ReadOnlyInstanceCollection.T. [▶ 3145].)

Methods

	Name	Description
	Contains(T)	Determines whether an element is in the ReadOnlyCollection.T.. (Inherited from ReadOnlyCollection.ISymbol [▶ 2691].)
	Contains(String) [▶ 3150]	Determines whether the ReadOnlyInstanceCollection.T. [▶ 3145] contains an instance with the specified instance path. (Inherited from ReadOnlyInstanceCollection.T. [▶ 3145].)
	ContainsName [▶ 3151]	Determines whether the specified instance is contained. (Inherited from ReadOnlyInstanceCollection.T. [▶ 3145].)
	CopyTo	Copies the entire ReadOnlyCollection.T. to a compatible one-dimensional Array, starting at the specified index of the target array. (Inherited from ReadOnlyCollection.ISymbol [▶ 2691].)
	Equals	Determines whether the specified object is equal to the current object. (Inherited from Object.)
	Finalize	Allows an object to try to free resources and perform other cleanup operations before it is reclaimed by garbage collection. (Inherited from Object.)
	GetEnumerator	Returns an enumerator that iterates through the ReadOnlyCollection.T.. (Inherited from ReadOnlyCollection.ISymbol [▶ 2691].)
	GetHashCode	Serves as the default hash function. (Inherited from Object.)

	Name	Description
	GetInstance [▶ 3152]	Gets the IInstance [▶ 2549] by instance path. (Inherited from ReadOnlyInstanceCollection.T. [▶ 3145].)
	GetInstanceByName [▶ 3152]	Gets the IInstance [▶ 2549] by instance name. (Inherited from ReadOnlyInstanceCollection.T. [▶ 3145].)
	GetType	Gets the Type of the current instance. (Inherited from Object.)
	IndexOf	Searches for the specified object and returns the zero-based index of the first occurrence within the entire ReadOnlyCollection.T.. (Inherited from ReadOnlyCollection.ISymbol [▶ 2691].)
	MemberwiseClone	Creates a shallow copy of the current Object. (Inherited from Object.)
	ToString	Returns a string that represents the current object. (Inherited from Object.)
	TryGetInstance [▶ 3153]	Tries to get the instance with the specified instance path. (Inherited from ReadOnlyInstanceCollection.T. [▶ 3145].)
	TryGetInstanceByName [▶ 3153]	Tries to get the instance by name. (Inherited from ReadOnlyInstanceCollection.T. [▶ 3145].)

6.11.121 ResultDataTypes Class

Class representing the asynchronous result of reading a [IDataTypeCollection](#) [[▶ 2484](#)] via ADS. Implements the [ResultValue.TValue.](#) [[▶ 1181](#)]

Inheritance Hierarchy

System.Object

[TwinCAT.Ads.ResultAds](#) [[▶ 1116](#)]

[TwinCAT.Ads.ResultValue](#) [[▶ 1181](#)].[IDataTypeCollection](#) [[▶ 2486](#)].[IDataType](#) [[▶ 2475](#)].

[TwinCAT.TypeSystem.ResultDataTypes](#)

Namespace: [TwinCAT.TypeSystem](#) [[▶ 2083](#)]

Assembly: TwinCAT.Ads.Abstractions (in TwinCAT.Ads.Abstractions.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public class ResultDataTypes : ResultValue<IDataTypeCollection<IDataType>>
```

The ResultDataTypes type exposes the following members.

Constructors

	Name	Description
	ResultDataTypes [▶ 2873]	Initializes a new instance of the ResultDataTypes class.

Properties

	Name	Description
	DataTypes [▸ 2874]	Gets the data types.
	ErrorCode [▸ 1120]	Gets the ADS Error code bound to this Result [▸ 1116] object. (Inherited from ResultAds [▸ 1116] .)
	Failed [▸ 1121]	Gets a value indicating whether the ResultAds [▸ 1116] state is failed. (Inherited from ResultAds [▸ 1116] .)
	Invokeld [▸ 1121]	Gets the ADS requests invoke identifier (or 0 if not supported) (Inherited from ResultAds [▸ 1116] .)
	Succeeded [▸ 1121]	Gets a value indicating whether the ResultAds [▸ 1116] state is succeeded. (Inherited from ResultAds [▸ 1116] .)
	Value [▸ 1185]	The value object. (Inherited from ResultValue.TValue. [▸ 1181] .)

Methods

	Name	Description
	CreateError [▸ 2875]	Creates an error result.
	CreateSuccess [▸ 2876]	Creates a success result
	Equals	Determines whether the specified object is equal to the current object. (Inherited from Object.)
	Finalize	Allows an object to try to free resources and perform other cleanup operations before it is reclaimed by garbage collection. (Inherited from Object.)
	GetHashCode	Serves as the default hash function. (Inherited from Object.)
	GetType	Gets the Type of the current instance. (Inherited from Object.)
	MemberwiseClone	Creates a shallow copy of the current Object. (Inherited from Object.)
	SetError [▸ 1128]	Sets the error state of this ResultAds [▸ 1116] (Inherited from ResultAds [▸ 1116] .)
	ToString	Returns a string that represents the current object. (Inherited from Object.)

Remarks

The Result value of this operation can be accessed by the [DataTypes \[▸ 2874\]](#) property.

[TwinCAT.Ads.ResultValue.TValue. \[▸ 1181\]](#)

6.11.121.1 ResultDataTypes Constructor

Initializes a new instance of the [ResultDataTypes \[▸ 2872\]](#) class.

Namespace: [TwinCAT.TypeSystem \[▸ 2083\]](#)

Assembly: TwinCAT.Ads.Abstractions (in TwinCAT.Ads.Abstractions.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public ResultDataTypes (
    AdsErrorCode errorCode,
    IDataValueCollection<IDataType>? dataTypes
)
```

Parameters

errorCode	Type: TwinCAT.Ads.AdsErrorCode [▸ 664] The error code.
dataTypes	Type: TwinCAT.TypeSystem.IDataValueCollection [▸ 2486]. IDataType [▸ 2475]. The datatype collection..

Reference

6.11.121.2 ResultDataTypes Properties

The [ResultDataTypes](#) [▸ 2872] type exposes the following members.

Properties

	Name	Description
	DataTypes [▸ 2874]	Gets the data types.
	ErrorCode [▸ 1120]	Gets the ADS Error code bound to this Result [▸ 1116] object. (Inherited from ResultAds [▸ 1116].)
	Failed [▸ 1121]	Gets a value indicating whether the ResultAds [▸ 1116] state is failed. (Inherited from ResultAds [▸ 1116].)
	Invokeld [▸ 1121]	Gets the ADS requests invoke identifier (or 0 if not supported) (Inherited from ResultAds [▸ 1116].)
	Succeeded [▸ 1121]	Gets a value indicating whether the ResultAds [▸ 1116] state is succeeded. (Inherited from ResultAds [▸ 1116].)
	Value [▸ 1185]	The value object. (Inherited from ResultValue.TValue . [▸ 1181].)

6.11.122 ResultDynamicSymbols Class

Class representing the asynchronous result of reading a dynamic symbol collection via ADS. Implements the [ResultValue.TValue](#). [[▶ 1181](#)]

Inheritance Hierarchy

System.Object

[TwinCAT.Ads.ResultAds](#) [[▶ 1116](#)]

[TwinCAT.Ads.ResultValue](#) [[▶ 1181](#)]. [IDynamicSymbolsCollection](#) [[▶ 2503](#)].

[TwinCAT.TypeSystem.ResultSymbols](#) [[▶ 2884](#)]. [IDynamicSymbolsCollection](#) [[▶ 2503](#)].

[TwinCAT.TypeSystem.ResultDynamicSymbols](#)

Namespace: [TwinCAT.TypeSystem](#) [[▶ 2083](#)]

Assembly: TwinCAT.Ads.Abstractions (in TwinCAT.Ads.Abstractions.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public class ResultDynamicSymbols : ResultSymbols<IDynamicSymbolsCollection>
```

The ResultDynamicSymbols type exposes the following members.

Constructors

	Name	Description
	ResultDynamicSymbols [▶ 2878]	Initializes a new instance of the ResultDynamicSymbols class.

Properties

	Name	Description
	ErrorCode [▶ 1120]	Gets the ADS Error code bound to this Result [▶ 1116] object. (Inherited from ResultAds [▶ 1116].)
	Failed [▶ 1121]	Gets a value indicating whether the ResultAds [▶ 1116] state is failed. (Inherited from ResultAds [▶ 1116].)
	Invokeld [▶ 1121]	Gets the ADS requests invoke identifier (or 0 if not supported) (Inherited from ResultAds [▶ 1116].)
	Succeeded [▶ 1121]	Gets a value indicating whether the ResultAds [▶ 1116] state is succeeded. (Inherited from ResultAds [▶ 1116].)
	Symbols [▶ 2886]	Get the Symbols enumerable (T) as result of an asynchronous operation. (Inherited from ResultSymbols.T . [▶ 2884].)
	Value [▶ 1185]	The value object. (Inherited from ResultValue.TValue . [▶ 1181].)

Methods

	Name	Description
	CreateError [▶ 2879]	Creates an Error Result.
	CreateSuccess [▶ 2880]	Creates a success result.
	Equals	Determines whether the specified object is equal to the current object. (Inherited from Object.)
	Finalize	Allows an object to try to free resources and perform other cleanup operations before it is reclaimed by garbage collection. (Inherited from Object.)
	GetHashCode	Serves as the default hash function. (Inherited from Object.)
	GetType	Gets the Type of the current instance. (Inherited from Object.)
	MemberwiseClone	Creates a shallow copy of the current Object. (Inherited from Object.)
	SetError [▶ 1128]	Sets the error state of this ResultAds [▶ 1116] (Inherited from ResultAds [▶ 1116].)
	ToString	Returns a string that represents the current object. (Inherited from Object.)

Remarks

This result class is used to return Symbol instances of dynamic nature in an [IDynamicSymbolsCollection](#) [[▸ 2503](#)]. The value/result of the completed operation can be returned by the [Symbols](#) [[▸ 2886](#)] property.

[TwinCAT.TypeSystem.ResultSymbols](#)

Namespace: [TwinCAT.TypeSystem](#) [[▸ 2083](#)]

Assembly: TwinCAT.Ads.Abstractions (in TwinCAT.Ads.Abstractions.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public class ResultSymbols : ResultSymbols<ISymbolCollection<ISymbol>>
```

The ResultSymbols type exposes the following members.

Constructors

	Name	Description
	ResultSymbols [▶ 2882]	Initializes a new instance of the ResultSymbols class.

Properties

	Name	Description
	ErrorCode [▶ 1120]	Gets the ADS Error code bound to this Result [▶ 1116] object. (Inherited from ResultAds [▶ 1116] .)
	Failed [▶ 1121]	Gets a value indicating whether the ResultAds [▶ 1116] state is failed. (Inherited from ResultAds [▶ 1116] .)
	Invokeld [▶ 1121]	Gets the ADS requests invoke identifier (or 0 if not supported) (Inherited from ResultAds [▶ 1116] .)
	Succeeded [▶ 1121]	Gets a value indicating whether the ResultAds [▶ 1116] state is succeeded. (Inherited from ResultAds [▶ 1116] .)
	Symbols [▶ 2886]	Get the Symbols enumerable (T) as result of an asynchronous operation. (Inherited from ResultSymbols.T . [▶ 2884] .)
	Value [▶ 1185]	The value object. (Inherited from ResultValue.TValue . [▶ 1181] .)

Methods

	Name	Description
	CreateError [▶ 2883]	Creates an Error Result.
	CreateSuccess [▶ 2884]	Creates a success result.
	Equals	Determines whether the specified object is equal to the current object. (Inherited from Object.)
	Finalize	Allows an object to try to free resources and perform other cleanup operations before it is reclaimed by garbage collection. (Inherited from Object.)
	GetHashCode	Serves as the default hash function. (Inherited from Object.)
	GetType	Gets the Type of the current instance. (Inherited from Object.)
	MemberwiseClone	Creates a shallow copy of the current Object. (Inherited from Object.)
	SetError [▶ 1128]	Sets the error state of this ResultAds [▶ 1116] (Inherited from ResultAds [▶ 1116] .)
	ToString	Returns a string that represents the current object. (Inherited from Object.)

Remarks

This result class is used to return generic Symbol instances. in an enumerable class. The value/result of the completed operation can be returned by the [Symbols](#) [\[▶ 2886\]](#) property.

Properties

	Name	Description
	ErrorCode [▶ 1120]	Gets the ADS Error code bound to this Result [▶ 1116] object. (Inherited from ResultAds [▶ 1116].)
	Failed [▶ 1121]	Gets a value indicating whether the ResultAds [▶ 1116] state is failed. (Inherited from ResultAds [▶ 1116].)
	Invokeld [▶ 1121]	Gets the ADS requests invoke identifier (or 0 if not supported) (Inherited from ResultAds [▶ 1116].)
	Succeeded [▶ 1121]	Gets a value indicating whether the ResultAds [▶ 1116] state is succeeded. (Inherited from ResultAds [▶ 1116].)
	Symbols [▶ 2886]	Get the Symbols enumerable (T) as result of an asynchronous operation.
	Value [▶ 1185]	The value object. (Inherited from ResultValue.TValue . [▶ 1181].)

6.11.124.3 ResultSymbols.T. Methods

The [ResultSymbols.T.](#) [[▶ 2884](#)] generic type exposes the following members.

Methods

	Name	Description
	Equals	Determines whether the specified object is equal to the current object. (Inherited from Object.)
	Finalize	Allows an object to try to free resources and perform other cleanup operations before it is reclaimed by garbage collection. (Inherited from Object.)
	GetHashCode	Serves as the default hash function. (Inherited from Object.)
	GetType	Gets the Type of the current instance. (Inherited from Object.)
	MemberwiseClone	Creates a shallow copy of the current Object. (Inherited from Object.)
	SetError [▶ 1128]	Sets the error state of this ResultAds [▶ 1116] (Inherited from ResultAds [▶ 1116].)
	ToString	Returns a string that represents the current object. (Inherited from Object.)

6.11.125 RpcInvokeException Class

Class [RpcInvokeException](#). Implements the [SymbolException](#) [[▶ 2933](#)]

Inheritance Hierarchy

System.Object
 System.Exception
[TwinCAT.AdsException](#) [[▶ 61](#)]
[TwinCAT.TypeSystem.SymbolException](#) [[▶ 2933](#)]
[TwinCAT.TypeSystem.RpcInvokeException](#)

Namespace: [TwinCAT.TypeSystem](#) [[▶ 2083](#)]

Assembly: [TwinCAT.Ads.Abstractions](#) (in [TwinCAT.Ads.Abstractions.dll](#)) Version: 6.0.328+39e3229

Syntax**C#**

```
[SerializableAttribute]
public class RpcInvokeException : SymbolException
```

The RpcInvokeException type exposes the following members.

Constructors

	Name	Description
	RpcInvokeException (SerializationInfo, StreamingContext) [▶ 2889]	Initializes a new instance of the RpcInvokeException class.
	RpcInvokeException (IInterfaceInstance, String, Exception) [▶ 2891]	Initializes a new instance of the RpcInvokeException class.
	RpcInvokeException (IInterfaceInstance, String, Int32) [▶ 2892]	Initializes a new instance of the RpcInvokeException class.

Properties

	Name	Description
	Data	Gets a collection of key/value pairs that provide additional user-defined information about the exception. (Inherited from Exception.)
	HelpLink	Gets or sets a link to the help file associated with this exception. (Inherited from Exception.)
	HResult	Gets or sets HRESULT, a coded numerical value that is assigned to a specific exception. (Inherited from Exception.)
	InnerException	Gets the Exception instance that caused the current exception. (Inherited from Exception.)
	InstancePath [▶ 2944]	Gets the instance path. (Inherited from SymbolException [▶ 2933].)
	Message	Gets a message that describes the current exception. (Inherited from Exception.)
	Source	Gets or sets the name of the application or the object that causes the error. (Inherited from Exception.)
	StackTrace	Gets a string representation of the immediate frames on the call stack. (Inherited from Exception.)
	Symbol [▶ 2944]	Gets the symbol. (Inherited from SymbolException [▶ 2933].)
	TargetSite	Gets the method that throws the current exception. (Inherited from Exception.)

Methods

	Name	Description
	Equals	Determines whether the specified object is equal to the current object. (Inherited from Object.)
	Finalize	Allows an object to try to free resources and perform other cleanup operations before it is reclaimed by garbage collection. (Inherited from Object.)
	GetBaseException	When overridden in a derived class, returns the Exception that is the root cause of one or more subsequent exceptions. (Inherited from Exception.)
	GetHashCode	Serves as the default hash function. (Inherited from Object.)

	Name	Description
	GetObjectData [▶ 2893]	When overridden in a derived class, sets the <code>SerializationInfo</code> with information about the exception. (Overrides SymbolException.GetObjectData(SerializationInfo, StreamingContext) [▶ 2945].)
	<code>GetType</code>	Gets the runtime type of the current instance. (Inherited from <code>Exception</code> .)
	<code>MemberwiseClone</code>	Creates a shallow copy of the current <code>Object</code> . (Inherited from <code>Object</code> .)
	<code>ToString</code>	Creates and returns a string representation of the current exception. (Inherited from <code>Exception</code> .)

Events

	Name	Description
	<code>SerializeObjectState</code>	Obsolete. Occurs when an exception is serialized to create an exception state object that contains serialized data about the exception. (Inherited from <code>Exception</code> .)

Collection of [RpcMethods](#). [► 2625]

Inheritance Hierarchy

System.Object
 TwinCAT.TypeSystem.RpcMethodCollection

Namespace: [TwinCAT.TypeSystem \[▸ 2083\]](#)

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public class RpcMethodCollection : IRpcMethodCollection,
    IList<IRpcMethod>, ICollection<IRpcMethod>, IEnumerable<IRpcMethod>,
    IEnumerable
```

The RpcMethodCollection type exposes the following members.

Constructors

	Name	Description
	RpcMethodCollection. [▸ 2909]	Initializes a new instance of the RpcMethodCollection class.
	RpcMethodCollection(IEnumerable.IRpcMethod.) [▸ 2910]	Initializes a new instance of the RpcMethodCollection class.

Properties

	Name	Description
	Count [▸ 2897]	Gets the number of elements contained in the ICollection.T..
	Empty [▸ 2899]	Gets the empty collection
	IsReadOnly [▸ 2897]	Gets a value indicating whether the ICollection.T. is read-only.
	Item.Int32. [▸ 2898]	Gets or sets the element at the specified index.
	Item.String. [▸ 2899]	Gets the IRpcMethod [▸ 2625] with the specified method name.

Methods

	Name	Description
	Add [▸ 2901]	Adds an item to the ICollection.T..
	AddRange [▸ 2908]	Adds the range of Methods.
	AsReadOnly [▸ 2901]	Gets a read only collection of this RpcMethodCollection
	Clear [▸ 2902]	Removes all items from the ICollection.T..
	Contains(IRpcMethod) [▸ 2903]	Determines whether the ICollection.T. contains a specific value.
	Contains(String) [▸ 2902]	Determines whether this collection contains the specified method name.
	CopyTo [▸ 2904]	Copies to.

	Name	Description
	Equals	Determines whether the specified object is equal to the current object. (Inherited from Object.)
	Finalize	Allows an object to try to free resources and perform other cleanup operations before it is reclaimed by garbage collection. (Inherited from Object.)
	GetEnumerator [▶ 2904]	Returns an enumerator that iterates through the collection.
	GetHashCode	Serves as the default hash function. (Inherited from Object.)
	GetType	Gets the Type of the current instance. (Inherited from Object.)
	IndexOf [▶ 2905]	Determines the index of a specific item in the IList.T..
	Insert [▶ 2905]	Inserts an item to the IList.T. at the specified index.
	MemberwiseClone	Creates a shallow copy of the current Object. (Inherited from Object.)
	Remove [▶ 2906]	Removes the first occurrence of a specific object from the ICollection.T..
	RemoveAt [▶ 2906]	Removes the IList.T. item at the specified index.
	ToString	Returns a string that represents the current object. (Inherited from Object.)
	TryGetMethod(Int32, IRpcMethod.) [▶ 2907]	Tries to get the specified method.
	TryGetMethod(String, IRpcMethod.) [▶ 2908]	Tries to get the specified method.

Namespace: [TwinCAT.TypeSystem](#) [▶ 2083]

Assembly: TwinCAT.Ads.Abstractions (in TwinCAT.Ads.Abstractions.dll) Version: 6.0.328+39e3229

Syntax

C#

```
[SerializableAttribute]
public class RpcMethodNotSupportedException : SymbolException
```

The [RpcMethodNotSupportedException](#) type exposes the following members.

Constructors

	Name	Description
	RpcMethodNotSupportedException(Int32, ISymbol) [▶ 2912]	Initializes a new instance of the RpcMethodNotSupportedException class.
	RpcMethodNotSupportedException(Ser	Initializes a new instance of the RpcMethodNotSupportedException class.

	Name	Description
	ializationInfo, StreamingContext) [▶ 2913]	
	RpcMethodNotSupportedException(String, ISymbol) [▶ 2913]	Initializes a new instance of the <code>RpcMethodNotSupportedException</code> class.

Properties

	Name	Description
	Data	Gets a collection of key/value pairs that provide additional user-defined information about the exception. (Inherited from <code>Exception</code> .)
	HelpLink	Gets or sets a link to the help file associated with this exception. (Inherited from <code>Exception</code> .)
	HResult	Gets or sets <code>HRESULT</code> , a coded numerical value that is assigned to a specific exception. (Inherited from <code>Exception</code> .)
	InnerException	Gets the <code>Exception</code> instance that caused the current exception. (Inherited from <code>Exception</code> .)
	InstancePath [▶ 2944]	Gets the instance path. (Inherited from SymbolException [▶ 2933].)
	Message	Gets a message that describes the current exception. (Inherited from <code>Exception</code> .)
	Source	Gets or sets the name of the application or the object that causes the error. (Inherited from <code>Exception</code> .)
	StackTrace	Gets a string representation of the immediate frames on the call stack. (Inherited from <code>Exception</code> .)
	Symbol [▶ 2944]	Gets the symbol. (Inherited from SymbolException [▶ 2933].)
	TargetSite	Gets the method that throws the current exception. (Inherited from <code>Exception</code> .)

Methods

	Name	Description
	Equals	Determines whether the specified object is equal to the current object. (Inherited from <code>Object</code> .)
	Finalize	Allows an object to try to free resources and perform other cleanup operations before it is reclaimed by garbage collection. (Inherited from <code>Object</code> .)
	GetBaseException	When overridden in a derived class, returns the <code>Exception</code> that is the root cause of one or more subsequent exceptions. (Inherited from <code>Exception</code> .)
	GetHashCode	Serves as the default hash function. (Inherited from <code>Object</code> .)
	GetObjectData [▶ 2945]	When overridden in a derived class, sets the <code>SerializationInfo</code> with information about the exception. (Inherited from SymbolException [▶ 2933].)
	GetType	Gets the runtime type of the current instance. (Inherited from <code>Exception</code> .)
	MemberwiseClone	Creates a shallow copy of the current <code>Object</code> . (Inherited from <code>Object</code> .)
	ToString	Creates and returns a string representation of the current exception. (Inherited from <code>Exception</code> .)

Events

	Name	Description
	SerializeObjectState	Obsolete. Occurs when an exception is serialized to create an exception state object that contains serialized data about the exception. (Inherited from Exception.)

	Equals	Determines whether the specified object is equal to the current object. (Inherited from Object.)
	Finalize	Allows an object to try to free resources and perform other cleanup operations before it is reclaimed by garbage collection. (Inherited from Object.)
	GetEnumerator [▶ 2923]	Returns an enumerator that iterates through the collection.
	GetHashCode	Serves as the default hash function. (Inherited from Object.)
	GetLengthIsParameter [▶ 2923]	Gets the length is parameter.
	GetType	Gets the Type of the current instance. (Inherited from Object.)
	IndexOf [▶ 2924]	Determines the index of a specific item in the IList.T..
	Insert [▶ 2924]	Inserts an item to the IList.T. at the specified index.
	MemberwiseClone	Creates a shallow copy of the current Object. (Inherited from Object.)
	Remove [▶ 2925]	Removes the first occurrence of a specific object from the ICollection.T..
	RemoveAt [▶ 2925]	Removes the IList.T. item at the specified index.
	ToString	Returns a string that represents the current object. (Inherited from Object.)

6.11.128.2.10 RpcMethodParameterCollection.Remove Method

Removes the first occurrence of a specific object from the ICollection.T..

Namespace: [TwinCAT.TypeSystem](#) [▶ 2083]

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public bool Remove(  
    IRpcMethodParameter item  
)
```

Parameters

item	Type: TwinCAT.TypeSystem.IRpcMethodParameter [▶ 2635] The object to remove from the ICollection.T..
------	--

Return Value

Type: Boolean

true if item was successfully removed from the ICollection.T.; otherwise, false. This method also returns false if item is not found in the original ICollection.T..

Implements

ICollection.T..Remove(T)

Reference

[RpcMethodParameterCollection Class](#) [▶ 2915]

[TwinCAT.TypeSystem Namespace](#) [▶ 2083]

6.11.128.2.11 RpcMethodParameterCollection.RemoveAt Method

Removes the IList.T. item at the specified index.

Namespace: [TwinCAT.TypeSystem](#) [▶ 2083]

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public void RemoveAt(
    int index
)
```

Parameters

index	Type: System.Int32 The zero-based index of the item to remove.
-------	---

Implements

IList.T..RemoveAt(Int32)

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax**C#**

```
public class SymbolCollection : SymbolCollection<ISymbol>,
    ISymbolCollection, ISymbolCollection<ISymbol>, IInstanceCollection<ISymbol>,
    IList<ISymbol>, ICollection<ISymbol>, IEnumerable<ISymbol>,
    IEnumerable
```

The SymbolCollection type exposes the following members.

Properties

	Name	Description
	Count [▶ 3107]	Gets the collection count. (Inherited from InstanceCollection.T. [▶ 3104].)
	Empty [▶ 2931]	Returns an Empty Collection.
	InnerList [▶ 3108]	Gets the List of instances. (Inherited from InstanceCollection.T. [▶ 3104].)
	InnerPathDict [▶ 3108]	The Path dictionary (Inherited from InstanceCollection.T. [▶ 3104].)
	IsReadOnly [▶ 3109]	Gets a value indicating whether this instance is read only. (Inherited from InstanceCollection.T. [▶ 3104].)
	Item.Int32. [▶ 3109]	Gets or sets the Instance [▶ 2549] at the specified index. (Inherited from InstanceCollection.T. [▶ 3104].)
	Item.String. [▶ 3110]	Gets the Instance [▶ 2549] with the specified instance path. (Inherited from InstanceCollection.T. [▶ 3104].)
	Mode [▶ 3111]	The mode this InstanceCollection.T. [▶ 3104] is working in. (Inherited from InstanceCollection.T. [▶ 3104].)

Methods

	Name	Description
	Add [▶ 3112]	Adds the specified item. (Inherited from InstanceCollection.T. [▶ 3104].)
	AddRange [▶ 3113]	Adds the specified items to this collection. (Inherited from InstanceCollection.T. [▶ 3104].)
	AsReadOnly [▶ 2932]	Returns a Read only version of this collection (shallow copy).
	Clear [▶ 3114]	Clears this instance. (Inherited from InstanceCollection.T. [▶ 3104].)
	Clone [▶ 2933]	Clones this instance.
	Contains(T) [▶ 3115]	Determines whether this collection contains the specified Instance [▶ 2549] (Inherited from InstanceCollection.T. [▶ 3104].)
	Contains(String) [▶ 3114]	Determines whether this collection contains an Instance [▶ 2549] with the specified InstanceName / InstancePath (Inherited from InstanceCollection.T. [▶ 3104].)
	ContainsName [▶ 3116]	Determines whether the specified instance name contains name. (Inherited from InstanceCollection.T. [▶ 3104].)
	CopyTo [▶ 3116]	Copies this InstanceCollection.T. [▶ 3104] to the specified array. (Inherited from InstanceCollection.T. [▶ 3104].)
	Equals	Determines whether the specified object is equal to the current object. (Inherited from Object.)
	Finalize	Allows an object to try to free resources and perform other cleanup operations before it is reclaimed by garbage collection. (Inherited from Object.)
	GetEnumerator [▶ 3117]	Gets the enumerator. (Inherited from InstanceCollection.T. [▶ 3104].)
	GetHashCode	Serves as the default hash function. (Inherited from Object.)
	GetInstance [▶ 3117]	Gets the Instance [▶ 2549]by instance path. (Inherited from InstanceCollection.T. [▶ 3104].)

	Name	Description
	GetInstanceByName [▶ 3118]	Gets the name of the instance by. (Inherited from InstanceCollection.T. [▶ 3104].)
	GetType	Gets the Type of the current instance. (Inherited from Object.)
	IndexOf [▶ 3119]	Determines the index of the specified IInstance [▶ 2549]. (Inherited from InstanceCollection.T. [▶ 3104].)
	Insert [▶ 3119]	Inserts the specified IInstance [▶ 2549] at the specified index. (Inherited from InstanceCollection.T. [▶ 3104].)
	MemberwiseClone	Creates a shallow copy of the current Object. (Inherited from Object.)
	Remove [▶ 3120]	Removes the specified item. (Inherited from InstanceCollection.T. [▶ 3104].)
	RemoveAt [▶ 3121]	Removes the IInstance [▶ 2549] at the specified index. (Inherited from InstanceCollection.T. [▶ 3104].)
	ToString	Returns a string that represents the current object. (Inherited from Object.)
	TryGetInstance [▶ 3121]	Tries to get the IInstance [▶ 2549]. of the specified path. (Inherited from InstanceCollection.T. [▶ 3104].)
	TryGetInstanceByName [▶ 3122]	Tries to get Instances by name. (Inherited from InstanceCollection.T. [▶ 3104].)
	TryGetInstances [▶ 3170]	Try to get instances with predicate function (Inherited from SymbolCollection.T. [▶ 3165].)

Assembly: TwinCAT.Ads.Abstractions (in TwinCAT.Ads.Abstractions.dll) Version: 6.0.328+39e3229

Syntax

C#

```
[SerializableAttribute]
public class SymbolException : AdsException
```

The SymbolException type exposes the following members.

Constructors

	Name	Description
	SymbolException(ISymbol) [▶ 2937]	Initializes a new instance of the SymbolException class.
	SymbolException(ISymbol, Exception) [▶ 2939]	Initializes a new instance of the SymbolException class.
	SymbolException(ISymbol, Int32) [▶ 2939]	Initializes a new instance of the SymbolException class.
	SymbolException(SerializationInfo, StreamingContext) [▶ 2938]	Initializes a new instance of the SymbolException class.
	SymbolException(String, ISymbol) [▶ 2938]	Initializes a new instance of the SymbolException class.
	SymbolException(ISymbol, Int32, Exception) [▶ 2941]	Initializes a new instance of the SymbolException class.
	SymbolException(String, String, Exception) [▶ 2942]	Initializes a new instance of the SymbolException class.

	Name	Description
	SymbolException(String, String, Int32) [▶ 2942]	Initializes a new instance of the SymbolException class.
	SymbolException(String, ISymbolException) [▶ 2940]	Initializes a new instance of the SymbolException class.
	SymbolException(String, ISymbol, Int32) [▶ 2940]	Initializes a new instance of the SymbolException class.
	SymbolException(String, String, Int32, Exception) [▶ 2943]	Initializes a new instance of the SymbolException class.
	SymbolException(String, ISymbol, Int32, Exception) [▶ 2941]	Initializes a new instance of the SymbolException class.

Properties

	Name	Description
	Data	Gets a collection of key/value pairs that provide additional user-defined information about the exception. (Inherited from Exception.)
	HelpLink	Gets or sets a link to the help file associated with this exception. (Inherited from Exception.)
	HResult	Gets or sets HRESULT, a coded numerical value that is assigned to a specific exception. (Inherited from Exception.)
	InnerException	Gets the Exception instance that caused the current exception. (Inherited from Exception.)
	InstancePath [▶ 2944]	Gets the instance path.
	Message	Gets a message that describes the current exception. (Inherited from Exception.)
	Source	Gets or sets the name of the application or the object that causes the error. (Inherited from Exception.)
	StackTrace	Gets a string representation of the immediate frames on the call stack. (Inherited from Exception.)
	Symbol [▶ 2944]	Gets the symbol.
	TargetSite	Gets the method that throws the current exception. (Inherited from Exception.)

Methods

	Name	Description
	Equals	Determines whether the specified object is equal to the current object. (Inherited from Object.)
	Finalize	Allows an object to try to free resources and perform other cleanup operations before it is reclaimed by garbage collection. (Inherited from Object.)

	Name	Description
	GetBaseException	When overridden in a derived class, returns the Exception that is the root cause of one or more subsequent exceptions. (Inherited from Exception.)
	GetHashCode	Serves as the default hash function. (Inherited from Object.)
	GetObjectData [▶ 2945]	When overridden in a derived class, sets the SerializationInfo with information about the exception. (Overrides Exception.GetObjectData(SerializationInfo, StreamingContext).)
	GetType	Gets the runtime type of the current instance. (Inherited from Exception.)
	MemberwiseClone	Creates a shallow copy of the current Object. (Inherited from Object.)
	ToString	Creates and returns a string representation of the current exception. (Inherited from Exception.)

Events

	Name	Description
	SerializeObjectState	Obsolete. Occurs when an exception is serialized to create an exception state object that contains serialized data about the exception. (Inherited from Exception.)

6.11.132.3.1 SymbolException.GetObjectData Method

When overridden in a derived class, sets the SerializationInfo with information about the exception.

Namespace: [TwinCAT.TypeSystem](#) [[▸ 2083](#)]

Assembly: TwinCAT.Ads.Abstractions (in TwinCAT.Ads.Abstractions.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public override void GetObjectData(
    SerializationInfo info,
    StreamingContext context
)
```

Parameters

info	Type: System.Runtime.Serialization.SerializationInfo The SerializationInfo that holds the serialized object data about the exception being thrown.
context	Type: System.Runtime.Serialization.StreamingContext The StreamingContext that contains contextual information about the source or destination.

Implements

ISerializable.GetObjectData(SerializationInfo, StreamingContext)

Exceptions

Exception	Condition
ArgumentNullException	info

Syntax

C#

```
public class TypeAttributeCollection : ITypeAttributeCollection,
    IList<ITypeAttribute>, ICollection<ITypeAttribute>, IEnumerable<ITypeAttribute>,
    IEnumerable
```

The TypeAttributeCollection type exposes the following members.

Constructors

	Name	Description
	TypeAttributeCollection. [▶ 2954]	Initializes a new instance of the TypeAttributeCollection class.
	TypeAttributeCollection(IEnumerable.ITypeAttribute.) [▶ 2954]	Initializes a new instance of the TypeAttributeCollection class.

Properties

	Name	Description
	Count [▶ 2955]	Gets the number of elements contained in the ICollection.T..
	Empty [▶ 2957]	Returns an Empty TypeAttributeCollection.
	IsReadOnly [▶ 2955]	Gets a value indicating whether the ICollection.T. is read-only.
	Item.Int32. [▶ 2956]	Gets or sets the element at the specified index.
	Item.String. [▶ 2957]	Gets the String with the specified name.

Methods

	Name	Description
	Add [▶ 2959]	Adds an item to the ICollection.T..
	AddRange [▶ 2959]	Adds the range.
	AsReadOnly [▶ 2960]	Gets a read only version of this TypeAttributeCollection
	Clear [▶ 2960]	Removes all items from the ICollection.T..

	Name	Description
	Contains(ITypeAttribute) [▶ 2961]	Determines whether the ICollection.T. contains a specific value.
	Contains(String) [▶ 2961]	Determines whether this TypeAttributeCollection contains the ITypeAttribute [▶ 2725] with the specified name.
	CopyTo [▶ 2962]	Copies to.
	Equals	Determines whether the specified object is equal to the current object. (Inherited from Object.)
	Finalize	Allows an object to try to free resources and perform other cleanup operations before it is reclaimed by garbage collection. (Inherited from Object.)
	GetEnumerator [▶ 2963]	Returns an enumerator that iterates through the collection.
	GetHashCode	Serves as the default hash function. (Inherited from Object.)
	GetType	Gets the Type of the current instance. (Inherited from Object.)
	IndexOf [▶ 2964]	Determines the index of a specific item in the IList.T..
	Insert [▶ 2964]	Inserts an item to the IList.T. at the specified index.
	MemberwiseClone	Creates a shallow copy of the current Object. (Inherited from Object.)
	Remove(ITypeAttribute) [▶ 2966]	Removes the first occurrence of a specific object from the ICollection.T..
	Remove(String) [▶ 2965]	Removes the specified ITypeAttribute [▶ 2725] from the TypeAttributeCollection
	RemoveAt [▶ 2966]	Removes the IList.T. item at the specified index.
	ToString	Returns a string that represents the current object. (Inherited from Object.)
	TryGetAttribute [▶ 2967]	Tries to get the specified ITypeAttribute [▶ 2725]
	TryGetValue [▶ 2967]	Tries to get the specified Attribute value.

Inheritance Hierarchy

System.Object
 System.EventArgs
 TwinCAT.TypeSystem.ValueChangedBaseEventArgs
 TwinCAT.TypeSystem.RawValueChangedEventArgs [[▶ 2813](#)]
 TwinCAT.TypeSystem.ValueChangedEventArgs [[▶ 2971](#)]

Namespace: [TwinCAT.TypeSystem](#) [[▶ 2083](#)]

Assembly: TwinCAT.Ads.Abstractions (in TwinCAT.Ads.Abstractions.dll) Version: 6.0.328+39e3229

Syntax**C#**

```
public class ValueChangedBaseEventArgs : EventArgs
```

The ValueChangedBaseEventArgs type exposes the following members.

Constructors

	Name	Description
	ValueChangedBaseEventArgs [▶ 2969]	Initializes a new instance of the RawValueChangedEventArgs [▶ 2813] class.

Properties

	Name	Description
	DateTime [▶ 2970]	Notification timestamp
	Symbol [▶ 2970]	Gets the symbol.

Methods

	Name	Description
	Equals	Determines whether the specified object is equal to the current object. (Inherited from Object.)
	Finalize	Allows an object to try to free resources and perform other cleanup operations before it is reclaimed by garbage collection. (Inherited from Object.)
	GetHashCode	Serves as the default hash function. (Inherited from Object.)
	GetType	Gets the Type of the current instance. (Inherited from Object.)
	MemberwiseClone	Creates a shallow copy of the current Object. (Inherited from Object.)
	ToString	Returns a string that represents the current object. (Inherited from Object.)

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public class AlignedMemberCollection : MemberCollection
```

The AlignedMemberCollection type exposes the following members.

Constructors

	Name	Description
	AlignedMemberCollection [▶ 2975]	Initializes a new instance of the AlignedMemberCollection class.

Properties

	Name	Description
	Count [▶ 3107]	Gets the collection count. (Inherited from InstanceCollection.T. [▶ 3104].)
	Empty [▶ 2976]	Returns an Empty Member Collection.
	InnerList [▶ 3108]	Gets the List of instances. (Inherited from InstanceCollection.T. [▶ 3104].)

Name	Description
InnerPathDict [▶ 3108]	The Path dictionary (Inherited from InstanceCollection.T. [▶ 3104].)
Instances [▶ 2807]	Gets the Instance members (non static) (Inherited from MemberCollection [▶ 2802].)
IsReadOnly [▶ 3109]	Gets a value indicating whether this instance is read only. (Inherited from InstanceCollection.T. [▶ 3104].)
Item.Int32. [▶ 3109]	Gets or sets the Instance [▶ 2549] at the specified index. (Inherited from InstanceCollection.T. [▶ 3104].)
Item.String. [▶ 3110]	Gets the Instance [▶ 2549] with the specified instance path. (Inherited from InstanceCollection.T. [▶ 3104].)
Mode [▶ 3111]	The mode this InstanceCollection.T. [▶ 3104] is working in. (Inherited from InstanceCollection.T. [▶ 3104].)
Statics [▶ 2807]	Gets the Static Members (Inherited from MemberCollection [▶ 2802].)

Methods

Name	Description
Add [▶ 2978]	Adds the specified item. (Overrides MemberCollection.Add(IMember) [▶ 2811].)
AddRange [▶ 3113]	Adds the specified items to this collection. (Inherited from InstanceCollection.T. [▶ 3104].)
AsReadOnly [▶ 2809]	Returns a read only copy of this collection (shallow copy) (Inherited from MemberCollection [▶ 2802].)
CalcSize [▶ 2811]	Calculates the Byte Size of the IMemberCollection [▶ 2565] (Inherited from MemberCollection [▶ 2802].)
Clear [▶ 3114]	Clears this instance. (Inherited from InstanceCollection.T. [▶ 3104].)
Clone [▶ 2809]	Clones this MemberCollection [▶ 2802]. (Inherited from MemberCollection [▶ 2802].)
Contains(T) [▶ 3115]	Determines whether this collection contains the specified Instance [▶ 2549] (Inherited from InstanceCollection.T. [▶ 3104].)
Contains(String) [▶ 3114]	Determines whether this collection contains an Instance [▶ 2549] with the specified InstanceName / InstancePath (Inherited from InstanceCollection.T. [▶ 3104].)
ContainsName [▶ 3116]	Determines whether the specified instance name contains name. (Inherited from InstanceCollection.T. [▶ 3104].)
CopyTo [▶ 3116]	Copies this InstanceCollection.T. [▶ 3104] to the specified array. (Inherited from InstanceCollection.T. [▶ 3104].)
Equals	Determines whether the specified object is equal to the current object. (Inherited from Object.)
Finalize	Allows an object to try to free resources and perform other cleanup operations before it is reclaimed by garbage collection. (Inherited from Object.)
GetEnumerator [▶ 3117]	Gets the enumerator. (Inherited from InstanceCollection.T. [▶ 3104].)
GetHashCode	Serves as the default hash function. (Inherited from Object.)
GetInstance [▶ 3117]	Gets the Instance [▶ 2549] by instance path. (Inherited from InstanceCollection.T. [▶ 3104].)
GetInstanceByName [▶ 3118]	Gets the name of the instance by. (Inherited from InstanceCollection.T. [▶ 3104].)

	Name	Description
	GetType	Gets the Type of the current instance. (Inherited from Object.)
	IndexOf [▶ 3119]	Determines the index of the specified IInstance [▶ 2549]. (Inherited from InstanceCollection.T. [▶ 3104].)
	Insert [▶ 2979]	Inserts the specified IInstance [▶ 2549] at the specified index. (Overrides InstanceCollection.T..Insert(Int32, T) [▶ 3119].)
	MemberwiseClone	Creates a shallow copy of the current Object. (Inherited from Object.)
	Remove [▶ 3120]	Removes the specified item. (Inherited from InstanceCollection.T. [▶ 3104].)
	RemoveAt [▶ 2979]	Removes the IInstance [▶ 2549] at the specified index. (Overrides InstanceCollection.T..RemoveAt(Int32) [▶ 3121].)
	ToString	Returns a string that represents the current object. (Inherited from Object.)
	TryGetInstance [▶ 3121]	Tries to get the IInstance [▶ 2549] of the specified path. (Inherited from InstanceCollection.T. [▶ 3104].)
	TryGetInstanceByName [▶ 3122]	Tries to get Instances by name. (Inherited from InstanceCollection.T. [▶ 3104].)
	TryGetMember [▶ 2810]	Tries to get the specified member (Inherited from MemberCollection [▶ 2802].)

Extension Methods

	Name	Description
	AddAligned [▶ 2981]	Adds a member to the StructType [▶ 1846] (Defined by FluentAlignedMemberCollectionExtension [▶ 2980].)

Remarks

The [AlignedMemberCollection](#) calculates its member offsets by itself. Dependant on the pack mode

6.11.137.3 AlignedMemberCollection Methods

The [AlignedMemberCollection](#) [▶ 2973] type exposes the following members.

Methods

Name	Description
Add [▶ 2978]	Adds the specified item. (Overrides MemberCollection.Add(IMember) [▶ 2811].)
AddRange [▶ 3113]	Adds the specified items to this collection. (Inherited from InstanceCollection.T. [▶ 3104].)
AsReadOnly [▶ 2809]	Returns a read only copy of this collection (shallow copy) (Inherited from MemberCollection [▶ 2802].)
CalcSize [▶ 2811]	Calculates the Byte Size of the IMemberCollection [▶ 2565] (Inherited from MemberCollection [▶ 2802].)
Clear [▶ 3114]	Clears this instance. (Inherited from InstanceCollection.T. [▶ 3104].)
Clone [▶ 2809]	Clones this MemberCollection [▶ 2802]. (Inherited from MemberCollection [▶ 2802].)
Contains(T) [▶ 3115]	Determines whether this collection contains the specified IInstance [▶ 2549] (Inherited from InstanceCollection.T. [▶ 3104].)
Contains(String) [▶ 3114]	Determines whether this collection contains an IInstance [▶ 2549] with the specified InstanceName / InstancePath (Inherited from InstanceCollection.T. [▶ 3104].)
ContainsName [▶ 3116]	Determines whether the specified instance name contains name. (Inherited from InstanceCollection.T. [▶ 3104].)
CopyTo [▶ 3116]	Copies this InstanceCollection.T. [▶ 3104] to the specified array. (Inherited from InstanceCollection.T. [▶ 3104].)
Equals	Determines whether the specified object is equal to the current object. (Inherited from Object.)
Finalize	Allows an object to try to free resources and perform other cleanup operations before it is reclaimed by garbage collection. (Inherited from Object.)
GetEnumerator [▶ 3117]	Gets the enumerator. (Inherited from InstanceCollection.T. [▶ 3104].)
GetHashCode	Serves as the default hash function. (Inherited from Object.)
GetInstance [▶ 3117]	Gets the IInstance [▶ 2549] by instance path. (Inherited from InstanceCollection.T. [▶ 3104].)
GetInstanceByName [▶ 3118]	Gets the name of the instance by. (Inherited from InstanceCollection.T. [▶ 3104].)
GetType	Gets the Type of the current instance. (Inherited from Object.)
IndexOf [▶ 3119]	Determines the index of the specified IInstance [▶ 2549]. (Inherited from InstanceCollection.T. [▶ 3104].)
Insert [▶ 2979]	Inserts the specified IInstance [▶ 2549] at the specified index. (Overrides InstanceCollection.T..Insert(Int32, T) [▶ 3119].)
MemberwiseClone	Creates a shallow copy of the current Object. (Inherited from Object.)
Remove [▶ 3120]	Removes the specified item. (Inherited from InstanceCollection.T. [▶ 3104].)
RemoveAt [▶ 2979]	Removes the IInstance [▶ 2549] at the specified index. (Overrides InstanceCollection.T..RemoveAt(Int32) [▶ 3121].)
ToString	Returns a string that represents the current object. (Inherited from Object.)
TryGetInstance [▶ 3121]	Tries to get the IInstance [▶ 2549]. of the specified path. (Inherited from InstanceCollection.T. [▶ 3104].)

	Name	Description
	TryGetInstanceByName [▶ 3122]	Tries to get Instances by name. (Inherited from InstanceCollection.T. [▶ 3104].)
	TryGetMember [▶ 2810]	Tries to get the specified member (Inherited from MemberCollection [▶ 2802].)

Extension Methods

6.11.140 InterfaceType Interface

Interface representing an Interface Data type. Implements the [IDataType \[▸ 2475\]](#)

Namespace: [TwinCAT.TypeSystem \[▸ 2083\]](#)

Assembly: TwinCAT.Ads.Abstractions (in TwinCAT.Ads.Abstractions.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public interface IInterfaceType : IDatatype,
    IBitSize, IRpcCallableType
```

The IInterfaceType type exposes the following members.

Properties

Name	Description
AllMembers [▸ 2987]	Gets all members (down the derivation hierarchy)
Attributes [▸ 2478]	Gets the attributes of the IDataType [▸ 2475] (Inherited from IDataType [▸ 2475] .)
BaseType [▸ 2988]	Gets the structs Base Type (Null if not derived).
BaseTypeName [▸ 2988]	Gets the the Name of the Base class (if derived)
BitSize [▸ 2473]	Gets the size of the IDataType [▸ 2475] in bits. (Inherited from IBitSize [▸ 2472] .)
ByteSize [▸ 2474]	Gets the (aligned) size of of the Type/Instance in Bytes (Inherited from IBitSize [▸ 2472] .)
Category [▸ 2478]	Gets the Data Type category (Inherited from IDataType [▸ 2475] .)
Comment [▸ 2479]	Gets the comment behind the variable declaration. (Inherited from IDataType [▸ 2475] .)
FullName [▸ 2479]	Gets the full name of the IDataType [▸ 2475] (Namespace + Name) (Inherited from IDataType [▸ 2475] .)
HasRpcMethods [▸ 2986]	Gets a value indicating whether this instance has RPC methods (Struct types only)
Id [▸ 2480]	Gets the ID of the DataType (Inherited from IDataType [▸ 2475] .)
InterfaceImplementationNames [▸ 2987]	Gets the names of the interfaces, this IDataType [▸ 2475] implements.
InterfaceImplementations [▸ 2987]	Gets the resolved interface types, this IDataType [▸ 2475] implements.
IsBitType [▸ 2474]	Gets a value indicating whether this instance is not basing on a full DataType but instead of some sort of bit mapping (Inherited from IBitSize [▸ 2472] .)
IsByteAligned [▸ 2475]	Indicates that the Size of the Object is Byte aligned (BitSize % 8 == 0) (Inherited from IBitSize [▸ 2472] .)
Members [▸ 2988]	Gets a readonly collection of the Members [▸ 2561] of the IInterfaceType.

Name	Description
Name [▶ 2482]	Gets the name of the Data Type (without namespace) (Inherited from IDataType [▶ 2475].)
Namespace [▶ 2482]	Gets the namespace string within the IDataType [▶ 2475] exists. (Inherited from IDataType [▶ 2475].)
RpcMethods [▶ 2624]	Gets the Method descriptions for the IRpcCallableType [▶ 2624] (Inherited from IRpcCallableType [▶ 2624].)
Size [▶ 2475]	Gets the size of the object in bytes or Bits dependant on IsBitType [▶ 2474] (Inherited from IBitSize [▶ 2472].)

Extension Methods

Name	Description
IsArrayOfPrimitives [▶ 3025]	Overloaded. Determines whether the dataType is an array of Primitives. (Defined by DataTypeExtension [▶ 3021].)
IsArrayOfPrimitives(Boolean) [▶ 3025]	Overloaded. Determines whether the dataType is an array of Primitives. (Defined by DataTypeExtension [▶ 3021].)
IsContainer [▶ 3027]	Overloaded. Gets a value indicating whether this IDataType [▶ 2475] is a container type (Defined by DataTypeExtension [▶ 3021].)
IsContainer(Boolean) [▶ 3028]	Overloaded. Gets a value indicating whether this IDataType [▶ 2475] is a container type (Defined by DataTypeExtension [▶ 3021].)
IsPointer [▶ 3031]	Gets a value indicating whether this IDataType [▶ 2475] is a pointer type (Defined by DataTypeExtension [▶ 3021].)
IsPrimitive [▶ 3033]	Overloaded. Gets a value indicating whether this IDataType [▶ 2475] is primitive (Defined by DataTypeExtension [▶ 3021].)
IsPrimitive(Boolean) [▶ 3034]	Overloaded. Gets a value indicating whether this IDataType [▶ 2475] is primitive (Defined by DataTypeExtension [▶ 3021].)
IsReference [▶ 3036]	Gets a value indicating whether this IDataType [▶ 2475] is a reference type (Defined by DataTypeExtension [▶ 3021].)
ReferencesExternalData [▶ 3037]	Indicates, that the Instance value includes process memory data, that cannot be read in one memory block. (Defined by DataTypeExtension [▶ 3021].)
ResolvableAsPrimitive [▶ 3039]	Overloaded. Indicates, that this data type can be resolved as primitive or primitive Array. (Defined by DataTypeExtension [▶ 3021].)
ResolvableAsPrimitive(Boolean) [▶ 3039]	Overloaded. Indicates, that this data type can be resolved as primitive or primitive Array. (Defined by DataTypeExtension [▶ 3021].)
Resolve [▶ 3040]	Overloaded. Resolves the specified data type for AliasReference [▶ 3042] (Defined by DataTypeExtension [▶ 3021].)

	Name	Description
	Resolve(DataTypeResolveStrategy) [▸ 3041]	Overloaded. Resolves the specified strategy. (Defined by DataTypeExtension [▸ 3021] .)

6.11.140.1 InterfaceType Properties

The [InterfaceType \[▸ 2983\]](#) type exposes the following members.

Properties

	Name	Description
	AllMembers [▸ 2987]	Gets all members (down the derivation hierarchy)
	Attributes [▸ 2478]	Gets the attributes of the IDataType [▸ 2475] (Inherited from IDataType [▸ 2475] .)
	BaseType [▸ 2988]	Gets the structs Base Type (Null if not derived).
	BaseTypeName [▸ 2988]	Gets the the Name of the Base class (if derived)
	BitSize [▸ 2473]	Gets the size of the IDataType [▸ 2475] in bits. (Inherited from IBitSize [▸ 2472] .)
	ByteSize [▸ 2474]	Gets the (aligned) size of of the Type/Instance in Bytes (Inherited from IBitSize [▸ 2472] .)
	Category [▸ 2478]	Gets the Data Type category (Inherited from IDataType [▸ 2475] .)
	Comment [▸ 2479]	Gets the comment behind the variable declaration. (Inherited from IDataType [▸ 2475] .)
	FullName [▸ 2479]	Gets the full name of the IDataType [▸ 2475] (Namespace + Name) (Inherited from IDataType [▸ 2475] .)
	HasRpcMethods [▸ 2986]	Gets a value indicating whether this instance has RPC methods (Struct types only)
	Id [▸ 2480]	Gets the ID of the DataType (Inherited from IDataType [▸ 2475] .)
	InterfaceImplementationNames [▸ 2987]	Gets the names of the interfaces, this IDataType [▸ 2475] implements.
	InterfaceImplementations [▸ 2987]	Gets the resolved interface types, this IDataType [▸ 2475] implements.
	IsBitType [▸ 2474]	Gets a value indicating whether this instance is not basing on a full DataType but instead of some sort of bit mapping (Inherited from IBitSize [▸ 2472] .)

	Name	Description
	IsByteAligned [▶ 2475]	Indicates that the Size of the Object is Byte aligned (BitSize % 8 == 0) (Inherited from IBitSize [▶ 2472].)
	Members [▶ 2988]	Gets a readonly collection of the Members [▶ 2561] of the IInterfaceType [▶ 2983].
	Name [▶ 2482]	Gets the name of the Data Type (without namespace) (Inherited from IDataType [▶ 2475].)
	Namespace [▶ 2482]	Gets the namespace string within the IDataType [▶ 2475] exists. (Inherited from IDataType [▶ 2475].)
	RpcMethods [▶ 2624]	Gets the Method descriptions for the IRpcCallableType [▶ 2624] (Inherited from IRpcCallableType [▶ 2624].)
	Size [▶ 2475]	Gets the size of the object in bytes or Bits dependant on IsBitType [▶ 2474] (Inherited from IBitSize [▶ 2472].)

[IDataType.IsPrimitive Property](#) [▶ 2481]

[IDataType.IsReference Property](#) [▶ 2482]

6.11.140.1.1 IInterfaceType.HasRpcMethods Property

Gets a value indicating whether this instance has RPC methods (Struct types only)

Namespace: [TwinCAT.TypeSystem](#) [▶ 2083]

Assembly: TwinCAT.Ads.Abstractions (in TwinCAT.Ads.Abstractions.dll) Version: 6.0.328+39e3229

Syntax

C#

```
bool HasRpcMethods { get; }
```

Property Value

Type: Boolean

true if this instance has RPC methods; otherwise, false.

Remarks

The DataType (Structure) must be marked with the PlcAttribute 'TcRpcEnable' to enable RpcMethods, otherwise RpcMethods are not passed through to the ADS symbolic information.

6.11.140.1.2 **InterfaceType.InterfaceImplementationNames Property**

Gets the names of the interfaces, this [IDataType](#) [[▶ 2475](#)] implements.

Namespace: [TwinCAT.TypeSystem](#) [[▶ 2083](#)]

Assembly: TwinCAT.Ads.Abstractions (in TwinCAT.Ads.Abstractions.dll) Version: 6.0.328+39e3229

Syntax

C#

```
string[] InterfaceImplementationNames { get; }
```

Property Value

Type: .String.

The interface implementations.

Reference

[IInterfaceType Interface](#) [[▶ 2983](#)]

6.11.140.1.3 **InterfaceType.InterfaceImplementations Property**

Gets the resolved interface types, this [IDataType](#) [[▶ 2475](#)] implements.

Namespace: [TwinCAT.TypeSystem](#) [[▶ 2083](#)]

Assembly: TwinCAT.Ads.Abstractions (in TwinCAT.Ads.Abstractions.dll) Version: 6.0.328+39e3229

Syntax

C#

```
IInterfaceType?[]? InterfaceImplementations { get; }
```

Property Value

Type: [.IInterfaceType](#) [[▶ 2983](#)].

The implements.

Reference

[IInterfaceType Interface](#) [[▶ 2983](#)]

[TwinCAT.TypeSystem Namespace](#) [[▶ 2083](#)]

6.11.140.1.4 **InterfaceType.AllMembers Property**

Gets all members (down the derivation hierarchy)

Namespace: [TwinCAT.TypeSystem](#) [[▶ 2083](#)]

Assembly: TwinCAT.Ads.Abstractions (in TwinCAT.Ads.Abstractions.dll) Version: 6.0.328+39e3229

Syntax

C#

```
IMemberCollection AllMembers { get; }
```

Property Value

Type: [IMemberCollection](#) [▶ 2565]
All members.

Reference

6.11.140.1.6 IInterfaceType.BaseTypeName Property

Gets the the Name of the Base class (if derived)

Namespace: [TwinCAT.TypeSystem](#) [▶ 2083]

Assembly: TwinCAT.Ads.Abstractions (in TwinCAT.Ads.Abstractions.dll) Version: 6.0.328+39e3229

Syntax

C#

```
string BaseTypeName { get; }
```

Property Value

Type: String
Empty if not derived.

Reference

[IInterfaceType Interface](#) [▶ 2983]

[TwinCAT.TypeSystem Namespace](#) [▶ 2083]

6.11.140.1.7 IInterfaceType.Members Property

Gets a readonly collection of the [Members](#) [▶ 2561] of the [IInterfaceType](#) [▶ 2983].

Namespace: [TwinCAT.TypeSystem](#) [[▶ 2083](#)]

Assembly: TwinCAT.Ads.Abstractions (in TwinCAT.Ads.Abstractions.dll) Version: 6.0.328+39e3229

Syntax

C#

```
IMemberCollection Members { get; }
```

Property Value

Type: [IMemberCollection](#) [[▶ 2565](#)]

The members as readonly collection.

Remarks

If the [IStructType](#) [[▶ 2671](#)] is derived, only the extended members are returned. To get all supported members down the inheritance chain, use the [AllMembers](#) [[▶ 2987](#)] property.

6.11.140.2 IInterfaceType Methods

The [IInterfaceType](#) [[▶ 2983](#)] type exposes the following members.

Extension Methods

Name	Description
IsArrayOfPrimitives [▶ 3025]	Overloaded. Determines whether the dataType is an array of Primitives. (Defined by DataTypeExtension [▶ 3021].)
IsArrayOfPrimitives(Boolean) [▶ 3025]	Overloaded. Determines whether the dataType is an array of Primitives. (Defined by DataTypeExtension [▶ 3021].)
IsContainer [▶ 3027]	Overloaded. Gets a value indicating whether this IDataType [▶ 2475] is a container type (Defined by DataTypeExtension [▶ 3021].)
IsContainer(Boolean) [▶ 3028]	Overloaded. Gets a value indicating whether this IDataType [▶ 2475] is a container type (Defined by DataTypeExtension [▶ 3021].)
IsPointer [▶ 3031]	Gets a value indicating whether this IDataType [▶ 2475] is a pointer type (Defined by DataTypeExtension [▶ 3021].)
IsPrimitive [▶ 3033]	Overloaded. Gets a value indicating whether this IDataType [▶ 2475] is primitive (Defined by DataTypeExtension [▶ 3021].)
IsPrimitive(Boolean) [▶ 3034]	Overloaded. Gets a value indicating whether this IDataType [▶ 2475] is primitive (Defined by DataTypeExtension [▶ 3021].)
IsReference [▶ 3036]	Gets a value indicating whether this IDataType [▶ 2475] is a reference type (Defined by DataTypeExtension [▶ 3021].)

	Name	Description
	ReferencesExternalData [▶ 3037]	Indicates, that the Instance value includes process memory data, that cannot be read in one memory block. (Defined by DataTypeExtension [▶ 3021].)
	ResolvableAsPrimitive [▶ 3039]	Overloaded. Indicates, that this data type can be resolved as primitive or primitive Array. (Defined by DataTypeExtension [▶ 3021].)
	ResolvableAsPrimitive(Boolean) [▶ 3039]	Overloaded. Indicates, that this data type can be resolved as primitive or primitive Array. (Defined by DataTypeExtension [▶ 3021].)
	Resolve [▶ 3040]	Overloaded. Resolves the specified data type for AliasReference [▶ 3042] (Defined by DataTypeExtension [▶ 3021].)
	Resolve(DataTypeResolveStrategy) [▶ 3041]	Overloaded. Resolves the specified strategy. (Defined by DataTypeExtension [▶ 3021].)

6.11.141 IRpcStructType Interface

Note: This API is now obsolete.

Interface [IRpcStructType](#) Implements the [IRpcCallableType](#) [[▶ 2624](#)] Implements the [IStructType](#) [[▶ 2671](#)]

Namespace: [TwinCAT.TypeSystem](#) [[▶ 2083](#)]

Assembly: TwinCAT.Ads.Abstractions (in TwinCAT.Ads.Abstractions.dll) Version: 6.0.328+39e3229

Syntax

C#

```
[ObsoleteAttribute("Use IStructType instead")]
public interface IRpcStructType : IRpcCallableType,
    IStructType, IInterfaceType, IDataTypes, IBitSize
```

The [IRpcStructType](#) type exposes the following members.

Properties

	Name	Description
	AllMembers [▶ 2987]	Gets all members (down the derivation hierarchy) (Inherited from IInterfaceType [▶ 2983].)
	Attributes [▶ 2478]	Gets the attributes of the IDataType [▶ 2475] (Inherited from IDataType [▶ 2475].)
	BaseType [▶ 2988]	Gets the structs Base Type (Null if not derived). (Inherited from IInterfaceType [▶ 2983].)
	BaseTypeName [▶ 2988]	Gets the the Name of the Base class (if derived) (Inherited from IInterfaceType [▶ 2983].)
	BitSize [▶ 2473]	Gets the size of the IDataType [▶ 2475] in bits. (Inherited from IBitSize [▶ 2472].)

Name	Description
ByteSize [▶ 2474]	Gets the (aligned) size of of the Type/Instance in Bytes (Inherited from IBitSize [▶ 2472].)
Category [▶ 2478]	Gets the Data Type category (Inherited from IDataType [▶ 2475].)
Comment [▶ 2479]	Gets the comment behind the variable declaration. (Inherited from IDataType [▶ 2475].)
FullName [▶ 2479]	Gets the full name of the IDataType [▶ 2475] (Namespace + Name) (Inherited from IDataType [▶ 2475].)
HasRpcMethods [▶ 2986]	Gets a value indicating whether this instance has RPC methods (Struct types only) (Inherited from IInterfaceType [▶ 2983].)
Id [▶ 2480]	Gets the ID of the DataType (Inherited from IDataType [▶ 2475].)
InterfacelImplementationNames [▶ 2987]	Gets the names of the interfaces, this IDataType [▶ 2475] implements. (Inherited from IInterfaceType [▶ 2983].)
InterfacelImplementations [▶ 2987]	Gets the resolved interface types, this IDataType [▶ 2475] implements. (Inherited from IInterfaceType [▶ 2983].)
IsBitType [▶ 2474]	Gets a value indicating whether this instance is not basing on a full DataType but instead of some sort of bit mapping (Inherited from IBitSize [▶ 2472].)
IsByteAligned [▶ 2475]	Indicates that the Size of the Object is Byte aligned ($\text{BitSize} \% 8 == 0$) (Inherited from IBitSize [▶ 2472].)
Members [▶ 2988]	Gets a readonly collection of the Members [▶ 2561] of the IInterfaceType [▶ 2983]. (Inherited from IInterfaceType [▶ 2983].)
Name [▶ 2482]	Gets the name of the Data Type (without namespace) (Inherited from IDataType [▶ 2475].)
Namespace [▶ 2482]	Gets the namespace string within the IDataType [▶ 2475] exists. (Inherited from IDataType [▶ 2475].)
RpcMethods [▶ 2624]	Gets the Method descriptions for the IRpcCallableType [▶ 2624] (Inherited from IRpcCallableType [▶ 2624].)
Size [▶ 2475]	Gets the size of the object in bytes or Bits dependant on IsBitType [▶ 2474] (Inherited from IBitSize [▶ 2472].)

Extension Methods

Name	Description
IsArrayOfPrimitives. [▶ 3025]	Overloaded. Determines whether the dataType is an array of Primitives. (Defined by DataTypeExtension [▶ 3021].)
IsArrayOfPrimitives(Boolean) [▶ 3025]	Overloaded. Determines whether the dataType is an array of Primitives. (Defined by DataTypeExtension [▶ 3021].)
IsContainer. [▶ 3027]	Overloaded. Gets a value indicating whether this IDataType [▶ 2475] is a container type (Defined by DataTypeExtension [▶ 3021].)
IsContainer(Boolean) [▶ 3028]	Overloaded. Gets a value indicating whether this IDataType [▶ 2475] is a container type (Defined by DataTypeExtension [▶ 3021].)

	Name	Description
	IsPointer [▶ 3031]	Gets a value indicating whether this IDataType [▶ 2475] is a pointer type (Defined by DataTypeExtension [▶ 3021].)
	IsPrimitive . [▶ 3033]	Overloaded. Gets a value indicating whether this IDataType [▶ 2475] is primitive (Defined by DataTypeExtension [▶ 3021].)
	IsPrimitive(Boolean) [▶ 3034]	Overloaded. Gets a value indicating whether this IDataType [▶ 2475] is primitive (Defined by DataTypeExtension [▶ 3021].)
	IsReference [▶ 3036]	Gets a value indicating whether this IDataType [▶ 2475] is a reference type (Defined by DataTypeExtension [▶ 3021].)
	ReferencesExternalData [▶ 3037]	Indicates, that the Instance value includes process memory data, that cannot be read in one memory block. (Defined by DataTypeExtension [▶ 3021].)
	ResolvableAsPrimitive . [▶ 3039]	Overloaded. Indicates, that this data type can be resolved as primitive or primitive Array. (Defined by DataTypeExtension [▶ 3021].)
	ResolvableAsPrimitive(Boolean) [▶ 3039]	Overloaded. Indicates, that this data type can be resolved as primitive or primitive Array. (Defined by DataTypeExtension [▶ 3021].)
	Resolve . [▶ 3040]	Overloaded. Resolves the specified data type for AliasReference [▶ 3042] (Defined by DataTypeExtension [▶ 3021].)
	Resolve(DataTypeResolveStrategy) [▶ 3041]	Overloaded. Resolves the specified strategy. (Defined by DataTypeExtension [▶ 3021].)

Namespace: [TwinCAT.TypeSystem \[▶ 2083\]](#)

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public class DynamicInterfaceInstance : DynamicSymbol,
    IInterfaceInstance, ISymbol, IAttributedInstance, IInstance, IBitSize,
    IRpcCallableInstance
```

The DynamicInterfaceInstance type exposes the following members.

Properties

Name	Description
_InnerSymbol [▶ 2274]	Gets the inner symbol of this DynamicSymbol [▶ 2266] (Inherited from DynamicSymbol [▶ 2266] .)
AccessRights [▶ 2274]	Gets the access rights. (Inherited from DynamicSymbol [▶ 2266] .)
AllowIIOAccess [▶ 2275]	Indicates, that the aggregates symbols is an IProcessImageAddress (and most probably IAdsSymbol) (Inherited from DynamicSymbol [▶ 2266] .)
Attributes [▶ 2275]	Gets the Symbol Attributes (Inherited from DynamicSymbol [▶ 2266] .)
BitSize [▶ 2276]	Gets the size of the IDataType [▶ 2475] in bits. (Inherited from DynamicSymbol [▶ 2266] .)
ByteSize [▶ 2276]	Gets the (aligned) size of of the Type/Instance in Bytes (Inherited from DynamicSymbol [▶ 2266] .)
Category [▶ 2277]	Gets the category. (Inherited from DynamicSymbol [▶ 2266] .)
Comment [▶ 2277]	Gets the comment of the IInstance [▶ 2549] (Inherited from DynamicSymbol [▶ 2266] .)
Connection [▶ 2277]	Gets the connection bound to this DynamicSymbol [▶ 2266] (Inherited from DynamicSymbol [▶ 2266] .)
DataType [▶ 2278]	Gets the IDataType [▶ 2475] of the IInstance [▶ 2549] . (Inherited from DynamicSymbol [▶ 2266] .)
HasRpcMethods [▶ 3001]	Gets a value indicating whether this instance has RPC methods
HasValue [▶ 2278]	Gets a value indicating whether this instance has value (only the non VirtualInstances, what means the Symbols with locations). (Inherited from DynamicSymbol [▶ 2266] .)

Name	Description
InstanceName [▶ 2279]	Gets the name of the instance (without periods (.)) (Inherited from DynamicSymbol [▶ 2266].)
InstancePath [▶ 2279]	Gets the relative / absolute access path to the instance (with periods (.)) (Inherited from DynamicSymbol [▶ 2266].)
IsBitType [▶ 2280]	Gets a value indicating whether this instance is not basing on a full DataType but instead of some sort of bit mapping (Inherited from DynamicSymbol [▶ 2266].)
IsByteAligned [▶ 2280]	Indicates that the Size of the Object is Byte aligned ($\text{BitSize} \% 8 == 0$) (Inherited from DynamicSymbol [▶ 2266].)
IsContainerType [▶ 2281]	Gets a value indicating whether this Symbol is acontainer type. (Inherited from DynamicSymbol [▶ 2266].)
IsPersistent [▶ 2281]	Gets a value indicating whether this ISymbol [▶ 2691] is persistent. (Inherited from DynamicSymbol [▶ 2266].)
IsPointer [▶ 2282]	Indicates that the IInstance [▶ 2549] represents a Pointer type (Pointer TO) (Inherited from DynamicSymbol [▶ 2266].)
IsPrimitiveType [▶ 2282]	Gets a value indicating whether this instance is a primitive type. (Inherited from DynamicSymbol [▶ 2266].)
IsReadOnly [▶ 2283]	Indicates that this instance is read only. (Inherited from DynamicSymbol [▶ 2266].)
IsRecursive [▶ 2283]	Gets a value indicating whether this instance is recursive. (Inherited from DynamicSymbol [▶ 2266].)
IsReference [▶ 2284]	Indicates that the IInstance [▶ 2549] represents a Reference type (REFERENCE TO) (Inherited from DynamicSymbol [▶ 2266].)
IsStatic [▶ 2284]	Gets a value indicating whether this instance is static. (Inherited from DynamicSymbol [▶ 2266].)
MemberInstances [▶ 3002]	Gets the member instances of the Struct Instance [▶ 2666].
NormalizedName [▶ 2285]	Gets the normalized instance name (fixed name for dynamic property access that doesn't contain invalid characters), (Inherited from DynamicSymbol [▶ 2266].)
NotificationSettings [▶ 2285]	Gets the notification settings. (Inherited from DynamicSymbol [▶ 2266].)
Parent [▶ 2286]	Gets the parent Symbol (Inherited from DynamicSymbol [▶ 2266].)
RpcMethods [▶ 3003]	Gets the Method descriptions for the IRpcCallableType [▶ 2624]
Size [▶ 2286]	Gets the size of the IInstance [▶ 2549] in bytes. (Inherited from DynamicSymbol [▶ 2266].)
SubSymbols [▶ 2287]	Gets the SubSymbols of the ISymbol [▶ 2691] (Inherited from DynamicSymbol [▶ 2266].)
TypeName [▶ 2287]	Gets the name of the DataType [▶ 2475] that is used for this IInstance [▶ 2549]. (Inherited from DynamicSymbol [▶ 2266].)
ValueEncoding [▶ 2288]	Gets the value encoding. (Inherited from DynamicSymbol [▶ 2266].)

Methods

Name	Description
Equals [▶ 2292]	Equals (Inherited from DynamicSymbol [▶ 2266].)

	Name	Description
	Finalize	Allows an object to try to free resources and perform other cleanup operations before it is reclaimed by garbage collection. (Inherited from Object.)
	GetDynamicMemberNames [▶ 3006]	Returns the enumeration of all dynamic member names. (Overrides DynamicSymbol.GetDynamicMemberNames . [▶ 2293].)
	GetHashCode [▶ 2293]	Gets the GetHashCode of the Address (Inherited from DynamicSymbol [▶ 2266].)
	GetMetaObject	Provides a DynamicMetaObject that dispatches to the dynamic virtual methods. The object can be encapsulated inside another DynamicMetaObject to provide custom behavior for individual actions. This method supports the Dynamic Language Runtime infrastructure for language implementers and it is not intended to be used directly from your code. (Inherited from DynamicObject .)
	GetType	Gets the Type of the current instance. (Inherited from Object.)
	InvokeRpcMethodAsync [▶ 3007]	Invokes the specified RPC Method asynchronously
	MemberwiseClone	Creates a shallow copy of the current Object. (Inherited from Object.)
	OnReadAnyValue [▶ 2293]	Handler function for reading ADS 'Any' Values. (Inherited from DynamicSymbol [▶ 2266].)
	OnReadRawValue [▶ 2294]	Handler function for reading Raw symbol value. (Inherited from DynamicSymbol [▶ 2266].)
	OnReadRawValueAsync [▶ 2294]	Handler function reading the raw value of the DynamicSymbol [▶ 2266]. (Inherited from DynamicSymbol [▶ 2266].)
	OnReadValue [▶ 2295]	Handler function for the (Inherited from DynamicSymbol [▶ 2266].)
	OnReadValueAsync [▶ 2296]	Handler function reading the DynamicSymbols [▶ 2266] value asynchronously. (Inherited from DynamicSymbol [▶ 2266].)
	OnSetInstanceName [▶ 2296]	Sets a new InstanceName InstancePath (Inherited from DynamicSymbol [▶ 2266].)
	OnTryReadValue [▶ 2297]	Handler function for the (Inherited from DynamicSymbol [▶ 2266].)
	OnTryWriteValue [▶ 2297]	Handler Function for writing value. (Inherited from DynamicSymbol [▶ 2266].)
	OnWriteRawValue [▶ 2298]	Handler function for reading symbols raw value. (Inherited from DynamicSymbol [▶ 2266].)
	OnWriteRawValueAsync [▶ 2298]	Handler function for writing the raw DynamicSymbol [▶ 2266] value. (Inherited from DynamicSymbol [▶ 2266].)
	OnWriteValue [▶ 2299]	Handler Function for writing value. (Inherited from DynamicSymbol [▶ 2266].)
	OnWriteValueAsync [▶ 2300]	Handler Function for writing value. (Inherited from DynamicSymbol [▶ 2266].)
	ReadAnyValue [▶ 2300]	Reads the value of this Value [▶ 2775] into a new created instance of the managed type (Inherited from DynamicSymbol [▶ 2266].)
	ReadRawValue . [▶ 2301]	Reads the raw value of the IValueSymbol [▶ 2775] (Ads Read / Write) (Inherited from DynamicSymbol [▶ 2266].)

	Name	Description
	ReadRawValue(Int32) [▶ 2302]	Reads the Symbols raw value (Inherited from DynamicSymbol [▶ 2266].)
	ReadRawValueAsync [▶ 2302]	Read raw value as an asynchronous operation. (Inherited from DynamicSymbol [▶ 2266].)
	ReadValue. [▶ 2303]	Reads the value of this DynamicSymbol [▶ 2266]. (Inherited from DynamicSymbol [▶ 2266].)
	ReadValue(Int32) [▶ 2306]	Reads the value of this DynamicSymbol [▶ 2266]. (Inherited from DynamicSymbol [▶ 2266].)
	ReadValueAsync [▶ 2307]	Reads the Value of the IValueSymbol [▶ 2775] asynchronously. (Inherited from DynamicSymbol [▶ 2266].)
	ToString [▶ 2307]	Returns a String that represents this instance. (Inherited from DynamicSymbol [▶ 2266].)
	TryBinaryOperation	Provides implementation for binary operations. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations such as addition and multiplication. (Inherited from DynamicObject .)
	TryConvert	Provides implementation for type conversion operations. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations that convert an object from one type to another. (Inherited from DynamicObject .)
	TryCreateInstance	Provides the implementation for operations that initialize a new instance of a dynamic object. This method is not intended for use in C# or Visual Basic. (Inherited from DynamicObject .)
	TryDeleteIndex	Provides the implementation for operations that delete an object by index. This method is not intended for use in C# or Visual Basic. (Inherited from DynamicObject .)
	TryDeleteMember	Provides the implementation for operations that delete an object member. This method is not intended for use in C# or Visual Basic. (Inherited from DynamicObject .)
	TryGetIndex	Provides the implementation for operations that get a value by index. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for indexing operations. (Inherited from DynamicObject .)
	TryGetMember [▶ 3008]	Provides the implementation for operations that get member values. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations such as getting a value for a property. (Overrides DynamicSymbol.TryGetMember(GetMemberBinder, Object.) [▶ 2308].)
	TryInvoke	Provides the implementation for operations that invoke an object. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations such as invoking an object or a delegate. (Inherited from DynamicObject .)
	TryInvokeMember [▶ 3009]	Provides the implementation for operations that invoke a member. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations such as calling a method. (Overrides DynamicObject.TryInvokeMember(InvokeMemberBinder, Object, Object.) .)
	TryInvokeRpcMethod(String, Object, Object.) [▶ 3010]	Invokes the specified RPC Method

	Name	Description
	TryInvokeRpcMethod(String, Object, Object, Object.) [▶ 3012]	Invokes the specified RPC Method
	TryReadValue [▶ 2309]	Reads the Value of the IValueSymbol [▶ 2775] (Inherited from DynamicSymbol [▶ 2266].)
	TrySetIndex	Provides the implementation for operations that set a value by index. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations that access objects by a specified index. (Inherited from DynamicObject .)
	TrySetMember [▶ 3013]	Provides the implementation for operations that set member values. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations such as setting a value for a property. (Overrides DynamicObject.TrySetMember(SetMemberBinder, Object) .)
	TryUnaryOperation	Provides implementation for unary operations. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations such as negation, increment, or decrement. (Inherited from DynamicObject .)
	TryWriteValue [▶ 2309]	Writes the specified value to the DynamicSymbol [▶ 2266]. (Inherited from DynamicSymbol [▶ 2266].)
	UpdateAnyValue [▶ 2312]	Reads the value of this Value [▶ 2775] into the specified managed value. (Inherited from DynamicSymbol [▶ 2266].)
	WriteAnyValue [▶ 2313]	Writes the value represented by the managed value to this Value [▶ 2775] (Inherited from DynamicSymbol [▶ 2266].)
	WriteRawValue(Byte.) [▶ 2314]	Writes the raw value of the IValueSymbol [▶ 2775] (Ads Read / Write) (Inherited from DynamicSymbol [▶ 2266].)
	WriteRawValue(Byte, Int32) [▶ 2314]	Writes the raw value of the IValueSymbol [▶ 2775] (Ads Read / Write) (Inherited from DynamicSymbol [▶ 2266].)
	WriteRawValueAsync [▶ 2315]	Writes the raw value of the IValueSymbol [▶ 2775] (Ads Read / Write) (Inherited from DynamicSymbol [▶ 2266].)
	WriteValue(Object) [▶ 2316]	Writes the specified value to the DynamicSymbol [▶ 2266]. (Inherited from DynamicSymbol [▶ 2266].)
	WriteValue(Object, Int32) [▶ 2319]	Writes the specified value to the DynamicSymbol [▶ 2266]. (Inherited from DynamicSymbol [▶ 2266].)
	WriteValueAsync [▶ 2321]	Writes the Value of the IValueSymbol [▶ 2775] (Inherited from DynamicSymbol [▶ 2266].)

Events

	Name	Description
	RawValueChanged [▶ 2323]	Occurs when the RawValue of the IValueSymbol [▶ 2775] has changed. (Inherited from DynamicSymbol [▶ 2266].)
	ValueChanged [▶ 2323]	Occurs when the (Primitive) value of the IValueSymbol [▶ 2775] has changed. (Inherited from DynamicSymbol [▶ 2266].)

Fields

	Name	Description
	syncObject [▶ 2327]	Synchronization object (Inherited from DynamicSymbol [▶ 2266].)

Extension Methods

	Name	Description
	ReferencesExternalData [▶ 3038]	Indicates, that the Instance value includes process memory data, that cannot be read in one memory block. (Defined by DataTypeExtension [▶ 3021].)

Reference

[TwinCAT.TypeSystem Namespace](#) [[▶ 2083](#)]

6.11.142.1 DynamicInterfaceInstance Properties

The [DynamicInterfaceInstance](#) [[▶ 2995](#)] type exposes the following members.

Properties

	Name	Description
	_InnerSymbol [▶ 2274]	Gets the inner symbol of this DynamicSymbol [▶ 2266] (Inherited from DynamicSymbol [▶ 2266].)
	AccessRights [▶ 2274]	Gets the access rights. (Inherited from DynamicSymbol [▶ 2266].)
	AllowGIOAccess [▶ 2275]	Indicates, that the aggregates symbols is an IProcessImageAddress (and most probably IAdsSymbol) (Inherited from DynamicSymbol [▶ 2266].)
	Attributes [▶ 2275]	Gets the Symbol Attributes (Inherited from DynamicSymbol [▶ 2266].)
	BitSize [▶ 2276]	Gets the size of the IDataType [▶ 2475] in bits. (Inherited from DynamicSymbol [▶ 2266].)
	ByteSize [▶ 2276]	Gets the (aligned) size of of the Type/Instance in Bytes (Inherited from DynamicSymbol [▶ 2266].)
	Category [▶ 2277]	Gets the category. (Inherited from DynamicSymbol [▶ 2266].)
	Comment [▶ 2277]	Gets the comment of the IInstance [▶ 2549] (Inherited from DynamicSymbol [▶ 2266].)
	Connection [▶ 2277]	Gets the connection bound to this DynamicSymbol [▶ 2266] (Inherited from DynamicSymbol [▶ 2266].)
	DataType [▶ 2278]	Gets the IDataType [▶ 2475] of the IInstance [▶ 2549]. (Inherited from DynamicSymbol [▶ 2266].)
	HasRpcMethods [▶ 3001]	Gets a value indicating whether this instance has RPC methods
	HasValue [▶ 2278]	Gets a value indicating whether this instance has value (only the non VirtualInstances , what means the Symbols with locations). (Inherited from DynamicSymbol [▶ 2266].)
	InstanceName [▶ 2279]	Gets the name of the instance (without periods (.)) (Inherited from DynamicSymbol [▶ 2266].)
	InstancePath [▶ 2279]	Gets the relative / absolute access path to the instance (with periods (.)) (Inherited from DynamicSymbol [▶ 2266].)
	IsBitType [▶ 2280]	Gets a value indicating whether this instance is not basing on a full DataType but instead of some sort of bit mapping (Inherited from DynamicSymbol [▶ 2266].)

	Name	Description
	IsByteAligned [▶ 2280]	Indicates that the Size of the Object is Byte aligned (BitSize % 8 == 0) (Inherited from DynamicSymbol [▶ 2266].)
	IsContainerType [▶ 2281]	Gets a value indicating whether this Symbol is a container type. (Inherited from DynamicSymbol [▶ 2266].)
	IsPersistent [▶ 2281]	Gets a value indicating whether this ISymbol [▶ 2691] is persistent. (Inherited from DynamicSymbol [▶ 2266].)
	IsPointer [▶ 2282]	Indicates that the IInstance [▶ 2549] represents a Pointer type (Pointer TO) (Inherited from DynamicSymbol [▶ 2266].)
	IsPrimitiveType [▶ 2282]	Gets a value indicating whether this instance is a primitive type. (Inherited from DynamicSymbol [▶ 2266].)
	IsReadOnly [▶ 2283]	Indicates that this instance is read only. (Inherited from DynamicSymbol [▶ 2266].)
	IsRecursive [▶ 2283]	Gets a value indicating whether this instance is recursive. (Inherited from DynamicSymbol [▶ 2266].)
	IsReference [▶ 2284]	Indicates that the IInstance [▶ 2549] represents a Reference type (REFERENCE TO) (Inherited from DynamicSymbol [▶ 2266].)
	IsStatic [▶ 2284]	Gets a value indicating whether this instance is static. (Inherited from DynamicSymbol [▶ 2266].)
	MemberInstances [▶ 3002]	Gets the member instances of the Struct Instance [▶ 2666].
	NormalizedName [▶ 2285]	Gets the normalized instance name (fixed name for dynamic property access that doesn't contain invalid characters), (Inherited from DynamicSymbol [▶ 2266].)
	NotificationSettings [▶ 2285]	Gets the notification settings. (Inherited from DynamicSymbol [▶ 2266].)
	Parent [▶ 2286]	Gets the parent Symbol (Inherited from DynamicSymbol [▶ 2266].)
	RpcMethods [▶ 3003]	Gets the Method descriptions for the IRpcCallableType [▶ 2624]
	Size [▶ 2286]	Gets the size of the IInstance [▶ 2549] in bytes. (Inherited from DynamicSymbol [▶ 2266].)
	SubSymbols [▶ 2287]	Gets the SubSymbols of the ISymbol [▶ 2691] (Inherited from DynamicSymbol [▶ 2266].)
	TypeName [▶ 2287]	Gets the name of the DataType [▶ 2475] that is used for this IInstance [▶ 2549]. (Inherited from DynamicSymbol [▶ 2266].)
	ValueEncoding [▶ 2288]	Gets the value encoding. (Inherited from DynamicSymbol [▶ 2266].)

Reference

[DynamicInterfaceInstance Class](#) [▶ 2995]

[TwinCAT.TypeSystem Namespace](#) [▶ 2083]

6.11.142.1.1 DynamicInterfaceInstance.HasRpcMethods Property

Gets a value indicating whether this instance has RPC methods

Namespace: [TwinCAT.TypeSystem](#) [▶ 2083]

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public bool HasRpcMethods { get; }
```

Property Value

Type: Boolean
true if this instance has RPC methods; otherwise, false.

Implements

[IInterfaceInstance.HasRpcMethods](#) [[▶ 3018](#)]

Remarks

If the struct instance supports RPC Methods, then the instance class is also supporting [IRpcStructInstance](#) [[▶ 2642](#)]

Reference

[DynamicInterfaceInstance Class](#) [[▶ 2995](#)]

[TwinCAT.TypeSystem Namespace](#) [[▶ 2083](#)]

[TwinCAT.TypeSystem.IRpcStructInstance](#) [[▶ 2642](#)]

[TwinCAT.TypeSystem.IRpcMethodParameter](#) [[▶ 2635](#)]

6.11.142.1.2 DynamicInterfaceInstance.MemberInstances Property

Gets the member instances of the [Struct Instance](#) [[▶ 2666](#)].

Namespace: [TwinCAT.TypeSystem](#) [[▶ 2083](#)]

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public ISymbolCollection<ISymbol> MemberInstances { get; }
```

Property Value

Type: [ISymbolCollection](#) [[▶ 2700](#)].[ISymbol](#) [[▶ 2691](#)].
The member instances.

Implements

[IInterfaceInstance.MemberInstances](#) [[▶ 3018](#)]

Reference

[DynamicInterfaceInstance Class](#) [[▶ 2995](#)]

[TwinCAT.TypeSystem Namespace](#) [[▶ 2083](#)]

6.11.142.1.3 DynamicInterfaceInstance.RpcMethods Property

Gets the Method descriptions for the [IRpcCallableType](#) [[▶ 2624](#)]

Namespace: [TwinCAT.TypeSystem](#) [[▶ 2083](#)]

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public IRpcMethodCollection RpcMethods { get; }
```

Property Value

Type: [IRpcMethodCollection](#) [[▶ 2629](#)]

The methods.

Implements

[IRpcCallableInstance.RpcMethods](#) [[▶ 2607](#)]

Reference

6.11.142.2 DynamicInterfaceInstance Methods

The [DynamicInterfaceInstance](#) [[▶ 2995](#)] type exposes the following members.

Methods

	Name	Description
	Equals [▶ 2292]	Equals (Inherited from DynamicSymbol [▶ 2266].)
	Finalize	Allows an object to try to free resources and perform other cleanup operations before it is reclaimed by garbage collection. (Inherited from Object.)
	GetDynamicMemberNames [▶ 3006]	Returns the enumeration of all dynamic member names. (Overrides DynamicSymbol.GetDynamicMemberNames . [▶ 2293].)
	GetHashCode [▶ 2293]	Gets the HashCode of the Address (Inherited from DynamicSymbol [▶ 2266].)
	GetMetaObject	Provides a DynamicMetaObject that dispatches to the dynamic virtual methods. The object can be encapsulated inside another DynamicMetaObject to provide custom behavior for individual actions. This method supports the Dynamic Language Runtime infrastructure for language implementers and it is not intended to be used directly from your code. (Inherited from DynamicObject.)
	GetType	Gets the Type of the current instance. (Inherited from Object.)
	InvokeRpcMethodAsync [▶ 3007]	Invokes the specified RPC Method asynchronously
	MemberwiseClone	Creates a shallow copy of the current Object. (Inherited from Object.)
	OnReadAnyValue [▶ 2293]	Handler function for reading ADS 'Any' Values. (Inherited from DynamicSymbol [▶ 2266].)

Name	Description
OnReadRawValue [▶ 2294]	Handler function for reading Raw symbol value. (Inherited from DynamicSymbol [▶ 2266].)
OnReadRawValueAsync [▶ 2294]	Handler function reading the raw value of the DynamicSymbol [▶ 2266]. (Inherited from DynamicSymbol [▶ 2266].)
OnReadValue [▶ 2295]	Handler function for the (Inherited from DynamicSymbol [▶ 2266].)
OnReadValueAsync [▶ 2296]	Handler function reading the DynamicSymbols [▶ 2266] value asynchronously. (Inherited from DynamicSymbol [▶ 2266].)
OnSetInstanceName [▶ 2296]	Sets a new InstanceName InstancePath (Inherited from DynamicSymbol [▶ 2266].)
OnTryReadValue [▶ 2297]	Handler function for the (Inherited from DynamicSymbol [▶ 2266].)
OnTryWriteValue [▶ 2297]	Handler Function for writing value. (Inherited from DynamicSymbol [▶ 2266].)
OnWriteRawValue [▶ 2298]	Handler function for reading symbols raw value. (Inherited from DynamicSymbol [▶ 2266].)
OnWriteRawValueAsync [▶ 2298]	Handler function for writing the raw DynamicSymbol [▶ 2266] value. (Inherited from DynamicSymbol [▶ 2266].)
OnWriteValue [▶ 2299]	Handler Function for writing value. (Inherited from DynamicSymbol [▶ 2266].)
OnWriteValueAsync [▶ 2300]	Handler Function for writing value. (Inherited from DynamicSymbol [▶ 2266].)
ReadAnyValue [▶ 2300]	Reads the value of this Value [▶ 2775] into a new created instance of the managed type (Inherited from DynamicSymbol [▶ 2266].)
ReadRawValue. [▶ 2301]	Reads the raw value of the IValueSymbol [▶ 2775] (Ads Read / Write) (Inherited from DynamicSymbol [▶ 2266].)
ReadRawValue(Int32) [▶ 2302]	Reads the Symbols raw value (Inherited from DynamicSymbol [▶ 2266].)
ReadRawValueAsync [▶ 2302]	Read raw value as an asynchronous operation. (Inherited from DynamicSymbol [▶ 2266].)
ReadValue. [▶ 2303]	Reads the value of this DynamicSymbol [▶ 2266]. (Inherited from DynamicSymbol [▶ 2266].)
ReadValue(Int32) [▶ 2306]	Reads the value of this DynamicSymbol [▶ 2266]. (Inherited from DynamicSymbol [▶ 2266].)
ReadValueAsync [▶ 2307]	Reads the Value of the IValueSymbol [▶ 2775] asynchronously. (Inherited from DynamicSymbol [▶ 2266].)
ToString [▶ 2307]	Returns a String that represents this instance. (Inherited from DynamicSymbol [▶ 2266].)
TryBinaryOperation	Provides implementation for binary operations. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations such as addition and multiplication. (Inherited from DynamicObject .)
TryConvert	Provides implementation for type conversion operations. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations that convert an object from one type to another. (Inherited from DynamicObject .)

	Name	Description
	TryCreateInstance	Provides the implementation for operations that initialize a new instance of a dynamic object. This method is not intended for use in C# or Visual Basic. (Inherited from DynamicObject.)
	TryDeleteIndex	Provides the implementation for operations that delete an object by index. This method is not intended for use in C# or Visual Basic. (Inherited from DynamicObject.)
	TryDeleteMember	Provides the implementation for operations that delete an object member. This method is not intended for use in C# or Visual Basic. (Inherited from DynamicObject.)
	TryGetIndex	Provides the implementation for operations that get a value by index. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for indexing operations. (Inherited from DynamicObject.)
	TryGetMember [▶ 3008]	Provides the implementation for operations that get member values. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations such as getting a value for a property. (Overrides DynamicSymbol.TryGetMember(GetMemberBinder, Object.) [▶ 2308].)
	TryInvoke	Provides the implementation for operations that invoke an object. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations such as invoking an object or a delegate. (Inherited from DynamicObject.)
	TryInvokeMember [▶ 3009]	Provides the implementation for operations that invoke a member. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations such as calling a method. (Overrides DynamicObject.TryInvokeMember(InvokeMemberBinder, Object, Object.) .)
	TryInvokeRpcMethod(String, Object, Object.) [▶ 3010]	Invokes the specified RPC Method
	TryInvokeRpcMethod(String, Object, Object, Object.) [▶ 3012]	Invokes the specified RPC Method
	TryReadValue [▶ 2309]	Reads the Value of the IValueSymbol [▶ 2775] (Inherited from DynamicSymbol [▶ 2266].)
	TrySetIndex	Provides the implementation for operations that set a value by index. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations that access objects by a specified index. (Inherited from DynamicObject.)
	TrySetMember [▶ 3013]	Provides the implementation for operations that set member values. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations such as setting a value for a property. (Overrides DynamicObject.TrySetMember(SetMemberBinder, Object.) .)
	TryUnaryOperation	Provides implementation for unary operations. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations such as negation, increment, or decrement. (Inherited from DynamicObject.)
	TryWriteValue [▶ 2309]	Writes the specified value to the DynamicSymbol [▶ 2266]. (Inherited from DynamicSymbol [▶ 2266].)
	UpdateAnyValue [▶ 2312]	Reads the value of this Value [▶ 2775] into the specified managed value. (Inherited from DynamicSymbol [▶ 2266].)

	Name	Description
	WriteAnyValue [▶ 2313]	Writes the value represented by the managed value to this Value [▶ 2775] (Inherited from DynamicSymbol [▶ 2266].)
	WriteRawValue(Byte) [▶ 2314]	Writes the raw value of the IValueSymbol [▶ 2775] (Ads Read / Write) (Inherited from DynamicSymbol [▶ 2266].)
	WriteRawValue(Byte, Int32) [▶ 2314]	Writes the raw value of the IValueSymbol [▶ 2775] (Ads Read / Write) (Inherited from DynamicSymbol [▶ 2266].)
	WriteRawValueAsync [▶ 2315]	Writes the raw value of the IValueSymbol [▶ 2775] (Ads Read / Write) (Inherited from DynamicSymbol [▶ 2266].)
	WriteValue(Object) [▶ 2316]	Writes the specified value to the DynamicSymbol [▶ 2266]. (Inherited from DynamicSymbol [▶ 2266].)
	WriteValue(Object, Int32) [▶ 2319]	Writes the specified value to the DynamicSymbol [▶ 2266]. (Inherited from DynamicSymbol [▶ 2266].)
	WriteValueAsync [▶ 2321]	Writes the Value of the IValueSymbol [▶ 2775] (Inherited from DynamicSymbol [▶ 2266].)

Extension Methods

	Name	Description
	ReferencesExternalData [▶ 3038]	Indicates, that the Instance value includes process memory data, that cannot be read in one memory block. (Defined by DataTypeExtension [▶ 3021].)

Reference

[DynamicInterfaceInstance Class](#) [▶ 2995]

[TwinCAT.TypeSystem Namespace](#) [▶ 2083]

6.11.142.2.1 DynamicInterfaceInstance.GetDynamicMemberNames Method

Returns the enumeration of all dynamic member names.

Namespace: [TwinCAT.TypeSystem](#) [▶ 2083]

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public override IEnumerable<string> GetDynamicMemberNames()
```

Return Value

Type: [IEnumerable.String](#).

A sequence that contains dynamic member names.

Reference

[DynamicInterfaceInstance Class](#) [▶ 2995]

[TwinCAT.TypeSystem Namespace](#) [▶ 2083]

6.11.142.2.2 DynamicInterfaceInstance.InvokeRpcMethodAsync Method

Invokes the specified RPC Method asynchronously

Namespace: [TwinCAT.TypeSystem](#) [[▸ 2083](#)]

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public Task<ResultRpcMethodAccess> InvokeRpcMethodAsync(
    string methodName,
    Object[]? inParameters,
    CancellationToken cancel
)
```

Parameters

methodName	Type: System.String The method name.
inParameters	Type: .System.Object. The parameters.
cancel	Type: System.Threading.CancellationToken The cancellation token

Return Value

Type: [Task.ResultRpcMethodAccess](#) [[▸ 3213](#)].

A task that represents the asynchronous 'InvokeRpcMethod' operation. The [ResultRpcMethodAccess](#) [[▸ 3213](#)] results contains the return value ([ReturnValue](#) [[▸ 3216](#)]) together with the output parameters. The succeeded communication is indicated by the [ErrorCode](#) property ([ErrorCode](#) [[▸ 3202](#)]) after the communication.

Implements

[IRpcCallableInstance.InvokeRpcMethodAsync\(String, .Object., CancellationToken\)](#) [[▸ 2614](#)]

Remarks

Because this overload doesn't provide any [AnyTypeSpecifier](#) [[▸ 2094](#)] specifications, only primitive datatypes will be correctly marshalled by this method. Complex types will fall back to byte[] arrays.

Examples

The following sample shows how to call (Remote Procedures / Methods) within the PLC.

Dynamic Tree Mode

```
class RpcCallVirtualProgram
{
    /// <summary>
    /// Defines the entry point of the application.
    /// </summary>
    /// <param name="args">The arguments.</param>
    static void Main(string[] args)
    {
        // Get the AdsAddress from command-line arguments
        AmsAddress address = ArgParser.Parse(args);

        using (AdsClient client = new AdsClient())
        {
            //client.Synchronize = false;

            // Connect to the target device
            client.Connect(address);
        }
    }
}
```

```

SymbolLoaderSettings settings = new SymbolLoaderSettings(SymbolsLoadMode.VirtualTree);
ISymbolLoader loader = SymbolLoaderFactory.Create(client, settings);

// Get the Symbols (Dynamic Symbols)

IStructInstance main = (IStructInstance)loader.Symbols["MAIN"]; // Gets the MAIN Instance of
the PLC Program

// Call a Method that has the following signature (within MAIN Program)
/* {attribute 'TcRpcEnable'}
METHOD PUBLIC M_Add : INT
VAR_INPUT
    i1 : INT := 0;
    i2 : INT := 0;
END_VAR
*/

short result = (short)main.InvokeRpcMethod("M_Add", new object[] {(short) 3, (short) 4});

// Call a Method that has no parameter and returns VOID
main.InvokeRpcMethod("M_Method1", new object[] {});

//Browsing RpcMethods
foreach(IRpcMethod method in main.RpcMethods)
{
    string methodName = method.Name;

    foreach(IRpcMethodParameter parameter in method.Parameters)
    {
        string parameterName = parameter.Name;
        string parameterType = parameter.TypeName;
    }
}
}
}
}

```

[TwinCAT.TypeSystem Namespace \[► 2083\]](#)

6.11.142.2.3 DynamicInterfaceInstance.TryGetMember Method

Provides the implementation for operations that get member values. Classes derived from the `DynamicObject` class can override this method to specify dynamic behavior for operations such as getting a value for a property.

Namespace: [TwinCAT.TypeSystem \[► 2083\]](#)

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```

public override bool TryGetMember(
    GetMemberBinder binder,
    out Object?? result
)

```

Parameters

binder	Type: <code>System.Dynamic.GetMemberBinder</code> Provides information about the object that called the dynamic operation. The <code>binder.Name</code> property provides the name of the member on which the dynamic operation is performed. For example, for the <code>Console.WriteLine(sampleObject.SampleProperty)</code> statement, where <code>sampleObject</code> is an instance of the class derived from the <code>DynamicObject</code> class, <code>binder.Name</code> returns "SampleProperty". The <code>binder.IgnoreCase</code> property specifies whether the member name is case-sensitive.
--------	---

result	Type: System.Object. The result of the get operation. For example, if the method is called for a property, you can assign the property value to result.
--------	--

Return Value

Type: Boolean
true if the operation is successful; otherwise, false. If this method returns false, the run-time binder of the language determines the behavior. (In most cases, a run-time exception is thrown.)

Reference

[DynamicInterfaceInstance Class \[► 2995\]](#)

[TwinCAT.TypeSystem Namespace \[► 2083\]](#)

6.11.142.2.4 DynamicInterfaceInstance.TryInvokeMember Method

Provides the implementation for operations that invoke a member. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations such as calling a method.

Namespace: [TwinCAT.TypeSystem \[► 2083\]](#)

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public override bool TryInvokeMember(
    InvokeMemberBinder binder,
    Object?[]? args,
    out Object?? returnValue
)
```

Parameters

binder	Type: System.Dynamic.InvokeMemberBinder Provides information about the dynamic operation. The binder.Name property provides the name of the member on which the dynamic operation is performed. For example, for the statement sampleObject.SampleMethod(100), where sampleObject is an instance of the class derived from the DynamicObject class, binder.Name returns "SampleMethod". The binder.IgnoreCase property specifies whether the member name is case-sensitive.
args	Type: .System.Object. The arguments that are passed to the object member during the invoke operation. For example, for the statement sampleObject.SampleMethod(100), where sampleObject is derived from the DynamicObject class, args[] is equal to 100.
returnValue	Type: System.Object. The result of the member invocation.

Return Value

Type: Boolean
true if the operation is successful; otherwise, false. If this method returns false, the run-time binder of the language determines the behavior. (In most cases, a language-specific run-time exception is thrown.)

6.11.142.2.5.1 DynamicInterfaceInstance.TryInvokeRpcMethod Method (String, .Object., Object.)

Invokes the specified RPC Method

Namespace: [TwinCAT.TypeSystem](#) [[▶ 2083](#)]

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public int TryInvokeRpcMethod(
    string methodName,
    Object[]? inParameters,
    out Object?? retValue
)
```

Parameters

methodName	Type: System.String The method name.
inParameters	Type: .System.Object. The parameters.
retValue	Type: System.Object. The return value of the RPC method as object.

Return Value

Type: Int32

The return value of the Method (as object).

Implements

[IRpcCallableInstance.TryInvokeRpcMethod\(String, .Object., Object.\)](#) [[▶ 2619](#)]

Remarks

Because this overload doesn't provide any [AnyTypeSpecifier \[► 2094\]](#) specifications, only primitive datatypes will be correctly marshalled by this method. Complex types will fall back to byte[] arrays.

Examples

The following sample shows how to call (Remote Procedures / Methods) within the PLC.

Dynamic Tree Mode

```

6.11.142.2.6 DynamicInterfaceInstance.TrySetMember Method

Provides the implementation for operations that set member values. Classes derived from the `DynamicObject` class can override this method to specify dynamic behavior for operations such as setting a value for a property.

Namespace: [TwinCAT.TypeSystem \[► 2083\]](#)

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```

public override bool TrySetMember(
    SetMemberBinder binder,
    Object? value
)

```

Parameters

binder	Type: <code>System.Dynamic.SetMemberBinder</code> Provides information about the object that called the dynamic operation. The <code>binder.Name</code> property provides the name of the member to which the value is being assigned. For example, for the statement <code>sampleObject.SampleProperty =</code>
--------	---

	"Test", where sampleObject is an instance of the class derived from the DynamicObject class, binder.Name returns "SampleProperty". The binder.IgnoreCase property specifies whether the member name is case-sensitive.
value	Type: System.Object The value to set to the member. For example, for sampleObject.SampleProperty = "Test", where sampleObject is an instance of the class derived from the DynamicObject class, the value is "Test".

Return Value

Type: Boolean

true if the operation is successful; otherwise, false. If this method returns false, the run-time binder of the language determines the behavior. (In most cases, a language-specific run-time exception is thrown.)

6.11.143 IInterfaceInstance Interface

Interface representing an instance of a [IInterfaceType \[► 2983\]](#)

Namespace: [TwinCAT.TypeSystem \[▸ 2083\]](#)

Assembly: TwinCAT.Ads.Abstractions (in TwinCAT.Ads.Abstractions.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public interface IInterfaceInstance : ISymbol,
    IAttributedInstance, IInstance, IBitSize, IRpcCallableInstance
```

The IInterfaceInstance type exposes the following members.

Properties

Name	Description
Attributes [▸ 2471]	Gets the Type Attributes. (Inherited from IAttributedInstance [▸ 2469].)
BitSize [▸ 2473]	Gets the size of the IDataType [▸ 2475] in bits. (Inherited from IBitSize [▸ 2472].)
ByteSize [▸ 2474]	Gets the (aligned) size of of the Type/Instance in Bytes (Inherited from IBitSize [▸ 2472].)
Category [▸ 2694]	Gets the Symbol/Datatype Category (Inherited from ISymbol [▸ 2691].)
Comment [▸ 2550]	Gets the comment of the IInstance [▸ 2549] (Inherited from IInstance [▸ 2549].)
DataType [▸ 2551]	Gets the IDataType [▸ 2475] of the IInstance [▸ 2549] . (Inherited from IInstance [▸ 2549].)
HasRpcMethods [▸ 3018]	Gets a value indicating whether this instance has RPC methods
InstanceName [▸ 2551]	Gets the name of the instance (without periods (.)) (Inherited from IInstance [▸ 2549].)
InstancePath [▸ 2552]	Gets the relative / absolute access path to the instance (with periods (.)) (Inherited from IInstance [▸ 2549].)
IsBitType [▸ 2474]	Gets a value indicating whether this instance is not basing on a full IDataType but instead of some sort of bit mapping (Inherited from IBitSize [▸ 2472].)
IsByteAligned [▸ 2475]	Indicates that the Size of the Object is Byte aligned ($BitSize \% 8 == 0$) (Inherited from IBitSize [▸ 2472].)
IsContainerType [▸ 2694]	Gets a value indicating whether this Symbol is acontainer type. (Inherited from ISymbol [▸ 2691].)
IsPersistent [▸ 2694]	Gets a value indicating whether this ISymbol [▸ 2691] is persistent. (Inherited from ISymbol [▸ 2691].)
IsPointer [▸ 2552]	Indicates that the IInstance [▸ 2549] represents a Pointer type (Pointer TO) (Inherited from IInstance [▸ 2549].)
IsPrimitiveType [▸ 2695]	Gets a value indicating whether this instance is a primitive type. (Inherited from ISymbol [▸ 2691].)
IsReadOnly [▸ 2695]	Indicates that this instance is read only. (Inherited from ISymbol [▸ 2691].)
IsRecursive [▸ 2696]	Gets a value indicating whether this instance is recursive. (Inherited from ISymbol [▸ 2691].)
IsReference [▸ 2552]	Indicates that the IInstance [▸ 2549] represents a Reference type (REFERENCE TO) (Inherited from IInstance [▸ 2549].)
IsStatic [▸ 2553]	Gets a value indicating whether this IInstance [▸ 2549] is static. (Inherited from IInstance [▸ 2549].)

Name	Description
MemberInstances [▶ 3018]	Gets the member instances of the Struct Instance.
Parent [▶ 2696]	Gets the parent Symbol (Inherited from ISymbol [▶ 2691].)
RpcMethods [▶ 2607]	Gets the Method descriptions for the IRpcCallableType [▶ 2624] (Inherited from IRpcCallableInstance [▶ 2606].)
Size [▶ 2475]	Gets the size of the object in bytes or Bits dependant on IsBitType [▶ 2474] (Inherited from IBitSize [▶ 2472].)
SubSymbols [▶ 2696]	Gets the SubSymbols of the ISymbol [▶ 2691] (Inherited from ISymbol [▶ 2691].)
TypeName [▶ 2553]	Gets the name of the DataType [▶ 2475] that is used for this Instance [▶ 2549]. (Inherited from Instance [▶ 2549].)
ValueEncoding [▶ 2472]	Gets the value encoding. (Inherited from IAttributedInstance [▶ 2469].)

Methods

Name	Description
InvokeRpcMethod(String, Object.) [▶ 2609]	Invokes the specified RPC Method (Inherited from IRpcCallableInstance [▶ 2606].)
InvokeRpcMethod(String, Object., Object.) [▶ 2610]	Invokes the specified RPC Method (Inherited from IRpcCallableInstance [▶ 2606].)
InvokeRpcMethodAsync [▶ 2614]	Invokes the specified RPC Method asynchronously (Inherited from IRpcCallableInstance [▶ 2606].)
TryInvokeRpcMethod(String, Object., Object.) [▶ 2619]	Invokes the specified RPC Method (Inherited from IRpcCallableInstance [▶ 2606].)
TryInvokeRpcMethod(String, Object., Object., Object.) [▶ 2620]	Invokes the specified RPC Method (Inherited from IRpcCallableInstance [▶ 2606].)

Extension Methods

Name	Description
ReferencesExternalData [▶ 3038]	Indicates, that the Instance value includes process memory data, that cannot be read in one memory block. (Defined by DataTypeExtension [▶ 3021].)

Reference

[TwinCAT.TypeSystem Namespace](#) [▶ 2083]

6.11.143.1 InterfacelInstance Properties

The [IInterfacelInstance](#) [▶ 3014] type exposes the following members.

Properties

Name	Description
Attributes [▶ 2471]	Gets the Type Attributes. (Inherited from IAttributedInstance [▶ 2469].)
BitSize [▶ 2473]	Gets the size of the IDataType [▶ 2475] in bits. (Inherited from IBitSize [▶ 2472].)
ByteSize [▶ 2474]	Gets the (aligned) size of of the Type/Instance in Bytes (Inherited from IBitSize [▶ 2472].)
Category [▶ 2694]	Gets the Symbol/Datatype Category (Inherited from ISymbol [▶ 2691].)
Comment [▶ 2550]	Gets the comment of the IInstance [▶ 2549] (Inherited from IInstance [▶ 2549].)
DataType [▶ 2551]	Gets the IDataType [▶ 2475] of the IInstance [▶ 2549]. (Inherited from IInstance [▶ 2549].)
HasRpcMethods [▶ 3018]	Gets a value indicating whether this instance has RPC methods
InstanceName [▶ 2551]	Gets the name of the instance (without periods (.)) (Inherited from IInstance [▶ 2549].)
InstancePath [▶ 2552]	Gets the relative / absolute access path to the instance (with periods (.)) (Inherited from IInstance [▶ 2549].)
IsBitType [▶ 2474]	Gets a value indicating whether this instance is not basing on a full DataType but instead of some sort of bit mapping (Inherited from IBitSize [▶ 2472].)
IsByteAligned [▶ 2475]	Indicates that the Size of the Object is Byte aligned ($\text{BitSize} \% 8 == 0$) (Inherited from IBitSize [▶ 2472].)
IsContainerType [▶ 2694]	Gets a value indicating whether this Symbol is acontainer type. (Inherited from ISymbol [▶ 2691].)
IsPersistent [▶ 2694]	Gets a value indicating whether this ISymbol [▶ 2691] is persistent. (Inherited from ISymbol [▶ 2691].)
IsPointer [▶ 2552]	Indicates that the IInstance [▶ 2549] represents a Pointer type (Pointer TO) (Inherited from IInstance [▶ 2549].)
IsPrimitiveType [▶ 2695]	Gets a value indicating whether this instance is a primitive type. (Inherited from ISymbol [▶ 2691].)
IsReadOnly [▶ 2695]	Indicates that this instance is read only. (Inherited from ISymbol [▶ 2691].)
IsRecursive [▶ 2696]	Gets a value indicating whether this instance is recursive. (Inherited from ISymbol [▶ 2691].)
IsReference [▶ 2552]	Indicates that the IInstance [▶ 2549] represents a Reference type (REFERENCE TO) (Inherited from IInstance [▶ 2549].)
IsStatic [▶ 2553]	Gets a value indicating whether this IInstance [▶ 2549] is static. (Inherited from IInstance [▶ 2549].)
MemberInstances [▶ 3018]	Gets the member instances of the Struct Instance [▶ 3014].
Parent [▶ 2696]	Gets the parent Symbol (Inherited from ISymbol [▶ 2691].)
RpcMethods [▶ 2607]	Gets the Method descriptions for the IRpcCallableType [▶ 2624] (Inherited from IRpcCallableInstance [▶ 2606].)
Size [▶ 2475]	Gets the size of the object in bytes or Bits dependant on IsBitType [▶ 2474] (Inherited from IBitSize [▶ 2472].)
SubSymbols [▶ 2696]	Gets the SubSymbols of the ISymbol [▶ 2691] (Inherited from ISymbol [▶ 2691].)

	Name	Description
	TypeName [▶ 2553]	Gets the name of the DataType [▶ 2475] that is used for this Instance [▶ 2549]. (Inherited from Instance [▶ 2549].)
	ValueEncoding [▶ 2472]	Gets the value encoding. (Inherited from AttributedInstance [▶ 2469].)

6.11.143.1.1 IInterfaceInstance.HasRpcMethods Property

Gets a value indicating whether this instance has RPC methods

Namespace: [TwinCAT.TypeSystem](#) [[▶ 2083](#)]

Assembly: TwinCAT.Ads.Abstractions (in TwinCAT.Ads.Abstractions.dll) Version: 6.0.328+39e3229

Syntax

C#

```
bool HasRpcMethods { get; }
```

Property Value

Type: Boolean

true if this instance has RPC methods; otherwise, false.

Remarks

If the struct instance supports RPC Methods, then the instance class is also supporting [IRpcStructInstance](#) [[▶ 2642](#)]:

6.11.143.1.2 IInterfaceInstance.MemberInstances Property

Gets the member instances of the [Struct Instance](#) [[▶ 3014](#)].

Namespace: [TwinCAT.TypeSystem](#) [[▶ 2083](#)]

Assembly: TwinCAT.Ads.Abstractions (in TwinCAT.Ads.Abstractions.dll) Version: 6.0.328+39e3229

Syntax

C#

```
ISymbolCollection<ISymbol> MemberInstances { get; }
```

Property Value

Type: [ISymbolCollection](#) [[▶ 2700](#)]. [ISymbol](#) [[▶ 2691](#)].
The member instances.

Reference

[IInterfaceInstance Interface](#) [[▶ 3014](#)]

[TwinCAT.TypeSystem Namespace](#) [[▶ 2083](#)]

6.11.143.2 IInterfaceInstance Methods

The [IInterfaceInstance](#) [[▶ 3014](#)] type exposes the following members.

Methods

	Name	Description
	InvokeRpcMethod(String, Object.) [▶ 2609]	Invokes the specified RPC Method (Inherited from IRpcCallableInstance [▶ 2606].)
	InvokeRpcMethod(String, Object., Object.) [▶ 2610]	Invokes the specified RPC Method (Inherited from IRpcCallableInstance [▶ 2606].)
	InvokeRpcMethodAsync [▶ 2614]	Invokes the specified RPC Method asynchronously (Inherited from IRpcCallableInstance [▶ 2606].)
	TryInvokeRpcMethod(String, Object., Object.) [▶ 2619]	Invokes the specified RPC Method (Inherited from IRpcCallableInstance [▶ 2606].)
	TryInvokeRpcMethod(String, Object., Object., Object.) [▶ 2620]	Invokes the specified RPC Method (Inherited from IRpcCallableInstance [▶ 2606].)

Extension Methods

	Name	Description
	ReferencesExternalData [▶ 3038]	Indicates, that the Instance value includes process memory data, that cannot be read in one memory block. (Defined by DataTypeExtension [▶ 3021].)

Reference

[IInterfaceInstance Interface](#) [[▶ 3014](#)]

6.11.144 SymbolIterationMask Enumeration

Mask Flagset to specify filters for [SymbolIterator.T.](#) [[▶ 3172](#)].

Namespace: [TwinCAT.TypeSystem \[▸ 2083\]](#)

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
[FlagsAttribute]
public enum SymbolIterationMask
```

Members

	Member name	Value	Description
	None	0	Uninitialized / None
	Structures	1	Iterates over Subelements of Structs
	Arrays	2	Iterates over Elements of Arrays
	Unions	4	Iterates over Subelements of Unions
	Pointer	8	Iterates over Pointer SubElements
	References	16	Iterates over References
	All	31	Iterates over All Complex/Combined types
	AllWithoutArrayElements	29	Iterates over All Complex/Combined types excluding Array elements

6.11.146 DataTypeExtension Class

Extends the [IDataType](#) [[▸ 2475](#)] interface with more sophisticated functions.

Inheritance Hierarchy

System.Object
TwinCAT.TypeSystem.DataTypeExtension

Namespace: [TwinCAT.TypeSystem](#) [[▸ 2083](#)]

Assembly: TwinCAT.Ads.Abstractions (in TwinCAT.Ads.Abstractions.dll) Version: 6.0.328+39e3229

Syntax**C#**

```
public static class DataTypeExtension
```

Methods

	Name	Description
	IsArrayOfPrimitives(DataType) [► 3025]	Determines whether the dataType is an array of Primitives.
	IsArrayOfPrimitives(DataType, Boolean) [► 3025]	Determines whether the dataType is an array of Primitives.
	IsContainer(DataTypeCategory) [► 3026]	Gets a value indicating whether this IDataType [► 2475] is a container type
	IsContainer(IDataType) [► 3027]	Gets a value indicating whether this IDataType [► 2475] is a container type
	IsContainer(IDataType, Boolean) [► 3028]	Gets a value indicating whether this IDataType [► 2475] is a container type
	IsPointer(DataTypeCategory) [► 3030]	Gets a value indicating whether this IDataType [► 2475] is a pointer type
	IsPointer(IDataType) [► 3031]	Gets a value indicating whether this IDataType [► 2475] is a pointer type
	IsPrimitive(AdsDataTypeId) [► 3032]	Determines whether the specified type identifier is primitive.
	IsPrimitive(DataTypeCategory) [► 3032]	Gets a value indicating whether this IDataType [► 2475] is primitive
	IsPrimitive(IDataType) [► 3033]	Gets a value indicating whether this IDataType [► 2475] is primitive
	IsPrimitive(IDataType, Boolean) [► 3034]	Gets a value indicating whether this IDataType [► 2475] is primitive
	IsReference(DataTypeCategory) [► 3035]	Gets a value indicating whether this IDataType [► 2475] is a reference type
	IsReference(IDataType) [► 3036]	Gets a value indicating whether this IDataType [► 2475] is a reference type
	ReferencesExternalData(IDataType) [► 3037]	Indicates, that the Instance value includes process memory data, that cannot be read in one memory block.

Name	Description
ReferencesExternalData(IInstance) [▶ 3038]	Indicates, that the Instance value includes process memory data, that cannot be read in one memory block.
ResolvableAsPrimitive(IDataType) [▶ 3039]	Indicates, that this data type can be resolved as primitive or primitive Array.
ResolvableAsPrimitive(IDataType, Boolean) [▶ 3039]	Indicates, that this data type can be resolved as primitive or primitive Array.
Resolve(IDataType) [▶ 3040]	Resolves the specified data type for AliasReference [▶ 3042]
Resolve(IDataType, DataTypeResolveStrategy) [▶ 3041]	Resolves the specified strategy.

Reference

[TwinCAT.TypeSystem Namespace](#) [▶ 2083]

6.11.146.1 DataTypeExtension Methods

Methods

Name	Description
IsArrayOfPrimitives(IDataType) [▶ 3025]	Determines whether the dataType is an array of Primitives.
IsArrayOfPrimitives(IDataType, Boolean) [▶ 3025]	Determines whether the dataType is an array of Primitives.
IsContainer(DataTypeCategory) [▶ 3026]	Gets a value indicating whether this IDataType [▶ 2475] is a container type
IsContainer(IDataType) [▶ 3027]	Gets a value indicating whether this IDataType [▶ 2475] is a container type
IsContainer(IDataType, Boolean) [▶ 3028]	Gets a value indicating whether this IDataType [▶ 2475] is a container type
IsPointer(DataTypeCategory) [▶ 3030]	Gets a value indicating whether this IDataType [▶ 2475] is a pointer type
IsPointer(IDataType) [▶ 3031]	Gets a value indicating whether this IDataType [▶ 2475] is a pointer type
IsPrimitive(AdsDataTypeId) [▶ 3032]	Determines whether the specified type identifier is primitive.

	Name	Description
	IsPrimitive(DataType Category) [► 3032]	Gets a value indicating whether this IDataType [► 2475] is primitive
	IsPrimitive(IDataType) [► 3033]	Gets a value indicating whether this IDataType [► 2475] is primitive
	IsPrimitive(IDataType, Boolean) [► 3034]	Gets a value indicating whether this IDataType [► 2475] is primitive
	IsReference(DataTypeCategory) [► 3035]	Gets a value indicating whether this IDataType [► 2475] is a reference type
	IsReference(IDataType) [► 3036]	Gets a value indicating whether this IDataType [► 2475] is a reference type
	ReferencesExternalData(IDataType) [► 3037]	Indicates, that the Instance value includes process memory data, that cannot be read in one memory block.
	ReferencesExternalData(IInstance) [► 3038]	Indicates, that the Instance value includes process memory data, that cannot be read in one memory block.
	ResolvableAsPrimitive(IDataType) [► 3039]	Indicates, that this data type can be resolved as primitive or primitive Array.
	ResolvableAsPrimitive(IDataType, Boolean) [► 3039]	Indicates, that this data type can be resolved as primitive or primitive Array.
	Resolve(IDataType) [► 3040]	Resolves the specified data type for AliasReference [► 3042]
	Resolve(IDataType, DataTypeResolveStrategy) [► 3041]	Resolves the specified strategy.

6.11.146.1.1.1 DataTypeExtension.IsArrayOfPrimitives Method (IDataType)

Determines whether the dataType is an array of Primitives.

Namespace: [TwinCAT.TypeSystem](#) [▶ 2083]

Assembly: TwinCAT.Ads.Abstractions (in TwinCAT.Ads.Abstractions.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public static bool IsArrayOfPrimitives(
    this IDataType type
)
```

Parameters

type	Type: TwinCAT.TypeSystem.IDataType [▶ 2475] The type.
------	--

Return Value

Type: Boolean
true if [is array of primitives] [the specified type]; otherwise, false.

Usage Note

In Visual Basic and C#, you can call this method as an instance method on any object of type [IDataType](#) [▶ 2475]. When you use instance method syntax to call this method, omit the first parameter. For more information, see [Extension Methods \(Visual Basic\)](#) or [Extension Methods \(C# Programming Guide\)](#).

6.11.146.1.1.2 DataTypeExtension.IsArrayOfPrimitives Method (IDataType, Boolean)

Determines whether the dataType is an array of Primitives.

Namespace: [TwinCAT.TypeSystem](#) [▶ 2083]

Assembly: TwinCAT.Ads.Abstractions (in TwinCAT.Ads.Abstractions.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public static bool IsArrayOfPrimitives(
    this IDataType type,
    bool resolve
)
```

Parameters

type	Type: TwinCAT.TypeSystem.IDataType [► 2475] The type.
resolve	Type: System.Boolean if set to true the array datatype and element datatypes will be resolved.

Return Value

Type: Boolean
true if [is array of primitives] [the specified type]; otherwise, false.

Usage Note

In Visual Basic and C#, you can call this method as an instance method on any object of type [IDataType](#) [► 2475]. When you use instance method syntax to call this method, omit the first parameter. For more information, see [Extension Methods \(Visual Basic\)](#) or [Extension Methods \(C# Programming Guide\)](#).

Gets a value indicating whether this [IDataTypes](#) [▶ 2475] is a container type

Namespace: [TwinCAT.TypeSystem](#) [▶ 2083]

Assembly: TwinCAT.Ads.Abstractions (in TwinCAT.Ads.Abstractions.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public static bool IsContainer(  
    this IDataTypeInfo type,  
    bool resolve  
)
```

Parameters

type	Type: TwinCAT.TypeSystem.IDataTypeInfo [▸ 2475] The type.
resolve	Type: System.Boolean if set to true [resolve].

Field Value

Type: Boolean
true if this instance is container type; otherwise, false.

Return Value

Type: Boolean
true if the specified resolve is container; otherwise, false.

Usage Note

In Visual Basic and C#, you can call this method as an instance method on any object of type [IDataTypeInfo](#) [▸ 2475]. When you use instance method syntax to call this method, omit the first parameter. For more information, see [Extension Methods \(Visual Basic\)](#) or [Extension Methods \(C# Programming Guide\)](#).

Remarks

Container Types are all types that contain SubElements like

- [Array](#) [▸ 2111]
- [Pointer](#) [▸ 2111]

```
public static bool IsPrimitive(
    this IDataType type,
    bool resolve
)
```

Parameters

type	Type: TwinCAT.TypeSystem.IDataType [▶ 2475] The dataType.
resolve	Type: System.Boolean if set to true the data type will be resolved.

Field Value

Type: Boolean
true if this instance is primitive; otherwise, false.

Return Value

Type: Boolean
true if the specified type is primitive; otherwise, false.

Usage Note

In Visual Basic and C#, you can call this method as an instance method on any object of type [IDataType](#) [[▶ 2475](#)]. When you use instance method syntax to call this method, omit the first parameter. For more information, see [Extension Methods \(Visual Basic\)](#) or [Extension Methods \(C# Programming Guide\)](#).

6.11.146.1.6 DataTypeExtension.ReferencesExternalData Method

Overload List

	Name	Description
	ReferencesExternalData(IDataType) [▶ 3037]	Indicates, that the Instance value includes process memory data, that cannot be read in one memory block.
	ReferencesExternalData(IInstance) [▶ 3038]	Indicates, that the Instance value includes process memory data, that cannot be read in one memory block.

Reference

[DataTypeExtension Class](#) [▶ 3021]

[TwinCAT.TypeSystem Namespace](#) [▶ 2083]

6.11.146.1.6.1 DataTypeExtension.ReferencesExternalData Method (IDataType)

Indicates, that the Instance value includes process memory data, that cannot be read in one memory block.

Namespace: [TwinCAT.TypeSystem](#) [▶ 2083]

Assembly: TwinCAT.Ads.Abstractions (in TwinCAT.Ads.Abstractions.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public static bool ReferencesExternalData(
    this IDataType type
)
```

Parameters

type	Type: TwinCAT.TypeSystem.IDataType [▶ 2475] The dataType.
------	--

Return Value

Type: Boolean

true if the value of this datatype is split into more than one memory block, false otherwise.

Usage Note

In Visual Basic and C#, you can call this method as an instance method on any object of type [IDataType](#) [▶ 2475]. When you use instance method syntax to call this method, omit the first parameter. For more information, see [Extension Methods \(Visual Basic\)](#) or [Extension Methods \(C# Programming Guide\)](#).

Remarks

This is the case, if the DataType contains static fields, Pointers or References that contain these types of instances/datatypes. The Value of the instance cannot be read in one ADS roundtrip.

Namespace: [TwinCAT.TypeSystem](#) [[▶ 2083](#)]

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public class DynamicArrayValue : DynamicValue
```

The DynamicArrayValue type exposes the following members.

Properties

Name	Description
Age [▶ 2351]	Gets the age of the value (last successful read of the value) (Inherited from DynamicValue [▶ 2347].)
CachedRaw [▶ 2351]	Gets the cached Raw internal Data. (Inherited from DynamicValue [▶ 2347].)
DataType [▶ 2352]	Gets the data type bound to this IValue [▶ 2745] (Inherited from DynamicValue [▶ 2347].)
IsPrimitive [▶ 2353]	Gets a value indicating whether this IValue [▶ 2745] is a primitive value. (Inherited from DynamicValue [▶ 2347].)
ParentValue [▶ 2356]	Gets the parent value. (Inherited from DynamicValue [▶ 2347].)
ResolvedType [▶ 2353]	Gets the resolved type. (Inherited from DynamicValue [▶ 2347].)
Symbol [▶ 2353]	Gets the symbol that is bound to this value. (Inherited from DynamicValue [▶ 2347].)
TimeStamp [▶ 2354]	Gets the Time stamp of the last successful read of the Value. (Inherited from DynamicValue [▶ 2347].)
UpdateMode [▶ 2354]	Gets / Sets the update mode (Inherited from DynamicValue [▶ 2347].)
ValueFactory [▶ 2355]	The value factory (Inherited from DynamicValue [▶ 2347].)

Methods

Name	Description
Equals	Determines whether the specified object is equal to the current object. (Inherited from Object.)
Finalize	Allows an object to try to free resources and perform other cleanup operations before it is reclaimed by garbage collection. (Inherited from Object.)
GetDynamicMemberNames [▶ 2358]	Returns the enumeration of all dynamic member names. (Inherited from DynamicValue [▶ 2347].)
GetHashCode	Serves as the default hash function. (Inherited from Object.)
GetMetaObject	Provides a DynamicMetaObject that dispatches to the dynamic virtual methods. The object can be encapsulated inside another DynamicMetaObject to provide custom behavior for individual actions. This method supports the Dynamic Language Runtime infrastructure for language implementers and it is not intended to be used directly from your code. (Inherited from DynamicObject .)
GetType	Gets the Type of the current instance. (Inherited from Object.)
MemberwiseClone	Creates a shallow copy of the current Object. (Inherited from Object.)
Read [▶ 2359]	Reads the value (via ADS) (Inherited from DynamicValue [▶ 2347].)
ReadAsync [▶ 2359]	read as an asynchronous operation. (Inherited from DynamicValue [▶ 2347].)
ResolveValue [▶ 2360]	Resolves the Value object to its primitive value. (Inherited from DynamicValue [▶ 2347].)
setMemberValue [▶ 2374]	Writes the specified member element. (Inherited from DynamicValue [▶ 2347].)

	Name	Description
	ToString [▶ 2361]	Returns a String that represents this instance. (Inherited from DynamicValue [▶ 2347].)
	TryBinaryOperation	Provides implementation for binary operations. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations such as addition and multiplication. (Inherited from DynamicObject .)
	TryConvert [▶ 2361]	Provides implementation for type conversion operations. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations that convert an object from one type to another. (Inherited from DynamicValue [▶ 2347].)
	TryCreateInstance	Provides the implementation for operations that initialize a new instance of a dynamic object. This method is not intended for use in C# or Visual Basic. (Inherited from DynamicObject .)
	TryDeleteIndex	Provides the implementation for operations that delete an object by index. This method is not intended for use in C# or Visual Basic. (Inherited from DynamicObject .)
	TryDeleteMember	Provides the implementation for operations that delete an object member. This method is not intended for use in C# or Visual Basic. (Inherited from DynamicObject .)
	TryGetArrayElement Values [▶ 2362]	Returns Array Element values. (Inherited from DynamicValue [▶ 2347].)
	TryGetIndex [▶ 2363]	Provides the implementation for operations that get a value by index. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for indexing operations. (Inherited from DynamicValue [▶ 2347].)
	TryGetIndexValue(.Int32., Object.) [▶ 2364]	Reads the specified array element. (Inherited from DynamicValue [▶ 2347].)
	TryGetIndexValue(.Object., Object.) [▶ 2364]	Tries the get index value. (Inherited from DynamicValue [▶ 2347].)
	TryGetMember [▶ 2365]	Provides the implementation for operations that get member values. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations such as getting a value for a property. (Inherited from DynamicValue [▶ 2347].)
	TryGetMemberValue [▶ 2366]	Tries the get member value. (Inherited from DynamicValue [▶ 2347].)
	TryInvoke [▶ 2366]	Provides the implementation for operations that invoke an object. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations such as invoking an object or a delegate. (Inherited from DynamicValue [▶ 2347].)
	TryInvokeMember [▶ 2367]	Provides the implementation for operations that invoke a member. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations such as calling a method. (Inherited from DynamicValue [▶ 2347].)
	TryResolveValue [▶ 2368]	Tries to resolve the Value object to its primitive value. (Inherited from DynamicValue [▶ 2347].)

Name	Description
TrySetIndex [▶ 2369]	Provides the implementation for operations that set a value by index. Classes derived from the <code>DynamicObject</code> class can override this method to specify dynamic behavior for operations that access objects by a specified index. (Inherited from DynamicValue [▶ 2347].)
TrySetIndexValue(Int32, Object) [▶ 2370]	Tries to set the indexed value on Arrays (Inherited from DynamicValue [▶ 2347].)
TrySetIndexValue(Object, Object) [▶ 2370]	Tries to set the indexed value on Arrays (Inherited from DynamicValue [▶ 2347].)
TrySetMember [▶ 2371]	Provides the implementation for operations that set member values. Classes derived from the <code>DynamicObject</code> class can override this method to specify dynamic behavior for operations such as setting a value for a property. (Inherited from DynamicValue [▶ 2347].)
TrySetMemberValue [▶ 2372]	Tries to Set a Member/Property Value (Inherited from DynamicValue [▶ 2347].)
TryUnaryOperation	Provides implementation for unary operations. Classes derived from the <code>DynamicObject</code> class can override this method to specify dynamic behavior for operations such as negation, increment, or decrement. (Inherited from <code>DynamicObject</code> .)
Write [▶ 2372]	Writes the value (via ADS) (Inherited from DynamicValue [▶ 2347].)
WriteAsync [▶ 2373]	write as an asynchronous operation. (Inherited from DynamicValue [▶ 2347].)

6.11.148.2 DynamicArrayValue Methods

The [DynamicArrayValue](#) [[▶ 3042](#)] type exposes the following members.

Methods

	Name	Description
	Equals	Determines whether the specified object is equal to the current object. (Inherited from Object .)
	Finalize	Allows an object to try to free resources and perform other cleanup operations before it is reclaimed by garbage collection. (Inherited from Object .)
	GetDynamicMemberNames [▶ 2358]	Returns the enumeration of all dynamic member names. (Inherited from DynamicValue [▶ 2347].)
	GetHashCode	Serves as the default hash function. (Inherited from Object .)
	GetMetaObject	Provides a DynamicMetaObject that dispatches to the dynamic virtual methods. The object can be encapsulated inside another DynamicMetaObject to provide custom behavior for individual actions. This method supports the Dynamic Language Runtime infrastructure for language implementers and it is not intended to be used directly from your code. (Inherited from DynamicObject .)
	GetType	Gets the Type of the current instance. (Inherited from Object .)
	MemberwiseClone	Creates a shallow copy of the current Object . (Inherited from Object .)
	Read [▶ 2359]	Reads the value (via ADS) (Inherited from DynamicValue [▶ 2347].)
	ReadAsync [▶ 2359]	read as an asynchronous operation. (Inherited from DynamicValue [▶ 2347].)
	ResolveValue [▶ 2360]	Resolves the Value object to its primitive value. (Inherited from DynamicValue [▶ 2347].)
	setMemberValue [▶ 2374]	Writes the specified member element. (Inherited from DynamicValue [▶ 2347].)
	ToString [▶ 2361]	Returns a String that represents this instance. (Inherited from DynamicValue [▶ 2347].)
	TryBinaryOperation	Provides implementation for binary operations. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations such as addition and multiplication. (Inherited from DynamicObject .)
	TryConvert [▶ 2361]	Provides implementation for type conversion operations. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations that convert an object from one type to another. (Inherited from DynamicValue [▶ 2347].)

	Name	Description
	TryCreateInstance	Provides the implementation for operations that initialize a new instance of a dynamic object. This method is not intended for use in C# or Visual Basic. (Inherited from DynamicObject.)
	TryDeleteIndex	Provides the implementation for operations that delete an object by index. This method is not intended for use in C# or Visual Basic. (Inherited from DynamicObject.)
	TryDeleteMember	Provides the implementation for operations that delete an object member. This method is not intended for use in C# or Visual Basic. (Inherited from DynamicObject.)
	TryGetArrayElementValues [▶ 2362]	Returns Array Element values. (Inherited from DynamicValue [▶ 2347].)
	TryGetIndex [▶ 2363]	Provides the implementation for operations that get a value by index. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for indexing operations. (Inherited from DynamicValue [▶ 2347].)
	TryGetIndexValue(Int32, Object) [▶ 2364]	Reads the specified array element. (Inherited from DynamicValue [▶ 2347].)
	TryGetIndexValue(Object, Object) [▶ 2364]	Tries the get index value. (Inherited from DynamicValue [▶ 2347].)
	TryGetMember [▶ 2365]	Provides the implementation for operations that get member values. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations such as getting a value for a property. (Inherited from DynamicValue [▶ 2347].)
	TryGetMemberValue [▶ 2366]	Tries the get member value. (Inherited from DynamicValue [▶ 2347].)
	TryInvoke [▶ 2366]	Provides the implementation for operations that invoke an object. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations such as invoking an object or a delegate. (Inherited from DynamicValue [▶ 2347].)
	TryInvokeMember [▶ 2367]	Provides the implementation for operations that invoke a member. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations such as calling a method. (Inherited from DynamicValue [▶ 2347].)
	TryResolveValue [▶ 2368]	Tries to resolves the Value object to its primitive value. (Inherited from DynamicValue [▶ 2347].)
	TrySetIndex [▶ 2369]	Provides the implementation for operations that set a value by index. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations that access objects by a specified index. (Inherited from DynamicValue [▶ 2347].)
	TrySetIndexValue(Int32, Object) [▶ 2370]	Tries to set the indexed value on Arrays (Inherited from DynamicValue [▶ 2347].)
	TrySetIndexValue(Object, Object) [▶ 2370]	Tries to set the indexed value on Arrays (Inherited from DynamicValue [▶ 2347].)

	Name	Description
	TrySetMember [▶ 2371]	Provides the implementation for operations that set member values. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations such as setting a value for a property. (Inherited from DynamicValue [▶ 2347].)
	TrySetMemberValue [▶ 2372]	Tries to Set a Member/Property Value (Inherited from DynamicValue [▶ 2347].)
	TryUnaryOperation	Provides implementation for unary operations. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations such as negation, increment, or decrement. (Inherited from DynamicObject.)
	Write [▶ 2372]	Writes the value (via ADS) (Inherited from DynamicValue [▶ 2347].)
	WriteAsync [▶ 2373]	write as an asynchronous operation. (Inherited from DynamicValue [▶ 2347].)

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public class DynamicEnumValue : DynamicValue
```

The DynamicEnumValue type exposes the following members.

Properties

	Name	Description
	Age [▶ 2351]	Gets the age of the value (last successful read of the value) (Inherited from DynamicValue [▶ 2347].)
	CachedRaw [▶ 2351]	Gets the cached Raw internal Data. (Inherited from DynamicValue [▶ 2347].)
	DataType [▶ 2352]	Gets the data type bound to this IValue [▶ 2745] (Inherited from DynamicValue [▶ 2347].)
	IsPrimitive [▶ 2353]	Gets a value indicating whether this IValue [▶ 2745] is a primitive value. (Inherited from DynamicValue [▶ 2347].)
	ParentValue [▶ 2356]	Gets the parent value. (Inherited from DynamicValue [▶ 2347].)

	Name	Description
	ResolvedType [▶ 2353]	Gets the resolved type. (Inherited from DynamicValue [▶ 2347].)
	Symbol [▶ 2353]	Gets the symbol that is bound to this value. (Inherited from DynamicValue [▶ 2347].)
	TimeStamp [▶ 2354]	Gets the Time stamp of the last successful read of the Value. (Inherited from DynamicValue [▶ 2347].)
	UpdateMode [▶ 2354]	Gets / Sets the update mode (Inherited from DynamicValue [▶ 2347].)
	ValueFactory [▶ 2355]	The value factory (Inherited from DynamicValue [▶ 2347].)

Methods

	Name	Description
	Equals	Determines whether the specified object is equal to the current object. (Inherited from Object.)
	Finalize	Allows an object to try to free resources and perform other cleanup operations before it is reclaimed by garbage collection. (Inherited from Object.)
	GetDynamicMemberNames [▶ 2358]	Returns the enumeration of all dynamic member names. (Inherited from DynamicValue [▶ 2347].)
	GetHashCode	Serves as the default hash function. (Inherited from Object.)
	GetMetaObject	Provides a DynamicMetaObject that dispatches to the dynamic virtual methods. The object can be encapsulated inside another DynamicMetaObject to provide custom behavior for individual actions. This method supports the Dynamic Language Runtime infrastructure for language implementers and it is not intended to be used directly from your code. (Inherited from DynamicObject .)
	GetType	Gets the Type of the current instance. (Inherited from Object.)
	MemberwiseClone	Creates a shallow copy of the current Object. (Inherited from Object.)
	Read [▶ 2359]	Reads the value (via ADS) (Inherited from DynamicValue [▶ 2347].)
	ReadAsync [▶ 2359]	read as an asynchronous operation. (Inherited from DynamicValue [▶ 2347].)
	ResolveValue [▶ 2360]	Resolves the Value object to its primitive value. (Inherited from DynamicValue [▶ 2347].)
	setMemberValue [▶ 2374]	Writes the specified member element. (Inherited from DynamicValue [▶ 2347].)
	ToString [▶ 2361]	Returns a String that represents this instance. (Inherited from DynamicValue [▶ 2347].)
	TryBinaryOperation	Provides implementation for binary operations. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations such as addition and multiplication. (Inherited from DynamicObject .)
	TryConvert [▶ 2361]	Provides implementation for type conversion operations. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations that convert an object from one type to another. (Inherited from DynamicValue [▶ 2347].)
	TryCreateInstance	Provides the implementation for operations that initialize a new instance of a dynamic object. This method is not intended for use in C# or Visual Basic. (Inherited from DynamicObject .)

	Name	Description
	TryDeleteIndex	Provides the implementation for operations that delete an object by index. This method is not intended for use in C# or Visual Basic. (Inherited from DynamicObject.)
	TryDeleteMember	Provides the implementation for operations that delete an object member. This method is not intended for use in C# or Visual Basic. (Inherited from DynamicObject.)
	TryGetArrayElement Values [▶ 2362]	Returns Array Element values. (Inherited from DynamicValue [▶ 2347].)
	TryGetIndex [▶ 2363]	Provides the implementation for operations that get a value by index. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for indexing operations. (Inherited from DynamicValue [▶ 2347].)
	TryGetIndexValue(.Int32., Object.) [▶ 2364]	Reads the specified array element. (Inherited from DynamicValue [▶ 2347].)
	TryGetIndexValue(Object., Object.) [▶ 2364]	Tries the get index value. (Inherited from DynamicValue [▶ 2347].)
	TryGetMember [▶ 2365]	Provides the implementation for operations that get member values. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations such as getting a value for a property. (Inherited from DynamicValue [▶ 2347].)
	TryGetMemberValue [▶ 2366]	Tries the get member value. (Inherited from DynamicValue [▶ 2347].)
	TryInvoke [▶ 2366]	Provides the implementation for operations that invoke an object. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations such as invoking an object or a delegate. (Inherited from DynamicValue [▶ 2347].)
	TryInvokeMember [▶ 2367]	Provides the implementation for operations that invoke a member. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations such as calling a method. (Inherited from DynamicValue [▶ 2347].)
	TryResolveValue [▶ 2368]	Tries to resolve the Value object to its primitive value. (Inherited from DynamicValue [▶ 2347].)
	TrySetIndex [▶ 2369]	Provides the implementation for operations that set a value by index. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations that access objects by a specified index. (Inherited from DynamicValue [▶ 2347].)
	TrySetIndexValue(Int32., Object.) [▶ 2370]	Tries to set the indexed value on Arrays (Inherited from DynamicValue [▶ 2347].)
	TrySetIndexValue(Object., Object.) [▶ 2370]	Tries to set the indexed value on Arrays (Inherited from DynamicValue [▶ 2347].)
	TrySetMember [▶ 2371]	Provides the implementation for operations that set member values. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations such as setting a value for a property. (Inherited from DynamicValue [▶ 2347].)

	Name	Description
	TrySetMemberValue [▶ 2372]	Tries to Set a Member/Property Value (Inherited from DynamicValue [▶ 2347].)
	TryUnaryOperation	Provides implementation for unary operations. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations such as negation, increment, or decrement. (Inherited from DynamicObject .)
	Write [▶ 2372]	Writes the value (via ADS) (Inherited from DynamicValue [▶ 2347].)
	WriteAsync [▶ 2373]	write as an asynchronous operation. (Inherited from DynamicValue [▶ 2347].)

6.11.149.2 DynamicEnumValue Methods

The [DynamicEnumValue \[▶ 3048\]](#) type exposes the following members.

Methods

Name	Description
Equals	Determines whether the specified object is equal to the current object. (Inherited from Object.)
Finalize	Allows an object to try to free resources and perform other cleanup operations before it is reclaimed by garbage collection. (Inherited from Object.)
GetDynamicMemberNames [▶ 2358]	Returns the enumeration of all dynamic member names. (Inherited from DynamicValue [▶ 2347].)
GetHashCode	Serves as the default hash function. (Inherited from Object.)
GetMetaObject	Provides a DynamicMetaObject that dispatches to the dynamic virtual methods. The object can be encapsulated inside another DynamicMetaObject to provide custom behavior for individual actions. This method supports the Dynamic Language Runtime infrastructure for language implementers and it is not intended to be used directly from your code. (Inherited from DynamicObject.)
GetType	Gets the Type of the current instance. (Inherited from Object.)
MemberwiseClone	Creates a shallow copy of the current Object. (Inherited from Object.)
Read [▶ 2359]	Reads the value (via ADS) (Inherited from DynamicValue [▶ 2347].)
ReadAsync [▶ 2359]	read as an asynchronous operation. (Inherited from DynamicValue [▶ 2347].)
ResolveValue [▶ 2360]	Resolves the Value object to its primitive value. (Inherited from DynamicValue [▶ 2347].)
setMemberValue [▶ 2374]	Writes the specified member element. (Inherited from DynamicValue [▶ 2347].)
ToString [▶ 2361]	Returns a String that represents this instance. (Inherited from DynamicValue [▶ 2347].)
TryBinaryOperation	Provides implementation for binary operations. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations such as addition and multiplication. (Inherited from DynamicObject.)
TryConvert [▶ 2361]	Provides implementation for type conversion operations. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations that convert an object from one type to another. (Inherited from DynamicValue [▶ 2347].)
TryCreateInstance	Provides the implementation for operations that initialize a new instance of a dynamic object. This method is not intended for use in C# or Visual Basic. (Inherited from DynamicObject.)
TryDeleteIndex	Provides the implementation for operations that delete an object by index. This method is not intended for use in C# or Visual Basic. (Inherited from DynamicObject.)
TryDeleteMember	Provides the implementation for operations that delete an object member. This method is not intended for use in C# or Visual Basic. (Inherited from DynamicObject.)
TryGetArrayElementValues [▶ 2362]	Returns Array Element values. (Inherited from DynamicValue [▶ 2347].)
TryGetIndex [▶ 2363]	Provides the implementation for operations that get a value by index. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for indexing operations. (Inherited from DynamicValue [▶ 2347].)

	Name	Description
	TryGetIndexValue(Int32, Object) [▶ 2364]	Reads the specified array element. (Inherited from DynamicValue [▶ 2347].)
	TryGetIndexValue(Object, Object) [▶ 2364]	Tries the get index value. (Inherited from DynamicValue [▶ 2347].)
	TryGetMember [▶ 2365]	Provides the implementation for operations that get member values. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations such as getting a value for a property. (Inherited from DynamicValue [▶ 2347].)
	TryGetMemberValue [▶ 2366]	Tries the get member value. (Inherited from DynamicValue [▶ 2347].)
	TryInvoke [▶ 2366]	Provides the implementation for operations that invoke an object. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations such as invoking an object or a delegate. (Inherited from DynamicValue [▶ 2347].)
	TryInvokeMember [▶ 2367]	Provides the implementation for operations that invoke a member. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations such as calling a method. (Inherited from DynamicValue [▶ 2347].)
	TryResolveValue [▶ 2368]	Tries to resolve the Value object to its primitive value. (Inherited from DynamicValue [▶ 2347].)
	TrySetIndex [▶ 2369]	Provides the implementation for operations that set a value by index. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations that access objects by a specified index. (Inherited from DynamicValue [▶ 2347].)
	TrySetIndexValue(Int32, Object) [▶ 2370]	Tries to set the indexed value on Arrays (Inherited from DynamicValue [▶ 2347].)
	TrySetIndexValue(Object, Object) [▶ 2370]	Tries to set the indexed value on Arrays (Inherited from DynamicValue [▶ 2347].)
	TrySetMember [▶ 2371]	Provides the implementation for operations that set member values. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations such as setting a value for a property. (Inherited from DynamicValue [▶ 2347].)
	TrySetMemberValue [▶ 2372]	Tries to Set a Member/Property Value (Inherited from DynamicValue [▶ 2347].)
	TryUnaryOperation	Provides implementation for unary operations. Classes derived from the DynamicObject class can override this method to specify dynamic behavior for operations such as negation, increment, or decrement. (Inherited from DynamicObject .)
	Write [▶ 2372]	Writes the value (via ADS) (Inherited from DynamicValue [▶ 2347].)
	WriteAsync [▶ 2373]	write as an asynchronous operation. (Inherited from DynamicValue [▶ 2347].)

6.11.150 UInt32Ptr Structure

Represents an 32-Bit Pointer (Process independant)

Namespace: [TwinCAT.TypeSystem \[► 2083\]](#)

Assembly: TwinCAT.Ads.Abstractions (in TwinCAT.Ads.Abstractions.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public struct UInt32Ptr
```

The UInt32Ptr type exposes the following members.

Constructors

	Name	Description
	UInt32Ptr. [► 3056]	Initializes a new instance of the UInt32Ptr struct.
	UInt32Ptr(UInt32) [► 3056]	Initializes a new instance of the UInt32Ptr struct.
	UInt32Ptr(Void*) [► 3056]	Initializes a new instance of the UInt32Ptr struct.

Properties

	Name	Description
	Size [► 3057]	Gets the size (4-Byte)

Methods

	Name	Description
	Add [► 3058]	Adds an offset to the pointer.
	Equals [► 3059]	Determines whether the specified Object is equal to this instance. (Overrides ValueType.Equals(Object).)
	GetHashCode [► 3059]	Returns a hash code for this instance. (Overrides ValueType.GetHashCode..)
	GetType	Gets the Type of the current instance. (Inherited from Object.)
	Subtract [► 3060]	Subtracts an offset from the specified pointer.
	ToPointer [► 3060]	Converts this 32-Pointer object to an unsafe void* pointer
	ToString [► 3060]	Returns a String that represents this instance. (Overrides ValueType.ToString..)
	ToUInt32 [► 3061]	Converts the 32-Bit Pointer to uint
	ToUInt64 [► 3061]	Converts the 32-Bit Pointer to ulong.

Operators

	Name	Description
	Addition [► 3062]	Implements the + operator.
	Equality [► 3063]	Implements the == operator.
	.UInt32 to UInt32Ptr [► 3064]	Performs an explicit conversion from UInt32 to UInt32Ptr.
	.UInt32Ptr to UInt32 [► 3065]	Performs an explicit conversion from UInt32Ptr to UInt32.
	.UInt32Ptr to UInt64 [► 3065]	Performs an explicit conversion from UInt32Ptr to UInt64.
	.UInt32Ptr to UIntPtr [► 3066]	Performs an explicit conversion from UInt32Ptr to UIntPtr.
	.UInt32Ptr to Void* [► 3066]	Performs an explicit conversion from UInt32Ptr to Void.
	.UInt64 to UInt32Ptr [► 3067]	Performs an explicit conversion from UInt64 to UInt32Ptr.
	.UInt64Ptr to UInt32Ptr [► 3067]	Performs an explicit conversion from UInt64Ptr [► 3070] to UInt32Ptr.
	.Void* to UInt32Ptr [► 3068]	Performs an explicit conversion from Void to UInt32Ptr.
	Inequality [► 3068]	Implements the != operator.
	Subtraction [► 3069]	Implements the - operator.

Fields

	Name	Description
	Zero [► 3070]	Zero/Null Pointer

6.11.150.3.1 UInt32Ptr.Add Method

Adds an offset to the pointer.

Namespace: [TwinCAT.TypeSystem](#) [[▶ 2083](#)]

Assembly: TwinCAT.Ads.Abstractions (in TwinCAT.Ads.Abstractions.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public static UInt32Ptr Add(
    UInt32Ptr pointer,
    int offset
)
```

Parameters

pointer	Type: TwinCAT.TypeSystem.UInt32Ptr [▶ 3054] The pointer.
offset	Type: <code>System.Int32</code> The offset.

Return Value

Type: [UInt32Ptr](#) [[▶ 3054](#)]
`UInt32Ptr`.

Reference

[UInt32Ptr Structure \[► 3054\]](#)

[TwinCAT.TypeSystem Namespace \[► 2083\]](#)

6.11.150.3.2 UInt32Ptr.Equals Method

Determines whether the specified Object is equal to this instance.

Namespace: [TwinCAT.TypeSystem \[► 2083\]](#)

Assembly: TwinCAT.Ads.Abstractions (in TwinCAT.Ads.Abstractions.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public override bool Equals(  
    Object? obj  
)
```

Parameters

obj	Type: System.Object The object to compare with the current instance.
-----	---

Return Value

Type: Boolean

true if the specified Object is equal to this instance; otherwise, false.

Reference

6.11.151 UInt64Ptr Structure

Represents an 64-Bit Pointer (Process independant)

Namespace: [TwinCAT.TypeSystem \[▸ 2083\]](#)

Assembly: TwinCAT.Ads.Abstractions (in TwinCAT.Ads.Abstractions.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public struct UInt64Ptr
```

The UInt64Ptr type exposes the following members.

Constructors

	Name	Description
	UInt64Ptr(UInt64) [▸ 3072]	Initializes a new instance of the UInt64Ptr struct.
	UInt64Ptr(Void*) [▸ 3072]	Initializes a new instance of the UInt64Ptr struct.

Properties

	Name	Description
	Size [▸ 3073]	Gets the size (8-Byte)

Methods

Name	Description
Add [▶ 3074]	Adds an offset to the pointer.
Equals [▶ 3075]	Determines whether the specified Object is equal to this instance. (Overrides ValueType.Equals(Object).)
GetHashCode [▶ 3075]	Returns a hash code for this instance. (Overrides ValueType.GetHashCode..)
GetType	Gets the Type of the current instance. (Inherited from Object.)
Subtract [▶ 3076]	Subtracts an offset from the pointer.
ToPointer [▶ 3076]	Converts this 64-Pointer object to an unsafe void* pointer
ToString [▶ 3076]	Returns a String that represents this instance. (Overrides ValueType.ToString..)
ToUInt32 [▶ 3077]	Converts this 64-Bit Pointer to an UInt32 value
ToUInt64 [▶ 3077]	Converts this 64-Bit Pointer to an UInt64 value

Operators

Name	Description
Addition [▶ 3078]	Implements the + operator.
Equality [▶ 3079]	Implements the == operator.
.UInt32 to UInt64Ptr [▶ 3080]	Performs an explicit conversion from UInt32 to UInt64Ptr.
.UInt32Ptr to UInt64Ptr [▶ 3081]	Performs an explicit conversion from UInt32Ptr [▶ 3054] to UInt64Ptr.
.UInt64 to UInt64Ptr [▶ 3081]	Performs an explicit conversion from UInt64 to UInt64Ptr.
.UInt64Ptr to UInt32 [▶ 3082]	Performs an explicit conversion from UInt64Ptr to UInt32.
.UInt64Ptr to UInt64 [▶ 3082]	Performs an explicit conversion from UInt64Ptr to UInt64.
.UInt64Ptr to UIntPtr [▶ 3083]	Performs an explicit conversion from UInt64Ptr to UIntPtr.
.UInt64Ptr to Void* [▶ 3083]	Performs an explicit conversion from UInt64Ptr to Void.
.Void* to UInt64Ptr [▶ 3084]	Performs an explicit conversion from Void to UInt64Ptr.
Inequality [▶ 3084]	Implements the != operator.
Subtraction [▶ 3085]	Subtracts an offset from the pointer.

Fields

Name	Description
Zero [▶ 3086]	The zero/null pointer

6.11.151.3.1 UInt64Ptr.Add Method

Adds an offset to the pointer.

Namespace: [TwinCAT.TypeSystem](#) [[▶ 2083](#)]

Assembly: TwinCAT.Ads.Abstractions (in TwinCAT.Ads.Abstractions.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public static UInt64Ptr Add(
    UInt64Ptr pointer,
    int offset
)
```

Parameters

pointer	Type: TwinCAT.TypeSystem.UInt64Ptr [▶ 3070] The pointer.
offset	Type: <code>System.Int32</code> The offset.

Return Value

Type: [UInt64Ptr](#) [[▶ 3070](#)]
`UInt64Ptr`.

Reference

[UInt64Ptr Structure \[► 3070\]](#)

[TwinCAT.TypeSystem Namespace \[► 2083\]](#)

6.11.151.3.2 UInt64Ptr.Equals Method

Determines whether the specified Object is equal to this instance.

Namespace: [TwinCAT.TypeSystem \[► 2083\]](#)

Assembly: TwinCAT.Ads.Abstractions (in TwinCAT.Ads.Abstractions.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public override bool Equals(  
    Object? obj  
)
```

Parameters

obj	Type: System.Object The object to compare with the current instance.
-----	---

Return Value

Type: Boolean

true if the specified Object is equal to this instance; otherwise, false.

Reference

[UInt64Ptr Structure \[► 3070\]](#)

[TwinCAT.TypeSystem Namespace \[► 2083\]](#)

6.11.151.3.3 UInt64Ptr.GetHashCode Method

Returns a hash code for this instance.

Namespace: [TwinCAT.TypeSystem \[► 2083\]](#)

Assembly: TwinCAT.Ads.Abstractions (in TwinCAT.Ads.Abstractions.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public override int GetHashCode()
```

Return Value

Type: Int32

A hash code for this instance, suitable for use in hashing algorithms and data structures like a hash table.

Reference

[UInt64Ptr Structure \[► 3070\]](#)

6.11.151.3.4 UInt64Ptr.Subtract Method

Subtracts an offset from the pointer.

Namespace: [TwinCAT.TypeSystem](#) [[▶ 2083](#)]

Assembly: TwinCAT.Ads.Abstractions (in TwinCAT.Ads.Abstractions.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public static UInt64Ptr Subtract(  
    UInt64Ptr pointer,  
    int offset  
)
```

Parameters

pointer	Type: TwinCAT.TypeSystem.UInt64Ptr [▶ 3070] The pointer.
offset	Type: System.Int32 The offset.

Return Value

Type: [UInt64Ptr](#) [[▶ 3070](#)]

UInt64Ptr.

Reference

[UInt64Ptr Structure](#) [[▶ 3070](#)]

[TwinCAT.TypeSystem Namespace](#) [[▶ 2083](#)]

6.11.151.3.5 UInt64Ptr.ToPointer Method

Converts this 64-Pointer object to an unsafe void* pointer

Namespace: [TwinCAT.TypeSystem](#) [[▶ 2083](#)]

Assembly: TwinCAT.Ads.Abstractions (in TwinCAT.Ads.Abstractions.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public void* ToPointer()
```

Return Value

Type: Void*

Reference

[UInt64Ptr Structure](#) [[▶ 3070](#)]

[TwinCAT.TypeSystem Namespace](#) [[▶ 2083](#)]

6.11.151.3.6 UInt64Ptr.ToString Method

Returns a String that represents this instance.

Namespace: [TwinCAT.TypeSystem](#) [[▶ 2083](#)]

Assembly: TwinCAT.Ads.Abstractions (in TwinCAT.Ads.Abstractions.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public override string ToString()
```

Return Value

Type: String

A String that represents this instance.

6.11.151.4 UInt64Ptr Operators and Type Conversions

The [UInt64Ptr \[► 3070\]](#) type exposes the following members.

Operators

Name	Description
Addition [► 3078]	Implements the + operator.
Equality [► 3079]	Implements the == operator.
.(UInt32 to UInt64Ptr) [► 3080]	Performs an explicit conversion from UInt32 to UInt64Ptr [► 3070] .
.(UInt32Ptr to UInt64Ptr) [► 3081]	Performs an explicit conversion from UInt32Ptr [► 3054] to UInt64Ptr [► 3070] .
.(UInt64 to UInt64Ptr) [► 3081]	Performs an explicit conversion from UInt64 to UInt64Ptr [► 3070] .
.(UInt64Ptr to UInt32) [► 3082]	Performs an explicit conversion from UInt64Ptr [► 3070] to UInt32.
.(UInt64Ptr to UInt64) [► 3082]	Performs an explicit conversion from UInt64Ptr [► 3070] to UInt64.
.(UInt64Ptr to UIntPtr) [► 3083]	Performs an explicit conversion from UInt64Ptr [► 3070] to UIntPtr.
.(UInt64Ptr to Void*) [► 3083]	Performs an explicit conversion from UInt64Ptr [► 3070] to Void.
.(Void* to UInt64Ptr) [► 3084]	Performs an explicit conversion from Void to UInt64Ptr [► 3070] .
Inequality [► 3084]	Implements the != operator.
Subtraction [► 3085]	Subtracts an offset from the pointer.

6.11.151.4.1 UInt64Ptr.Addition Operator

Implements the + operator.

Namespace: [TwinCAT.TypeSystem \[► 2083\]](#)

Assembly: TwinCAT.Ads.Abstractions (in TwinCAT.Ads.Abstractions.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public static UInt64Ptr operator +(
    UInt64Ptr pointer,
    int offset
)
```

Parameters

pointer	Type: TwinCAT.TypeSystem.UInt64Ptr [▶ 3070] The pointer.
offset	Type: System.Int32 The offset.

Return Value

Type: [UInt64Ptr](#) [[▶ 3070](#)]
The result of the operator.

Reference

6.11.151.4.2 UInt64Ptr.Equality Operator

Implements the == operator.

Namespace: [TwinCAT.TypeSystem](#) [[▶ 2083](#)]

Assembly: [TwinCAT.Ads.Abstractions](#) (in [TwinCAT.Ads.Abstractions.dll](#)) Version: 6.0.328+39e3229

Syntax

C#

```
public static bool operator ==(
    UInt64Ptr value1,
    UInt64Ptr value2
)
```

Parameters

value1	Type: TwinCAT.TypeSystem.UInt64Ptr [▶ 3070] The value1.
value2	Type: TwinCAT.TypeSystem.UInt64Ptr [▶ 3070] The value2.

Return Value

Type: Boolean
The result of the operator.

6.12 TwinCAT.TypeSystem.Generic Namespace

Namespace for the dynamic part of the common type system.

Classes

	Class	Description
	DataTypeCollection.T. [► 3087]	Data type collection
	InstanceCollection.T. [► 3104]	Base class for IInstance [► 2549] object collections (abstract).
	NamespaceCollection.T. [► 3126]	Generic class for Namespace collections
	ReadOnlyDataTypeCollection.T. [► 3139]	ReadOnly DataType collection
	ReadOnlyInstanceCollection.T. [► 3145]	ReadOnly Instance collection

	Class	Description
	ReadOnlyNamespaceCollection.T. [▶ 3154]	Read Only namespace collection
	ReadOnlySymbolCollection.T. [▶ 3161]	Read only symbol collection.
	SymbolCollection.T. [▶ 3165]	Interface represents a collection of ISymbol [▶ 2691] objects.
 	SymbolIterator.T. [▶ 3172]	Iterator class for enumerations of Symbols [▶ 2691].

Interfaces

	Interface	Description
	INamespace.TType. [▶ 3102]	Namespace interface
	ISymbolProvider.TNamespace, TDataType, TSymbol. [▶ 3122]	Symbol provider interface

6.12.1 DataTypeCollection.T. Class

Data type collection

Inheritance Hierarchy

System.Object
 TwinCAT.TypeSystem.Generic.DataTypeCollection.T.
 TwinCAT.TypeSystem.DataTypeCollection [▶ 2112]

Namespace: TwinCAT.TypeSystem.Generic [▶ 3086]

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public class DataTypeCollection<T> : IList<T>,
    ICollection<T>, IEnumerable<T>, IEnumerable, IDatatypeCollection<T>
where T : class, IDatatype
```

Type Parameters

T

The DataTypeCollection.T. type exposes the following members.

Constructors

	Name	Description
	DataTypeCollection.T.. [▶ 3089]	Initializes a new instance of the DataTypeCollection [▶ 2112] class.

	Name	Description
	DataTypeCollection.T.(IEnumerable.T.) [▶ 3090]	Initializes a new instance of the DataTypeCollection.T. class.

Properties

	Name	Description
	Count [▶ 3090]	Gets the count of contained IDataType [▶ 2475]s.
	IsReadOnly [▶ 3091]	Gets a value indicating whether this instance is read only.
	Item.Int32. [▶ 3092]	Gets or sets the IDataType [▶ 2475] at the specified index.
	Item.String. [▶ 3092]	Gets the IDataType [▶ 2475] with the specified name.

Methods

	Name	Description
	Add [▶ 3094]	Adds the specified item to the collection.
	AddRange [▶ 3094]	Adds a range of types
	AsReadOnly [▶ 3095]	Converts the DataTypeCollection.T. into a ReadOnlyCollection.T.
	Clear [▶ 3095]	Clears the collection.
	Clone [▶ 3095]	Clones this instance.
	Contains [▶ 3096]	Determines whether this DataTypeCollection [▶ 2112] contains the specified IDataType [▶ 2475].
	ContainsType [▶ 3096]	Determines whether the container contains the specified IDataType [▶ 2475].
	CopyTo [▶ 3097]	Copies the data types to the specified array, starting at the array index.
	Equals	Determines whether the specified object is equal to the current object. (Inherited from Object.)
	Finalize	Allows an object to try to free resources and perform other cleanup operations before it is reclaimed by garbage collection. (Inherited from Object.)
	GetEnumerator [▶ 3098]	Gets the enumerator.
	GetHashCode	Serves as the default hash function. (Inherited from Object.)
	GetType	Gets the Type of the current instance. (Inherited from Object.)
	IndexOf [▶ 3098]	Determines the Index of the specified IDataType [▶ 2475].
	Insert [▶ 3099]	Inserts an IDataType [▶ 2475] into the DataTypeCollection [▶ 2112].
	LookupType [▶ 3099]	Determines the specified IDataType [▶ 2475]
	MemberwiseClone	Creates a shallow copy of the current Object. (Inherited from Object.)
	Remove [▶ 3100]	Removes the specified IDataType [▶ 2475].
	RemoveAt [▶ 3100]	Removes the IDataType [▶ 2475] object at the specified index.

	Name	Description
	ToString	Returns a string that represents the current object. (Inherited from Object.)
	TryGetType [▶ 3101]	Tries to get the specified IDataType [▶ 2475] from the IDataTypeCollection.T. [▶ 2486] .

Fields

	Name	Description
	list [▶ 3102]	Internal list of data types

Reference

Namespace: [TwinCAT.TypeSystem.Generic \[► 3086\]](#)

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public abstract class InstanceCollection<T> : IList<T>,
    ICollection<T>, IEnumerable<T>, IEnumerable, IInstanceCollection<T>
where T : class, IInstance
```

Type Parameters

T

The InstanceCollection.T. type exposes the following members.

Constructors

	Name	Description
	InstanceCollection.T : (InstanceCollection Mode) [► 3106]	Initializes a new instance of the InstanceCollection.T. class.
	InstanceCollection.T .(IEnumerable.T., InstanceCollectionMode) [► 3106]	Initializes a new instance of the InstanceCollection.T. class.

Properties

	Name	Description
	Count [► 3107]	Gets the collection count.
	InnerList [► 3108]	Gets the List of instances.
	InnerPathDict [► 3108]	The Path dictionary
	IsReadOnly [► 3109]	Gets a value indicating whether this instance is read only.

	Name	Description
	Item.Int32 [▶ 3109]	Gets or sets the Instance [▶ 2549] at the specified index.
	Item.String [▶ 3110]	Gets the Instance [▶ 2549] with the specified instance path.
	Mode [▶ 3111]	The mode this InstanceCollection.T. is working in.

Methods

	Name	Description
	Add [▶ 3112]	Adds the specified item.
	AddRange [▶ 3113]	Adds the specified items to this collection.
	AsReadOnly [▶ 3113]	Converts the InstanceCollection.T. to an ReadOnlyInstanceCollection.T. [▶ 3145]
	Clear [▶ 3114]	Clears this instance.
	Contains(T) [▶ 3115]	Determines whether this collection contains the specified Instance [▶ 2549]
	Contains(String) [▶ 3114]	Determines whether this collection contains an Instance [▶ 2549] with the specified InstanceName / InstancePath
	ContainsName [▶ 3116]	Determines whether the specified instance name contains name.
	CopyTo [▶ 3116]	Copies this InstanceCollection.T. to the specified array.
	Equals	Determines whether the specified object is equal to the current object. (Inherited from Object.)
	Finalize	Allows an object to try to free resources and perform other cleanup operations before it is reclaimed by garbage collection. (Inherited from Object.)
	GetEnumerator [▶ 3117]	Gets the enumerator.
	GetHashCode	Serves as the default hash function. (Inherited from Object.)
	GetInstance [▶ 3117]	Gets the Instance [▶ 2549] by instance path.
	GetInstanceByName [▶ 3118]	Gets the name of the instance by.
	GetType	Gets the Type of the current instance. (Inherited from Object.)
	IndexOf [▶ 3119]	Determines the index of the specified Instance [▶ 2549].
	Insert [▶ 3119]	Inserts the specified Instance [▶ 2549] at the specified index.
	MemberwiseClone	Creates a shallow copy of the current Object. (Inherited from Object.)
	Remove [▶ 3120]	Removes the specified item.
	RemoveAt [▶ 3121]	Removes the Instance [▶ 2549] at the specified index.
	ToString	Returns a string that represents the current object. (Inherited from Object.)
	TryGetInstance [▶ 3121]	Tries to get the Instance [▶ 2549] of the specified path.
	TryGetInstanceByName [▶ 3122]	Tries to get Instances by name.

6.12.3.2.6 InstanceCollection.T..Mode Property

The mode this [InstanceCollection.T.](#) [[▶ 3104](#)] is working in.

Namespace: [TwinCAT.TypeSystem.Generic](#) [[▶ 3086](#)]

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public InstanceCollectionMode Mode { get; }
```

Property Value

Type: [InstanceCollectionMode](#) [[▶ 2573](#)]

Implements

[IInstanceCollection.T..Mode](#) [[▶ 2556](#)]

Reference

[InstanceCollection.T. Class](#) [[▶ 3104](#)]

[TwinCAT.TypeSystem.Generic Namespace](#) [[▶ 3086](#)]

6.12.3.3 InstanceCollection.T. Methods

The [InstanceCollection.T.](#) [[▶ 3104](#)] generic type exposes the following members.

Methods

	Name	Description
	Add [▶ 3112]	Adds the specified item.

	Name	Description
	AddRange [▶ 3113]	Adds the specified items to this collection.
	AsReadOnly [▶ 3113]	Converts the InstanceCollection.T. [▶ 3104] to an ReadOnlyInstanceCollection.T. [▶ 3145]
	Clear [▶ 3114]	Clears this instance.
	Contains(T) [▶ 3115]	Determines whether this collection contains the specified Instance [▶ 2549]
	Contains(String) [▶ 3114]	Determines whether this collection contains an Instance [▶ 2549] with the specified InstanceName / InstancePath
	ContainsName [▶ 3116]	Determines whether the specified instance name contains name.
	CopyTo [▶ 3116]	Copies this InstanceCollection.T. [▶ 3104] to the specified array.
	Equals	Determines whether the specified object is equal to the current object. (Inherited from Object.)
	Finalize	Allows an object to try to free resources and perform other cleanup operations before it is reclaimed by garbage collection. (Inherited from Object.)
	GetEnumerator [▶ 3117]	Gets the enumerator.
	GetHashCode	Serves as the default hash function. (Inherited from Object.)
	GetInstance [▶ 3117]	Gets the Instance [▶ 2549] by instance path.
	GetInstanceByName [▶ 3118]	Gets the name of the instance by.
	GetType	Gets the Type of the current instance. (Inherited from Object.)
	IndexOf [▶ 3119]	Determines the index of the specified Instance [▶ 2549] .
	Insert [▶ 3119]	Inserts the specified Instance [▶ 2549] at the specified index.
	MemberwiseClone	Creates a shallow copy of the current Object. (Inherited from Object.)
	Remove [▶ 3120]	Removes the specified item.
	RemoveAt [▶ 3121]	Removes the Instance [▶ 2549] at the specified index.
	ToString	Returns a string that represents the current object. (Inherited from Object.)
	TryGetInstance [▶ 3121]	Tries to get the Instance [▶ 2549] of the specified path.
	TryGetInstanceByName [▶ 3122]	Tries to get Instances by name.

6.12.4 ISymbolProvider.TNamespace, TDataType, TSymbol. Interface

Symbol provider interface

Namespace: [TwinCAT.TypeSystem.Generic \[► 3086\]](#)

Assembly: TwinCAT.Ads.Abstractions (in TwinCAT.Ads.Abstractions.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public interface ISymbolProvider<TNamespace, TDataType, TSymbol>
where TDataType : class, IDataType
where TSymbol : class, ISymbol
```

Type Parameters

TNamespace	Namespace type
TDataType	DataType type
TSymbol	Symbol type

The ISymbolProvider.TNamespace, TDataType, TSymbol. type exposes the following members.

Properties

	Name	Description
	DataTypes [▶ 3124]	Gets all data types from all Namespaces
	Namespaces [▶ 3124]	Get the Namespaces of DataTypes for this Symbol provider
	RootNamespace [▶ 3124]	Gets the root (main) namespace of the Symbol provider.
	RootNamespaceName [▶ 3125]	Gets the name of the root namespace
	Symbols [▶ 3125]	Gets the (root) symbols of the Symbol provider.

Reference

6.12.5 NamespaceCollection.T. Class

Generic class for Namespace collections

Inheritance Hierarchy

System.Object

TwinCAT.TypeSystem.Generic.NamespaceCollection.T.

Namespace: [TwinCAT.TypeSystem.Generic \[► 3086\]](#)

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public class NamespaceCollection<T> : IList<INamespace<T>>,
    ICollection<INamespace<T>>, IEnumerable<INamespace<T>>, IEnumerable<
where T : class, IDatatype
```

Type Parameters

T

The NamespaceCollection.T. type exposes the following members.

Constructors

	Name	Description
	NamespaceCollection.T. [► 3127]	Initializes a new instance of the NamespaceCollection.T. class.

Properties

	Name	Description
	AllTypes [► 3128]	Gets all types included in all namespaces.
	Count [► 3128]	Gets the number of elements contained in the ICollection.T..
	InnerAllTypes [► 3129]	Dictionary FullPath -> IDatatype
	IsReadOnly [► 3129]	Gets a value indicating whether the ICollection.T. is read-only.
	Item.Int32. [► 3130]	Gets or sets the element at the specified index.
	Item.String. [► 3131]	Gets or sets the element at the specified index.

Methods

	Name	Description
	Add [► 3132]	Adds an item to the ICollection.T..
	Clear [► 3133]	Removes all items from the ICollection.T..

	Name	Description
	Contains [▶ 3133]	Determines whether the ICollection.T. contains a specific value.
	ContainsNamespace [▶ 3134]	Determines whether the specified name contains namespace.
	CopyTo [▶ 3134]	Copies to.
	Equals	Determines whether the specified object is equal to the current object. (Inherited from Object.)
	Finalize	Allows an object to try to free resources and perform other cleanup operations before it is reclaimed by garbage collection. (Inherited from Object.)
	GetEnumerator [▶ 3135]	Returns an enumerator that iterates through the collection.
	GetHashCode	Serves as the default hash function. (Inherited from Object.)
	GetType	Gets the Type of the current instance. (Inherited from Object.)
	IndexOf [▶ 3135]	Determines the index of a specific item in the IList.T..
	Insert [▶ 3136]	Inserts an item to the IList.T. at the specified index.
	MemberwiseClone	Creates a shallow copy of the current Object. (Inherited from Object.)
	Remove [▶ 3136]	Removes the first occurrence of a specific object from the ICollection.T..
	RemoveAt [▶ 3137]	Removes the IList.T. item at the specified index.
	ToString	Returns a string that represents the current object. (Inherited from Object.)
	TryGetNamespace [▶ 3137]	Tries to get the namespace object
	TryGetType [▶ 3138]	Tries to get the specified type.
	TryGetTypeByFullName [▶ 3139]	Tries to get the data type by full name.

Reference

[TwinCAT.TypeSystem.Generic Namespace \[▶ 3086\]](#)

6.12.5.1 NamespaceCollection.T. Constructor

Initializes a new instance of the [NamespaceCollection.T. \[▶ 3126\]](#) class.

Namespace: [TwinCAT.TypeSystem.Generic \[▶ 3086\]](#)

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public NamespaceCollection()
```

Reference

6.12.5.2 NamespaceCollection.T. Properties

The [NamespaceCollection.T.](#) [[▶ 3126](#)] generic type exposes the following members.

Properties

	Name	Description
	AllTypes [▶ 3128]	Gets all types included in all namespaces.
	Count [▶ 3128]	Gets the number of elements contained in the ICollection.T..
	InnerAllTypes [▶ 3129]	Dictionary FullPath -> IDataType
	IsReadOnly [▶ 3129]	Gets a value indicating whether the ICollection.T. is read-only.
	Item.Int32. [▶ 3130]	Gets or sets the element at the specified index.
	Item.String. [▶ 3131]	Gets or sets the element at the specified index.

6.12.5.2.1 NamespaceCollection.T..AllTypes Property

Gets all types included in all namespaces.

Namespace: [TwinCAT.TypeSystem.Generic](#) [[▶ 3086](#)]

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public IDataTypeCollection<T> AllTypes { get; }
```

Property Value

Type: [IDataTypeCollection](#) [[▶ 2486](#)].T [[▶ 3126](#)].

All types.

Reference

[NamespaceCollection.T. Class](#) [[▶ 3126](#)]

[TwinCAT.TypeSystem.Generic Namespace](#) [[▶ 3086](#)]

6.12.5.2.2 NamespaceCollection.T..Count Property

Gets the number of elements contained in the ICollection.T..

Namespace: [TwinCAT.TypeSystem.Generic](#) [[▶ 3086](#)]

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public int Count { get; }
```

Return Value

Type: Int32

The number of elements contained in the ICollection.T..

Implements

ICollection.T..Count

Reference

6.12.5.2.3 NamespaceCollection.T..InnerAllTypes Property

Dictionary FullPath -> IDataType

Namespace: [TwinCAT.TypeSystem.Generic \[► 3086\]](#)

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
protected IDictionary<string, T> InnerAllTypes { get; }
```

Property Value

Type: [IDictionary.String, T \[► 3126\]](#).

Reference

[NamespaceCollection.T. Class \[► 3126\]](#)

[TwinCAT.TypeSystem.Generic Namespace \[► 3086\]](#)

6.12.5.2.4 NamespaceCollection.T..IsReadOnly Property

Gets a value indicating whether the ICollection.T. is read-only.

Namespace: [TwinCAT.TypeSystem.Generic \[► 3086\]](#)

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public bool IsReadOnly { get; }
```

Return Value

Type: Boolean

true if the ICollection.T. is read-only; otherwise, false.

Implements

ICollection.T..IsReadOnly

6.12.5.3 NamespaceCollection.T. Methods

The [NamespaceCollection.T. \[▶ 3126\]](#) generic type exposes the following members.

Methods

	Name	Description
	Add [▶ 3132]	Adds an item to the ICollection.T..
	Clear [▶ 3133]	Removes all items from the ICollection.T..
	Contains [▶ 3133]	Determines whether the ICollection.T. contains a specific value.
	ContainsNamespace [▶ 3134]	Determines whether the specified name contains namespace.
	CopyTo [▶ 3134]	Copies to.
	Equals	Determines whether the specified object is equal to the current object. (Inherited from Object.)

	Name	Description
	Finalize	Allows an object to try to free resources and perform other cleanup operations before it is reclaimed by garbage collection. (Inherited from Object.)
	GetEnumerator [▶ 3135]	Returns an enumerator that iterates through the collection.
	GetHashCode	Serves as the default hash function. (Inherited from Object.)
	GetType	Gets the Type of the current instance. (Inherited from Object.)
	IndexOf [▶ 3135]	Determines the index of a specific item in the IList.T..
	Insert [▶ 3136]	Inserts an item to the IList.T. at the specified index.
	MemberwiseClone	Creates a shallow copy of the current Object. (Inherited from Object.)
	Remove [▶ 3136]	Removes the first occurrence of a specific object from the ICollection.T..
	RemoveAt [▶ 3137]	Removes the IList.T. item at the specified index.
	ToString	Returns a string that represents the current object. (Inherited from Object.)
	TryGetNamespace [▶ 3137]	Tries to get the namespace object
	TryGetType [▶ 3138]	Tries to get the specified type.
	TryGetTypeByFullName [▶ 3139]	Tries to get the data type by full name.

Reference

6.12.5.3.9 NamespaceCollection.T..Remove Method

Removes the first occurrence of a specific object from the [ICollection.T.](#)

Namespace: [TwinCAT.TypeSystem.Generic](#) [[▶ 3086](#)]

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax**C#**

```
public bool Remove(
    INamespace<T> item
)
```

Parameters

item	Type: TwinCAT.TypeSystem.Generic.INamespace [▶ 3102]. T [▶ 3126]. The object to remove from the ICollection.T. .
------	---

Return Value

Type: Boolean

true if item was successfully removed from the [ICollection.T.](#); otherwise, false. This method also returns false if item is not found in the original [ICollection.T.](#).

Implements

[ICollection.T.](#).[Remove\(T\)](#)

Reference

[NamespaceCollection.T. Class](#) [[▶ 3126](#)]

[TwinCAT.TypeSystem.Generic Namespace](#) [[▶ 3086](#)]

6.12.5.3.10 NamespaceCollection.T..RemoveAt Method

Removes the [IList.T.](#) item at the specified index.

Namespace: [TwinCAT.TypeSystem.Generic](#) [[▶ 3086](#)]

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public void RemoveAt(  
    int index  
)
```

Parameters

index	Type: System.Int32 The zero-based index of the item to remove.
-------	---

Implements

public class ReadOnlyDataTypeCollection<T> : ReadOnlyCollection<T>,
    IDataValueCollection<T>, IList<T>, ICollection<T>, IEnumerable<T>,
    IEnumerable
where T : class, IDataType
```

Type Parameters

T

The ReadOnlyDataTypeCollection.T. type exposes the following members.

Constructors

	Name	Description
	ReadOnlyDataTypeCollection.T. (DataTypeCollection.T.) [▶ 3141]	Initializes a new instance of the ReadOnlyDataTypeCollection.T. class.
	ReadOnlyDataTypeCollection.T. (ReadOnlyDataTypeCollection.T.) [▶ 3142]	Initializes a new instance of the ReadOnlyDataTypeCollection.T. class.

Properties

	Name	Description
	Count	Gets the number of elements contained in the ReadOnlyCollection.T. instance. (Inherited from ReadOnlyCollection.T..)
	Item.Int32.	Gets the element at the specified index. (Inherited from ReadOnlyCollection.T..)
	Item.String. [▶ 3143]	Gets the element with the specified type name.
	Items	Returns the IList.T. that the ReadOnlyCollection.T. wraps. (Inherited from ReadOnlyCollection.T..)

Methods

	Name	Description
	Contains	Determines whether an element is in the ReadOnlyCollection.T.. (Inherited from ReadOnlyCollection.T..)
	ContainsType [▶ 3144]	Determines whether the specified name contains type.
	CopyTo	Copies the entire ReadOnlyCollection.T. to a compatible one-dimensional Array, starting at the specified index of the target array. (Inherited from ReadOnlyCollection.T..)
	Equals	Determines whether the specified object is equal to the current object. (Inherited from Object.)
	Finalize	Allows an object to try to free resources and perform other cleanup operations before it is reclaimed by garbage collection. (Inherited from Object.)
	GetEnumerator	Returns an enumerator that iterates through the ReadOnlyCollection.T.. (Inherited from ReadOnlyCollection.T..)
	GetHashCode	Serves as the default hash function. (Inherited from Object.)
	GetType	Gets the Type of the current instance. (Inherited from Object.)
	IndexOf	Searches for the specified object and returns the zero-based index of the first occurrence within the entire ReadOnlyCollection.T.. (Inherited from ReadOnlyCollection.T..)
	MemberwiseClone	Creates a shallow copy of the current Object. (Inherited from Object.)

	Name	Description
	ToString	Returns a string that represents the current object. (Inherited from Object.)
	TryGetType [▶ 3145]	Tries to get the Type with the specified name out of the collection.

Syntax

C#

```
public class ReadOnlyInstanceCollection<T> : ReadOnlyCollection<T>,
    ICollection<T>, IList<T>, ICollection<T>, IEnumerable<T>,
    IEnumerable
where T : class, IInstance
```

Type Parameters

T

The `ReadOnlyInstanceCollection.T` type exposes the following members.

Constructors

	Name	Description
	<code>ReadOnlyInstanceCollection.T</code> [▶ 3147]	Initializes a new instance of the <code>ReadOnlyInstanceCollection.T</code> class.

Properties

	Name	Description
	<code>Count</code>	Gets the number of elements contained in the <code>ReadOnlyCollection.T</code> instance. (Inherited from <code>ReadOnlyCollection.T</code> .)
	<code>Item.Int32</code>	Gets the element at the specified index. (Inherited from <code>ReadOnlyCollection.T</code> .)
	<code>Item.String</code> [▶ 3148]	Gets the element with the specified instance path.
	<code>Items</code>	Returns the <code>IList.T</code> that the <code>ReadOnlyCollection.T</code> wraps. (Inherited from <code>ReadOnlyCollection.T</code> .)
	<code>Mode</code> [▶ 3149]	Gets the <code>InstanceCollectionMode</code> [▶ 2573].

Methods

	Name	Description
	<code>Contains(T)</code>	Determines whether an element is in the <code>ReadOnlyCollection.T</code> . (Inherited from <code>ReadOnlyCollection.T</code> .)
	<code>Contains(String)</code> [▶ 3150]	Determines whether the <code>ReadOnlyInstanceCollection.T</code> contains an instance with the specified instance path.
	<code>ContainsName</code> [▶ 3151]	Determines whether the specified instance is contained.
	<code>CopyTo</code>	Copies the entire <code>ReadOnlyCollection.T</code> to a compatible one-dimensional Array, starting at the specified index of the target array. (Inherited from <code>ReadOnlyCollection.T</code> .)
	<code>Equals</code>	Determines whether the specified object is equal to the current object. (Inherited from <code>Object</code> .)
	<code>Finalize</code>	Allows an object to try to free resources and perform other cleanup operations before it is reclaimed by garbage collection. (Inherited from <code>Object</code> .)
	<code>GetEnumerator</code>	Returns an enumerator that iterates through the <code>ReadOnlyCollection.T</code> . (Inherited from <code>ReadOnlyCollection.T</code> .)
	<code>GetHashCode</code>	Serves as the default hash function. (Inherited from <code>Object</code> .)
	<code>GetInstance</code> [▶ 3152]	Gets the <code>IInstance</code> [▶ 2549] by instance path.

	Name	Description
	GetInstanceByName [▶ 3152]	Gets the IInstance [▶ 2549] by instance name.
	GetType	Gets the Type of the current instance. (Inherited from Object .)
	IndexOf	Searches for the specified object and returns the zero-based index of the first occurrence within the entire ReadOnlyCollection.T.. (Inherited from ReadOnlyCollection.T..)
	MemberwiseClone	Creates a shallow copy of the current Object . (Inherited from Object .)
	ToString	Returns a string that represents the current object. (Inherited from Object .)
	TryGetInstance [▶ 3153]	Tries to get the instance with the specified instance path.
	TryGetInstanceByName [▶ 3153]	Tries to get the instance by name.

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public class ReadOnlyNamespaceCollection<T> : ReadOnlyCollection<INamespace<T>>,
    INamespaceCollection<T>, ICollection<INamespace<T>>, IEnumerable<INamespace<T>>,
    IEnumerable
where T : class, IDataTypeInfo
```

Type Parameters

T

The `ReadOnlyNamespaceCollection.T.` type exposes the following members.

Constructors

	Name	Description
	<code>ReadOnlyNamespaceCollection.T.</code> [▶ 3156]	Initializes a new instance of the <code>ReadOnlyNamespaceCollection.T.</code> class.

Properties

	Name	Description
	<code>AllTypes</code> [▶ 3156]	Gets all types included in all namespaces.
	<code>Count</code>	Gets the number of elements contained in the <code>ReadOnlyCollection.T.</code> instance. (Inherited from <code>ReadOnlyCollection.INamespace</code> [▶ 3102].T...)
	<code>Item.Int32.</code>	Gets the element at the specified index. (Inherited from <code>ReadOnlyCollection.INamespace</code> [▶ 3102].T...)
	<code>Item.String.</code> [▶ 3157]	Gets the element at the specified index.
	<code>Items</code>	Returns the <code>IList.T.</code> that the <code>ReadOnlyCollection.T.</code> wraps. (Inherited from <code>ReadOnlyCollection.INamespace</code> [▶ 3102].T...)

Methods

	Name	Description
	<code>Contains</code>	Determines whether an element is in the <code>ReadOnlyCollection.T..</code> (Inherited from <code>ReadOnlyCollection.INamespace</code> [▶ 3102].T...)
	<code>ContainsNamespace</code> [▶ 3158]	Determines whether this collection contains a namespace with the specified name.
	<code>CopyTo</code>	Copies the entire <code>ReadOnlyCollection.T.</code> to a compatible one-dimensional Array, starting at the specified index of the target array. (Inherited from <code>ReadOnlyCollection.INamespace</code> [▶ 3102].T...)
	<code>Equals</code>	Determines whether the specified object is equal to the current object. (Inherited from <code>Object.</code>)
	<code>Finalize</code>	Allows an object to try to free resources and perform other cleanup operations before it is reclaimed by garbage collection. (Inherited from <code>Object.</code>)
	<code>GetEnumerator</code>	Returns an enumerator that iterates through the <code>ReadOnlyCollection.T..</code> (Inherited from <code>ReadOnlyCollection.INamespace</code> [▶ 3102].T...)
	<code>GetHashCode</code>	Serves as the default hash function. (Inherited from <code>Object.</code>)
	<code>GetType</code>	Gets the Type of the current instance. (Inherited from <code>Object.</code>)
	<code>IndexOf</code>	Searches for the specified object and returns the zero-based index of the first occurrence within the entire <code>ReadOnlyCollection.T..</code> (Inherited from <code>ReadOnlyCollection.INamespace</code> [▶ 3102].T...)
	<code>MemberwiseClone</code>	Creates a shallow copy of the current <code>Object.</code> (Inherited from <code>Object.</code>)
	<code>ToString</code>	Returns a string that represents the current object. (Inherited from <code>Object.</code>)
	<code>TryGetNamespace</code> [▶ 3159]	Tries to get the namespace with the specified name.
	<code>TryGetType</code> [▶ 3160]	Tries to get the specified data type.
	<code>TryGetTypeByFullName</code> [▶ 3160]	Tries to get the specified type (by <code>fullName</code>)

Reference

6.12.8.3.3 ReadOnlyNamespaceCollection.T..TryGetType Method

Tries to get the specified data type.

Namespace: [TwinCAT.TypeSystem.Generic](#) [[▶ 3086](#)]

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public bool TryGetType(  
    string typeName,  
    out T? dataType  
)
```

Parameters

typeName	Type: System.String Name of the type.
dataType	Type: T [▶ 3154]. Data Type (out-parameter).

Return Value

Type: Boolean

true if found, false if not contained.

Reference

[ReadOnlyNamespaceCollection.T. Class](#) [[▶ 3154](#)]

[TwinCAT.TypeSystem.Generic Namespace](#) [[▶ 3086](#)]

6.12.8.3.4 ReadOnlyNamespaceCollection.T..TryGetTypeByFullName Method

Tries to get the specified type (by fullName)

Namespace: [TwinCAT.TypeSystem.Generic](#) [[▶ 3086](#)]

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public bool TryGetTypeByFullName(  
    string fullname,  
    out T? dataType  
)
```

Parameters

fullname	Type: System.String FullName of the data type.
dataType	Type: T [▶ 3154]. Found Data type (out-parameter).

Return Value

Type: Boolean

true if found, false if not contained.

Reference

6.12.9 ReadOnlySymbolCollection.T. Class

Read only symbol collection.

Inheritance Hierarchy

System.Object
 System.Collections.ObjectModel.ReadOnlyCollection.T.
[TwinCAT.TypeSystem.Generic.ReadOnlyInstanceCollection \[▶ 3145\].T.](#)
[TwinCAT.TypeSystem.Generic.ReadOnlySymbolCollection.T.](#)
[TwinCAT.TypeSystem.ReadOnlySymbolCollection \[▶ 2861\]](#)

Namespace: [TwinCAT.TypeSystem.Generic \[▶ 3086\]](#)
Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public class ReadOnlySymbolCollection<T> : ReadOnlyInstanceCollection<T>
where T : class, ISymbol
```

Type Parameters

T

The ReadOnlySymbolCollection.T. type exposes the following members.

Constructors

	Name	Description
	ReadOnlySymbolCollection.T. [▶ 3162]	Initializes a new instance of the ReadOnlySymbolCollection.T. class.

Properties

	Name	Description
	Count	Gets the number of elements contained in the ReadOnlyCollection.T. instance. (Inherited from ReadOnlyCollection.T..)
	Empty [▶ 3163]	Returns an empty collection.
	Item.Int32.	Gets the element at the specified index. (Inherited from ReadOnlyCollection.T..)
	Item.String. [▶ 3148]	Gets the element with the specified instance path. (Inherited from ReadOnlyInstanceCollection.T. [▶ 3145].)
	Items	Returns the IList.T. that the ReadOnlyCollection.T. wraps. (Inherited from ReadOnlyCollection.T..)
	Mode [▶ 3149]	Gets the InstanceCollectionMode [▶ 2573] . (Inherited from ReadOnlyInstanceCollection.T. [▶ 3145].)

Methods

	Name	Description
	Contains(T)	Determines whether an element is in the ReadOnlyCollection.T.. (Inherited from ReadOnlyCollection.T..)
	<u>Contains(String)</u> [▶ 3150]	Determines whether the <u>ReadOnlyInstanceCollection.T.</u> [▶ 3145] contains an instance with the specified instance path. (Inherited from <u>ReadOnlyInstanceCollection.T.</u> [▶ 3145].)
	<u>ContainsName</u> [▶ 3151]	Determines whether the specified instance is contained. (Inherited from <u>ReadOnlyInstanceCollection.T.</u> [▶ 3145].)
	CopyTo	Copies the entire ReadOnlyCollection.T. to a compatible one-dimensional Array, starting at the specified index of the target array. (Inherited from ReadOnlyCollection.T..)
	Equals	Determines whether the specified object is equal to the current object. (Inherited from Object.)
	Finalize	Allows an object to try to free resources and perform other cleanup operations before it is reclaimed by garbage collection. (Inherited from Object.)
	GetEnumerator	Returns an enumerator that iterates through the ReadOnlyCollection.T.. (Inherited from ReadOnlyCollection.T..)
	GetHashCode	Serves as the default hash function. (Inherited from Object.)
	<u>GetInstance</u> [▶ 3152]	Gets the <u>IInstance</u> [▶ 2549] by instance path. (Inherited from <u>ReadOnlyInstanceCollection.T.</u> [▶ 3145].)
	<u>GetInstanceByName</u> [▶ 3152]	Gets the <u>IInstance</u> [▶ 2549] by instance name. (Inherited from <u>ReadOnlyInstanceCollection.T.</u> [▶ 3145].)
	GetType	Gets the Type of the current instance. (Inherited from Object.)
	IndexOf	Searches for the specified object and returns the zero-based index of the first occurrence within the entire ReadOnlyCollection.T.. (Inherited from ReadOnlyCollection.T..)
	MemberwiseClone	Creates a shallow copy of the current Object. (Inherited from Object.)
	ToString	Returns a string that represents the current object. (Inherited from Object.)
	<u>TryGetInstance</u> [▶ 3153]	Tries to get the instance with the specified instance path. (Inherited from <u>ReadOnlyInstanceCollection.T.</u> [▶ 3145].)
	<u>TryGetInstanceByName</u> [▶ 3153]	Tries to get the instance by name. (Inherited from <u>ReadOnlyInstanceCollection.T.</u> [▶ 3145].)

Reference

TwinCAT.TypeSystem.Generic Namespace [▶ 3086]

6.12.9.1 ReadOnlySymbolCollection.T. Constructor

Initializes a new instance of the ReadOnlySymbolCollection.T. [▶ 3161] class.

Namespace: TwinCAT.TypeSystem.Generic [▶ 3086]

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public ReadOnlySymbolCollection(
    ICollection<T> coll
)
```

Parameters

coll	Type: TwinCAT.TypeSystem.IInstanceCollection [▶ 2554].T [▶ 3161]. The coll.

6.12.9.2 ReadOnlySymbolCollection.T. Properties

The [ReadOnlySymbolCollection.T.](#) [[▶ 3161](#)] generic type exposes the following members.

Properties

	Name	Description
	Count	Gets the number of elements contained in the ReadOnlyCollection.T. instance. (Inherited from ReadOnlyCollection.T [▶ 3161].)
	Empty [▶ 3163]	Returns an empty collection.
	Item.Int32.	Gets the element at the specified index. (Inherited from ReadOnlyCollection.T [▶ 3161].)
	Item.String. [▶ 3148]	Gets the element with the specified instance path. (Inherited from ReadOnlyInstanceCollection.T. [▶ 3145].)
	Items	Returns the IList.T. that the ReadOnlyCollection.T. wraps. (Inherited from ReadOnlyCollection.T [▶ 3161].)
	Mode [▶ 3149]	Gets the InstanceCollectionMode [▶ 2573]. (Inherited from ReadOnlyInstanceCollection.T. [▶ 3145].)

6.12.9.3 ReadOnlySymbolCollection.T. Methods

The [ReadOnlySymbolCollection.T.](#) [[▶ 3161](#)] generic type exposes the following members.

Methods

	Name	Description
	Contains(T)	Determines whether an element is in the ReadOnlyCollection.T.. (Inherited from ReadOnlyCollection.T [▶ 3161]..)
	Contains(String) [▶ 3150]	Determines whether the ReadOnlyInstanceCollection.T. [▶ 3145] contains an instance with the specified instance path. (Inherited from ReadOnlyInstanceCollection.T. [▶ 3145].)
	ContainsName [▶ 3151]	Determines whether the specified instance is contained. (Inherited from ReadOnlyInstanceCollection.T. [▶ 3145].)
	CopyTo	Copies the entire ReadOnlyCollection.T. to a compatible one-dimensional Array, starting at the specified index of the target array. (Inherited from ReadOnlyCollection.T [▶ 3161]..)
	Equals	Determines whether the specified object is equal to the current object. (Inherited from Object .)
	Finalize	Allows an object to try to free resources and perform other cleanup operations before it is reclaimed by garbage collection. (Inherited from Object .)
	GetEnumerator	Returns an enumerator that iterates through the ReadOnlyCollection.T.. (Inherited from ReadOnlyCollection.T [▶ 3161]..)
	GetHashCode	Serves as the default hash function. (Inherited from Object .)
	GetInstance [▶ 3152]	Gets the IInstance [▶ 2549] by instance path. (Inherited from ReadOnlyInstanceCollection.T. [▶ 3145].)
	GetInstanceByName [▶ 3152]	Gets the IInstance [▶ 2549] by instance name. (Inherited from ReadOnlyInstanceCollection.T. [▶ 3145].)
	GetType	Gets the Type of the current instance. (Inherited from Object .)
	IndexOf	Searches for the specified object and returns the zero-based index of the first occurrence within the entire ReadOnlyCollection.T.. (Inherited from ReadOnlyCollection.T [▶ 3161]..)
	MemberwiseClone	Creates a shallow copy of the current Object . (Inherited from Object .)
	ToString	Returns a string that represents the current object. (Inherited from Object .)
	TryGetInstance [▶ 3153]	Tries to get the instance with the specified instance path. (Inherited from ReadOnlyInstanceCollection.T. [▶ 3145].)
	TryGetInstanceByName [▶ 3153]	Tries to get the instance by name. (Inherited from ReadOnlyInstanceCollection.T. [▶ 3145].)

where T : class, ISymbol
```

Type Parameters

T

The [SymbolCollection.T.](#) type exposes the following members.

Properties

	Name	Description
	Count [▶ 3107]	Gets the collection count. (Inherited from InstanceCollection.T. [▶ 3104].)
	Empty [▶ 3168]	Creates an Empty SymbolCollection.T.
	InnerList [▶ 3108]	Gets the List of instances. (Inherited from InstanceCollection.T. [▶ 3104].)
	InnerPathDict [▶ 3108]	The Path dictionary (Inherited from InstanceCollection.T. [▶ 3104].)
	IsReadOnly [▶ 3109]	Gets a value indicating whether this instance is read only. (Inherited from InstanceCollection.T. [▶ 3104].)
	Item.Int32. [▶ 3109]	Gets or sets the Instance [▶ 2549] at the specified index. (Inherited from InstanceCollection.T. [▶ 3104].)
	Item.String. [▶ 3110]	Gets the Instance [▶ 2549] with the specified instance path. (Inherited from InstanceCollection.T. [▶ 3104].)
	Mode [▶ 3111]	The mode this InstanceCollection.T. [▶ 3104] is working in. (Inherited from InstanceCollection.T. [▶ 3104].)

Methods

	Name	Description
	Add [▶ 3112]	Adds the specified item. (Inherited from InstanceCollection.T. [▶ 3104].)
	AddRange [▶ 3113]	Adds the specified items to this collection. (Inherited from InstanceCollection.T. [▶ 3104].)
	AsReadOnly [▶ 3169]	Returns a Read only version of this collection (shallow copy).
	Clear [▶ 3114]	Clears this instance. (Inherited from InstanceCollection.T. [▶ 3104].)
	Clone [▶ 3170]	Clones this instance.
	Contains(T) [▶ 3115]	Determines whether this collection contains the specified Instance [▶ 2549] (Inherited from InstanceCollection.T. [▶ 3104].)
	Contains(String) [▶ 3114]	Determines whether this collection contains an Instance [▶ 2549] with the specified InstanceName / InstancePath (Inherited from InstanceCollection.T. [▶ 3104].)
	ContainsName [▶ 3116]	Determines whether the specified instance name contains name. (Inherited from InstanceCollection.T. [▶ 3104].)
	CopyTo [▶ 3116]	Copies this InstanceCollection.T. [▶ 3104] to the specified array. (Inherited from InstanceCollection.T. [▶ 3104].)
	Equals	Determines whether the specified object is equal to the current object. (Inherited from Object .)
	Finalize	Allows an object to try to free resources and perform other cleanup operations before it is reclaimed by garbage collection. (Inherited from Object .)
	GetEnumerator [▶ 3117]	Gets the enumerator. (Inherited from InstanceCollection.T. [▶ 3104].)
	GetHashCode	Serves as the default hash function. (Inherited from Object .)
	GetInstance [▶ 3117]	Gets the Instance [▶ 2549] by instance path. (Inherited from InstanceCollection.T. [▶ 3104].)

	Name	Description
	GetInstanceByName [▶ 3118]	Gets the name of the instance by. (Inherited from InstanceCollection.T. [▶ 3104].)
	GetType	Gets the Type of the current instance. (Inherited from Object.)
	IndexOf [▶ 3119]	Determines the index of the specified IInstance [▶ 2549]. (Inherited from InstanceCollection.T. [▶ 3104].)
	Insert [▶ 3119]	Inserts the specified IInstance [▶ 2549] at the specified index. (Inherited from InstanceCollection.T. [▶ 3104].)
	MemberwiseClone	Creates a shallow copy of the current Object. (Inherited from Object.)
	Remove [▶ 3120]	Removes the specified item. (Inherited from InstanceCollection.T. [▶ 3104].)
	RemoveAt [▶ 3121]	Removes the IInstance [▶ 2549] at the specified index. (Inherited from InstanceCollection.T. [▶ 3104].)
	ToString	Returns a string that represents the current object. (Inherited from Object.)
	TryGetInstance [▶ 3121]	Tries to get the IInstance [▶ 2549]. of the specified path. (Inherited from InstanceCollection.T. [▶ 3104].)
	TryGetInstanceByName [▶ 3122]	Tries to get Instances by name. (Inherited from InstanceCollection.T. [▶ 3104].)
	TryGetInstances [▶ 3170]	Try to get instances with predicate function

Namespace: [TwinCAT.TypeSystem.Generic](#) [► 3086]

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public bool TryGetInstances(
    Func<T, bool> predicate,
    bool recurse,
    out IList<T>? instances
)
```

Parameters

predicate	Type: System.Func.T [▶ 3165], Boolean. The predicate function
recurse	Type: System.Boolean if set to true the symbol hierarchy will be searched recursively.
instances	Type: System.Collections.Generic.IList.T [▶ 3165]. The instances.

Return Value

Type: Boolean
true if the Instance(s) is/are found, false otherwise.

Iterator class for enumerations of [Symbols](#) [[▶ 2691](#)].

Inheritance Hierarchy

System.Object

TwinCAT.TypeSystem.Generic.SymbolIterator.T.

[TwinCAT.Ads.TypeSystem.SymbolIterator](#) [[▶ 1916](#)]

Namespace: [TwinCAT.TypeSystem.Generic](#) [[▶ 3086](#)]

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public class SymbolIterator<T> : IEnumerable<T>,
    IEnumerable
where T : class, ISymbol
```

Type Parameters

T	Concrete ISymbol [▶ 2691] type.
---	---

The SymbolIterator.T. type exposes the following members.

Constructors

	Name	Description
	SymbolIterator.T. (ICollection . T.) [▶ 3174]	Initializes a new instance of the SymbolIterator.T. class.
	SymbolIterator.T. (IEnumerable . T. , Boolean) [▶ 3175]	Initializes a new instance of the SymbolIterator.T. class.
	SymbolIterator.T. (ICollection . T. , Func . T. , Boolean .) [▶ 3175]	Initializes a new instance of the SymbolIterator.T. class.
	SymbolIterator.T. (IEnumerable . T. , Boolean , Func . T. , Boolean .) [▶ 3176]	Initializes a new instance of the SymbolIterator.T. class.
	SymbolIterator.T. (IEnumerable . T. , Boolean , SymbolIterationMas k , Func . T. , Boolean ., Func . T. , Boolean .) [▶ 3177]	Initializes a new instance of the SymbolIterator.T. class.

Properties

	Name	Description
	Mask [▶ 3178]	Gets or sets the SymbolIterationMask [▶ 3019]

	Name	Description
	SymbolRecursionDetection [▶ 3178]	Gets or sets a value indicating whether the iterator checks for Symbol recursions (true by default).

Methods

	Name	Description
	Equals	Determines whether the specified object is equal to the current object. (Inherited from Object.)
	Finalize	Allows an object to try to free resources and perform other cleanup operations before it is reclaimed by garbage collection. (Inherited from Object.)
	GetEnumerator [▶ 3179]	Gets the enumerator that enumerates through a collection
	GetHashCode	Serves as the default hash function. (Inherited from Object.)
	GetType	Gets the Type of the current instance. (Inherited from Object.)
	MemberwiseClone	Creates a shallow copy of the current Object. (Inherited from Object.)
	ToString	Returns a string that represents the current object. (Inherited from Object.)

Remarks

This iterator class can be used to iterate over collections of symbol trees (root symbols + sub symbols). By constructor the user can choose if the iterator works recursively within the symbol tree and optionally a filter function to select only specific symbols (predicate).

Examples

The following example shows how to determine, browse and filter symbols.

Browsing and filtering Symbols

```
using (AdsClient client = new AdsClient())
{
    CancellationToken cancel = CancellationToken.None;

    uint valueToRead = 0;
    uint valueToWrite = 42;

    client.Connect(AmsNetId.Local, 851);

    // Load all Symbols + DataTypes
    ISymbolLoader loader = SymbolLoaderFactory.Create(client, SymbolLoaderSettings.Default);

    ResultSymbols resultSymbols = await loader.GetSymbolsAsync(cancel);

    if (resultSymbols.Succeeded)
    {
        Symbol symbol = (Symbol)resultSymbols.Symbols["MAIN.nCounter"];

        // Works for ALL Primitive 'ANY TYPES' Symbols
        ResultWriteAccess resultWrite = await symbol.WriteValueAsync(valueToWrite, cancel);
        ResultReadValueAccess resultRead = await symbol.ReadValueAsync(cancel);

        if (resultRead.Succeeded)
            valueToRead = (uint)resultRead.Value;

        // Simple filtering of Symbols
        Regex filterExpression = new Regex(pattern: @"^MAIN.*"); // Everything that starts with "MAIN"

        // FilterFunction that filters for the InstancePath
        Func<ISymbol, bool> filter = s => filterExpression.IsMatch(s.InstancePath);
        SymbolIterator iterator = new SymbolIterator(symbols: resultSymbols.Symbols, recurse: true, selector: filter);
    }
}
```

```

foreach (ISymbol filteredSymbol in iterator)
{
    Console.WriteLine(filteredSymbol.InstancePath);
}
}

```

Initializes a new instance of the [SymbolIterator.T. \[▶ 3172\]](#) class.

Namespace: [TwinCAT.TypeSystem.Generic \[▶ 3086\]](#)

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public SymbolIterator(
    IEnumerable<T> symbols,
    bool recurse,
    SymbolIterationMask mask,
    Func<T, bool>? selector,
    Func<T, bool>? areChildsIterated
)
```

Parameters

symbols	Type: System.Collections.Generic.IEnumerable.T [▶ 3172] . Input collection (root objects).
recurse	Type: System.Boolean if set to true, the iterator works recursively over all subsymbols.
mask	Type: TwinCAT.TypeSystem.SymbolIterationMask [▶ 3019] Specifies a mask over the symbols, that filters out specific symbol categories. The default is All [▶ 3019] and all symbols are shown.
selector	Type: System.Func.T [▶ 3172] , Boolean . Predicate function indicating that symbols are visible for the iteration. The default value null returns all symbols (of the specified mask).
areChildsIterated	Type: System.Func.T [▶ 3172] , Boolean . Predicate function indicating that child of the actual symbol should be iterated (in recurse mode). The default value iterates all child (of the specified mask).

6.13 TwinCAT.ValueAccess Namespace

Namespace for the common (non ADS dependent) value access.

Classes

	Class	Description
	CannotAccessValueException [▶ 3181]	Class CannotAccessValueException. This class cannot be inherited. Implements the SymbolException [▶ 2933]
	ResultAccess [▶ 3197]	Result class for an asynchronous access operation.
	ResultHandleAccess [▶ 3224]	Asynchronous read access result returning an variable handle. Implements the ResultAccess [▶ 3197]
	ResultReadDynamicValueAccess [▶ 3204]	Asynchronous read access result returning an Dynamic value object (IDynamicValue [▶ 2504]. Implements the ResultReadValueAccess.T. [▶ 3211]
	ResultReadRawAccess [▶ 3206]	Asynchronous read access result object, reading raw (byte[]) data into memory locations. Implements the ResultReadValueAccess.T. [▶ 3211]
	ResultReadValueAccess [▶ 3209]	Asynchronous read access result returning an untyped Value object type 'object'. Implements the ResultAccess [▶ 3197]
	ResultReadValueAccess.T. [▶ 3211]	Result object of an asynchronous read of a specific value of type T. Implements the ResultAccess [▶ 3197]
	ResultReadValueAccess2.I, V. [▶ 3226]	Result object of an asynchronous read. Implements the ResultAccess [▶ 3197]
	ResultRpcMethodAccess [▶ 3213]	Asynchronous Invoke RPC Method result class. Implements the ResultReadValueAccess [▶ 3209]
	ResultWriteAccess [▶ 3217]	Asynchronous write access result class.

Interfaces

	Interface	Description
	IAccessorRawValue [▶ 3184]	Helper Interface to access Symbol Values as byte Arrays
	IAccessorValueFactory [▶ 3192]	Factory interfaces for Accessor implementations.

Enumerations

	Enumeration	Description
	SymbolNotificationTypes [▶ 3222]	Specifies the Notification type of ADS Notifications
	ValueAccessMode [▶ 3228]	Enum ValueAccessMethod
	ValueCreationModes [▶ 3223]	Creation mode for Values
	ValueUpdateMode [▶ 3229]	Value Update Mode.

6.13.1 CannotAccessValueException Class

Class CannotAccessValueException. This class cannot be inherited. Implements the [SymbolException](#) [[▶ 2933](#)]

Inheritance Hierarchy

System.Object
 System.Exception
 [TwinCAT.AdsException](#) [[▶ 61](#)]
 [TwinCAT.TypeSystem.SymbolException](#) [[▶ 2933](#)]
 TwinCAT.ValueAccess.CannotAccessValueException

Namespace: [TwinCAT.ValueAccess](#) [[▶ 3179](#)]

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
[SerializableAttribute]
public sealed class CannotAccessValueException : SymbolException
```

The CannotAccessValueException type exposes the following members.

Constructors

	Name	Description
	CannotAccessValueException . [▶ 3182]	Initializes a new instance of the CannotAccessValueException class.
	CannotAccessValueException(ISymbol) [▶ 3183]	Initializes a new instance of the CannotAccessValueException class.

Properties

	Name	Description
	Data	Gets a collection of key/value pairs that provide additional user-defined information about the exception. (Inherited from Exception.)
	HelpLink	Gets or sets a link to the help file associated with this exception. (Inherited from Exception.)
	HResult	Gets or sets HRESULT, a coded numerical value that is assigned to a specific exception. (Inherited from Exception.)
	InnerException	Gets the Exception instance that caused the current exception. (Inherited from Exception.)
	InstancePath [▶ 2944]	Gets the instance path. (Inherited from SymbolException [▶ 2933].)
	Message	Gets a message that describes the current exception. (Inherited from Exception.)
	Source	Gets or sets the name of the application or the object that causes the error. (Inherited from Exception.)
	StackTrace	Gets a string representation of the immediate frames on the call stack. (Inherited from Exception.)
	Symbol [▶ 2944]	Gets the symbol. (Inherited from SymbolException [▶ 2933].)
	TargetSite	Gets the method that throws the current exception. (Inherited from Exception.)

Methods

	Name	Description
	Equals	Determines whether the specified object is equal to the current object. (Inherited from Object.)
	GetBaseException	When overridden in a derived class, returns the Exception that is the root cause of one or more subsequent exceptions. (Inherited from Exception.)
	GetHashCode	Serves as the default hash function. (Inherited from Object.)
	GetObjectData [▶ 2945]	When overridden in a derived class, sets the SerializationInfo with information about the exception. (Inherited from SymbolException [▶ 2933] .)
	GetType	Gets the runtime type of the current instance. (Inherited from Exception.)
	ToString	Creates and returns a string representation of the current exception. (Inherited from Exception.)

6.13.2.2.1 IAccessorRawValue.ReadArrayElementRawAsync Method

Reads the array element value as bytes asynchronously.

Namespace: [TwinCAT.ValueAccess](#) [[▶ 3179](#)]

Assembly: TwinCAT.Ads.Abstractions (in TwinCAT.Ads.Abstractions.dll) Version: 6.0.328+39e3229

Syntax

C#

```
Task<ResultReadRawAccess> ReadArrayElementRawAsync(
    IArrayInstance arrayInstance,
    int[] indices,
    Memory<byte> readBuffer,
    CancellationToken cancel
)
```

Parameters

arrayInstance	Type: TwinCAT.TypeSystem.IArrayInstance [▶ 2453] The array instance.
indices	Type: <code>.System.Int32</code> . The indices, which specify the element to read.
readBuffer	Type: <code>System.Memory.Byte</code> . Read buffer where to read the data
cancel	Type: <code>System.Threading.CancellationToken</code> The cancellation token.

Return Value

Type: [Task.ResultReadRawAccess](#) [[▶ 3206](#)].

A task that represents the asynchronous 'ReadArrayElementRaw' operation. The [ResultReadRawAccess](#) [[▶ 3206](#)] result contains the ([Value](#) [[▶ 3213](#)]) and the [ErrorCode](#) [[▶ 3202](#)] after execution.

Reference

6.13.2.2 IAccessorRawValue.ReadRawAsync Method

Read a Symbol value asynchronously as bytes .

Namespace: [TwinCAT.ValueAccess](#) [[▶ 3179](#)]

Assembly: TwinCAT.Ads.Abstractions (in TwinCAT.Ads.Abstractions.dll) Version: 6.0.328+39e3229

Syntax

C#

```
Task<ResultReadRawAccess> ReadRawAsync (
    ISymbol symbolInstance,
    Memory<byte> readBuffer,
    CancellationToken cancel
)
```

Parameters

symbolInstance	Type: TwinCAT.TypeSystem.ISymbol [▶ 2691] The symbol instance.
readBuffer	Type: System.Memory.Byte. Read buffer where to read the value.
cancel	Type: System.Threading.CancellationToken The cancellation token.

Return Value

Type: [Task.ResultReadRawAccess](#) [[▶ 3206](#)].

A task that represents the asynchronous 'ReadRaw' operation. The [ResultReadRawAccess](#) [[▶ 3206](#)] result contains the ([Value](#) [[▶ 3213](#)]) and the [ErrorCode](#) [[▶ 3202](#)] after execution.

6.13.2.3 IAccessorRawValue.TryReadArrayElementRaw Method

Reads an array element value as bytes.

Namespace: [TwinCAT.ValueAccess](#) [[▶ 3179](#)]

Assembly: TwinCAT.Ads.Abstractions (in TwinCAT.Ads.Abstractions.dll) Version: 6.0.328+39e3229

Syntax

C#

```
int TryReadArrayElementRaw (
    IArrayInstance arrayInstance,
    int[] indices,
    Memory<byte> readBuffer,
    out DateTimeOffset? timeStamp
)
```

Parameters

arrayInstance	Type: TwinCAT.TypeSystem.IArrayInstance [▶ 2453] The array instance.
indices	Type: .System.Int32. The indices specify which element to read.

readBuffer	Type: System.Memory.Byte. ReadBuffer where to read the value.
timeStamp	Type: System.Nullable.DateTimeOffset.. The readtime snapshot

Return Value

Type: Int32
Error code. 0 represents succeed.

6.13.2.2.4 IAccessorRawValue.TryReadRaw Method

Read a Symbol value as bytes.

Namespace: [TwinCAT.ValueAccess \[▶ 3179\]](#)
Assembly: TwinCAT.Ads.Abstractions (in TwinCAT.Ads.Abstractions.dll) Version: 6.0.328+39e3229

Syntax

C#

```
int TryReadRaw(
    ISymbol symbolInstance,
    Memory<byte> readBuffer,
    out DateTimeOffset? timeStamp
)
```

Parameters

symbolInstance	Type: TwinCAT.TypeSystem.ISymbol [▶ 2691] The symbol instance.
readBuffer	Type: System.Memory.Byte. Read buffer where to read the value.
timeStamp	Type: System.Nullable.DateTimeOffset.. The readtime snapshot

Return Value

Type: Int32
Error code. 0 represents succeed.

6.13.2.2.5 IAccessorRawValue.TryWriteArrayElementRaw Method

Writes an array element value from raw memory asynchronously to the ADS Device.

Namespace: [TwinCAT.ValueAccess \[▶ 3179\]](#)
Assembly: TwinCAT.Ads.Abstractions (in TwinCAT.Ads.Abstractions.dll) Version: 6.0.328+39e3229

Syntax

C#

```
int TryWriteArrayElementRaw(
    IArrayInstance arrayInstance,
    int[] indices,
    ReadOnlyMemory<byte> writeBuffer,
    out DateTimeOffset? timeStamp
)
```

Parameters

arrayInstance	Type: TwinCAT.TypeSystem.IArrayInstance [► 2453] The array instance.
indices	Type: .System.Int32 . The indices of the array element.
writeBuffer	Type: System.ReadOnlyMemory.Byte . The write buffer containing the data to write.
timeStamp	Type: System.Nullable.DateTimeOffset.. Write time / timestamp

Return Value

Type: [Int32](#)
Error code. 0 represents succeed.

Reference

6.13.2.2.7 IAccessorRawValue.WriteArrayElementRawAsync Method

Writes an array element value from raw memory asynchronously to the ADS Device.

Namespace: [TwinCAT.ValueAccess \[▶ 3179\]](#)

Assembly: TwinCAT.Ads.Abstractions (in TwinCAT.Ads.Abstractions.dll) Version: 6.0.328+39e3229

Syntax

C#

```
Task<ResultWriteAccess> WriteArrayElementRawAsync (
    IArrayInstance arrayInstance,
    int[] indices,
    ReadOnlyMemory<byte> writeBuffer,
    CancellationToken cancel
)
```

Parameters

arrayInstance	Type: TwinCAT.TypeSystem.IArrayInstance [▶ 2453] The array instance.
indices	Type: .System.Int32 . The indices of the array element.
writeBuffer	Type: System.ReadOnlyMemory.Byte . The write buffer containing the data to write (element value).
cancel	Type: System.Threading.CancellationToken The cancellation token.

Return Value

Type: [Task.ResultWriteAccess \[▶ 3217\]](#).

A task that represents the asynchronous 'WriteRaw' operation. The [ResultWriteAccess \[▶ 3217\]](#) result contains the the [ErrorCode \[▶ 3202\]](#) after execution.

Reference

6.13.3 IAccessorValueFactory Interface

Factory interfaces for Accessor implementations.

Namespace: [TwinCAT.ValueAccess](#) [▶ 3179]

Assembly: [TwinCAT.Ads.Abstractions](#) (in [TwinCAT.Ads.Abstractions.dll](#)) Version: 6.0.328+39e3229

Syntax**C#**

```
public interface IAccessorValueFactory
```

The [IAccessorValueFactory](#) type exposes the following members.

Methods

	Name	Description
	CreatePrimitiveValue [▶ 3193]	Creates a primitive value, independent of any settings.
	CreateValue [▶ 3194]	Creates the symbols value from raw memory data.

Remarks

This interface is used by a custom Accessor class to create Value objects from memory representations.

Reference

[TwinCAT.ValueAccess Namespace](#) [▶ 3179]

6.13.3.1 IAccessorValueFactory Methods

The [IAccessorValueFactory](#) [▶ 3192] type exposes the following members.

Methods

	Name	Description
	CreatePrimitiveValue [▶ 3193]	Creates a primitive value, independent of any settings.
	CreateValue [▶ 3194]	Creates the symbols value from raw memory data.

Reference

[IAccessorValueFactory Interface](#) [▶ 3192]

[TwinCAT.ValueAccess Namespace](#) [▶ 3179]

Also see about this

-  [IAccessorValueFactory.CreateValue Method \(ISymbol, ReadOnlySpan.Byte., DateTimeOffset\)](#) [▶ 3196]
-  [IAccessorValueFactory.CreateValue Method \(ISymbol, ReadOnlySpan.Byte., IValue, DateTimeOffset\)](#) [▶ 3196]

6.13.3.1.1 IAccessorValueFactory.CreatePrimitiveValue Method

Creates a primitive value, independent of any settings.

Namespace: [TwinCAT.ValueAccess](#) [▶ 3179]

Assembly: TwinCAT.Ads.Abstractions (in TwinCAT.Ads.Abstractions.dll) Version: 6.0.328+39e3229

Syntax

C#

```
Object CreatePrimitiveValue(
    ISymbol symbol,
    Memory<byte> sourceData,
    IValue? parent,
    DateTimeOffset timeStamp
)
```

Parameters

symbol	Type: TwinCAT.TypeSystem.ISymbol [▶ 2691] The symbol.
sourceData	Type: System.Memory.Byte. The source data.
parent	Type: TwinCAT.TypeSystem.IValue [▶ 2745] The parent.
timeStamp	Type: System.DateTimeOffset The time stamp.

Return Value

Type: Object
A primitive value.

Reference

[IAccessorValueFactory Interface](#) [▶ 3192]

[TwinCAT.ValueAccess Namespace \[► 3179\]](#)

6.13.3.1.2 IAccessorValueFactory.CreateValue Method

Creates the symbols value from raw memory data.

Namespace: [TwinCAT.ValueAccess \[► 3179\]](#)

Assembly: TwinCAT.Ads.Abstractions (in TwinCAT.Ads.Abstractions.dll) Version: 6.0.328+39e3229

Syntax

C#

```
Object CreateValue(
    ISymbol symbol,
    Memory<byte> sourceData,
    IValue? parent,
    DateTimeOffset timeStamp
)
```

Parameters

symbol	Type: TwinCAT.TypeSystem.ISymbol [► 2691] The symbol.
sourceData	Type: System.Memory.Byte. The data.
parent	Type: TwinCAT.TypeSystem.IValue [► 2745] The parent value
timeStamp	Type: System.DateTimeOffset The time stamp.

Return Value

Type: Object
System.Object.

Remarks

The parent argument is used to organize values in hierarchies, equally to the corresponding symbol/instance trees.

6.13.4 ResultAccess Class

Result class for an asynchronous access operation.

Inheritance Hierarchy

- System.Object
- TwinCAT.ValueAccess.ResultAccess
- [TwinCAT.ValueAccess.ResultHandleAccess](#) [[▶ 3224](#)]
- [TwinCAT.ValueAccess.ResultReadValueAccess.T.](#) [[▶ 3211](#)]
- [TwinCAT.ValueAccess.ResultWriteAccess](#) [[▶ 3217](#)]

Namespace: [TwinCAT.ValueAccess](#) [[▶ 3179](#)]

Assembly: TwinCAT.Ads.Abstractions (in TwinCAT.Ads.Abstractions.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public class ResultAccess
```

The ResultAccess type exposes the following members.

Constructors

	Name	Description
	ResultAccess(Int32, UInt32) [▶ 3200]	Initializes a new instance of the ResultAccess class.
	ResultAccess(Int32, DateTimeOffset, UInt32) [▶ 3200]	Initializes a new instance of the ResultReadValueAccess [▶ 3209] struct.

Properties

	Name	Description
	DateTime [▶ 3201]	The Timestamp / the date time of the communication access.
	ErrorCode [▶ 3202]	The ErrorCode of the communication access
	Failed [▶ 3202]	Gets a value indicating whether this ResultAccess represents a failed access.
	Invokeld [▶ 3203]	Gets the invoke identifier (optionally) or 0
	Succeeded [▶ 3202]	Gets a value indicating whether this ResultAccess represents a succeeded access.

Methods

	Name	Description
	Equals	Determines whether the specified object is equal to the current object. (Inherited from Object.)
	Finalize	Allows an object to try to free resources and perform other cleanup operations before it is reclaimed by garbage collection. (Inherited from Object.)
	GetHashCode	Serves as the default hash function. (Inherited from Object.)
	GetType	Gets the Type of the current instance. (Inherited from Object.)
	MemberwiseClone	Creates a shallow copy of the current Object. (Inherited from Object.)
	SetError [▶ 3204]	Sets the error to this ResultAccess object.
	ToString	Returns a string that represents the current object. (Inherited from Object.)

Remarks

This result is independent of any used protocol and is used by the different protocol providers (ADS, OPC, IOT etc.)

Namespace: [TwinCAT.ValueAccess \[► 3179\]](#)

Assembly: TwinCAT.Ads.Abstractions (in TwinCAT.Ads.Abstractions.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public class ResultReadDynamicValueAccess : ResultReadValueAccess<IDynamicValue>
```

The [ResultReadDynamicValueAccess](#) type exposes the following members.

Properties

	Name	Description
	DateTime [► 3201]	The Timestamp / the date time of the communication access. (Inherited from ResultAccess [► 3197] .)
	ErrorCode [► 3202]	The ErrorCode of the communication access (Inherited from ResultAccess [► 3197] .)
	Failed [► 3202]	Gets a value indicating whether this ResultAccess [► 3197] represents a failed access. (Inherited from ResultAccess [► 3197] .)

	Name	Description
	Invokeld [▶ 3203]	Gets the invoke identifier (optionally) or 0 (Inherited from ResultAccess [▶ 3197].)
	Succeeded [▶ 3202]	Gets a value indicating whether this ResultAccess [▶ 3197] represents a succeeded access. (Inherited from ResultAccess [▶ 3197].)
	Value [▶ 3213]	The value (Inherited from ResultReadValueAccess.T. [▶ 3211].)

Methods

	Name	Description
	Equals	Determines whether the specified object is equal to the current object. (Inherited from Object.)
	Finalize	Allows an object to try to free resources and perform other cleanup operations before it is reclaimed by garbage collection. (Inherited from Object.)
	GetHashCode	Serves as the default hash function. (Inherited from Object.)
	GetType	Gets the Type of the current instance. (Inherited from Object.)
	MemberwiseClone	Creates a shallow copy of the current Object. (Inherited from Object.)
	SetError [▶ 3204]	Sets the error to this ResultAccess [▶ 3197] object. (Inherited from ResultAccess [▶ 3197].)
	ToString	Returns a string that represents the current object. (Inherited from Object.)

Constructors

	Name	Description
	ResultWriteAccess(Int32, UInt32) [► 3220]	Initializes a new instance of the ResultWriteAccess class.
	ResultWriteAccess(Int32, DateTimeOffset, UInt32) [► 3221]	Initializes a new instance of the ResultWriteAccess struct.

Properties

	Name	Description
	DateTime [► 3201]	The Timestamp / the date time of the communication access. (Inherited from ResultAccess [► 3197] .)
	Empty [► 3222]	Gets the empty ResultWriteAccess object.
	ErrorCode [► 3202]	The ErrorCode of the communication access (Inherited from ResultAccess [► 3197] .)
	Failed [► 3202]	Gets a value indicating whether this ResultAccess [► 3197] represents a failed access. (Inherited from ResultAccess [► 3197] .)
	Invokeld [► 3203]	Gets the invoke identifier (optionally) or 0 (Inherited from ResultAccess [► 3197] .)
	Succeeded [► 3202]	Gets a value indicating whether this ResultAccess [► 3197] represents a succeeded access. (Inherited from ResultAccess [► 3197] .)

Methods

	Name	Description
	Equals	Determines whether the specified object is equal to the current object. (Inherited from Object.)
	Finalize	Allows an object to try to free resources and perform other cleanup operations before it is reclaimed by garbage collection. (Inherited from Object.)
	GetHashCode	Serves as the default hash function. (Inherited from Object.)
	GetType	Gets the Type of the current instance. (Inherited from Object.)
	MemberwiseClone	Creates a shallow copy of the current Object. (Inherited from Object.)
	SetError [► 3204]	Sets the error to this ResultAccess [► 3197] object. (Inherited from ResultAccess [► 3197] .)
	ToString	Returns a string that represents the current object. (Inherited from Object.)

6.13.12 ValueCreationModes Enumeration

Creation mode for Values

Namespace: [TwinCAT.ValueAccess \[▸ 3179\]](#)

Assembly: TwinCAT.Ads.Abstractions (in TwinCAT.Ads.Abstractions.dll) Version: 6.0.328+39e3229

Syntax

C#

```
[FlagsAttribute]
public enum ValueCreationModes
```

Members

	Member name	Value	Description
	None	0	None / Uninitialized Mask
	Primitives	1	Convert to .NET Primitives, wherever possible.
	Enums	2	Use IEnumValue on EnumTypes instead of .NET Primitives
	FullDynamics	4	Wraps all Primitives also in IValue Objects
	PlcOpenTypes	8	Use PlcOpen Times (TIME, LTIME, DT, TOD, DATETIME) instead of .NET Primitives DateTime and TimeSpan
	Default	1	Default settings for the value creation mode (Translate to Primitives)

Remarks

This setting is used by the ValueFactory/ to create Read values. In default primitive mode all values will be transferred to Primitive .NET Symbols if possible. E.g PlcOpen.TIME --> TimeSpan, IEnumValue --> .NET Primitives. They won't be wrapped into

6.13.15 ValueAccessMode Enumeration

Enum ValueAccessMethod

Namespace: [TwinCAT.ValueAccess](#) [[▶ 3179](#)]

Assembly: TwinCAT.Ads.Abstractions (in TwinCAT.Ads.Abstractions.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public enum ValueAccessMode
```

Members

	Member name	Value	Description
	None	0	None / Uninitialized
	IndexGroupOffset	1	Value access via Index Group and Offset Only
	SymbolicByHandle	2	Symbolic access via Instance Path only.
	IndexGroupOffsetPreferred	3	Uses IndexGroup IndexOffset Preferred (and Symbolic for Dereferenced Pointers / References)
	InstancePath	4	Access by symbolic instance path.
	Default	2	The Default access mode (SymbolicByHandle)

Remarks

Mode	Description
None	None/Uninitialized. No Valid mode.
IndexGroupOffset	Communicates over IndexGroup/IndexOffset only. This is the most direct/efficient access into the Process image. The advantage is that, the symbol access is done via 1 ADS round trip. Disadvantages are that not all Symbols can be accessed via IG/IO (e.g. References) and IndexOffsets could be invalid after online changes / PlcProgram downloads. Detection of these events and following invalidation of all changed symbols need to be done within the user application.
SymbolicByHandle	The Symbolic-only mode is the most safe mode to use but needs more time than the IndexGroupOffset. It could need up to 3 ADS round trips (create handle, access value, close handle) but is not influenced by online changes or / plcProgram downloads.
IndexGroupOffsetPreferred	This is a mixed access mode. For symbols, where it is possible it uses the IndexGroup/IndexOffset. For others it chooses the SymbolicByHandle access.
Default	The Default-Mode setting if no other ValueAccessMode is specified. This is set to SymbolicByHandle.

Reference

[TwinCAT.ValueAccess Namespace \[▶ 3179\]](#)

6.13.16 ValueUpdateMode Enumeration

Value Update Mode.

Namespace: [TwinCAT.ValueAccess \[▶ 3179\]](#)

Assembly: TwinCAT.Ads.Abstractions (in TwinCAT.Ads.Abstractions.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public enum ValueUpdateMode
```

Members

	Member name	Value	Description
	None	0	No automatic Value Update / Uninitialized
	Immediately	1	Update Value immediately on property set access.
	Triggered	2	Triggers the ValueUpdate explicitly

Remarks

Mode	Description
Immediately	Writes the values of this DynamicValue instantly when setting its value or the value of its child members/elements.
Triggered	Caches internally the value of this DynamicValue until the DynamicValue.Write method is called. This reduces ADS roundtrips, if one or more member/element values should be changed. Furthermore the write on the destination system happens consistently in one ADS Write operation, which could be important for dependent properties/members/elements.

Namespace: [TwinCAT.Ads.Server.TypeSystem \[► 3230\]](#)

Assembly: TwinCAT.Ads.SymbolicServer (in TwinCAT.Ads.SymbolicServer.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public class DataArea
```

The DataArea type exposes the following members.

Constructors

	Name	Description
	DataArea [▶ 3231]	Initializes a new instance of the DataArea class.

Properties

	Name	Description
	IndexGroup [▶ 3232]	Gets the index group of the DataArea.
	IndexOffset [▶ 3233]	Gets the index offset of the DataArea.
	Name [▶ 3233]	Gets the name of the DataArea.
	Size [▶ 3234]	Gets the size of the DataArea.

Methods

	Name	Description
	Equals	Determines whether the specified object is equal to the current object. (Inherited from Object .)
	Finalize	Allows an object to try to free resources and perform other cleanup operations before it is reclaimed by garbage collection. (Inherited from Object .)
	GetHashCode	Serves as the default hash function. (Inherited from Object .)
	GetType	Gets the Type of the current instance. (Inherited from Object .)
	MemberwiseClone	Creates a shallow copy of the current Object . (Inherited from Object .)
	ToString	Returns a string that represents the current object. (Inherited from Object .)

Remarks

The DataArea class organizes the ProcessImage in different memory areas to address them independently via their IndexGroup.

6.14.1.2.2 DataArea.IndexOffset Property

Gets the index offset of the [DataArea](#) [[▶ 3230](#)].

Namespace: [TwinCAT.Ads.Server.TypeSystem](#) [[▶ 3230](#)]

Assembly: TwinCAT.Ads.SymbolicServer (in TwinCAT.Ads.SymbolicServer.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public uint IndexOffset { get; }
```

Property Value

Type: [UInt32](#)
The index offset.

Reference

6.14.1.3 DataArea Methods

The [DataArea](#) [[▶ 3230](#)] type exposes the following members.

Methods

	Name	Description
	Equals	Determines whether the specified object is equal to the current object. (Inherited from Object .)
	Finalize	Allows an object to try to free resources and perform other cleanup operations before it is reclaimed by garbage collection. (Inherited from Object .)
	GetHashCode	Serves as the default hash function. (Inherited from Object .)
	GetType	Gets the Type of the current instance. (Inherited from Object .)
	MemberwiseClone	Creates a shallow copy of the current Object . (Inherited from Object .)
	ToString	Returns a string that represents the current object. (Inherited from Object .)

Reference

[DataArea Class](#) [[▶ 3230](#)]

[TwinCAT.Ads.Server.TypeSystem Namespace](#) [[▶ 3230](#)]

6.14.2 IAddSymbolicInformation Interface

Interface [IAddSymbolicInformation](#)

Namespace: [TwinCAT.Ads.Server.TypeSystem](#) [[▶ 3230](#)]

Assembly: [TwinCAT.Ads.SymbolicServer](#) (in [TwinCAT.Ads.SymbolicServer.dll](#)) Version: 6.0.328+39e3229

Syntax

C#

```
public interface IAddSymbolicInformation
```

The IAddSymbolicInformation type exposes the following members.

Methods

	Name	Description
	AddDataArea [▶ 3236]	Adds a DataArea [▶ 3230]to the symbolic information.
	AddSymbol(String, String, String) [▶ 3237]	Adds and registers a ISymbol [▶ 2691].
	AddSymbol(String, IDataType, DataArea) [▶ 3238]	Adds and registers a symbol
	AddType [▶ 3238]	Adds and registers a DataType [▶ 1721]
	ClearDataAreas [▶ 3239]	Removes all DataAreas.
	ClearSymbols [▶ 3239]	Removes all symbols.
	ClearTypes [▶ 3240]	Removes all DataTypes.
	RemoveDataArea [▶ 3240]	Removes a DataArea [▶ 3230] from the symbolic information.
	RemoveSymbol(ISymbol) [▶ 3241]	Removes the ISymbol [▶ 2691] from the Symbolic information.
	RemoveSymbol(String) [▶ 3241]	Removes the ISymbol [▶ 2691] from the Symbolic information
	RemoveType [▶ 3242]	Removes the DataType [▶ 1721] from the symbolic information.

Remarks

Fluent interface for method chaining (method cascading) [ISymbol](#) [▶ 2691] and [DataType](#) [▶ 1721] information. This helps building up DataTypes, DataAreas and Symbols for the AdsSymbolServer with the help of an [ServerSymbolFactory](#) [▶ 3242].

6.14.2.1 IAddSymbolicInformation Methods

The [IAddSymbolicInformation](#) [▶ 3234] type exposes the following members.

Methods

	Name	Description
	AddDataArea [▶ 3236]	Adds a DataArea [▶ 3230]to the symbolic information.
	AddSymbol(String, String, String) [▶ 3237]	Adds and registers a ISymbol [▶ 2691].

	Name	Description
	AddSymbol(String, IDataTypes, DataArea) [▶ 3238]	Adds and registers a symbol
	AddType [▶ 3238]	Adds and registers a DataType [▶ 1721]
	ClearDataAreas [▶ 3239]	Removes all DataAreas.
	ClearSymbols [▶ 3239]	Removes all symbols.
	ClearTypes [▶ 3240]	Removes all DataTypes.
	RemoveDataArea [▶ 3240]	Removes a DataArea [▶ 3230] from the symbolic information.
	RemoveSymbol(ISymbol) [▶ 3241]	Removes the ISymbol [▶ 2691] from the Symbolic information.
	RemoveSymbol(String) [▶ 3241]	Removes the ISymbol [▶ 2691] from the Symbolic information
	RemoveType [▶ 3242]	Removes the DataType [▶ 1721] from the symbolic information.

6.14.2.1.1 IAddSymbolicInformation.AddDataArea Method

Adds a [DataArea](#) [[▶ 3230](#)] to the symbolic information.

Namespace: [TwinCAT.Ads.Server.TypeSystem](#) [[▶ 3230](#)]

Assembly: TwinCAT.Ads.SymbolicServer (in TwinCAT.Ads.SymbolicServer.dll) Version: 6.0.328+39e3229

Syntax

C#

```
IAddSymbolicInformation AddDataArea (
    DataArea area
)
```

Parameters

area	Type: TwinCAT.Ads.Server.TypeSystem.DataArea [▶ 3230] The area.
------	--

Return Value

Type: [IAddSymbolicInformation](#) [[▶ 3234](#)]

The self-referential [IAddSymbolicInformation](#) [[▶ 3234](#)] object to support method chaining/cascading.

Reference

6.14.2.1.2.1 IAddSymbolicInformation.AddSymbol Method (String, String, String)

Adds and registers a [ISymbol](#) [[▶ 2691](#)].

Namespace: [TwinCAT.Ads.Server.TypeSystem](#) [[▶ 3230](#)]

Assembly: TwinCAT.Ads.SymbolicServer (in TwinCAT.Ads.SymbolicServer.dll) Version: 6.0.328+39e3229

Syntax

C#

```
IAddSymbolicInformation AddSymbol(
    string instancePath,
    string dataType,
    string dataArea
)
```

Parameters

instancePath	Type: System.String The instancePath.
dataType	Type: System.String The name of the already registered DataType
dataArea	Type: System.String The data area.

Return Value

Type: [IAddSymbolicInformation](#) [[▶ 3234](#)]

The self-referential [IAddSymbolicInformation](#) [[▶ 3234](#)] object to support method chaining/cascading.

Remarks

The address in the DataArea will be calculated automatically (indexGroup, indexOffset).

Adds and registers a symbol

Namespace: [TwinCAT.Ads.Server.TypeSystem](#) [[▶ 3230](#)]

Assembly: TwinCAT.Ads.SymbolicServer (in TwinCAT.Ads.SymbolicServer.dll) Version: 6.0.328+39e3229

Syntax

C#

```
IAddSymbolicInformation AddSymbol(
    string instancePath,
    IDataType dataType,
    DataArea dataArea
)
```

Parameters

instancePath	Type: System.String The InstancePath (FullPath) to the symbol.
dataType	Type: TwinCAT.TypeSystem.IDataType [▶ 2475] The (already registered) DataType
dataArea	Type: TwinCAT.Ads.Server.TypeSystem.DataArea [▶ 3230] The data area.

Return Value

Type: [IAddSymbolicInformation](#) [[▶ 3234](#)]

The self-referential [IAddSymbolicInformation](#) [[▶ 3234](#)] object to support method chaining/cascading.

Remarks

The address in the DataArea will be calculated automatically (indexGroup, indexOffset).

6.14.3 ServerSymbolFactory Class

Class ServerSymbolFactory.

Inheritance Hierarchy

System.Object

TwinCAT.Ads.Server.TypeSystem.ServerSymbolFactory

Namespace: [TwinCAT.Ads.Server.TypeSystem](#) [▶ 3230]

Assembly: TwinCAT.Ads.SymbolicServer (in TwinCAT.Ads.SymbolicServer.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public class ServerSymbolFactory : IAddSymbolicInformation
```

The ServerSymbolFactory type exposes the following members.

Constructors

	Name	Description
	ServerSymbolFactory [▶ 3244]	Initializes a new instance of the ServerSymbolFactory class.

Methods

	Name	Description
	AddDataArea [▶ 3245]	Adds a DataArea [▶ 3230] to the symbolic information.
	AddSymbol(String, String, String) [▶ 3246]	Adds and registers a ISymbol [▶ 2691].
	AddSymbol(String, IDataTypes, DataArea) [▶ 3247]	Adds and registers a symbol
	AddType [▶ 3248]	Adds and registers a DataType [▶ 1721]
	ClearDataAreas [▶ 3249]	Removes all DataAreas.
	ClearSymbols [▶ 3249]	Removes all symbols.
	ClearTypes [▶ 3250]	Removes all DataTypes.
	CreateSymbol(String, IDataTypes, ISymbol, Int32) [▶ 3251]	Creates the symbol.
	CreateSymbol(String, String, IDataTypes, UInt32, UInt32) [▶ 3251]	Creates the symbol.
	Equals	Determines whether the specified object is equal to the current object. (Inherited from Object .)
	Finalize	Allows an object to try to free resources and perform other cleanup operations before it is reclaimed by garbage collection. (Inherited from Object .)
	GetHashCode	Serves as the default hash function. (Inherited from Object .)

	Name	Description
	GetType	Gets the Type of the current instance. (Inherited from Object .)
	MemberwiseClone	Creates a shallow copy of the current Object . (Inherited from Object .)
	RemoveDataArea [▶ 3252]	Removes a DataArea [▶ 3230] from the symbolic information.
	RemoveSymbol(ISymbol) [▶ 3253]	Removes the ISymbol [▶ 2691] from the Symbolic information.
	RemoveSymbol(String) [▶ 3254]	Removes the ISymbol [▶ 2691] from the Symbolic information
	RemoveType [▶ 3254]	Removes the DataType [▶ 1721] from the symbolic information.
	ToString	Returns a string that represents the current object. (Inherited from Object .)

Remarks

Factory class supporting creating DataAreas, DataTypes and Symbols.

Reference

6.14.3.1 ServerSymbolFactory Constructor

Initializes a new instance of the [ServerSymbolFactory](#) [\[▶ 3242\]](#) class.

Namespace: [TwinCAT.Ads.Server.TypeSystem](#) [\[▶ 3230\]](#)

Assembly: TwinCAT.Ads.SymbolicServer (in TwinCAT.Ads.SymbolicServer.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public ServerSymbolFactory(
    AdsSymbolicServer server
)
```

Parameters

server	Type: TwinCAT.Ads.Server.AdsSymbolicServer [▶ 1468] The server.
--------	--

Reference

6.14.3.2 ServerSymbolFactory Methods

The [ServerSymbolFactory](#) [\[▶ 3242\]](#) type exposes the following members.

Methods

	Name	Description
	AddDataArea [▶ 3245]	Adds a DataArea [▶ 3230] to the symbolic information.

	Name	Description
	AddSymbol(String, String, String) [▶ 3246]	Adds and registers a ISymbol [▶ 2691].
	AddSymbol(String, IDataType, DataArea) [▶ 3247]	Adds and registers a symbol
	AddType [▶ 3248]	Adds and registers a DataType [▶ 1721]
	ClearDataAreas [▶ 3249]	Removes all DataAreas .
	ClearSymbols [▶ 3249]	Removes all symbols.
	ClearTypes [▶ 3250]	Removes all DataTypes .
	CreateSymbol(String, IDataType, ISymbol, Int32) [▶ 3251]	Creates the symbol.
	CreateSymbol(String, String, IDataType, UInt32, UInt32) [▶ 3251]	Creates the symbol.
	Equals	Determines whether the specified object is equal to the current object. (Inherited from Object .)
	Finalize	Allows an object to try to free resources and perform other cleanup operations before it is reclaimed by garbage collection. (Inherited from Object .)
	GetHashCode	Serves as the default hash function. (Inherited from Object .)
	GetType	Gets the Type of the current instance. (Inherited from Object .)
	MemberwiseClone	Creates a shallow copy of the current Object . (Inherited from Object .)
	RemoveDataArea [▶ 3252]	Removes a DataArea [▶ 3230] from the symbolic information.
	RemoveSymbol(ISymbol) [▶ 3253]	Removes the ISymbol [▶ 2691] from the Symbolic information.
	RemoveSymbol(String) [▶ 3254]	Removes the ISymbol [▶ 2691] from the Symbolic information
	RemoveType [▶ 3254]	Removes the DataType [▶ 1721] from the symbolic information.
	ToString	Returns a string that represents the current object. (Inherited from Object .)

Namespace: [TwinCAT.Ads.Server.TypeSystem](#) [► 3230]

Assembly: TwinCAT.Ads.SymbolicServer (in TwinCAT.Ads.SymbolicServer.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public IAddSymbolicInformation AddSymbol(
    string instancePath,
    string dataType,
    string dataArea
)
```

Parameters

instancePath	Type: System.String The instancePath.
dataType	Type: System.String The name of the already registered DataType
dataArea	Type: System.String The data area.

Return Value

Type: [IAddSymbolicInformation](#) [[▶ 3234](#)]
The self-referential [IAddSymbolicInformation](#) [[▶ 3234](#)] object to support method chaining/cascading.

Implements

[IAddSymbolicInformation.AddSymbol\(String, String, String\)](#) [[▶ 3237](#)]

Exceptions

Exception	Condition
ArgumentOutOfRangeException	dataArea - Cannot find DataArea'{dataArea}'
DataTypeException [▶ 2121]	DataType '{dataType}' not found!

Remarks

The address in the DataArea will be calculated automatically (indexGroup, indexOffset).

Creates the symbol.

Namespace: [TwinCAT.Ads.Server.TypeSystem \[► 3230\]](#)

Assembly: TwinCAT.Ads.SymbolicServer (in TwinCAT.Ads.SymbolicServer.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public Symbol CreateSymbol(
    string instanceName,
    IDataTypes dataType,
    ISymbol parent,
    int fieldOffset
)
```

Parameters

instanceName	Type: System.String Name of the instance.
dataType	Type: TwinCAT.TypeSystem.IDataTypes [► 2475] Type of the data.
parent	Type: TwinCAT.TypeSystem.ISymbol [► 2691] The parent.
fieldOffset	Type: System.Int32 The field offset.

Return Value

Type: [Symbol \[► 1863\]](#)
Symbol.

Exceptions

Exception	Condition
ArgumentNullException	instanceName
ArgumentNullException	dataType
NotSupportedException

Creates the symbol.

Namespace: [TwinCAT.Ads.Server.TypeSystem \[► 3230\]](#)

Assembly: TwinCAT.Ads.SymbolicServer (in TwinCAT.Ads.SymbolicServer.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public Symbol CreateSymbol(
    string instanceName,
    string instancePath,
    IDataType dataType,
    uint indexGroup,
    uint indexOffset
)
```

Parameters

instanceName	Type: System.String Name of the instance.
instancePath	Type: System.String The instance path.
dataType	Type: TwinCAT.TypeSystem.IDataType [▶ 2475] Type of the data.
indexGroup	Type: System.UInt32 The index group.
indexOffset	Type: System.UInt32 The index offset.

Return Value

Type: [Symbol](#) [[▶ 1863](#)]
Symbol.

Exceptions

Exception	Condition
ArgumentNullException	instanceName
ArgumentNullException	dataType
NotSupportedException	Data Type is not supported!

Classes

	Class	Description
	RouterPort [▶ 3255]	Class represents a Router Port
	RouterPortInfo [▶ 3264]	Class RouterPortInfo.

6.15.1 RouterPort Class

Class represents a Router Port

Inheritance Hierarchy

System.Object
[TwinCAT.Router.RouterPortInfo](#) [[▶ 3264](#)]
 TwinCAT.Router.RouterPort

Namespace: [TwinCAT.Router](#) [[▶ 3255](#)]

Assembly: TwinCAT.Ads.Abstractions (in TwinCAT.Ads.Abstractions.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public class RouterPort : RouterPortInfo
```

The RouterPort type exposes the following members.

Constructors

	Name	Description
	RouterPort . [▶ 3257]	Constructs the RouterPort object
	RouterPort(AmsRegi sterPort) . [▶ 3257]	Constructs the RouterPort object

Properties

	Name	Description
	Attributes [▶ 3258]	Gets additional attributes of the Port
	HasSymbols [▶ 3259]	Gets, whether the Port contains Symbol informations
	IsAdsSecurePort [▶ 3259]	Gets a value indicating whether this instance is ads secure port.
	IsClientPort [▶ 3259]	Gets, whether the port is an Client port
	IsFixedPort [▶ 3260]	Gets, whether the Port is fixed
	IsServerPort [▶ 3260]	Gets, whether the port is an Server port
	IsSynchronized [▶ 3260]	Gets, whether the Port is Synchronized
	Name [▶ 3267]	Gets the Name of the Port (Inherited from RouterPortInfo [▶ 3264].)
	PortID [▶ 3267]	Gets the PortNumber (Inherited from RouterPortInfo [▶ 3264].)
	PortType [▶ 3261]	Gets the type of the Port
	QueueSize [▶ 3261]	Gets the current Queue size

Methods

	Name	Description
	Equals [▶ 3268]	Equals (Inherited from RouterPortInfo [▶ 3264].)
	Finalize	Allows an object to try to free resources and perform other cleanup operations before it is reclaimed by garbage collection. (Inherited from Object.)
	GetHashCode [▶ 3269]	Gets the HashCode of the Address (Inherited from RouterPortInfo [▶ 3264].)
	GetType	Gets the Type of the current instance. (Inherited from Object.)
	MemberwiseClone	Creates a shallow copy of the current Object. (Inherited from Object.)
	ToString [▶ 3262]	Returns a String that represents this instance. (Overrides RouterPortInfo.ToString . [▶ 3269].)

Fields

	Name	Description
	fixedPort [▶ 3263]	Fixed port
	port [▶ 3272]	Port Number (Inherited from RouterPortInfo [▶ 3264].)
	portAttributes [▶ 3263]	Port Attributes.
	portName [▶ 3272]	Port name (Inherited from RouterPortInfo [▶ 3264].)
	portQueueSize [▶ 3264]	Port Queue size.
	portType [▶ 3264]	Port Type

Class AdsSysServState.

Namespace: [TwinCAT.SystemService \[▶ 3272\]](#)

Assembly: TwinCAT.Ads.Abstractions (in TwinCAT.Ads.Abstractions.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public struct AdsSysServState
```

The AdsSysServState type exposes the following members.

Methods

	Name	Description
	Equals	Indicates whether this instance and a specified object are equal. (Inherited from ValueType.)
	GetHashCode	Returns the hash code for this instance. (Inherited from ValueType.)
	GetType	Gets the Type of the current instance. (Inherited from Object.)
	ToString	Returns the fully qualified type name of this instance. (Inherited from ValueType.)

Fields

	Name	Description
	AdsState [▶ 3277]	The AdsState
	Build [▶ 3277]	The build number of the target system.
	DeviceState [▶ 3278]	The device state
	Flags [▶ 3278]	The System Service flags.
	OsType [▶ 3279]	The Operation System ID of the target system.
	Platform [▶ 3279]	The platform ID of the target system.
	Reserved [▶ 3279]	Reserved data
	RestartIndex [▶ 3280]	The restart index
	Revision [▶ 3280]	The revision of the target system.
	Version [▶ 3280]	The major version of the target system.

)
```

Parameters

connection	Type: TwinCAT.Ads.IAdsConnection [► 876] The client (should be an IAdsConnection on port 10000 with FastWriteThrough)
------------	--

trigger	Type: System.IObservable.Unit. The trigger.
---------	--

Return Value

Type: IObservable.ResultValue [▶ 1181].AdsSysServState [▶ 3275]..
IObservable<ResultValue<AdsSysServState>>.

Usage Note

In Visual Basic and C#, you can call this method as an instance method on any object of type [IAdsConnection](#) [▶ 876]. When you use instance method syntax to call this method, omit the first parameter. For more information, see [Extension Methods \(Visual Basic\)](#) or [Extension Methods \(C# Programming Guide\)](#).

6.16.4.1.5 SystemServiceExtension.RestartTwinCATAsync Method

Sends a SystemService Restart to the target system and waits until the system has finished the state changes (SystemService, Port 10000) (asynchronously)

Namespace: [TwinCAT.SystemService \[▸ 3272\]](#)

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public static Task<ResultWriteControl> RestartTwinCATAsync(
    this IAdsConnection connection,
    AdsStateCommand request,
    TimeSpan pollingRate,
    TimeSpan waitTimeout,
    bool noReinit,
    CancellationToken cancel
)
```

Parameters

connection	Type: TwinCAT.Ads.IAdsConnection [▶ 876] The connection (should be an IAdsConnection on port 10000 in FastWriteThrough mode)
request	Type: TwinCAT.Ads.AdsStateCommand [▶ 1233] The request/command for (Reconfig/Reset)
pollingRate	Type: System.TimeSpan The polling rate (should be lower than the connection timeout).
waitTimeout	Type: System.TimeSpan The wait timeout.
noReinit	Type: System.Boolean if set to true then this method first checks if the system is already in the requested target state. In that case the method can return immediatly.
cancel	Type: System.Threading.CancellationToken The cancellation token that can be used by other objects or threads to receive notice of cancellation.

Return Value

Type: [Task.ResultWriteControl](#) [[▶ 1236](#)].

A [Task<System.Boolean>](#) representing whether the restart is detected (true), or the timeout occurred (false).

Usage Note

In Visual Basic and C#, you can call this method as an instance method on any object of type [IAdsConnection](#) [[▶ 876](#)]. When you use instance method syntax to call this method, omit the first parameter. For more information, see [Extension Methods \(Visual Basic\)](#) or [Extension Methods \(C# Programming Guide\)](#).

Exceptions

Classes

	Class	Description
	TlsException [► 3288]	Base class for all exceptions thrown by the TwinCAT.Ads component

6.17.1 TlsException Class

Base class for all exceptions thrown by the TwinCAT.Ads component

Inheritance Hierarchy

```

System.Object
  System.Exception
    TwinCAT.Tls.TlsException

```

Namespace: [TwinCAT.Tls](#) [► 3288]

Assembly: TwinCAT.Ads.Abstractions (in TwinCAT.Ads.Abstractions.dll) Version: 6.0.328+39e3229

Syntax

C#

```

[SerializableAttribute]
public class TlsException : Exception

```

The TlsException type exposes the following members.

Constructors

	Name	Description
	TlsException [► 3289]	Initializes a new Instance of the AdsException [► 61] class.

Properties

	Name	Description
	Data	Gets a collection of key/value pairs that provide additional user-defined information about the exception. (Inherited from Exception.)
	Error [► 3290]	Gets the TlsError value.

	Name	Description
	HelpLink	Gets or sets a link to the help file associated with this exception. (Inherited from Exception.)
	HResult	Gets or sets HRESULT, a coded numerical value that is assigned to a specific exception. (Inherited from Exception.)
	InnerException	Gets the Exception instance that caused the current exception. (Inherited from Exception.)
	Message	Gets a message that describes the current exception. (Inherited from Exception.)
	Source	Gets or sets the name of the application or the object that causes the error. (Inherited from Exception.)
	StackTrace	Gets a string representation of the immediate frames on the call stack. (Inherited from Exception.)
	TargetSite	Gets the method that throws the current exception. (Inherited from Exception.)

Methods

	Name	Description
	Equals	Determines whether the specified object is equal to the current object. (Inherited from Object.)
	Finalize	Allows an object to try to free resources and perform other cleanup operations before it is reclaimed by garbage collection. (Inherited from Object.)
	GetBaseException	When overridden in a derived class, returns the Exception that is the root cause of one or more subsequent exceptions. (Inherited from Exception.)
	GetHashCode	Serves as the default hash function. (Inherited from Object.)
	GetObjectData	When overridden in a derived class, sets the SerializationInfo with information about the exception. (Inherited from Exception.)
	GetType	Gets the runtime type of the current instance. (Inherited from Exception.)
	MemberwiseClone	Creates a shallow copy of the current Object. (Inherited from Object.)
	ToString	Creates and returns a string representation of the current exception. (Inherited from Exception.)

Events

	Name	Description
	SerializeObjectState	Obsolete. Occurs when an exception is serialized to create an exception state object that contains serialized data about the exception. (Inherited from Exception.)

Parameters

connection	Type: TwinCAT.Ads.IAdsConnection [876] The connection.
pollingInterval	Type: System.TimeSpan The interval.
cancel	Type: System.Threading.CancellationToken The cancellation token.

Return Value

Type: [IObservable.ResultReadAdsState](#) [[1146](#)].

[IObservable<AdsState>](#).

Usage Note

In Visual Basic and C#, you can call this method as an instance method on any object of type [IAdsConnection](#) [[876](#)]. When you use instance method syntax to call this method, omit the first parameter. For more information, see [Extension Methods \(Visual Basic\)](#) or [Extension Methods \(C# Programming Guide\)](#).

Examples

The following sample shows how observe [AdsState](#) [[729](#)] via polling with the reactive [AdsClientExtensions](#) [[1215](#)]

Observe changing ADS States with reactive extensions.

```
// To Test the observer, Start/Stop the local PLC

using (AdsClient client = new AdsClient())
{
    // Connect to target
    client.Connect(new AmsAddress(AmsNetId.Local, 851));

    // Create Symbol information
    var symbolLoader = SymbolLoaderFactory.Create(client, SymbolLoaderSettings.DefaultDynamic);

    // Reactive Change Handler
    var valueObserver = Observer.Create<IList<AdsState>>(not =>
    {
        AdsState oldValue = not[0];
        AdsState newValue = not[1];

        Console.WriteLine(string.Format("Changed ADSState from '{0}' --> '{1}!", oldValue, newValue));
    });

    // Create a subscription for the AdsState change and buffering 2 Values (for oldValue --
    > newValue output).
```

```

IDisposable subscription = client.PollAdsState(TimeSpan.FromMilliseconds(200)).Buffer(2, 1).Subscribe(valueObserver);

Console.ReadKey(); // Wait for Key press
subscription.Dispose(); // Dispose the Subscription
}

```

Reference

[PollAdsStateAsync Overload \[▶ 3296\]](#)

[TwinCAT.Ads.Extensions Namespace \[▶ 3292\]](#)

6.18.1.1.3 ConnectionStateExtension.SetAdsState Method

Sets an AdsState/AdsStateCommand to an AdsServer and waits until the StateChange finishes.

Namespace: [TwinCAT.Ads.Extensions \[▶ 3292\]](#)

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```

public static ResultWriteControl SetAdsState(
    this IAdsConnection connection,
    AdsStateCommand requested,
    TimeSpan pollingRate,
    TimeSpan waitTimeout,
    bool noReinit,
    bool noWait
)

```

Parameters

connection	Type: TwinCAT.Ads.IAdsConnection [▶ 876] The connection.
requested	Type: TwinCAT.Ads.AdsStateCommand [▶ 1233] The requested state / command.
pollingRate	Type: System.TimeSpan The polling rate.
waitTimeout	Type: System.TimeSpan The wait timeout.
noReinit	Type: System.Boolean Checks first for the actual state and decides to return immediatly if the device is already in the expected target state.
noWait	Type: System.Boolean if set to true [no wait].

Return Value

Type: [ResultWriteControl \[▶ 1236\]](#)
ResultWriteControl.

Usage Note

In Visual Basic and C#, you can call this method as an instance method on any object of type [IAdsConnection \[▶ 876\]](#). When you use instance method syntax to call this method, omit the first parameter. For more information, see [Extension Methods \(Visual Basic\)](#) or [Extension Methods \(C# Programming Guide\)](#).

Exceptions

Exception	Condition
ClientNotConnectedException [▶ 67]	
AdsException [▶ 61]	Polling rate higher than connection timeout!
AdsException [▶ 61]	Cannot set '{address}' to '{requested}'. This would leave the target system unavailable for ADS!

6.18.1.1.4 ConnectionStateExtension.SetAdsStateAsync Method

Sets an AdsState/AdsStateCommand to an AdsServer and waits until the StateChange finishes.

Namespace: [TwinCAT.Ads.Extensions](#) [[▶ 3292](#)]

Assembly: TwinCAT.Ads (in TwinCAT.Ads.dll) Version: 6.0.328+39e3229

Syntax

C#

```
public static Task<ResultWriteControl> SetAdsStateAsync(
    this IAdsConnection connection,
    AdsStateCommand requested,
    TimeSpan pollingRate,
    TimeSpan waitTimeout,
    bool noReinit,
    bool noWait,
    CancellationToken cancel
)
```

Parameters

connection	Type: TwinCAT.Ads.IAdsConnection [▶ 876] The connection.
requested	Type: TwinCAT.Ads.AdsStateCommand [▶ 1233] The requested state / command.
pollingRate	Type: System.TimeSpan The polling rate.
waitTimeout	Type: System.TimeSpan The wait timeout.
noReinit	Type: System.Boolean Checks first for the actual state and decides to return immediately if the device is already in the expected target state.
noWait	Type: System.Boolean if set to true [no wait].
cancel	Type: System.Threading.CancellationToken The cancellation token that can be used by other objects or threads to receive notice of cancellation.

Return Value

Type: [Task.ResultWriteControl](#) [[▶ 1236](#)].
ResultWriteControl.

Usage Note

In Visual Basic and C#, you can call this method as an instance method on any object of type [IAdsConnection \[► 876\]](#). When you use instance method syntax to call this method, omit the first parameter. For more information, see [Extension Methods \(Visual Basic\)](#) or [Extension Methods \(C# Programming Guide\)](#).

Exceptions

Exception	Condition
ClientNotConnectedException [► 67]	
AdsException [► 61]	Polling rate higher than connection timeout!
AdsException [► 61]	Cannot set '{address}' to '{requested}'. This would leave the target system unavailable for ADS!
